SERVO PISTON & ACCUMULATOR PISTONS: Disassembly - Place a 7/16" deep socket over long end of servo piston pin, then position a "U" shaped spacer against piston end of piston assembly and place the socket, piston assembly and "U" shaped spacer between jaws of a bench vise. Slowly tighten vise sufficiently to remove the snap ring, then remove servo piston-to-piston pin snap ring and washer being careful

COMPENSATOR VALVE (EXPLODED)

SERVO PISTON

not to spread snap ring more than necessary as it can be easily distorted. Remove piston assembly from vise, then remove servo piston, springs, and retainer. From upper accumulator piston, remove and discard lip s al.

Inspection: Inspect servo piston ring and ring groove for broken ring and ring groove for nicks or burrs. Check release spring for collapsed coils or broken spring. Check piston stem for scoring. Use a fine wire and check oil passages in piston. Inspect lower accumulator piston ring and ring groove for broken ring and ring grooves for nicks or burrs. Replace rubber lip type seal on upper accumulator piston. Inspect accumulator release springs for collapsed coils or broken spring. Inspect accumulator piston pin for scoring.

Reassembly: Install a new piston seal on upper accumulator piston with lip facing flat side of piston, then install spring retainer, springs and servo piston ver servo piston pin. Install assembly is vise in same manner used at disassembly, then align pin carefully and compress the assembly to allow flat washer and snap ring to be installed. Remove servo piston assembly and tools from vise.

►*CONTROL VALVE INSPECTION NOTE:* **Inspect each valve for free movement in valve body bore. If necessary, stone the valve lands slightly to remove small burrs. DO NOT remove square edges of valve lands. Inspect springs for distortion or collapsed coils. Make sure ball seats are not pitted or chipped. Inspect spacer plates for restrictions, dents or distortion.**

COMPENSATOR VALVE BODY: Disassembly - Compress compensator plug and remove retaining pin, then remove plug. Remove secondary and primary valves and springs.

Reassembly: Install spring on primary compensator valve and install spring and valve (small end first) into body. Install spring on secondary compensator valve and install spring and valve into body (spring end first). Install plug with threaded side out, then compress plug and install retaining pin.

2-3 BOOST BODY: Disassembly - Remove boost body from main valve body (one attaching scr ew is located on

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

channel plate side of body). *NOTE - B car ful not t lose the three loose check balls in boost body.* Remove three check balls and spacer plate from valve body, then remove retainer from 2-3 boost body (retainer is under spring pressure). Remove 2-1 cut-off valve spring and valve, 2-3 boost plug, spring and valve.

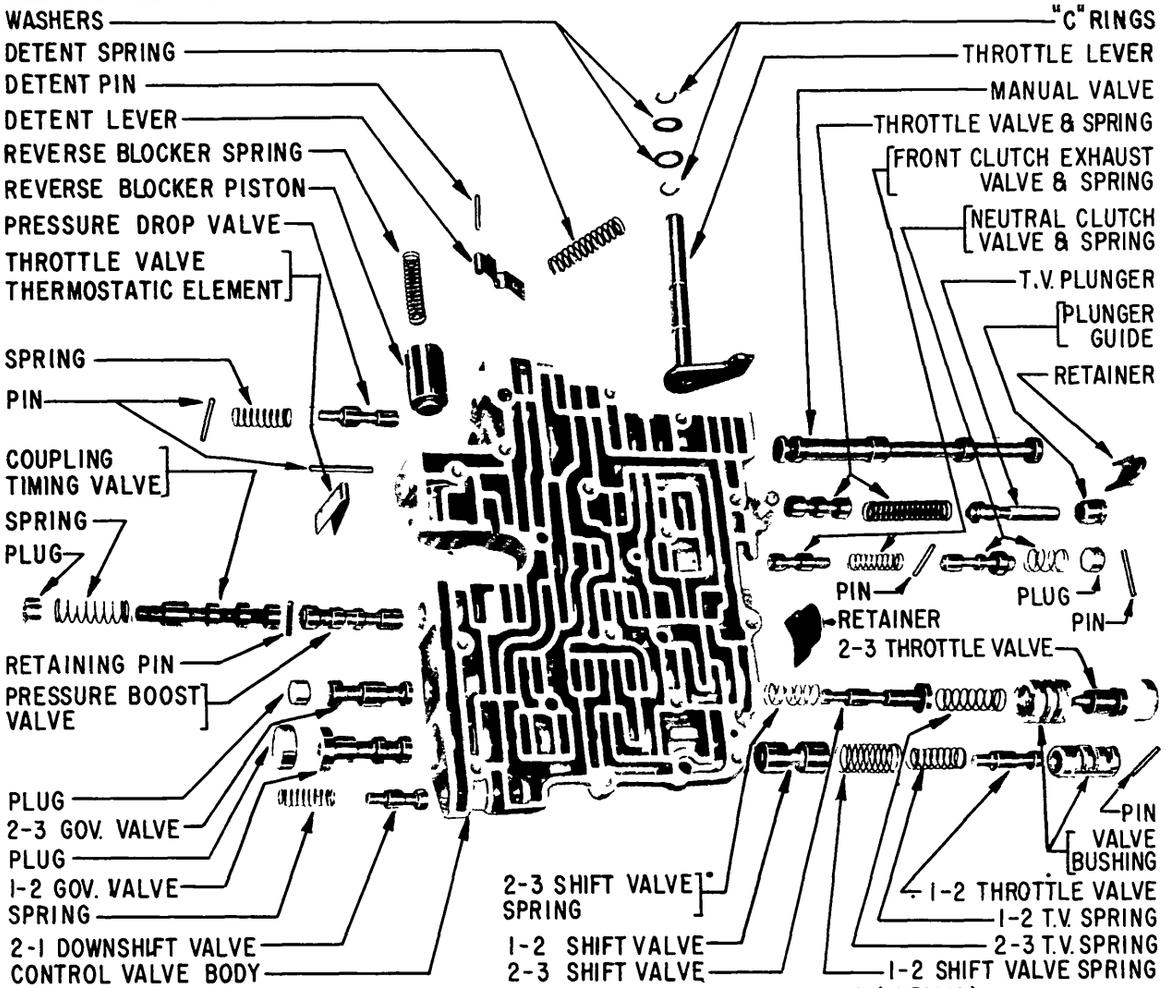
R assembly: Install 2-3 boost valve (long stem out), spring and plug into bore of boost body nearest the cored face. Compress 2-3 boost plug against spring tension and partly install 2-3 boost body retainer. Install 2-1 cut-off valve (stem out), and spring in remaining bore of boost body, then compress 2-1 cut-off valve spring and slide 2-3 boost body retainer over spring. *NOTE - See "Assembly of Complete Control Valve" below for installation of 2-3 Boost Body.*

►*1961 VALVE BODY TOOL NOTE:* To aid in removing and replacing valves in control valve assembly, make tools illustrated below. Tool No. 1 is made from 1/8" diameter soft metal rod and is used to remove stuck valves. Tool Nos. 2 & 3 are made from 3/8" & 5/16" diameter copper tubing and are used to compress and hold valve spring while spring retaining pin is being removed or replaced.

►*CONTROL VALVE DISASSEMBLY & REASSEMBLY NOTE: Carefully identify all valve assembly parts so they may be returned to same location in valve body at reassembly. See "Changes, Cautions, Corrections" above for differences in control valve assemblies.*

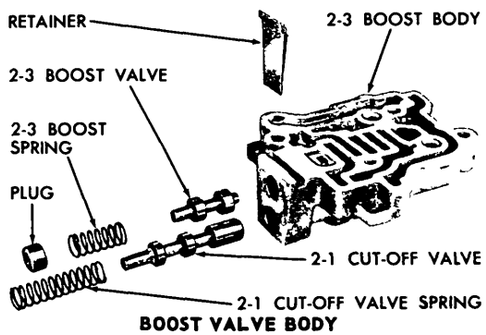
CONTROL VALVE BODY: Disassembly - 1) Remove channel plate from valve body assembly (two screws on valve body side and thirteen screws on channel plate side), then remove neutral clutch bypass valve from cored side of channel plate. Remove front clutch bypass valve.

2) If necessary to remove pressure relief ball and spring, proceed as follows: Turn channel plate over to casting side and remove retaining pin. *CAUTION - Pin is under xtreme pressure.* Remove pressure relief spring and ball. After cleaning and inspection, reassemble channel plate by installing pressure relief ball, spring and retainer, neutral clutch bypass and front clutch bypass valve, then set channel plate aside and continue with disassembly.



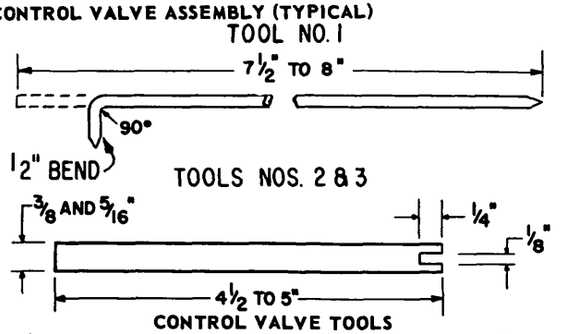
3) Remove channel plate-to-valve body spacer and place on channel plate and check alignment of bypass valves. Remove two check balls and throttle valve thermostatic element. Remove throttle valve plunger guide retainer located in cored passage near throttle valve adjusting screw. Position control valve assembly with cored side up and throttle valve lever positioned on top right hand side.

►*DISASSEMBLY NOTE: Refer to valve body illustration and proceed as follows:*



4) Remove multiple valve plug retainer (plugs are under spring tension), then remove 1-2 downshift valve and spring.

►*VALVE PLUG REMOVAL NOTE: All valve plugs are threaded so that a valve body attaching screw can be threaded into plug for removal and installation.*



5) Remove plug from 1-2 governor valve bore and remove valve and spring, then remove 2-3 governor valve plug and 2-3 governor valve. Remove plug from coupling timing valve bore and remove spring and coupling timing

3-SPEED HYDRA-MATIC TRANSMISSION CONTROL VALVE ASSEMBLY (TYPICAL)

BOOST VALVE BODY

CONTROL VALVE TOOLS

valve. Remove pressure boost valve retaining pin from center of cored side of valve body (in coupling timing valve bore). *NOTE - On arly transmissi n, cover nd of bore with finger to prevent loss of pressure boost plug which is und r spring pr ssur .* Remove pressure boost plug and spring.

6) From opposite side of valve body, remove pin retain-

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

ing 1-2 throttle valve bushing and remove bushing and 1-2 throttle valve. From the same bore, remove shift valve springs and 1-2 shift valve.

7) From the next bore, remove valve bore plug retainer and plug (plug is under spring tension), then remove 2-3 throttle valve, spring and bushing, and 2-3 shift valve and spring.

8) Remove retaining pin from neutral clutch valve bore, then remove plug, neutral clutch valve and spring. From the same bore, remove front clutch exhaust valve retaining pin on cored side of valve body (use a small screwdriver to relieve spring pressure on pin for removal),then remove front clutch exhaust valve spring and valve.

9) Mark throttle valve adjustment screw and **loosen xactly 5 turns.** Turn valve body over and remove throttle lever by removing outside "C" ring and washer, positioning shaft so that lever will clear throttle valve adjustment screw, then remove washer. Remove throttle valve plunger, sleeve, spring and valve.

10) Remove pressure drop valve retaining spring, pressure drop valve and spring. If necessary, remove reverse blocker piston retaining pin, spring and reverse blocker piston.

11) Remove detent spring. *NOTE - Do not remove detent l v r unless n c ssary to replace.* If necessary, drive pin out with a small punch.

R ass mbly: *NOTE - All attaching screws must be tightened to 2.5-3.5 ft. lbs. and all attaching bolts to 6-8 ft. lbs.*

1) Install manual detent lever and retaining pin, then install detent spring. Install reverse blocker piston, spring and pin. Install pressure drop valve (stem end of valve last) spring and retaining pin in top bore adjacent to detent spring.

2) Install throttle valve (round end first), spring, plunger and sleeve in throttle valve bore adjacent to manual valve bore. Place washer against "C" ring on throttle valve lever shaft, then install shaft through hole in valve body so throttle valve lever will index between plunger and throttle adjusting screw. Install washer and "C" ring securing lever assembly to valve body. Turn throttle valve adjusting screw back to original position (**xactly 5 turns**). Install throttle valve plunger guide retainer through cored side of valve body into annular groove in throttle valve plunger.

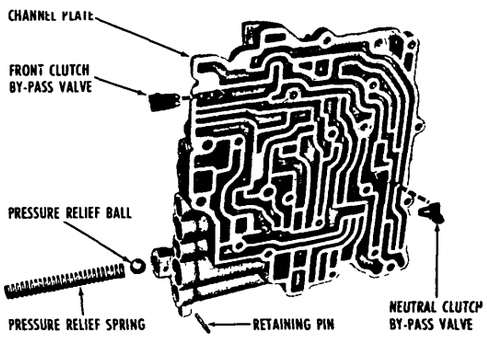
3) Install front clutch exhaust valve (land end first) and front clutch exhaust valve spring in bore adjacent to throttle valve bore. Install short retaining pin through cored side of valve body while compressing exhaust valve spring, then install neutral clutch valve and spring in same bore. Compress valve spring and install valve bore plug (threaded end out) and retaining pin.

4) Place 2-3 shift valve spring on 2-3 shift valve, then install assembly in bore next to neutral clutch valve. Install 2-3 throttle valve spring into spring pocket in 2-3 shift valve, then install 2-3 throttle valve into 2-3 regulator bushing so valve will completely enter bore of bushing. Install 2-3 throttle valve and bushing into 2-3 bore in valve body (small end of throttle valve first) and install valve bore plug (threaded end out) and retainer.

5) Install 1-2 shift valve in bore next to 2-3 shift valve, then install 1-2 shift valve spring and 1-2 throttle valve spring. Install 1-2 throttle valve into bushing (stem end out)and install this assembly into bore (valve end first). Depress bushing and install short retaining pin from cored side of valve body.

6) In bore adjacent to "U" shaped cutout of valve body, install pressure boost valve (use brass rod to guide valve into bore, long end first). Install retaining pin through same bore, then install coupling timing valve (land end first). Install line boost plug into line boost valve spring (retain with petrolatum). Use a 5/16" copper tube (5" long) and load line boost plug and spring into end of copper tube, then place tube into bore against line boost valve, spring end first. Use 1/8" brass rod (8" long) and insert it through tube, pushing line boost plug and spring into line boost valve. While holding line boost plug and spring compressed with brass rod, withdraw copper tube far enough to insert retaining pin. Then gently remove brass rod to allow pin to be installed. Install coupling timing valve (land end first), then install coupling timing valve spring over stem of coupling timing valve. Install valve bore plug and partially install multiple plug retainer in such a manner that only one corner of plug is retained, permitting installation of remaining plugs and valves.

7) Install 2-3 governor valve (small land first),then install bore plug against governor valve, compressing plug against spring tension into bore and position multiple retainer again so edge of plug is secured and adjacent bore is not obstructed. Install 1-2 governor valve in bore next to 2-3 governor valve and install plug, compressing valve against spring pressure. Again reposition multiple retainer to secure plug. Install 2-1 downshift valve (land end first) into remaining bore, then place 2-1 downshift valve spring over 2-1 downshift valve, compressing the spring, and secure with multiple retainer.



ASSEMBLY OF COMPLETE CONTROL VALVE: 1) Install throttle valve thermostatic element (open end down) in cavity behind throttle valve in control valve body, then position spacer plate over cored side of control valve body.

2) Install two small check balls into pocket on cored side of valve body, then position channel plate on valve body and attach with thirteen screws (leave loose for final adjustment). Turn control valve body over and install three ball check valves into pockets.

3) Place 2-3 boost valve body spacer on valve body, then place 2-3 boost valve body on spacer plate and install three attaching screws (do not tighten screws). Install loosely two screws attaching valve body to channel plate. Turn control valve assembly over and install remaining 2-3 boost valve body-to-control valve body assembly long attaching screw. Tighten all attaching screws to 2.5-3.5 ft. lbs.

TRANSMISSION DISASSEMBLY

NEUTRAL CLUTCH, CASE CENTER SUPPORT & REVERSE CLUTCH: Place transmission in holding fixture with front end up, then install neutral clutch backing plate (flat side up). Install four drive and four driven plates as follows: Install a composition drive plate above clutch backing plate and then a steel driven plate with notched lug of plate in a slot adjacent to one of the wide lugs in case. Install a second composition plate

CHANNEL PLATE (EXPLODED)

and then another steel plate with its notched lug on opposite side of wide case lug from the first steel plate. *NOTE - Steel plates must be installed in this arrangement to properly "un-nest" the clutch pack.* Alternately install composition and steel plates so that notches on first and third steel plates are on one side of case lug and the second and fourth steel plates are on opposite side. With plates properly installed, install long case center support key with long lip toward front of case (hold it in place with petrolatum). Mark the case to indicate sides of key to assist in alignment for installation of case center support. Install neutral andreverse clutch assembly (case center support) into case, aligning center support key with keyway. *NOTE - If n cessary, tap into place and make sure oil rings do not come unhooked during installation.* Install reverse stationary cone key into case (rounded side toward front of case). Install reverse cone (steel) into case cover reverse piston, then install reverse stationary cone (plastic) in case, aligning reverse stationary cone key with keyway in cone (lightly tap into place if necessary). Install large reverse cone snap ring into snap ring groove in case with flat ends of snap ring up, and ring gap at open segment of ring groove in case. Reposition transmission with rear end upward, and install overrun clutch band over anchor in case. *NOTE - If overrun clutch is excessively worn, lining cracked or distorted, install a new clutch band.* Install rear unit internal gear, sprag assembly and sprag retainer into case, aligning neutral clutch plates with sprag outer race. *CAUTION - B sure sprag retainer bottoms against case center support to insure engagement of all plates.*

►*NEUTRAL & REVERSE CLUTCH ASSEMBLIES CHECKING NOTE:* At this point in reassembly, apply air pressure to Neutral Clutch passage and to Reverse Clutch passage (see "Transmission Case Passages" illustration). A destinctive "clunk" will be heard when pressure is released if clutch is operating properly.

FRONT UNIT & REAR UNIT: *NOTE - Before installation of front unit carrier assembly, inspect plan t pinions for damage and for free movement of gears n pins. Make sure pinion pins are well staked. Check splines on carrier hub. Inspect front sun gear-to carrier thrust washer for excessive wear, nicks, burrs or for ign mat rial imbedd d in thrust race.* Position transmission with bottom upward, then install front clutch assembly into front of transmission engaging

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION (Cont.)

teeth in front clutch hub with reverse cone. *NOTE-Make sure bronze washer is positioned in counterbore of front unit clutch drum.* Install thick bearing race, thrust bearing, thin cupped bearing race on front sun gear and shaft assembly. Install front sun gear and shaft assembly through case center support, aligning splines of sun gear shaft with rear internal gear and cutaway splines with sprag retainer. *CAUTION - Be sure to hold rear unit internal gear forward during this operation.* Install front sun gear shaft-to-rear unit internal gear snap ring, then install bearing race (flange up) and bearing on rear planet carrier (retain in place with petrolatum). Install rear planet carrier through front unit sun gear shaft from rear of transmission, then install front carrier thrust bearing race onto rear carrier shaft (inner flange out) and install front carrier thrust bearing into race. Install thrust bearing race over front thrust bearing (outer flange inward). Hold rear planet carrier forward and install front unit carrier. Install front unit carrier-to-rear planet carrier snap ring while holding rear carrier forward.

PARKING LINKAGE: Position transmission with rear end upward, then install pawl spacer in case. Install parking assembly (parking pawl first) through hole in rear of case so that pawl tooth faces inside of case. Install pawl pin into case, through pawl and spacer. Push parking bracket shaft to bottom of its bore and move pawl to its disengaged position.

OUTPUT SHAFT & GOVERNOR: *NOTE - Before installing output shaft, inspect splines for nicks and burrs. Make sure snap ring groove is free of dirt and chips. Inspect mainshaft pilot bushing for excessive wear and tight fit. Inspect parking sprocket lugs for burred edges and speedometer gear for misalignment and tight fit on shaft.* Install rear unit sun gear-to-rear carrier bearing race into rear carrier with flange up and retain in place with petrolatum. Install rear unit sun gear-to-rear carrier thrust bearing into bearing race, then assemble rear unit sun gear to mainshaft, if removed, and install through rear carrier. Install governor gasket and governor on output shaft and install speedometer drive gear with Tool J-6133. Position speedometer gear so rear side of gear is 2 3/64" (Oldsmobile); 9/16" (Pontiac) from forward edge of nearest snap ring groove. Install output shaft to rear carrier assembly, using aligning marks, then engage parking pawl. Install governor attaching bolts and tighten to 19-23 ft. lbs., then install snap ring on front output shaft groove.

REAR BEARING RETAINER: Install gasket on rear bearing retainer and retain with petrolatum, then start rear bearing retainer down over output shaft and install rear output shaft snap ring through access hole and over end of output shaft while retainer is being lowered over governor assembly. Carefully align parking linkage pin and manual detent lever as rear bearing retainer is aligned with dowel pin and case. *NOTE - If necessary, seat rear bearing snap ring with Tool J-6133. Install* two short retainer-to-case attaching bolts at center location on each side, then install remaining short bolt inside rear bearing retainer. Install five remaining long retainer bolts and tighten all bolts to 20-25 ft. lbs. If rear seal was removed, install new seal with Tool J-5154. Install retainer cover plate and gasket.

TORUS: *NOTE - Before installing torus, inspect driven torus member for bent or damaged vanes and hub splines for nicks and burrs. Check oil rings for damage and grooves for nicks and burrs. When locked, rings should turn freely in groove. Inspect balance weight (if present) for good weld. Inspect driven coupling to stator thrust bearing race for distorted bearing surface or excessive wear on thrust race (a slight distortion or bend could cause a side loading effect and cause part of the rollers to dislodge from cage).* Install front unit drive torus, aligning front unit clutch plates with drive slots in drive torus (make sure clutch plates are engaged by looking through vent port in bottom of case). Install hook type oil ring on stator hub (torque multiplier), if removed, then install hook type oil ring on front and rear hubs of driven torus member. Install stator (torque multiplier) into drive torus, aligning splines, then position stator so that inner diameter of hub of stator is flush with planet carrier shaft (a light tap with a plastic hammer may be required). Install driven torus -to-stator rear bearing race into stator, then install flanged race (flange up) into driven torus. Install bearing into flanged race and retainer with petrolatum. Install driven torus member over main shaft. Position transmission so bottom is upward. *CAUTION - Do not position more than 90° or parts will fall out.* While moving mainshaft forward (with small tool inserted in hole of mainshaft) install driven torus-to-mainshaft spiral retaining ring. Position transmission with front end upward, then install new drive torus-to-torus cover metal gasket on torus drive member and retain in place with petrolatum. Install flat bearing race into torus cover, then install bearing into flanged race and install bearing and flanged race assembly into torus cover (flanged down). Install torus cover to drive torus member, aligning the dowel pins. *NOTE - Guide Pins, Tool J-8938 may be used.* Install box wrench on case as a tool to hold torus cover, then install torus cover-to-drive torus attaching bolts and cross-tighten the bolts to 17-20 ft. lbs. Remove box wrench.

CASE COVER: Install gasket on case cover and retain in place with petrolatum, then install case cover and pump assembly on transmission. Install five of the six large case cover-to-case attaching bolts (leaving one hole in which to install dial indicator support) and tighten to 30-35 ft. lbs. Install the three smaller attaching bolts two shorter bolts from rear of case cover), and tighten to 15-18 ft. lbs. After front unit endplay is checked and adjusted (see below), install front seal, rubber lip down with Tool J-8761 and Seal Protector J-8828.

►*1961 FRONT PUMP SEAL INSTALLATION CAUTION:* When replacing seal, Front Seal Installer Tool J-8761 and Seal Protector Tool J-8828 must be used. Make sure that seal is properly seated and that small "grater" spring is not dislodged or hanging up on spline of input shaft. Apply seal lubricant, Part No. 567196 to sealing lip and a light coat of suitable sealer to outer diameter of seal before positioning into pump. When seal is properly seated, seal cage might project past pump body. This is normal and should not be used as a location point for depth.

FRONT UNIT ENDPLAY CHECK: See "Front Unit Endplay Check" above. If endplay is not within limits of .004-.022", remove case cover and install proper thrust washer or combination of thrust washers between case cover and torus cover to obtain proper endplay. See table below for selective thrust washer sizes and identification.

Endplay Selective Thrust Washers

Part No.	Thickness	Color
8620697	.027-.029"	Bright
8620698	.036-.038"	Copper
8620699	.045-.047"	Black
8620700	.054-.056"	Bright & Notched

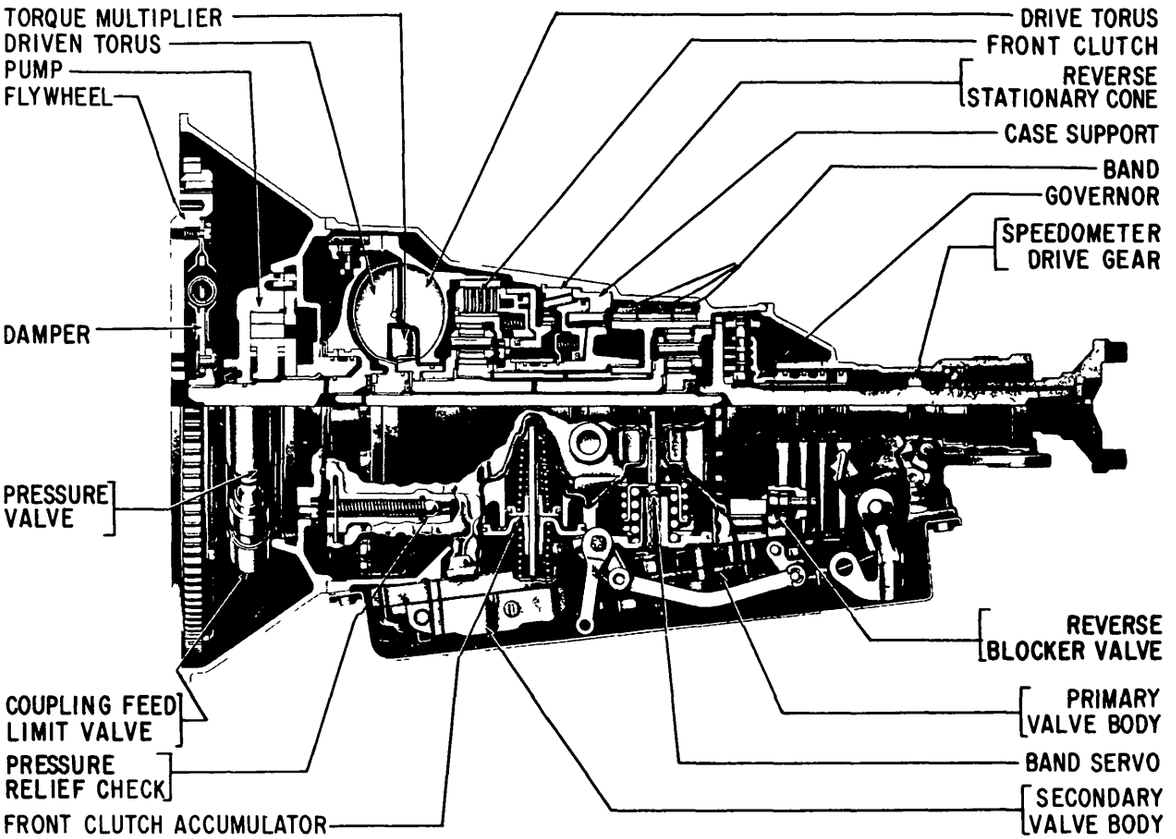
SERVO & ACCUMULATOR: Install accumulator pin in case, then install upper accumulator spring (small end first). Install new upper accumulator seal (lip of seal facing flat side of piston) and upper accumulator piston (lip of seal facing away from tapered spring). Install lower accumulator piston ring on piston and install piston over pin with spring pocket facing out. Install lower accumulator into spring pocket. Install servo release spring into case bore and install servo piston assembly (stem first), then install three case center support-to-case seals and springs (seals down). Install gasket on servo and accumulator cover and install cover. Install four bolts and align center support to case seal springs and accumulator spring, then with cover properly aligned, install all bolts loosely (except the one attaching compensator valve body) and tighten to 6-8 ft. lbs. Install compensator valve body on cover and tighten the three attaching screws to 2.3-3.5 ft. lbs. and the one attaching bolt to 6-8 ft. lbs. Install seals on both ends of pipe assembly and install pipe assembly (fixed end first) into case cover through opening in case. Install seal and washer on pipe assembly attaching bolt, and install bolt to pipe assembly from front side of case cover.

CONTROL VALVE BODY & OIL PAN: Install manual valve in valve body, then apply petrolatum to valve body ports and install valve body assembly, to rear bearing retainer, guiding throttle valve shaft through opening in rear retainer and position manual valve on pickup pin. Position pipe assembly to index with pipe ports in valve body and move forward to seat pipe seals. Secure valve body assembly with five attaching bolts and tighten to 6-8 ft. lbs. *NOTE - If it is difficult to index pipe with valve body ports, loosen pipe assembly to case cover bolt one-half turn. Be sure and retighten after control valve is installed.* Install throttle shaft seal over shaft into case, using care not to fold lip under. Install a case to strainer neck "O" ring in case bore, then install strainer assembly and secure in position with one servo and accumulator cover bolt. Tighten to 6-8 ft. lbs. Install new oil pan gasket and oil pan and tighten bolts to 12-15 ft. lbs. Install outer shift lever and throttle valve lever, then install speedometer driven gear assembly.

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION

Oldsmobile F-85 (1.61)

►CHANGES, CAUTIONS, CORRECTIONS



►*1961 OLDSMOBILE F-85 TRANSMISSION PRODUCTION CHANGE (Pressur Compensated Shift Pattern):* Beginning with Transmission Serial No. 0561-49150 (2-Bbl. Carbs.) and OD561-012353 (4-Bbl. Carbs.), control valve assembly and separator plate were changed to provide a "Pressure Compensated Shift Pattern". Later type control valve assemblies are stamped "0-3" or "OD-2" on throttle lever side of valve bodies and channel plate. Later type control valve assemblies, Part No. 8620999 ("0" Model Trans.); No. 8621900 ("OD" Model Trans.) must be used on all transmissions after the above serial numbers. *DO NOT USE on earlier transmissions.* Later type separator plates must be us d with later type control valve assembly and may be used with early control valve assemblies. *DO NOT USE early type separator plate with later type control valve assembly.*

►*1961 OLDSMOBILE F-85 TRANSMISSION "BUZZ" CORRECTION:* Before disassembling any part of transmission, check installed height of filler tube on transmission which should measure 15 13/16" from top of tube to its entry point in transmission case. If less than the above dimension, raise to correct height and bend filler tube attaching bracket as necessary to hold it in position. Fill transmission to proper level with recommended fluid (see "Lubrication" above). If "buzz" is eliminated (because of low oil level), further correction is unnecessary.

►*1961 OLDSMOBILE F-85 TRANSMISSION ENGINE "REV-UP" DURING 1-2 SHIFT (OIL HOT OR COLD) CORRECTION:* This condition may be caused by front clutch piston bottoming in clutch housing, blocking off oil pressure to clutch piston. To correct, file four grooves ¼" wide 1/16" deep and 90° apart on raised inner rim of housing side of clutch piston. Remove any sharp edges or burrs caused by filing. When assembling, align one of the grooves with a clutch piston oil feed passage.

►*1961 OLDSMOBILE F-85 TRANSMISSION SLIP OR ENGINE "REV-UP" DURING 1-2 SHIFT (WITH COLD OIL) CORRECTION: NOTE - This slippage may only occur on first few shifts and may not occur if engine is run for a few minutes before placing selector lever in "Drive" range.* On transmissions before Transmission Serial No. 0561-26287 contents of Parts Pkg. No. 8620976 should be installed in secondary valve body. This parts package contains one each of the following parts: Coupling Signal Valve, Coupling Signal Valve Spring, Coupling Valve Bore Plug and Coupling Valve Bore Plug Retainer. Complete valve body assembly must be removed from transmission, then secondary valve body can be removed from complete assembly for installation of the above parts. Transmissions having serial numbers higher than 0561-26287 have these parts installed in production.

DESCRIPTION: "Split-Torque" type hydraulically controlled automatic planetary transmission and torque converter (fluid coupling and torque multiplier). Engine torque is transmitted completely by hydraulic action in first speed and completely by mechanical action in second speed. In third speed, the torque is "split", causing the torque converter to carry only 40% of engine torque with remaining 60% being transmitted mechanically.

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION SECTIONAL VIEW

OPERATION: Neutral Range - Engine torque is transmitted through torus cover to drive torus member causing it to rotate driven torus and turn mainshaft and rear unit sun gear in direction of engine rotation. In neutral, the band is released and allows rear unit internal gear to turn. As rear unit sun gear turns in direction of engine rotation, rear unit pinions turn in opposite direction, driving rear internal gear opposite engine rotation. The front unit sun gear being mechanically connected to rear internal gear is also turning opposite engine rotation causing front unit pinions to turn in direction of engine rotation, driving front internal gear in same direction. With both rear unit internal gear and front unit internal gear spinning freely, there is no transfer of torque from front or rear units to carriers or output shaft.

First Speed: Engine torque is transmitted through torus cover to torus drive member then through oil to torus driven member which redirects it through the stator (torque multiplier) and back to driven member. This action multiplies the engine torque and applies to mainshaft and rear unit sun gear. The band is applied locking rear unit internal gear stationary causing output shaft to rotate in direction of engine rotation within the internal gear at a reduced speed and with increased torque. As rear carrier and output shaft rotate clockwise at reduced speed the front carrier, which is mechanically connected to rear carrier, also rotates in direction of engine rotation at a reduced speed. As the band is holding front unit sun gear stationary, the carrier and pinions rotate front unit internal gear in direction of engine rotation at approximately one-half engine speed.

Second Speed: Engine torque is transmitted through torus cover to torus drive member. The front clutch is applied and coupling is empty so engine torque is mechanically applied to front unit internal gear. Front unit sun gear is splined to rear unit internal gear and is prevented from turning opposite engine rotation when band is applied. Engine torque at front internal gear is then applied to pinions, and because sun gear cannot rotate opposite engine rotation then planet pinions and carrier are compelled to revolve in direction of engine rotation around the sun gear in reduction. Front carrier is splined to rear unit carrier and shaft assembly which in turn is bolted directly to output shaft.

CONTINUED ON NEXT PAGE

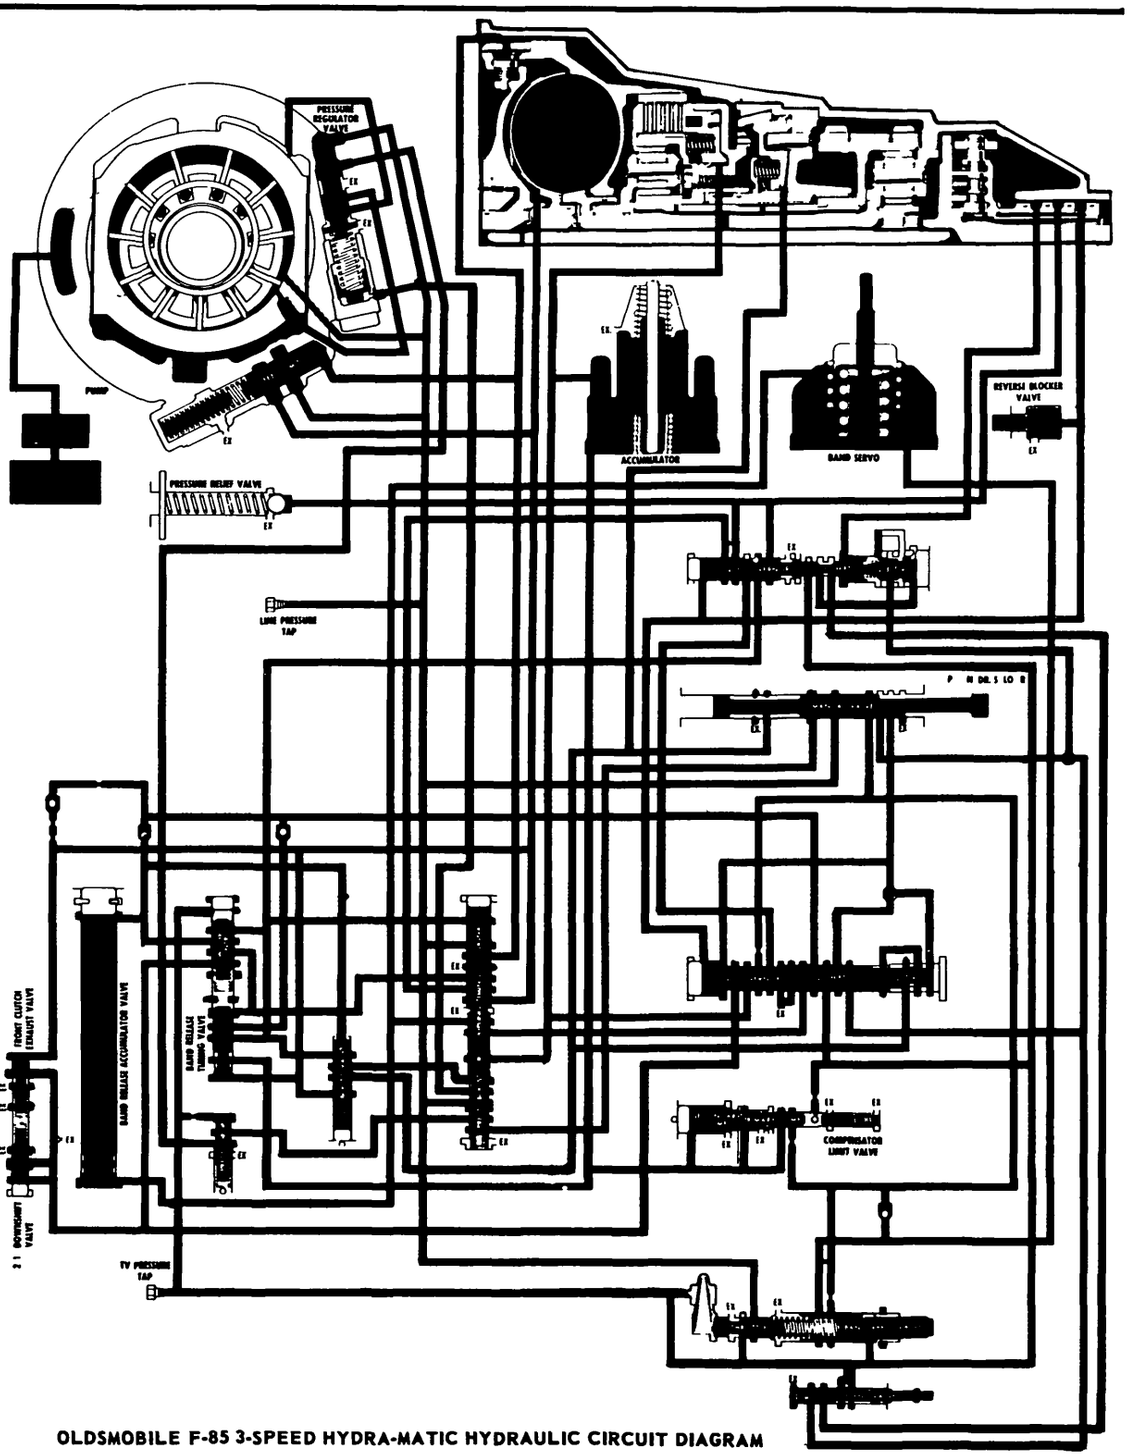
OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

Third Speed: Engine torque is transmitted through torus cover and is applied through front clutch to front unit internal gear. Front unit internal gear, through pinions, tends to turn front sun gear opposite engine rotation. This would cause front carrier to run in direction of engine rotation, in reduction. The rear carrier, then must also attempt to rotate in direction of engine rotation, in reduction. With rear carrier rotating opposite engine rotation in reduction, and rear unit internal gear tending to turn in opposite direction, the rear unit pinions attempt to rotate in direction of engine rotation on their pins, thus driving rear unit sun gear and driven torus in direction of engine rotation faster than engine speed. As the fluid coupling is filled, coupling driven member and rear unit sun gear cannot revolve faster than drive torus which turns at engine speed. Therefore rear unit sun gear is slowed down to approximately engine speed. In so doing, rear unit pinions are slowed down in their rotation on pinion pins. Carriers and pinions then change direction of load against internal gear causing it to revolve in direction of engine rotation with carrier and sun gear at the same speed. Because output shaft and carriers are connected to the stator (torque multiplier) in the coupling, the torque multiplier is also turning at same speed as drive and driven members so that it has no effect in multiplying torque in coupling, causing the entire train to rotate as one common unit.

Reverse: Engine torque is applied to mainshaft in same manner as in "First Speed" above. Rear unit sun gear then drives rear unit pinions as idlers which in turn drive rear unit internal gear in a direction opposite to engine rotation. With rear unit internal gear turning opposite engine rotation, front unit sun gear is turning in same direction. The reverse cone which is applied holds front unit internal gear stationary so that front unit pinions and carriers are compelled to walk around front internal gear in a direction opposite to engine rotation, and in reduction. The output shaft being connected to front and rear unit carrier is also turning in a direction opposite engine rotation, and in reduction.

LUBRICATION

LUBRICATION INTERVALS: Check fluid level every 2000 miles. Drain and refill every 26,000 miles.



Recommended Lubricant: Use only Automatic Transmission Fluid Type "A" (Suffix "A").

CHECKING FLUID LEVEL: With car on a level floor, transmission at normal operating temperature and selector lever in "P" (Park) position, check fluid level on dipstick. Add recommended fluid as necessary to bring level to FULL mark on dipstick. *NOTE - 1 pint of fluid is required to bring level from ADD mark to FULL mark. DO NOT OVERFILL.*

DRAINING & REFILLING: Remove drain plug from transmission oil pan and drain fluid, then replace plug. Remove dipstick and add 3½ qts. of recommended fluid, then with selector lever in "P" (Park) position and car on a level floor, start engine. With engine running, add sufficient fluid to bring level to FULL mark on dipstick. *CAUTION - D n t ov rfill.*

Capacity: Approximately 4 qts. (after drain); 5 qts. (after removal of pan); 7 qts. (after overhaul).

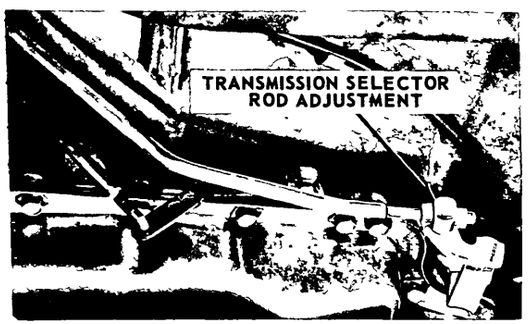
CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC HYDRAULIC CIRCUIT DIAGRAM

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

LINKAGE ADJUSTMENT

THROTTLE LINKAGE ADJUSTMENT: *See "Carburetor" on car mod l pag .*



THROTTLE VALVE LEVER (ON TRANSMISSION) ADJUSTMENT: Remove lower throttle valve rod from throttle valve lever and place pin of Throttle Valve Lever Gauge, BT-33-2 in threaded hole in case (located in boss on left side of transmission case at forward end). If hole in lever does not align WITHIN the hole in gauge, bend throttle valve lever as necessary with Bending Tool, BT-33-7 to align center of hole WITHIN gauge hole.

MANUAL LINKAGE ADJUSTMENT: Place selector lever in "N" (Neutral) position, then loosen front and rear locknuts at manual lever on transmission. Hold manual rod and shift lever upward so selector lever is positioned against neutral stop. Tighten rear locknut until it just contacts swivel, **then tighten it two additional turns.** Tighten front locknut.

BAND ADJUSTMENT: Adjust every 26,000 miles. Remove oil pan and cleaner and loosen adjusting screw locknut. Use an inch pound torque wrench and Tool J-8591 and tighten adjusting screw to 20 inch pounds. **L sen screw tw c mpl te turns** and hold while tightening locknut. Tighten locknut to 18-20 ft. lbs.

ACCELERATOR PEDAL HEIGHT: Place Tool BT-33-2 in position (with hole nearest the pin) over the throttle valve bellcrank pin. Swing gauge in an arc and adjust length of accelerator lever rod until end of gauge just contacts closest surface of cowl.

THROTTLE STOPSCREW ADJUSTMENT: *NOTE - This adjustment is requir d whenever channel body and thr ttl body have been separated or either has been replaced.* Disconnect throttle valve rod from outer throttle valve lever on transmission, then insert Tool BT-33-6 between throttle valve plunger and throttle valve lever by pushing plunger into its bore and holding the lever rearward. Adjust stopscrew against lever until throttle valve plunger bottoms in its bore, **then back st pscr w ut nly nough to permit removal of gauge.**

MANUAL SELECTOR LINKAGE

NEUTRAL SAFETY SWITCH ADJUSTMENT: Loosen switch attaching screws on mast jacket, then with selector lever in "N" (Neutral), position switch so that a .090" pin can be inserted through hole in switch arm and into hole in face of switch. Tighten switch attaching screws and remove pin. Check to make sure starter is not operative in any selector lever position except "N" (Neutral) and "P" (Park).

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. See "Shift Speed Tables" below for correct shift speeds under different operating conditions.

►*CAUTION: Do not stall test transmission under any conditions.*

OIL PRESSURE TEST: Main Line Pressure - Connect a 300 lbs. pressure gauge to main line passage in case (remove plug in side of case just forward of outer throttle valve lever). With engine at normal operating temperature, engine idling at 500 RPM and parking brake applied, pressure should be 60-125 lbs. in all transmission ranges. Pressure should not vary more than 10 lbs. between ranges. With pressure gauge connected, operate car on road. Pressures should be as indicated in table below.

Operating Pressure Test

Selector Lever Position	Shift	ℂ Pressure
Dr., S., L., Rev.	1st	118-175 lbs.
S (30 MPH)	2nd	98-111 lbs.
Dr. (Zero Throttle, 30 MPH)	3rd	68-78 lbs.

℄ - A drop in pressure of approximately 10 lbs. as each shift is made is normal, but gauge reading should stabilize after each shift is made.

SHIFT SPEED TABLES

UPSHIFTS

Drive Range	1-2 CAR SPEED	2-3
Min. Throttle	12-15 MPH	17-24 MPH
Max. Throttle	24-30 MPH	58-65 MPH
Super Range		
Min. Throttle	12-15 MPH	60-68 MPH
Max. Throttle	24-30 MPH	60-68 MPH
Lo Range		
Min. Throttle	ℂ	ℂ
Max. Throttle	60-68 MPH	60-68 MPH

DOWNSHIFTS

Drive Range	3-2 CAR SPEED	2-1
Medium Throttle	30-16 MPH	12-8 MPH
Part Throttle	30-16 MPH	None
Detent	58-50 MPH	22-8 MPH
Super Range		
Medium Throttle	58-50 MPH	12-8 MPH
Part Throttle	58-50 MPH	None
Detent	58-50 MPH	22-8 MPH
Lo Range		
Medium Throttle	58-50 MPH	28-22 MPH
Part Throttle	58-50 MPH	28-22 MPH
Detent	58-50 MPH	28-22 MPH

℄ - Not possible.

TROUBLE SHOOTING & DIAGNOSIS

NO DRIVE IN DRIVE RANGE: Check for low oil level or low pressure. Manual linkage out of adjustment. Sticking valve in control valve assembly. Band not applying. Check for internal leakage. Check for restricted passage with air pressure. Coupling not filling.

MISSING ALL SHIFTS: Sticking governor valve. Sticking valve in control valve assembly. Clutch not applying.

DRIVE IN SECOND & THIRD ONLY: Sticking valve in control valve assembly. Clutch is locked (too many plates).

DRIVE IN FIRST & THIRD ONLY (This may be reported as a 1-2 Slip): Sticking valve in control valve assembly. Coupling not emptying.

DRIVE IN FIRST & SECOND ONLY: Governor "G-2" valve sticking. Sticking valve in control valve assembly.

DRIVE IN THIRD ONLY: Sticking valve in control valv assembly. Band not applying. Sticking governor valves.

DRIVE IN NEUTRAL (REVERSE OR FORWARD): Internal manual linkage engaging. Neutral clutch mispositioned. Reverse cone clutch not applying.

NO REVERSE: Internal manual linkage mispositioned. Low oil pressure. Reverse cone clutch not engaging. Restricted passage. Band not releasing.

ROUGH 1-2 UPSHIFT: Throttle valve linkage not adjusted properly. Sticking valves in control valve assembly. Sticking parts in accumulator. Coupling not emptying fast enough. Front clutch slipping. 1-2 oil passage resticted.

ROUGH 2-3 UPSHIFT: Band not releasing quickly. Sticking parts in servo.

SLIPPING IN ALL RANGES: Low oil pressure.

SLIPPING 1-2 UPSHIFT: Throttle valve linkage too long. Low oil pressure. Check for restrictions or sticking parts in accumulator. Sticking valves in control valve assembly. Band slipping. Check number of plates in front clutch. 1-2 oil passage restricted.

SLIPPING 2-3 UPSHIFT: Sticking valves in control valve assembly. Coupling not filling fast enough. Front clutch slipping.

NO ENGINE BRAKING IN INTERMEDIATE OR LOW RANGE: Sticking valves in control valve assembly. Band slipping or servo not applying.

NO PART THROTTLE OR DETENT DOWNSHIFT: Throttle valve linkage too long. Sticking valves in control valve assembly. Accelerator travel too short. Governor valves sticking.

SELECTOR LEVER WILL NOT GO INTO REVERSE: Internal manual linkage mispositioned. Reverse blocker valve stuck open. Governor "G-2" valve stuck open.

SELECTOR LEVER WILL NOT GO INTO PARK: Parking linkage broken, improperly assembled or distorted. Manual linkage not properly adjusted.

FORWARD DRIVE IN REVERSE: Internal manual linkage improperly assembled or distorted.

HIGH UPSHIFTS: Throttle valve linkage too short. Sticking valve in control valve assembly or in governor. Throttle valve lever bent. Throttle valve pressure too high. Line pressure too high. Governor oil passage restricted.

LOW UPSHIFTS: Throttle valve linkage too long. Control valve assembly or governor valves sticking. Throttle lever bent. Throttle valve or line pressure too low. Governor passages restricted.

HANGING IN SECOND OR ENGINE STALLS UPON STOP: Control valve assembly or governor valves sticking. Throttle valve linkage too short. Clutch not releasing.

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (Cont.)

REMOVAL & INSTALLATION

REMOVAL: Install Engine Support Tool J-8974, then remove oil filler tube and breather tube. Disconnect propeller shaft, shift and throttle linkage, cooler lines and speedometer cable. Remove exhaust pipe and transmission rear support bar, then place transmission lift in position and remove transmission to engine bolts.

Installation: Reverse removal procedures and note the following: Lubricate threads of transmission-to-engine block bolts with Lubricant, Part No. 980131 and tighten to 30-35 ft. lbs.

TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

►*NOTE: The following transmission components can be removed without removing transmission assembly from car. See "Transmission Disassembly" and "Transmission Reassembly" below.*

Without Removing Oil Pan Extension Housing: Limit Valve. Pressure Regulator Valve. Companion Flange. Rear Oil Seal. Oil Filler Pipe. Oil Pan. Rear Bearing Retainer.

After Removing Oil Pan: Control Valve Assembly. Parking Linkage. Channel Plate. Band Adjusting Screw & Nut. Accumulator-Servo. Throttle and Manual Control Levers, Shafts and Seals. Oil Cleaner, Oil Pump Intake Pipe and "O" Rings.

After Removing Extension Housing: Speedometer Drive Gear. Governor. Reverse Blocker Valve. Rear Bearing.

TRANSMISSION DISASSEMBLY

►*TRANSMISSION DISASSEMBLY NOTE: Instructions below cover removal of sub-assemblies in their proper order from transmission case. See "OVERHAUL OF UNITS" for disassembly, inspection, and reassembly.*

1) Remove filler pipe "O" ring from side of transmission case, then install transmission in a suitable holding fixture with bottom side upward. Remove oil pan and discard gasket, then remove oil cleaner assembly. Discard "O" ring seal in case if damaged.

►*TRANSMISSION FRONT UNIT ENDPLAY CHECK NOTE:* If transmission is to be completely disassembled check front unit endplay as follows: Remove one case cover-to-case bolt and install a suitable dial indicator support, then assemble Endplay Adapter, Tool J-6135 on input shaft of torus cover. Clamp a dial indicator on support so contact of indicator is against front edge of adapter and in line with adapter bolt. Gently pry on output shaft to position units forward (insert screwdriver through case, behind flange on output shaft), being careful not to pry on governor weights. At the same time move input shaft in or out and record endplay which should be .006-.018". Remove tools.

2) Remove inside throttle valve link from rear throttle valve lever by removing "E" retaining ring. *CAUTION - Do not lose spacer from end of detent valve.* Remove outer throttle valve lever, "O" ring and spacer, then remove lever and linkage assembly. Disengage linkage by removing "E" ring retaining from throttle valve lever to inside throttle valve link.

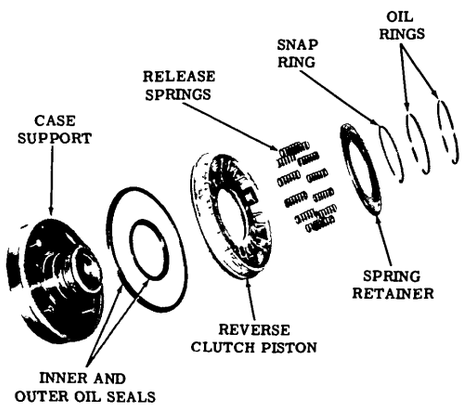
3) Loosen inside manual and detent lever lock screw and remove "E" ring from end of manual shaft, then slide manual shaft out of retainer to remove valve link. Remove manual and detent lever assembly from rear bearing retainer, and remove manual shaft "O" ring.

4) Remove control valve assembly from transmission case, being carefull not to lose detent valve spacer, then remove servo and accumulator pistons, springs and pin. Unhook parking pawl spring from parking lever, then remove band adjusting screw and nut. *NOTE - Band anchor pin is located under adjusting screw and will fall out when transmission is turned over.*

5) Remove two case center support seal spring retainers, springs and seals. *CAUTION - Retainer is under spring pressure.* Remove rear bearing retainer cover attaching bolts, then engage parking pawl to hold output shaft and remove companion flange attaching bolt and companion flange. Use Tool J-8614 to pull flange from shaft. If replacement of rear seal is necessary, remove it by driving around outer edge with a sharp punch and prying the seal out of the retainer. Remove three internal and five external rear bearing retainer-to-case bolts, breather pipe clip, then remove retainer assembly with bearing and gasket. Remove rear bearing to output shaft snap ring, and with parking pawl engaged, remove speedometer drive gear with Tool J-8760 and J-6123. Remove governor.

6) Scribe mark on dowel of carrier and lug of output shaft for alignment at reassembly, then remove output shaft and parking pawl assembly. If necessary to remove pump seal, crimp seal with pliers and remove.

7) Rotate transmission so pan is downward to allow band anchor pin to fall free from case, then turn transmission front end upward. Remove eight remaining case cover-to-case attaching bolts. *NOTE - If pump seal was not removed, install seal protector, Tool J-8828 over input shaft.* Remove case cover, gasket, and pump assembly by lifting straight up. Remove seal protector, then remove twelve torus cover attaching bolts and remove torus cover assembly by lifting straight up on input shaft. Remove and discard metal torus cover-to-drive torus gasket, then remove torus cover-to-driven member race, thrust bearing and race.



8) Rotate transmission so oil pan side is up and remove mainshaft retaining ring (spirlox) with an awl or pointed tool, then push mainshaft through driven torus and remove torus. Remove driven torus to torque multiplier race, thrust bearing and second race from multiplier. Inspect and remove if necessary, two lock type oil rings from driven torus.

9) Remove mainshaft sun gear and thrust washer from rear of transmission and remove rear sun gear from mainshaft. Remove drive torus and torque multiplier as a unit. Inspect and remove if damaged, lock type oil ring from torque multiplier.

10) Remove front carrier-to-rear carrier shaft snap ring, then remove front planet carrier assembly, bronze thrust washer, and front unit sun gear. Remove rear unit carrier assembly and internal gear bronze thrust washer from rear of transmission. Remove rear internal gear and turn transmission so front end is up.

11) Remove front sun gear and front internal gear backing washers and bronze thrust washer, then remove front unit internal gear and clutch housing assembly by lifting straight up. Remove front internal gear-to-case center support bronze thrust washer.

12) Remove stationary cone-to-case snapring and remove

REVERSE CLUTCH ASSEMBLY

reverse cone and stationary cone, using Tool J-8768 and slide hammer (if reverse cone sticks). Remove reverse stationary cone key from transmission case by pressing from bottom of case. Remove case center support assembly. *NOTE - If unit does not remove easily, tap on back of support with a brass drift.* Remove center support key from transmission case, then lift band and band anchor out of case.

OVERHAUL OF UNITS

►*OVERHAUL NOTE:* Clean all parts thoroughly and blow out case passages with air. Inspect bolt threads for cross threading and transmission leaks for leaks or interconnected passages. Examine case for "hairpin" cracks. Inspect case-to-strainer neck "O" ring seal for cuts, hardness or pinched seal. If parking linkage was not removed, inspect pawl pin and parking brake links for wear or bind. Inspect case support-to-case seals for hardness or cracks. Inspect seal springs for collapsed coils and for fit of seals on spring ends.

TRANSMISSION CASE: Disassembly - If necessary to replace pressure relief ball or spring, pull tapered pin, then remove spring and ball check valve. *CAUTION - spring is under considerable tension. Use extreme care during disassembly.* Remove two pressure take-off plugs from case.

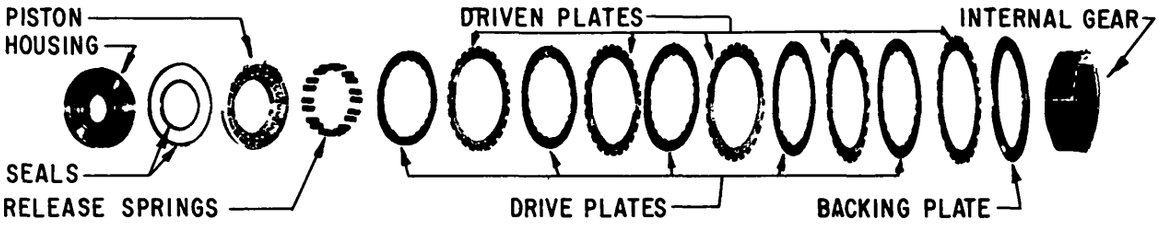
Reassembly: Install two pressure take-off pipe plugs, then install ball check valve, spring, and a new tapered pin (use a new pin at each reassembly). *CAUTION - Use extreme care when compressing spring and installing pin.*

CASE SUPPORT: Disassembly - Remove two lock type oil rings from case support, then use Clutch Spring Compressor, Tools J-4670-B and J-6129; and Reverse-Neutral Clutch Piston Adapter, Tool J-8765, and remove case support snap ring. Remove tools, then remove spring retainer, 12 reverse clutch release springs and reverse clutch piston. Remove inner and outer reverse piston seals and discard.

Reassembly: Install new inner and outer reverse piston seals so that lip of seals will face case support. Install reverse piston inner seal protector. Tool J-8843 over oil delivery sleeve of case center support, then install reverse piston into case center support, guiding outer

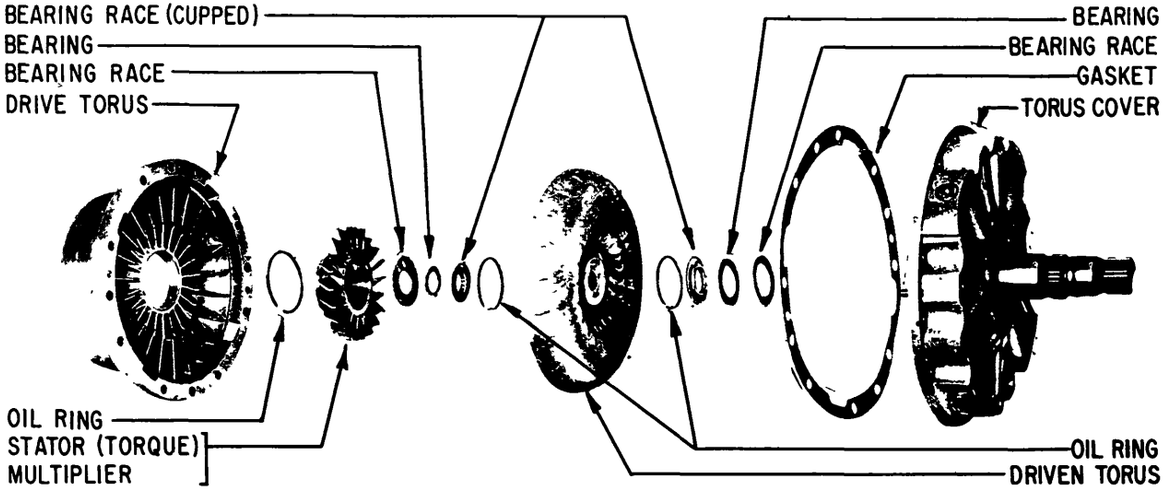
CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)



piston seal into support with a small screwdriver. *NOTE - Piston will go on only two ways because of offset dowels.* Remove seal protector and install twelve reverse clutch release springs and spring retainer. *CAUTION - Mak sur all release springs are properly s ated in th ir pockets.* Place snap ring on case support and attach spring compressing tools used at disassembly. Install case support spring retainer snap ring and remove tools. Install two new lock type oil rings.

FRONT INTERNAL GEAR AND CLUTCH HOUSING: Disass mbly - Install Tool J-8938 (two studs) in dowel pin holes in clutch housing assembly and secure in a vise. Remove four front internal gear-to-clutch housing attaching bolts, then remove assembly from dowel pins and place on bench. Separate internal gear and clutch drum by tapping on assembly to free internal gear from dowel pins. Remove front unit internal gear, backing plate and disc. Remove twenty clutch release springs, clutch piston and outer piston seal (discard seal), then remove inner clutch seal from clutch housing (discard seal).

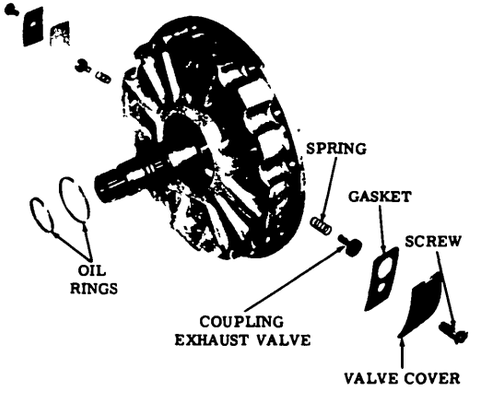


R assembly: Install a new inner piston seal on clutch housing, with lip of seal facing down. Install new outer piston seal on clutch piston with lip of seal facing flat side of piston (lubricate with No. 567196 lubricant). Install piston into clutch housing using small screwdriver to guide outer seal into bore, then install twenty clutch release springs into pockets in clutch piston. Install front clutch backing plate over front internal gear with counterbore facing tooth flange on front internal gear. Install five composition drive and five steel driven front clutch plates alternately, nesting them as follows: Position a composition plate over front unit internal gear, then place a steel plate over internal gear and notice position of slight half moon notch in edge of steel plate. Continue to install composition and steel plates alternately so that all steel plates have their notches one above the other. With all plates installed, carefully place front unit internal gear backing plate and clutch plates over front clutch housing, aligning dowel pins and holes. Install four front in-internal gear-to-clutch housing bolts and tighten lightly and evenly, using caution so as not to pinch bottom steel plate between internal gear and clutch piston. Install Tool J-8938 (two studs) in dowel pin holes in clutch housing assembly and secure in vise. Tighten internal gear-to-clutch housing bolts to 22-27 ft. lbs.

TORUS COVER: Disass mbly - Install Tools J-6122-01 (exhaust Valve Retainers), then remove exhaust valve covers by using Tool J-8874 to remove attaching screws. Remove and discard exhaust valve cover gaskets, then remove both exhaust valves and springs. Inspect and remove, if necessary, two lock type oil rings from input shaft.

R ass mbly: Install two new lock type oil rings on input shaft, if removed, then install exhaust valve springs and valves (retain valves with Tool J-6122-01). Replace torus cover exhaust valve covers and new gaskets with attaching screw and Tool J-8874. Tighten to 20-25 ft. lbs. and remove Tool J-6122-01.

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC FRONT UNIT CLUTCH



OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TORQUE CONVERTER

REAR BEARING RETAINER: Disassembly - Remove reverse blocker valve and spring by removing "E" ring, then remove detent plunger and spring by holding plunger against spring tension while removing retainer. Remove rear bearing snap ring and bearing. If necessary to remove parking pawl bracket shaft, remove two bracket shaft "E" rings.

Reassembly: Install rear bearing and snap ring, then install detent plunger and spring and compress to install retainer. Install reverse blocker valve and spring into rear bearing retainer and secure with "E" ring. Apply a coating of Permatex No. 2 to outer diameter of rear oil seal and install with Tool J-5154. Install parking pawl bracket, shaft and spring into bearing retainer and install two "E" rings on shaft.

GOVERNOR: Disassembly - Inspect and remove, if necessary, 4 lock type oil rings. Remove G-2 valve retainer, plug and valve.

R assembly: Install G-2 valve (stem end out), then install plug (cupped end first). Install G-2 valve plug retainer and four new lock type oil rings (if removed).

TORUS COVER ASSEMBLY

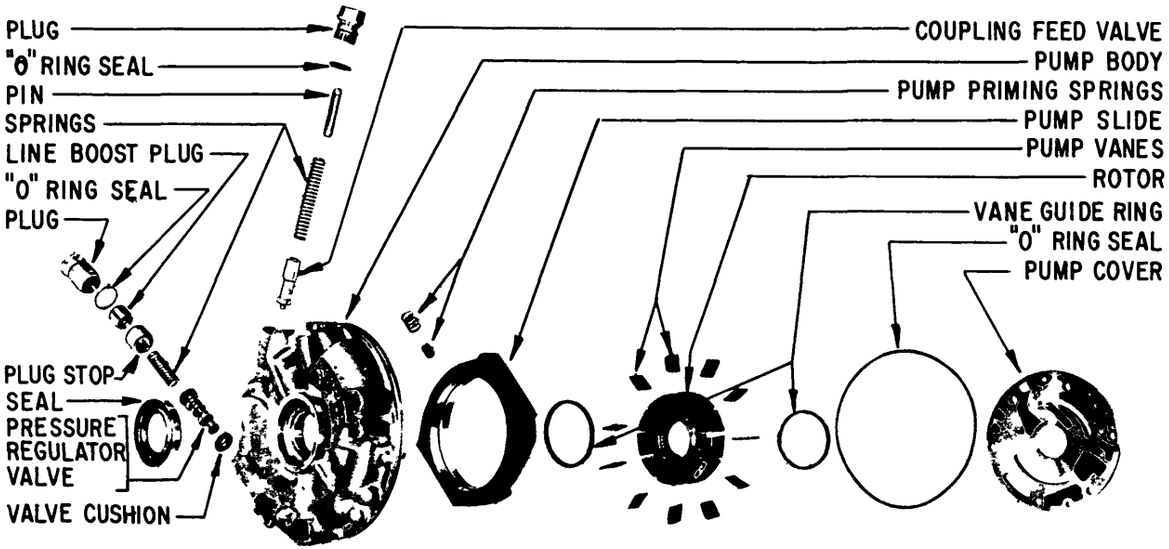
SERVO PISTON: Disassembly - Place Tool J-8760 against servo piston, then clamp in vise and remove retaining ring and washer. Slowly open vise and release spring pressure, then remove assembly from vise and

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

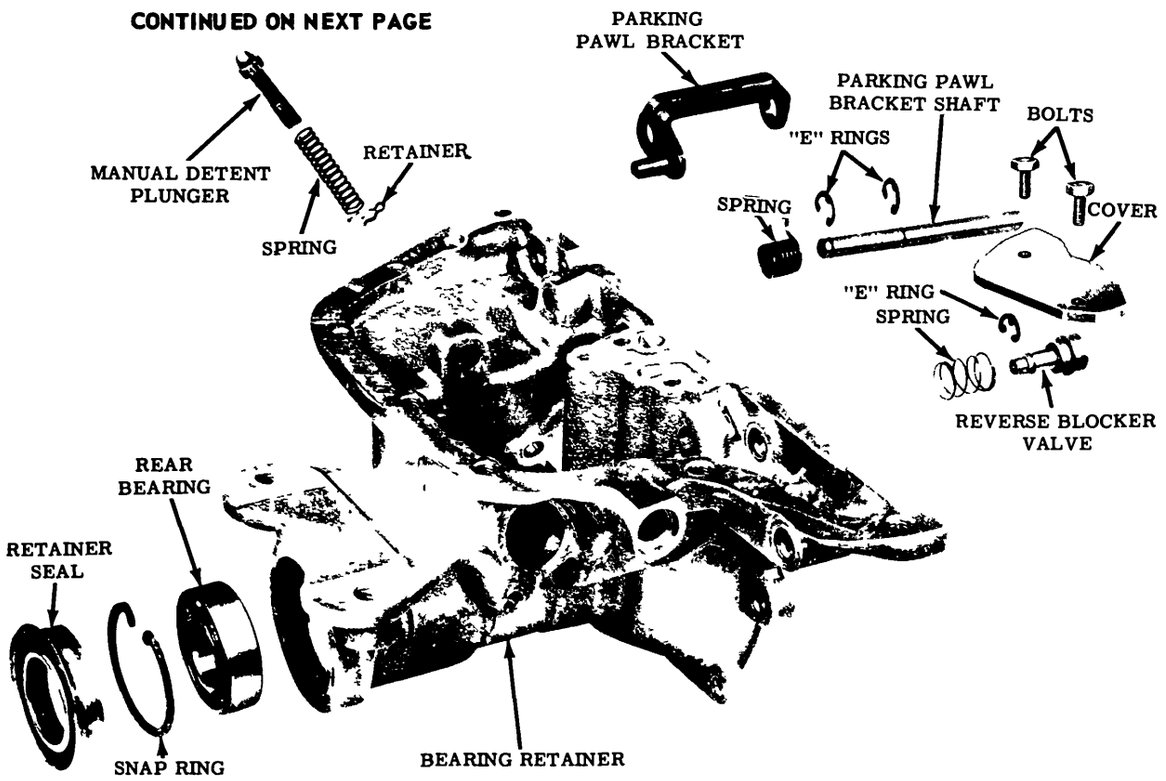
remove servo piston, spring and retainer. Inspect servo piston oil ring and replace if necessary.

R assembly: Install spring retainer, spring and servo piston pin. Place assembled components into vise using Tool J-8760 and carefully compress the assembly to allow the flat washer and retaining ring to be installed. Remove from vise and install new oil ring (if removed).



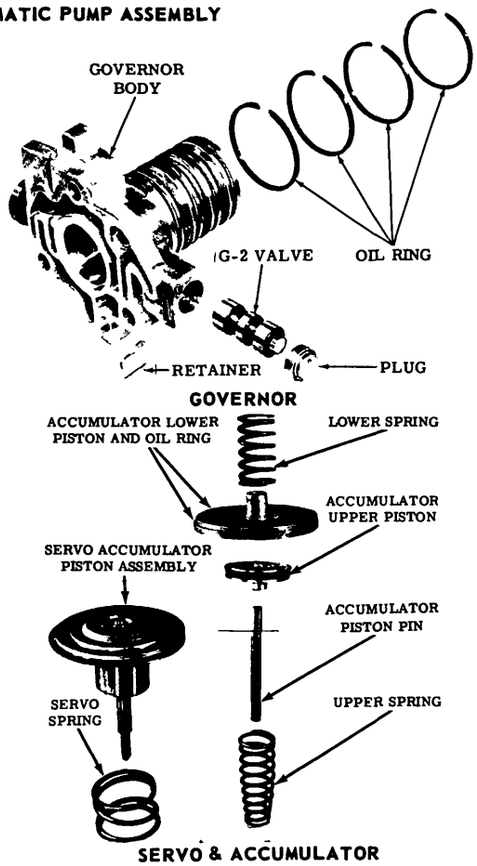
ACCUMULATOR PISTON: Disassembly - Remove and discard lip seal from upper accumulator piston (if necessary). Inspect seal ring on lower accumulator piston and replace if necessary.

R assembly: Install new piston seal on upper accumulator piston with lip facing flat side of piston. Install new ring on lower piston (if removed).



PUMP: Removal (From Case Cover) - Loosen six case cover-to-pump attaching bolts approximately four turns each, then carefully tap on bolt heads to free pump and "O" ring seal from case cover assembly. Remove attaching bolts and remove pump.

Disassembly: Inspect and if necessary, remove and dispump-to-case cover "O" ring seal, then remove pump cover. Remove upper vane ring, rotor, eleven vanes and



CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC PUMP ASSEMBLY

REAR BEARING RETAINER

SERVO & ACCUMULATOR

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

bottom vane ring. Remove pump slide and inner and outer priming springs. Remove coupling feed limit valve plug and "O" ring. Remove "O" ring from plug if necessary. Remove coupling feed limit valve spring, valve and pin. Remove pressure regulator plug, "O" ring seal and line boost plug (line boost plug is in the pressure regulator plug). Inspect and remove "O" ring, if necessary. Remove pressure regulator spring, valve and line boost plug stop. *NOTE - DO NOT remove pressure regulator valv cushion unl ss replacement is necessary.*

R ass mbly: Install a new pressure regulator valve cushion (if removed), then install pressure regulator valve, spring, plug stop, boost plug, "O" ring and plug. Tighten plug to 15-20 ft. lbs. Install coupling feed valve limit spring, pin, "O" ring and plug. Tighten to 15-20 ft. lbs. Install inner and outer priming springs and slide. *NOTE - Slide will fit one way only.* Install lower vane guide ring into pump body, then install pump rotor so shoulder on rotor seats over raised center portion of pump body. Install eleven vanes so vane ring wear pattern on edge of vanes faces towards vane rings, then install upper vane guide ring. Install pump cover by locating on pin and secure with one attaching screw. Tighten to 6-8 ft. lbs. Install pump body to case cover "O" ring seal (if removed).

Installati n (On Cas Cov r): Support pump assembly on a convenient support to raise pump above work bench enough to allow case cover to fit against pump. Align case cover-to-pump bolt holes and position case cover on pump. *NOTE - Hol s will only align in one position.* Install six case cover-to-pump attaching bolts, drawing bolts up evenly to properly seat "O" ring seal in case cover. Tighten to 20-25 ft. lbs.

CONTROL VALVE: Disassembly (Complete Control Valv) -Place control valve assembly on a clean surface with channel plate-to-case spacer down, and the rear throttle valve lever located in lower left hand corner. Remove the one retaining screw from each valve body, then turn control valve assembly over so rear throttle valve lever is located in upper left hand corner. Remove three screws retaining channel plate-to-case spacer plate, and remove plate. Remove three ball checks from channel plate, and three channel plate-to-valve body attaching screws. Remove manual valve from primary valve body, then remove channel plate and rear throttle valve lever from valve bodies. Remove sleeve, detent valve and spring from primary valve body. Remove the three exposed ball checks, then the channel plate-to-valve body spacer. *NOTE - To remove throttle valv lever from channel plate, remove the "E" ring.*

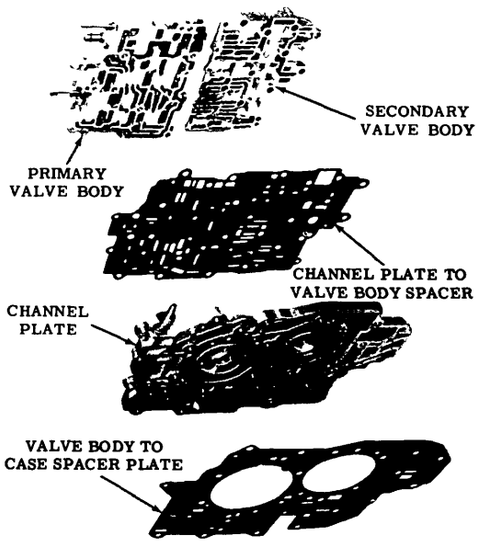
Primary Valv Body: Disassembly - 1) Remove band apply valve bushing retainer from cored face of primary body, then remove band apply valve and bushing from throttle valve bore. Remove band apply valve spring, throttle valve spring and valve.

2) Remove retaining pin from cored face of 1-2 valve bore while holding 1-2 throttle valve bushing. Remove 1-2 throttle valve bushing, 1-2 throttle valve, valve spring, and 1-2 shift valve spring and valve.

3) Remove 2-3 bore plug retainer and plug. *NOTE - M st of th valv bore plugs ar tapp d to all w an attaching screw to be threaded in for disassembly purpose.* Remove 2-3 throttle valve and throttle valve bushing, then remove valve from bushing. Remove 2-3 Throttle valve spring.

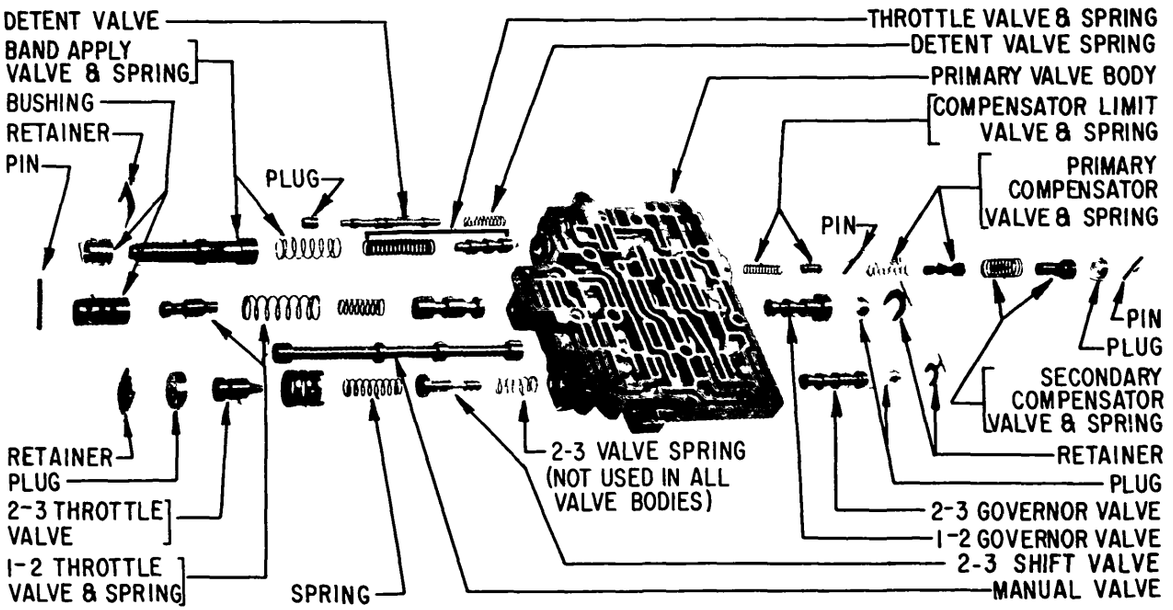
4) Remove 2-3 shift valve and spring, then remove bore plug retainer and bore plug from other end of 2-3 shift valve bore. Remove 2-3 governor valve. Remove bore plug retainer and bore plug from 1-2 valve bore and remove the 1-2 governor valve.

5) Remove bore plug retaining pin from cored face of compensator bore while holding bore plug, then remove compensator bore plug and secondary compensator valve and spring. Remove primary compensator valve and spring. Remove compensator limit valve retainer pin by compressing limit valve spring with a brass rod, and remove compensator limit valve and spring. *CAUTION - DO NOT disturb thermostatic throttle valve element adjusting screw.*



Reassembly - 1) Install compensator limit valve spring and valve, then install retaining pin by compressing limit valve spring with a brass rod. Install primary compensator valve spring and valve (small land first), then install secondary compensator valve spring and valve (small land first). Install bore plug (tapped hole out) and retaining pin.

2) Install 1-2 governor valve and bore plug (large end first) into 1-2 valve bore, and install bore plug retainer. Install 2-3 governor valve and bore plug (large end first) into 2-3 valve bore, and install retaining pin.



3) Install 2-3 shift valve spring on 2-3 shift valve and install valve and spring (small land first) into other end of 2-3 valve bore. Install 2-3 throttle valve spring in spring pocket of shift valve, then install 2-3 throttle valve in the 2-3 throttle valve bushing so it completely enters the bushing. Install 2-3 valve and bushing (tapered end first) and install retainer (flat side out).

►*NOTE: Install all flanged bore plug retainers with flat side out.*

CONTINUED ON NEXT PAGE

CONTROL VALVE ASSEMBLY

PRIMARY VALVE BODY ASSEMBLY

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (Cont.)

4) Install 1-2 shift valve in 1-2 bore (small land first), then install 1-2 shift valve spring and 1-2 throttle valve spring. Install 1-2 throttle valve into 1-2 throttle valve bushing (land end first), and install 1-2 throttle valve and bushing. Install retaining pin while holding springs compressed. Install throttle valve in throttle valve bore (stem end out).

5) Install band apply valve spring and the throttle valve spring, then install band apply valve (spring pocket first). Install band apply valve bushing on band apply valve and install band apply valve retainer while holding valve and bushing compressed. *DO NOT install manual valve and detent valve train at this time.*

Secondary Valve Body: Disassembly - 1) Remove band release accumulator bore plug retainer from cored face, then remove bore plug from accumulator bore (large bore). Remove band release accumulator valve.

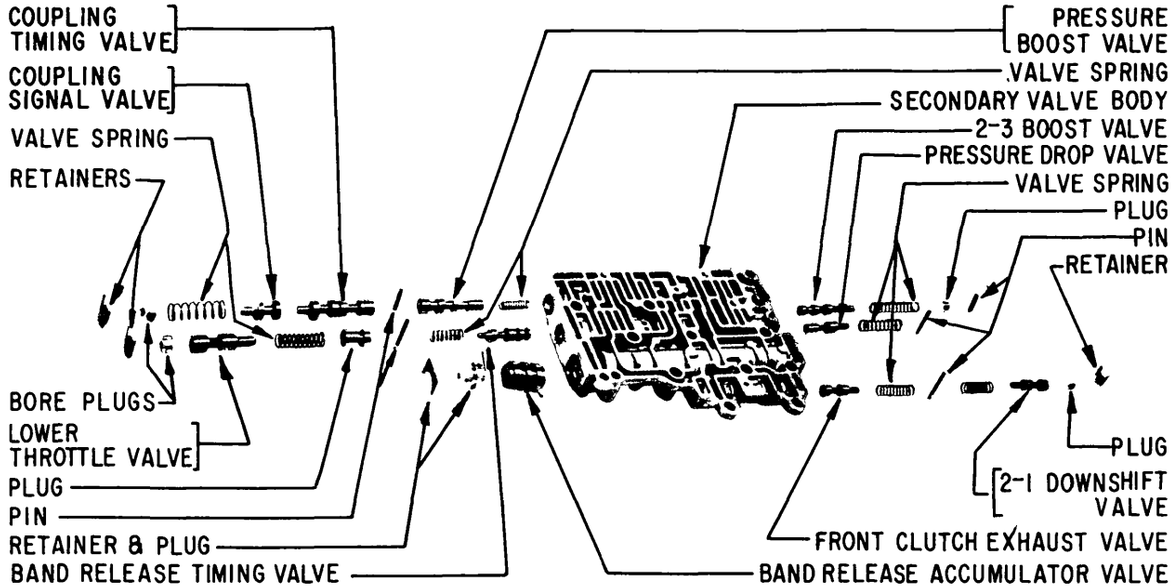
2) Remove low throttle control valve bore plug retainer from next bore, then remove plug, low throttle control valve and spring.

3) Remove band release timing valve plug, spring, and valve. From the next bore, remove coupling signal valve bore plug retainer, plug, spring, coupling signal valve, and coupling timing valve.

4) Remove pressure boost valve retaining pin from cored face while compressing valve with a brass rod, then remove valve and spring. Remove 2-3 boost valve retaining pin from cored face while compressing bore plug, then remove 2-3 boost valve spring and valve.

5) Remove pressure drop valve retaining pin while holding drop valve spring compressed, then remove pressure drop valve and spring. Remove 2-1 downshift valve bore plug retainer and plug, then remove valve and spring. Remove front clutch exhaust valve retaining pin from cored face while holding spring compressed and remove spring and valve.

Reassembly - *NOTE - All attaching screws must be tightened to 2.5-3.5 ft. lbs.*



1) Install front clutch exhaust valve (stem out), and valve spring, then compress spring and install retaining pin. Install 2-1 downshift valve spring and valve (stem first) and install bore plug and retainer.

2) Install pressure drop valve (stem last), and valve spring, then compress spring and install retaining pin. Install 2-3 boost valve (stem last) and valve spring, then install bore plug and short retaining pin.

3) Install pressure valve spring and valve (hollow end first), then install retaining pin by compressing valve with a brass rod. Install coupling timing valve (stem end last), coupling signal valve (stem end last), coupling signal valve spring and bore plug, then compress the spring and install retaining clip.

4) Install band release timing valve (stem end last) into next bore, and install spring and plug (short land of plug first). Compress spring and install retaining pin. Install low throttle control valve spring, valve (stem end first), bore plug and retainer. Install band release accumulator valve, bore plug and retaining clip.

Reassembly (Complete Control Valve): Install two medium and one large ball checks into ball check seats in channel plate (see illustration for location), then install channel plate-to-valve body spacer over channel plate. Install detent spring and valve (long stem first) into primary valve assembly, then install throttle valve sleeve on detent valve. Install primary valve assembly on spacer plate while compressing throttle valve sleeve and band apply valve. Install one attaching screw loosely. Install secondary valve assembly on spacer plate and install one attaching screw loosely. Turn assembly over and install one small and two large check balls into their pockets in channel plate (see illustration). Install manual valve (land with hole out), then install channel plate-to-case spacer plate and install all attaching screws loosely. Install ¼" drill in an attaching bolt hole to align primary valve assembly with channel plate, then tighten the countersunk flat head screw to 2.5-3.5 ft. lbs. Install secondary valve body-to-case attaching screws for guides and tighten all valve body attaching screws to 2.5-3.5 ft. lbs. Remove case attaching screws and ¼" drill.

SECONDARY VALVE BODY ASSEMBLY

TRANSMISSION REASSEMBLY

1) Install transmission into a suitable holding fixture with front end upward, then install band with a single ear facing servo side of case. Install band anchor link between band and case with cupped end of link against band adjusting stop pin hole.

2) Install case center support with bevel upward and install center support assembly, aligning keyway in support with key. Install reverse stationary cone key into case, then install the reverse cone over reverse piston. Install reverse stationary cone, aligning key with key slot. Install reverse stationary cone retaining snap ring with ring gap at open section of ring groove.

3) Install case center support-to-front internal gear bronze thrust washer into front clutch housing and retain in place with petrolatum. Install front internal gear and clutch assembly over splines of reverse cone.

4) Rotate transmission bottom side upward. *CAUTION - Do not rotate over ¼ turn or clutch assembly will fall out.* Install rear internal gear into rear of transmission case. Install steel backing washer, bronze thrust washer, steel backing washer and sun gear on front sun gear shaft. Install rear carrier-to-rear internal gear bronze thrust washer over carrier shaft, then install rear carrier from rear of transmission.

5) Install front sun gear-to-front carrier bronze thrust washer over carrier shaft and retain with petrolatum. Install front carrier assembly and retain with snap ring.

6) Rotate transmission so rear end is upward, then install rear sun gear on mainshaft. Install rear carrier-to-sun gear bronze thrust washer into rear carrier and install mainshaft. Install output shaft on rear carrier using the marks made at disassembly for proper alignment.

7) Install parking pawl spacer into counterbore in case, then install parking pawl and linkage against the spacer so that tooth of pawl faces flange on output shaft. Install parking pawl pivot shaft and engage pawl with output shaft. Install governor assembly with three attaching bolts and tighten to 22-27 ft. lbs.

8) Install speedometer drive gear ¼" past snap ring groove using Tools J-8760 and J-6133-A. Install rear bearing-to-output shaft snap ring. Retain a new gasket on rear bearing retainer with petrolatum, then install bearing retainer over output shaft, guiding parking pawl shaft into parking pawl assembly. *CAUTION - Use care when guiding retainer over governor rings.* Install one long rear retainer attaching bolt in lower left hand corner of retainer, then install breather pipe clip over upper right bolt. Install seven remaining rear bearing retainer attaching bolts and tighten to 20-25 ft. lbs.

9) Rotate transmission so front end is upward, then install drive torus over front unit clutch. *CAUTION - Be sure all clutch plates are engaged by observing that drive torus rests against front carrier.* Install lock type

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

oil ring on torque multiplier (if removed), then install torque multiplier.

10) If removed, install two lock type oil rings on driven torus. Install flat bearing race into torque multiplier, then install cupped race and bearing into driven torus (bearing out), and retain in place with petrolatum. Install driven torus on mainshaft and install a new driven torus-to-mainshaft retaining ring. *NOTE - It may be n c ssary to lift up on mainshaft to install retaining ring.* Install flat bearing race, bearing and cupped race (cup facing torus cover) into torus cover, retaining in place with petrolatum.

11) Install a new gasket on torus cover, aligning dowel pin holes, and retain with petrolatum. Install twelve torus cover attaching bolts and cross-tighten to 10-12 ft. lbs. Install gasket on case cover and retain with petrolatum, then install case cover and pump assembly while aligning attaching bolt holes. *NOTE - Install Tool J-8828 on shaft before installing case cover if s al was not r moved.* Install nine case cover-to-case attaching bolts and tighten to 20-25 ft. lbs. *NOTE - Of th nin bolts, on is long r.*

12) Install new seal by placing front seal protector, Tool J-8828 over input shaft, install seal and drive into pump with Tool J-8761. Remove tools and rotate transmission so oil pan is upward.

13) Check front unit endplay *(see "Transmission Front Unit Endplay Check" under "Transmission Disassembly" above).*

14) Hook curved end of parking pawl spring into notch in parking lever, then install rear bearing retainer cover and tighten bolts to 20-25 ft. lbs.

15) Install upper accumulator spring, pin, upper piston, lower piston, and spring into case, then install servo spring and piston assembly. Install two case support-to-case seals on springs, then install into case and push retainers into place. Place control valve assembly over servo and accumulator pistons and install attaching bolts. Tighten to 6-8 ft. lbs.

16) Install band anchor stop pin into hole in case, then install band adjusting screw and locknut (leave locknut loose). Use Tool J-8591 and an inch-pound torque wrench and tighten adjusting screw to 20 inch-pounds, **then back scr w ff tw turns.** Tighten locknut to 18-20 ft. lbs.

17) Install an "O" ring seal on manual lever shaft and install shaft. *NOTE - Depress detent plunger to allow manual and detent assembly to slide by.* Install "E" ring on manual shaft, then install manual valve link in detent lever and manual valve. Position detent and manual lever over detent plunger. Tighten manual shaft lockscrew, indexing lockscrew with groove in manual shaft. Tighten to 6-8 ft. lbs.

18) If removed, install inside throttle valve link to front throttle valve lever assembly and retain with "E" ring. Install spacer on outer throttle valve lever through case and into front throttle valve lever, then align lockscrew with hole in shaft and tighten lockscrew to 6-8 ft. lbs. Install inside throttle valve link over rear throttle valve lever shaft and retain with "E" ring.

19) Install filler pipe "O" ring seal into bore inside of case (if removed), then install cleaner "O" ring into bore in case. Install cleaner and clip into valve body. Install a new oil pan gasket and oil pan and tighten attaching bolts to 12-15 ft. lbs. Engage parking pawl in "Park" position and install companion flange assembly, using Tool J-6505. Install attaching bolt and tighten to 30-40 ft. lbs.

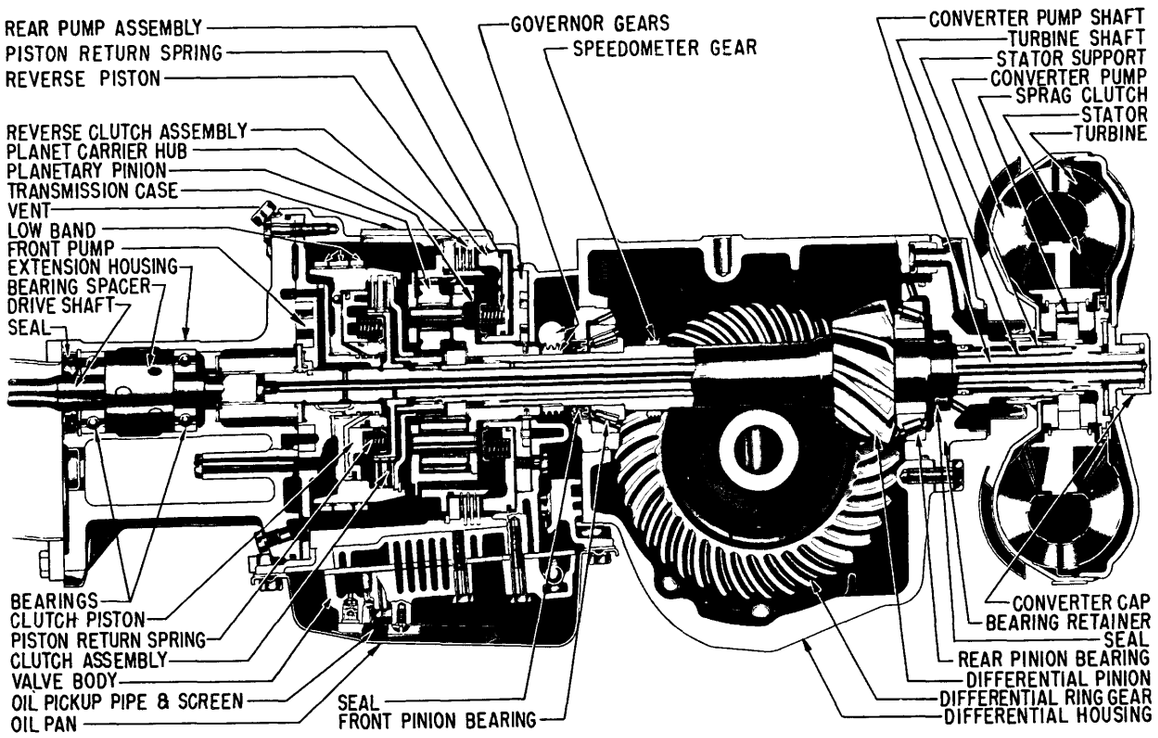
PONTIAC TEMPEST TRANSAXLE

Pontiac Tempest (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 TEMPEST AUTOMATIC TRANSMISSION SHUDDER CORRECTION (EARLY MODELS WITH 4-BBL. CARBS):* This condition which occurs on minimum throttle upshifts after transmission is warm, may be caused by lack of proper orifice in transmission-to-carburetor vacuum line. *NOTE - Later carburetors with vacuum take-off located between idle mixture screws on carburetor do not require an orifice.* To correct, pull hose and vacuum pipe from modulator valve at transmission, then remove rubber hose from pipe. Drill out end of vacuum pipe with a No. 32 (.116") drill. Remove hose from front end of pipe and blow out any chips from drilling. Install an Orifice, Part No. 540933, small end first and tap into vacuum pipe, making sure orifice is not loose in pipe (pinch pipe around orifice). Slip rubber hose over vacuum pipe and reinstall vacuum pipe to modulator valve.

►*1961 TEMPEST V8 AUTOMATIC TRANSMISSION PRODUCTION CHANGE & SERVICE REPLACEMENT (To Correct Engine Idle Speed Increase on a Low Speed Forced Downshift):* A new Downshift Timing Valve, Part No. 3751214 is being used in production and may be used for service replacement on earlier cars to correct the above condition. To install, remove transmission oil pan and control valve body assembly. Downshift Timing Valve is located adjacent to servo piston in a bore in transmission case.



►*1961 TEMPEST SYNCHRO-MESH TRANSMISSION CASE OIL PLUG PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE (To Provide More Positive Differential Drive Pinion Bearing Lubrication):* A new transmission case oil plug, Part No. 541774 is being installed in production and should be installed on earlier cars whenever transmission or differential carrier assembly is removed from car. The new plug restricts flow of lubricant between transmission and differential carrier housing.

DESCRIPTION: The Transaxle assembly consists of either an integral differential (rear axle) unit and synchro-mesh transmission; or a differential (rear axle) unit and an automatic type transmission as follows:

Differential (Rear Axle) Assembly: Straddle mounted hypoid gear design which is contained in a separate housing attached directly to transmission case. On cars with automatic transmission, the torque converter is located to rear of differential housing with transmission input and output shafts running axially through differential pinion shaft. Each axle shaft is independently suspended and is free to move in a vertical plane in an arc. Axle shafts are attached to universal joints which are splined into differential side gears.

Axle Ratios - *NOTE - Axle ratio stamped on right side of carrier housing on flat surface next to side cover.* 3.08-1 (37-12), 3.31-1 (43-13), 3.55-1 (39-11), 3.73-1 (41-11), 3.90-1 (39-10). *NOTE - 3.08-1 not available on Station Wagons. 3.90-1 not availabl on Automatic Transmission cars.*

Synchr -m sh Transmissi n: Three-speed synchro-mesh type integral with rear axle differential carrier.

PONTIAC TEMPEST TRANSAXLE (WITH AUTOMATIC TRANSMISSION)

Transmission Ratios - 2.94-1 (1st Speed), 1.68-1 (2nd Speed), 1.00-1 (3rd Speed). 3.32-1 (Reverse).

Automatic Transmission: Three element torque converter and a hydraulically operated two-speed type automatic shift transmission which is integral with rear axle differential carrier. Engine torque is transmitted through converter pump shaft (located within hollow turbine shaft) to torque converter turbine, then back to transmission through the hollow turbine shaft (located within hollow differential driven pinion shaft). Transmission output shaft is splined directly to differential drive pinion shaft.

LUBRICATION

Check fluid level in all units every 2000 miles.

►*AUTOMATIC TRANSMISSION NOTE:* Draining and refilling of automatic transmission is not recommended except at time of overhaul.

Recommended Oil (Rear Axle & Synchro-mesh Trans.) - SAE 80 or SAE 90 "Multi-Purpose" gear lubricant. *CAUTION - Do not use straight mineral oil gear lubricants or lubricants containing active sulphur soap.* Differential carrier and synchro-mesh transmission are connected by internal passages.

Aut matic Transmission - Automatic Transmission Fluid Type "A" (Suffix "A"). *NOTE - Automatic Transmission is s al d off from differ ntial carri r.*

Ch cking Fluid Level: Rear Axle & Synchro-mesh Transmissi n - With unit at normal operating temperature, check fluid in differential carrier first (plug is adjacent to rear axle universal joint on left side of transmission case). If level is low in differential case, also check level in transmission housing. *NOTE - With unit at operating temperature, fluid should b l v l with bottom of filler plug hole.*

Automatic Transmission - With transmission at normal operating temperature and transmission selector lever in "N" (Neutral) position, engine idling, check fluid level on dipstick in filler tube located under a plate in right-front of luggage compartment. Add recommended fluid as necessary to bring level to "Full" mark on dipstick. Approximately one pint of oil is required to raise level from "Add" to "Full".

Draining & Refilling: Rear Axl & Synchr -m sh Transmission - *NOTE - Not rec mm nded exc pt at time f overhaul or repair.*

Capacity - 2.8 pints (Transmission); 3 pints (Differential).

Automatic Transmission - *NOTE - N t recomm nd d except at time of transmission overhaul.* Drain oil by loosening filler tube attaching nut in oil pan. To refill, tighten filler tube nut and add 4 pints of recommended fluid using filler tube and funnel. Start engine and allow to idle 3-5 minutes in "N", then add sufficient fluid to bring level to "Full" mark.

Capacity - 6 pts. (after draining). 12 pts. (after overhaul).

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (Continued)

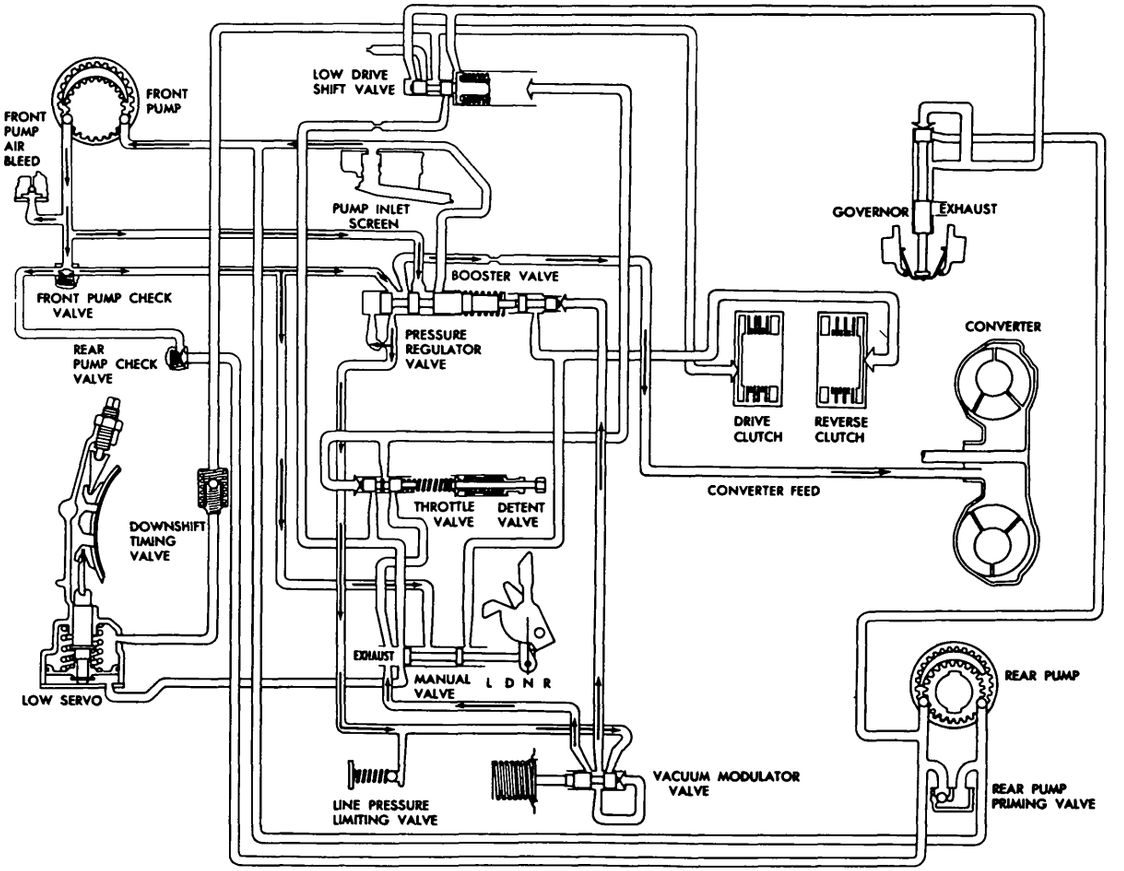
ADJUSTMENT

Transmission Throttle Linkage (Automatic Trans.): See *CARBURETOR in Car Model page.*

Manual Linkage (Automatic Trans.): Drain transmission oil and remove oil pan. Place selector lever in "D" (Drive) range, then insert Tool J-8365 into manual valve bore (end opposite linkage) with tab of gauge upward so it engages forward port of valve body. With tool in place, push forward on manual valve levers. If valve is properly adjusted, tool will be held in place horizontally without being supported. If adjustment is necessary, loosen lockscrew in manual valve linkage (inside transmission) and push manual valve levers forward so Tool J-8365 is held in a horizontal position. Recheck adjustment. Install oil pan and fill transmission with fluid.

Neutral Starter Switch Adjustment (Automatic Trans.): Loosen two switch mounting screws and place transmission selector lever in "N" (Neutral) position. Turn ignition switch to start position, then move neutral switch fore and aft until engine cranking begins. Secure switch in that position. Recheck to make sure engine will not start with transmission selector lever in any position other than "N" (Neutral). *NOTE - Neutral switch is located on rear of gearshift control and indicator assembly.*

Low Band: *NOTE - Periodic adjustment is not recommended, however, if necessary, proceed as follows:* Lower transmission for access to adjusting screw, then loosen locknut and tighten screw to 40±5 inch lbs. torque, **then back off four full turns exactly.** Hold adjusting screw stationary and tighten locknut.



TROUBLE SHOOTING (AUTOMATIC TRANSMISSION)

NO DRIVE IN ANY SELECTOR LEVER POSITION (CANNOT LOAD ENGINE): Low oil level. Clogged oil suction pipe screen. Broken or disconnected manual cable. Defective pressure regulator valve. Defective line pressure limit valve. Defective front pump. Rear pump check valve and rear pump priming ball not seating (both must occur for possible malfunction). Front pump shaft disengaged at either converter or pump gear. Front pump priming ball not seating.

ENGINE SPEED FLARES ON STANDSTILL STARTS BUT ACCELERATION LAGS: Low band only partially applied caused by one or more of the following conditions: Low oil pressure. Clogged pickup pipe screen. Improper band adjustment. Servo piston apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding.

ENGINE SPEED FLARES ON UPSHIFT: Low oil level. Clogged oil suction screen or pipe. High clutch partially applied (blocked feed orifice). Clutch plates worn. Clutch seals leaking. Clutch piston hung up. Clutch drum relief ball not seating. Vacuum modulator hose collapsed.

TRANSMISSION WILL NOT UPSHIFT: Low band not releasing due to one of the following conditions: Stuck low-drive valve. Defective governor. No rear pump output (stuck priming ball, drive pins not engaged, or defective pump). Throttle valve stuck or improperly adjusted. Improperly adjusted manual valve lever.

PONTIAC TEMPEST AUTOMATIC TRANSMISSION HYDRAULIC CIRCUIT

HARSH UPSHIFT: Incorrect carburetor-to-transmission throttle valve rod adjustment. Improper low band adjustment. Vacuum modulator hose broken or disconnected. Vacuum modulator diaphragm leaks. Vacuum modulator valve stuck. Hydraulic modulator valve stuck.

CLOSED THROTTLE HARSH DOWNSHIFT: Improper low band adjustment. Vacuum modulator hose disconnected or broken. Vacuum modulator diaphragm ruptured. Vacuum modulator valve stuck. Engine idle speed too high. Sticking pressure regulator or hydraulic modulator valves in valve body.

CAR CREEPS EXCESSIVELY IN DRIVE: Idle speed too high.

CAR CREEPS IN NEUTRAL: Incorrect manual valve lever adjustment. High clutch or low band not released.

NO DRIVE IN REVERSE: Manual valve lever adjustment not correct. Cable linkage adjustment not correct. Reverse clutch piston stuck. Reverse clutch plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

IMPROPER SHIFT POINTS (see "Shift Speed" table below): Incorrect accelerator control linkage adjustment. Throttle valve incorrectly adjusted. Governor defective. Rear pump priming ball stuck.

OIL FORCED OUT OF FILLER TUBE: Oil level too high. Oil pickup pipe split or not sealed causing air entrainment.

UNABLE TO PUSH START: Rear pump drive gear not engaged with drive pins on planet carrier hub. Rear pump defective. Rear pump priming ball not seating.

TESTING (AUTOMATIC TRANSMISSION)

►*TESTING NOTE: Transmission must be at normal operating temperature, fluid level at "F" mark on dipstick, and manual and throttle linkage adjustments must be correct.*

ROAD TEST: Road test car to determine transmission shift points as indicated in table below.

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (Continued)

Transmission Shift Speeds

UPSHIFTS	©MPH
Minimum Throttle	12-15
Full Throttle	43-50
Part Throttle (Detent Touch)	35-45
DOWNSHIFTS	**©MPH**
Closed Throttle	9-15
Full Throttle	39-46
Part Throttle (Detent Touch)	21-33

© - With 3.55-1 ratio rear axle.

PRESSURE TESTS: *NOTE - Pressure tests can be made by raising rear wheels 3-5" off floor on jack stands.*

Front Pump: Remove pipe plug located at "6 o'clock" position in front face of transmission extension housing and connect pressure gauge. With engine at idle speed (approximately 16" of vacuum), pressures should be as follows with selector lever in indicated range: 106-130 lbs. (Reverse); 55-67 lbs. (Neutral & Drive); 124-137 lbs. (Low). Disconnect vacuum hose at vacuum modulator, then with engine at idle speed, check pressure which should be 198-222 lbs. (Reverse); 101-114 lbs. (Neutral & Drive); 124-137 lbs. (Low). If there is no pressure in front pump, check for stuck pressure regulator, broken or disengaged front pump shaft or missing plug from front end of converter pump shaft. Moderately low front pump pressures in all ranges indicate a restricted front pump inlet. Failure of pressure to rise when vacuum hose disconnected (or high pressures with vacuum hose connected) indicates a stuck vacuum modulator valve, defective vacuum modulator, or a collapsed hose.

Rear Pump: With gauge connected as for "Front Pump" (rear wheels raised), place selector lever in "D" (Drive) and accelerate engine. Front pump pressure should drop to approximately 0-5 lbs. at 20 MPH. If pressure does not drop, rear pump is disengaged or clogged or rear pump check ball is not seating.

Throttle Valve: Remove plug located at "8 o'clock" position in front face of transmission extension housing and connect pressure gauge. Disconnect throttle valve rod at carburetor and vacuum hose at vacuum modulator, then with engine at idle speed, depress accelerator to wide open position. *NOTE - By disconnecting throttle valve rod at carburetor, engine remains at idle speed throughout test.* Pressure should be as follows with selector lever in indicated range: 0 lbs. (Reverse & Neutral); 50-52 lbs. (Drive); 119-132 lbs. (Low). If pressures not as specified, they can be corrected by adjusting position of jam nut located on end of detent valve assembly (part of throttle valve assembly inside transmission case). Insert an Allen wrench in end of adjusting screw and hold screw from turning, then turn jam nut (one full turn is equal to 3 psi). Tightening the nut lowers pressure.

REMOVAL & INSTALLATION

►*AXLE FLANGE RUNOUT NOTE: Flange runout should not exceed .010" when checked just outside wheel bolts.*

AXLE SHAFT: Removal - Remove wheel and brake drum, then remove axle bearing retainer-to-brake backing plate attaching nuts (accessible through hole in axle shaft flange) and pull backing plate out slightly. Push backing plate back on control arm studs to break plate away from bearing retainer. Remove universal joint-to-rear axle flange U-bolts and pull axle shaft to separate flange from U-bolts. Remove axle shaft with Tool J-8614 and pull axle shaft from lower control arm.

Installation: Insert axle shaft through lower control arm and install flange on axle splines. *NOTE - It may be necessary to lightly tap flange onto splines.* Install and securely tighten axle shaft-to-flange bolt. Attach universal joint to flange on axle shaft with U-bolts and tighten nuts to 14-20 ft. lbs. With bearing retainer and brake backing plate holes aligned with control arm studs, insert universal joint splined yoke through seal at side bearing and index with splines of side gears. *NOTE - Coat lip of seal and splines with hypoid lubricant to prevent damage to seal.* Install nuts securing bearing retainer to backing plate (through access hole in axle flange) and tighten to 30-45 ft. lbs. Install wheel and drums and tighten mounting nuts to 70-85 ft. lbs.

TRANSAXLE (TRANSMISSION & DIFFERENTIAL CARRIER): Removal - Raise car and support transaxle assembly and rear of engine, then drain lubricant from transmission and differential carrier housing (see *"Draining & Refilling"*). Remove axle bearing retainer-to-brake backing plate attaching nuts and pull axle shafts out far enough to remove universal joints from differential assembly (cover universal joint splines). Remove propeller shaft damper bearing retainer bolts at both bearings, then remove speedometer driven gear from differential assembly. Disconnect transmission control rods and cables from transmission and remove cables and lines from torque tube. On synchro-mesh cars, remove gearshift lever housing. On cars with V8 engine, remove exhaust crossover pipe. On all cars, remove flywheel cover and torque tube access hole cover, then disconnect propeller shaft from flywheel or clutch drive extension. *CAUTION - Place a rag between shaft and torque tube to protect propeller shaft coating.* Disconnect torque tube from flywheel housing, then disconnect transaxle from rear crossmember (remove two bolts through access hole in trunk or from under car). Remove transaxle, propeller shaft, and torque tube as an assembly.

Installation: With torque tube and propeller shaft installed on transaxle, position the assembly in car and install two bolts securing transaxle assembly to rear crossmember (through access holes in trunk) and tighten to 65-85 ft. lbs. Install propeller shaft on flywheel and secure front flange to flywheel, tightening bolts finger tight. Remove protecting rag or cloth from propeller shaft and secure torque tube to flywheel housing, tightening bolts finger tight. Tighten propeller shaft flange-to-flywheel or clutch drive shaft to 30-35 ft. lbs., then tighten torque tube-to-flywheel housing bolts to 30-45 ft. lbs. Install axle shaft universal joint splines in differential carrier assembly. *NOTE - Coat lip of seal and splines with hypoid lubricant to prevent damage to seal.* Install rear axle bearing retainer in position on brake backing plate and tighten attaching nuts to 30-45 ft. lbs. Tighten universal joint U-bolts 14-20 ft. lbs. *CAUTION - Make sure universal joint snap rings are properly installed.* Install wheel and brake drum assemblies, flywheel cover and torque tube access cover plate. On V8 models, install exhaust crossover pipe. Remove support from transaxle and engine, then install transmission control rods and cables. Install parking brake cable on torque tube and adjust. Install speedometer cable in differential carrier assembly and fill transmission and differential housing with proper lubricant (see *"Lubrication" above*). Idle engine approximately one minute, then tighten propeller shaft bearing bolts to 8-12 ft. lbs.

SYNCHRO-MESH TRANSMISSION: Removal - With transaxle assembly removed from car (see above), remove bolts attaching torque tube to transmission, then remove propeller shaft and torque tube as a unit by pulling on propeller shaft flange. Remove transmission-to-differential carrier attaching bolts and separate transmission from differential carrier.

Installation: Install transmission on differential carrier and tighten attaching bolts. Install propeller shaft and torque tube being careful to engage spline of propeller shaft into transmission and journal diameter into transmission extension bearings so journal surfaces are not damaged. *CAUTION - Check alignment of propeller shaft into transmission extension and, if absolutely necessary tap front flange of propeller shaft lightly with a soft rubber hammer. Be sure splines are completely engaged in transmission.* To complete installation in car, see "Transaxle" above.

AUTOMATIC TRANSMISSION: Removal - With transaxle removed from car, remove converter cover cap using Tool J-9183 or other suitable "strap wrench" to hold converter. Remove converter retaining ring and converter. *NOTE - Reinstall cap on converter after removal and place cap side down to retain oil.* Remove bolts attaching torque tube to transmission, then remove propeller shaft and torque tube as a unit by pulling on propeller shaft flange. Remove speedometer driven gear, governor assembly and "O" ring, then pull turbine drive shaft out of transmission. Remove screws retaining transmission to differential carrier and separate transmission from differential carrier.

Installation: *CAUTION - Before connecting Automatic Transmission and differential carrier, determine thickness of thrust washers required at front face of governor gear. See "Rear Selective Thrust Washer" below.* After determining proper thickness thrust washer, install a new gasket to either carrier or rear face of transmission. Align carrier and transmission on a flat surface and carefully guide pump shaft through differential carrier so as not to damage bushing in differential pinion, then engage splines of pinion shaft with planet internal splines in transmission. Install governor and "O" ring seal and secure transmission to carrier with four screws. *NOTE - Drive two screws from carrier side first to minimize chance of cocking mating surface of transmission and carrier.* Tighten screws to 30-35 ft. lbs. Install turbine shaft into converter, then install converter and turbine shaft into transmission, being careful not to damage turbine shaft bushings when sliding over converter pump shaft. *CAUTION - Do not use force when engaging splines in converter and at end of turbine shaft. Engagement will occur easily if splines are correctly aligned.* Retain converter with retaining ring, then install converter cap and seal assembly. Tighten to 60-70 ft.

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinu d)

lbs. *NOTE - If not previously installed, install modulator valve and vacuum modulator assembly.*

R ar Selectiv Thrust Washer: Any time repairs are made that require separation of automatic transmission and differential carrier, the proper thickness of thrust washer to be used at front face of governor gear must be determined as follows: Install dial indicator on Support J-8364 and install a 3" indicator extension. Without gasket, place support J-8364 on rear pump cavity surface of transmission case (transmission front end down) so that dial indicator extension tip rests on planet carrier hub. Adjust indicator as required to permit maximum indicator travel, then set dial to zero. *NOTE - Transmission must face downward when indicator is zeroed.* Slowly lift indicator and support off rear pump cavity and note its range of needle deflection from zero Position. *NOTE - If indicator is properly positioned on support, indicator should not d flect more than .050" (one-half turn) when removed; otherwise raise or lower dial indicator on support as required and again "zero" indicator.* Place support and dial indicator on governor gear on differential carrier pinion shaft (Support J-8364 will fit over pinion shaft), then slowly lower support (indicator tip of dial indicator against machined face of differential carrier housing) so that revolutions of dial indicator needle can be counted. *NOTE - Measurement starts onc th n dl reaches "zero".* Finally depress support on governor gear and note indicator reading, then refer to following table for thickness of spacers to be installed on governor gear.

►*NOTE: After s lected spacers are installed on governor gear, r ch ck m asurement. If spacer stack is corr ct, indicator reading will now be between .025-.038". If n t, add or r move spacers until reading is within this range.*

Thrust Spacer Chart

Indicat r R ading	N .Reqd.	©Spacer Thickness

DIFFERENTIAL CARRIER: Removal & Installation - *See instructi ns abov for "Synchro-mesh" or "Automatic" Transmissions.*

SYNCHRO-MESH TRANSMISSION OVERHAUL

DISASSEMBLY: With transmission removed from differential carrier, proceed as follows:

1) Mount transmission on fixture J-7896-01 and remove extension assembly, being careful not to dent or damage mounting surface. Remove filler plug, case top cover and gasket.

2) Remove snap ring from mainshaft groove at rear of case (snap ring is immediately behind mainshaft bearing).

1961 PONTIAC TEMPEST SYNCHRO-MESH TRANSMISSION

Drive out clutch gear bearing and clutch gear by driving on mainshaft, then continue to drive or press mainshaft out of transmission and remove thrust washer. *CAUTION - Be sure synchronizer ring tangs are lined up with mainshaft splines before driving out mainshaft.*

3) Remove second speed gear, first and reverse sliding gear, and second and third speed clutch sleeve from case by lifting out through top cover hole, then remove second speed gear from clutch sleeve. To remove mainshaft bearing from case, fully expand retaining ring and start bearing out by tapping on outer race, then drive bearing out of case.

4) Remove detent cover plug and remove second and third gear detent spring and ball. Use a suitable punch and drive out roll pin securing second and third speed shift fork to shaft, then tap shaft toward front of case with a drift and remove fork, shaft and roll pin. Remove interlock from detent cavity, then remove first and reverse shift fork and shaft in same manner. Remove first and reverse gear detent ball and spring.

5) Remove two capscrews and lock tabs securing shift finger to manual shift shaft and pull shaft from case. Remove manual shift shaft seal.

6) Remove countergear and thrust washers by driving countergear shaft out from front of case using Tool J-5777. *CAUTION - H ld tool in c ntact with count r-g ar t prev nt n edl b arings from dropping out.* If necessary to remove reverse idler gear, drive reverse idler lock pin into shaft, then drive reverse idler shaft out of case. Remove caged needle bearing and thrust washer at rear of reverse idler gear. Remove mainshaft bearing retainer ring from case.

Clutch Sleeves & Synchronizer Rings (Disassembly & Reassembly): Remove first and reverse sliding gear, then turn synchronizer ring in clutch sleeve until ends or ring retainer can be seen through slots in clutch sleeve. Use Tool J-932 and expand retainer into counterbore in clutch sleeve, then slip synchronizer ring out of sleeve. *NOTE - If cones are damaged it will be necessary to replace clutch sleeve assembly and both synchronizer rings. Replace clutch sleeve if there is more than .030" endplay between cone and snap ring.* Inspect rings for smoothness, then place rings in synchronizer cones and check with thumbs to see that rings do not rock. Install synchronizer ring retainers in counterbores in end of clutch sleeve, then use Tool J-932 in slot in clutch sleeve and expand each retainer in counterbore. Lubricate each synchronizer ring with light oil and install in clutch sleeve. *CAUTION - Mak sure retainers seat in gro v all th way around rings s rings will turn fre ly.* Install first and reverse sliding gear on clutch sleeve.

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinu d)

INSPECTION: Wash all parts in clean solvent and blow dry with air. Check bearings for roughness and replace if necessary. Inspect case for cracks and inspect machined surfaces for burrs. Dress burrs off with a flat file. Inspect all gears and replace any that are worn or damaged. Make sure first and reverse sliding gear slides freely on clutch sleeve and that clutch sleeve slides freely on mainshaft. *NOTE - If reverse idler gear bushings are worn or damaged, replace entire assembly. Gear and bushing are not serviced separately.* Proper clearance between idler gear bushing and shaft is .002-.004".

►*SYNCHRONIZER ENERGIZING SPRING CAUTION:* If these springs have been removed, new springs must be installed. Assemble each spring in its groove in clutch gear and second speed gear with offset or locking end of spring between the third and fourth teeth of either of the two banks of teeth on these gears, thus keeping spring from turning in its groove. *CAUTION - Spring must be carefully installed so as not to expand it greater than the diameter of the gear teeth as spring will take a "set".*

REASSEMBLY: **1)** Install manual shaft seal. Place thrust washer (with tab facing out) on large gear end of countergear assembly, then place countergear and thrust washer in bottom of transmission case. Insert countershaft at rear of case and drive out Tool J-5777 with countergear shaft (notched end facing rear of case). *CAUTION - Hold Tool J-5777 against countergear while driving out to prevent displacement of needle bearings.*

2) If reverse idler gear was removed, coat needle thrust bearing and thrust washers with grease and position them on reverse idler gear in that order (needle bearing must be against end of gear having the chamfer). Coat bushings with transmission lubricant, then place reverse idler gear assembly in position in case so thrust bearing is toward rear of case.

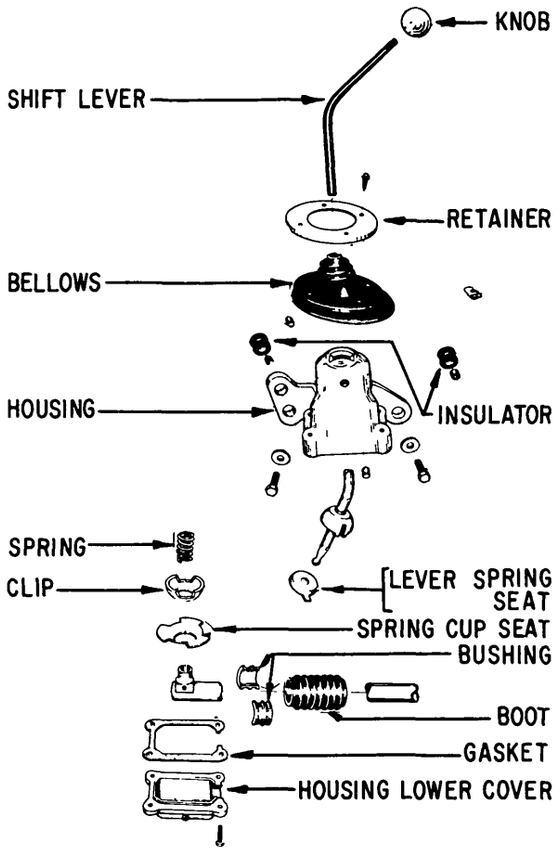
3) Install reverse idler shaft from rear, making sure lock pin hole in shaft lines up with hole in case and at the same angle. Use a new shaft lock pin and drive it in approximately 1/16" below surface of case. Lubricate manual shift shaft with oil, then insert through seal into case. Position actuating finger and secure to shaft with two lock tabs and capscrews. Tighten screws to 5-7 ft. lbs. and bend lock tabs onto heads of screws. Install detent spring and ball in detent cavity, tapping it into place to make sure spring is on bottom of cavity.

4) Start roll pin into first and reverse fork, then start first and reverse shaft (shorter than second and third shaft) through lower hole at front of case with three detents facing detent ball, and slip yoke on shaft. While depressing detent ball, press shaft over ball to center detent position. Secure fork to shaft with a roll pin.

5) Coat interlock with oil and install in detent cavity. *NOTE - Before installing second and third shift fork, mak sure first and revers shift fork is engaged with manual shift l v r shift finger.* Start roll pin into fork, then insert second and third fork shaft through front of case with three detents facing away from interlock, and slip fork onto shaft. Secure fork to shaft with a roll pin. Insert detent ball and spring for second and third shaft fork and install detent cover and gasket. Tighten cover to 25-35 ft. lbs. *NOTE - Check for fre movement of manual shift shaft in all positions after installing detent plug.*

6) Check synchronizer rings for freeness, then index second speed gear properly with synchronizer ring tangs and install in clutch sleeve. Place assembled clutch sleeve, first and reverse sliding, and second speed gear in case (with second speed gear at rear of case). *NOTE* - Make sure first and reverse sliding gear and shoulder on clutch sleeve are in proper forks.

7) Place mainshaft in clutch gear, then from front of case, insert mainshaft through bores of clutch sleeve and second speed gear. *CAUTION - Make sure that tangs of synchronizer ring are aligned with mainshaft splines before installing mainshaft and that clutch gear slots are properly aligned with larger tangs on synchronizer ring.*



8) Drive clutch bearing into place, then install thrust washer on mainshaft with its oil grooves toward second speed gear and install mainshaft bearing retainer ring. Install mainshaft bearing with ring groove toward case and, with retainer ring expanded, drive bearing onto mainshaft with Tool J-6133. Install a ½" deep socket in clutch gear and continue to drive mainshaft bearing until snap ring groove on mainshaft is accessible, then remove socket.

9) Install snap ring, then check endplay of mainshaft by inserting feeler gauge between snap ring and bearing inner race. Endplay should not exceed .004". If necessary, install a snap ring of proper thickness to bring endplay within limits. Selective snap rings are furnished in four sizes from .086" to .097". After checking endplay, drive mainshaft forward into case until snap ring contacts bearing inner race.

10) Check for free movement of manual shift shaft and be sure movement into each gear position is free, then install top cover and gasket. Tighten cover bolts to 3-4 ft. lbs. Install filler plug and tighten to 25-35 ft. lbs., then install extension assembly and tighten bolts to 35-40 ft. lbs.

GEARSHIFT LEVER ASSEMBLY: **Disassembly** - Remove housing lower cover, then remove "half bushings" and transmission control rod (use a wire to support control rod at front). Remove control lever ball and remove shift control assembly from torque tube. Mount shift control in a vise (lever downward), then depress spring cup and rotate spring cup seat to disengage it from housing. Remove spring cup seat, spring cup, and spring. Remove control lever and control lever spring seat.

Reassembly: Lightly coat all bearing surfaces with wheel bearing lubricant, then install control lever spring seat in control lever. *NOTE - Spring seat must be installed with tab on correct side so spring tension will position lever towards second and high position.* Install control lever in housing, then install spring and spring cup, lining up notches in cup with lever. Install spring cup seat with seat detent aligned to engage notch in housing. Depress spring cup and rotate spring cup seat until three seat extensions fully engage three housing shoulders. *CAUTION - S at must be fully engaged or control lever will not operate properly.* Install shift control assembly on torque tube, then install control rod and bushings. *NOTE - Plac wh l bearing lubricant into control rod socket before connecting control rod to control lever ball.* Install housing lower cover gasket and cover and tighten bolts to 40-60 inch pounds. Install gearshift lever knob.

1961 PONTIAC TEMPEST SYNCHRO-MESH TRANSMISSION GEARSHIFT ASSEMBLY

EXTENSION HOUSING: **Disass mbly** - Remove seal, then remove bearing retaining ring and install Tool J-8918. Use a slide hammer to remove front and rear bearings and spacer as an assembly. If rear retainer ring must be removed for any reason, extension housing must be separated from transmission.

Reassembly: Install rear bearing using a suitable socket that rides on outer race to drive it into position. Install spacer, then install front bearing in same manner as for rear bearing. Install retainer ring and a new seal.

AUTOMATIC TRANSMISSION

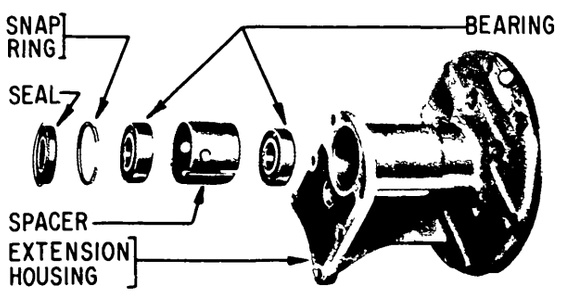
►*1961 TEMPEST AUTOMATIC TRANSMISSION SUN GEAR THRUST WASHER PRODUCTION CHANGE & SERVICE INSTALLATION CAUTION:* Transmissions having a Date Code of "2-03" or later (see "Transmission Date Code Identification Note" below) have a Torrington Needle Thrust Bearing replacing the earlier thrust washer in planet carrier assembly. In conjunction with this change, clutch flange, low sun gear as-

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinu d)

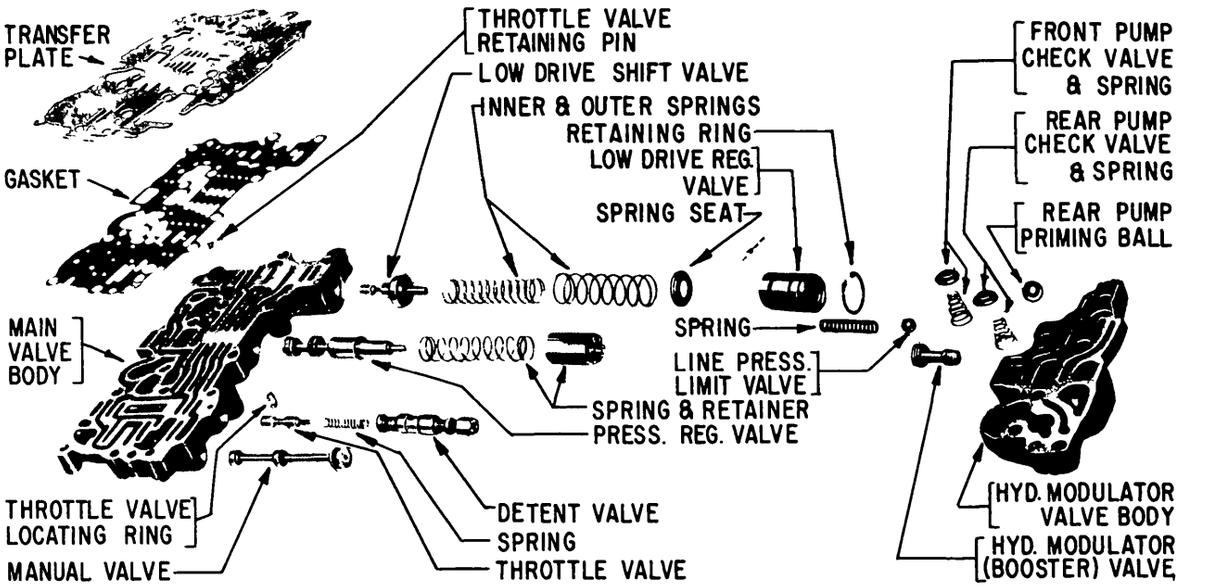
sembly, and turbine shaft assembly were also changed. On earlier transmissions (with bronze thrust washer), if any of the above components require replacement, it will be necessary to install Low Sun Gear Thrust Washer Repair Package, Part No. 539588 which includes a Planet Carrier Assembly (with later type needle thrust bearing), Turbine Shaft Assembly, and Low Sun Gear Flange Assembly. Transmission having the later type parts installed in production may be identified by a daub of blue paint on transmission case in area of date code stamp.

►*1961 TEMPEST AUTOMATIC TRANSMISSION FRONT PUMP BUSHING PRODUCTION CHANGE & FRONT PUMP DRIVE PLATE THRUST WASHER CHANGE:* A non-replaceable bushing is used in front pump between inside diameter of pump internal gear and body on later cars. Use Thrust Washer, Part No. 3796016 (.088-.092" thick) with later type unit. On earlier units, use Thrust Washer, Part No. 3784643 (.058-.062" thick).



►*1961 TEMPEST AUTOMATIC TRANSMISSION NOT SHIFTING TO HIGH RANGE (After Selector Lever M v d From Low to Driv):* If transmission will shift to high when lever is moved from Neutral to Drive, throttle valve retaining ring has broken or fallen out of valve body. To correct, install a reinforced retaining ring, Part No. 9416713.

►*1961 TEMPEST AUTOMATIC TRANSMISSION DATE CODE IDENTIFICATION: Date code is hand stamped on right hand sid of transmission case above oil pan flang . As an example, "B 2 03" would indicate manufacturing plant (B); month of February (2) third day of month (03).*



TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

EXTENSION HOUSING OIL SEAL REPLACEMENT: Remove torque tube and propeller shaft *(see "Pontiac T mpest Prop ll r Shaft & Torque Tube")*, then pry out old seal. Tap a new seal into position and install propeller shaft and torque tube.

EXTENSION HOUSING BEARINGS REPLACEMENT: Remove oil seal (see above), then remove bearing retainer ring with Truarc pliers. Insert Tool J-8918 into extension housing so that it picks up inner race of rear bearing. Install slide hammer on tool and tap out front bearing, spacer, and rear bearing as an assembly. To install, use a suitable socket (large enough to contact outer race of bearing) and tap rear bearing into position. Install spacer, then tap new front bearing into position. Install retainer ring, oil seal, torque tube and propeller shaft.

1961 PONTIAC TEMPEST EXTENSION HOUSING

1961 PONTIAC TEMPEST CONTROL VALVE ASSEMBLY

VACUUM MODULATOR: Removal - Remove vacuum hose at modulator, then unscrew modulator from transmission using channel lock pliers or a thin 1" wrench. Remove modulator valve from bore.

Inspection: Check valve for nicks and burrs. If light stoning will not eliminate nicks and burrs, replace modulator.

Installation: Install modulator valve in transmission bore, then place a new gasket on vacuum modulator and hold gasket centered with petroleum jelly. *CAUTION - Gasket must be held in a centered position during installation to prevent external oil leaks.* Install modulator and tighten securely, then install vacuum hose.

GOVERNOR: Removal - *NOTE - Governor is located on left side of transmission case and is accessible from below car.* Unscrew lock screw securing governor tab to case and pull governor from transmission.

Driven Gear Installation: *NOTE - This is the only replaceable part on governor.* To remove, drive out roll pin with a punch and pull out old gear. Drill a new hole in governor 90° from original hole, then insert driven gear and install roll pin.

Installation: Install new "0" ring on governor and install governor into transmission with a slight twist to engage gear teeth. Secure in place with lock bolt.

VALVE BODY & LOW SERVO: Removal - Drain transmission and remove oil filler pipe and oil pan, then remove transmission throttle rod from lever on transmission. Remove retainer screw, oil screen and "0" ring seal. Improvise a sheet metal strap to fit across corner of transmission case in area of low servo and secure loosely in position with an oil pan screw. Remove screws securing valve body to transmission case and tap body lightly with a soft hammer to loosen it from dowels in case. Carefully lower valve body about 1/16", then rotate improvised strap into position so it spans the servo piston hub and tighten strap retaining screw securely. *NOTE - This will eliminate possibility of piston slipping down out of its bore and the loss of low band engagement with its apply components.* Remove control valve body. If necessary to replace downshift valve, remove it from bore in case (adjacent to low servo piston). If low servo is to be removed, tighten low band adjusting screw fully, then remove retainer and pull downward on piston shaft with a screwdriver. *CAUTION - Do not remove low servo piston (with transmission in car) without fully tightening low band adjusting screw.* If front pump air bleed ball is to be replaced, remove retainer with needle nose pliers.

Disassembly, Inspection & Reassembly: *See "Valv Body" and "Low Servo" under "Overhaul" below.*

Installation: If downshift valve or front pump air bleed ball was removed, replace these parts and install retainer. Install low servo piston and return spring in bore and engage notch in piston shaft with low band apply strut, loosening low band adjusting screw slightly to permit piston ring to seat in case bore. Install retainer to hold piston in bore. Position new gasket on valve body, then position valve body on transmission case, indexing on dowels, and remove piston retainer. *CAUTION - Be sure manual valve indexes properly with pin on inner shaft lever.* Install valve body screws and tighten to 9-11 ft. lbs. Install oil pick-up screen and "0" ring in valve body and secure with screw. Position manual lever in full reverse position so it is held securely by wedging devise in transfer plate, then engage control cable and secure. Install oil pan

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (Continu d)

and new gasket and tighten attaching screws to 3-4 ft. lbs. Tighten filler tube attaching nut and refill transmission with fluid *(see "Draining & Refilling" above).*

OVERHAUL

(TRANSMISSION OUT OF CAR)

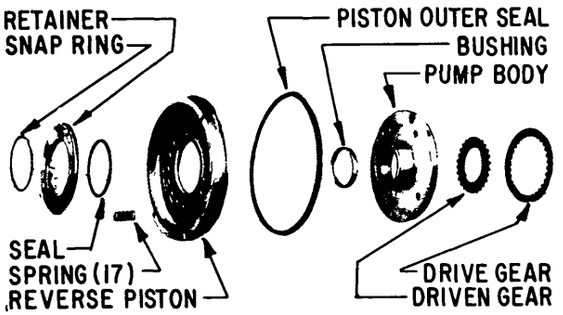
DISASSEMBLY

►*NOTE: Instructions below cover removal of sub-assemblies from transmission case. See "OVERHAUL OF UNITS" for disassembly, inspection and reassembly of these units.*

1) With transmission removed from differential carrier, remove modulator and modulator valve, then mount transmission in Holding Fixture, J-7896-01. Loosen low band adjusting screw locknut and fully tighten low band adjusting screw.

2) Remove extension housing attaching screws and tap housing off transmission with a soft hammer. Remove thrust washer and coupling and remove converter pump drive shaft. *NOTE - It is not necessary to remove drive key unless it is to be replaced.* Remove second thrust washer from pump body and remove pump gears. Stack gears so they may be reassembled with same face upward.

3) Remove pump body and gasket, then remove pump body-to-clutch drum thrust washer. Loosen low band adjusting screw and remove low band, apply strut and reaction strut. Remove clutch drum assembly. On early cars not having a needle bearing type sun gear thrust washer, remove thrust washer. *NOTE - Later cars have a Torrington Needle Thrust Bearing which cannot be removed from carrier assembly. See "Automatic Transmission Sun Gear Thrust Washer Production Change & Service Installation Caution" above.* Remove planet carrier assembly from ring gear, then remove ring gear from engagement with reverse clutch plates.



4) Remove clip mounted on thick reverse reaction plate between ends of reverse clutch plate snap ring and remove snap ring. Remove thick reaction plate, three drive plates (faced) and three reaction plates (steel).

5) Place transmission in a horizontal position and remove rear pump and reverse piston mounting bolts at rear of case, then remove rear pump and reverse piston assembly. Remove rear pump wear plate.

TRANSMISSION UNIT OVERHAUL

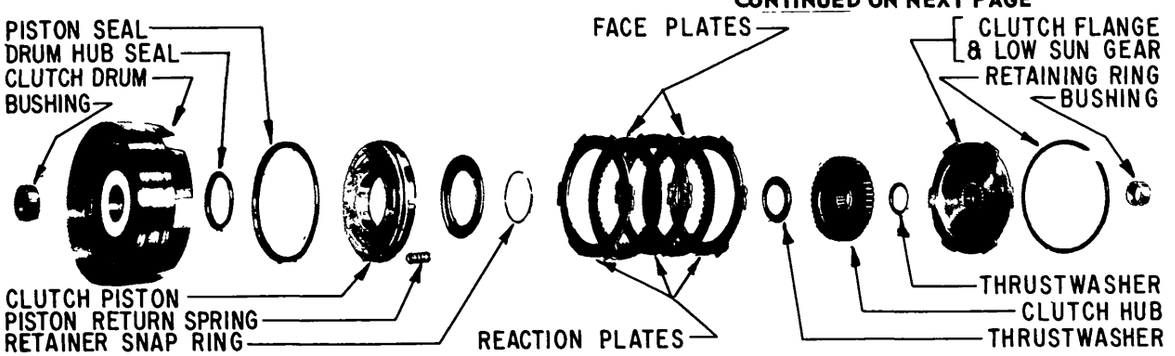
REAR PUMP & REVERSE PISTON: Disassembly - Remove drive and driven gears from pump body and stack so they may be reassembled with same face upward. Compress spring retainer with Tool J-6129, J-4670-C and J-8765. With spring retainer compressed until springs bottom, remove snap ring, then carefully release pressure and remove spring retainer and return springs. To remove reverse piston, fill snap ring groove in hub of rear pump body with string, a small rubber band, or a similar size "O" ring. Once groove is filled, rear pump body can be pushed out of reverse piston bore. Remove square cut piston inner seal and piston outer seal. *NOTE - Discard seals and install new seals at reassembly.*

Inspection: Wash all parts in solvent and blow dry with air, then check pump clearances which should be as follows: .0025-.005" between outer diameter of driven gear and body. .003-.009" between driven gear and crescent. .0005-.0015" between top of pump housing and top of both pump gears, measured with a straightedge and feeler gauge. Inspect pump body for leaks and scoring and hub of pump body for smoothness. Check for broken piston return spring and make a comparative check of spring heights by standing all springs in a row. If there is any appreciable difference in height, replace springs. If rear pump body bushing is scored or worn, replace.

1961 PONTIAC TEMPEST REAR PUMP & REVERSE PISTON

Reassembly: Install piston inner seal in reverse piston, then install piston outer seal in piston with lip of seal toward pump body (opposite from spring seats in piston). Install on pump body. *NOTE - It is not necessary to fill snap ring groove on pump body for installation of piston.* Position return springs in their seats on reverse piston, then place spring retainer on springs. Compress spring in same manner as for disassembly and install snap ring in groove in rear pump body. Complete assembly by installing drive and driven gears in pump body. *NOTE - Apply a small amount of petroleum jelly to gears to prevent their being dropped out.*

CLUTCH DRUM: Disassembly - Remove retainer ring securing low sun gear and clutch flange assembly to drum, then remove low sun gear clutch flange and hub-to-flange thrust washer. Lift out clutch hub, then remove nested drive and reaction plates and hub thrust washer. To remove spring retainer, compress springs in same manner as for reverse piston (above), then remove snap ring and carefully release pressure. Remove retainer and return springs. To remove clutch piston, pull upward with a twisting motion on center, and remove piston seal. Remove piston inner seal from hub of clutch drum.



Inspection: Wash all parts in solvent and blow dry with air. *CAUTION - Do not use rags to dry parts.* Inspect brake drum band surface for scoring or burning and check drum bushing for scoring or excessive wear. Check steel ball in clutch drum that acts as a relief valve. Be sure that it is free to move in hole and that orifice leading to front of drum is open. *NOTE - If relief ball is loose enough to fall out or not loose enough to rattle, replace clutch drum as an assembly. DO NOT attempt to replace or restake ball.* Check fit of clutch flange in drum slots. There should be no appreciable play between these two parts. Check low sun gear for nicks or burrs and bushing for wear. Check clutch plates for burring, pitting or metal pick-up. Check to see that plates (faced) are a free fit over clutch hub and that steel plates are a free fit in clutch flange. Check for excessive wear on friction facing or drive plate teeth. Check condition of clutch hub splines and mating splines on faced plates.

Clutch Drum Bushing Replacement: Remove old bushing with chisel, Tool J-8400-1 being careful not to damage bushing bore. Install new bushing with Tool J-9211.

Low Sun Gear Bushing Replacement: Remove old bushing with a chisel or other suitable tool being careful not to damage bushing bore. Install new bushing with Tool J-8360-3.

Reassembly: Install piston inner seal in hub of clutch drum. *NOTE - Make sure seal lips are downward or toward front of transmission.* Install new piston seal in clutch piston (seal lips toward clutch drum when installed). Lubricate both seals, then install clutch piston in clutch drum with a twisting motion. Place 15 return springs in position on clutch piston, then place spring retainer on springs. Compress springs with same tools used at disassembly (see above), then install snap ring in groove on clutch drum with Truarc pliers. Install hub front thrust washer with its lip toward clutch drum, then install clutch hub. Install steel reaction plate, faced drive plate, two steel plates, faced plate, then steel plate. Install hub rear thrust washer with its flange toward sun gear, then low sun gear and clutch flange assembly and secure in place with retainer ring. *NOTE - Finally installed, openings of retainer ring should be adjacent to one of the lands*

CONTINUED ON NEXT PAGE

1961 PONTIAC TEMPEST CLUTCH DRUM ASSEMBLY

PONTIAC TEMPEST TRANSAXLE (Continued)

of clutch drum. Check assembly by turning clutch hub to be sure it is free to rotate.

FRONT PUMP & EXTENSION HOUSING: Disassembly - *NOTE - Front pump body was removed from extension housing when transmission case was disassembled.* Pry seal out of extension housing and remove bearing retainer ring with Truarc pliers. Invert extension housing and drive out front bearing, spacer, and rear bearing using a suitable socket as a driver.

Insp ction: Wash all parts in solvent and blow dry with air. *CAUTION - Do not use rags to dry parts.* Inspect pump gears for nicks or damage. Inspect pump cover (face of extension housing) and pump body for nicks or scoring. Check oil control rings on pump body. Check condition of bushing in front pump body. On early cars, if bushing is damaged, replace bushing. On later cars, a non-replaceable bushing is used. *See "Tempest Automatic Transmission Front Pump Bushing Production Change & Front Pump Drive Plate Thrust Washer Change" above.* Install pump gears and check following clearances: Between outer diameter of driven gear and the body (should be .0025-.005"); between the driven gear and crescent (should be .003-.009"). Use a scale and a feeler gauge and check gear end clearance which should be .0005-.0015". Inspect front and rear extension housing bearings for damage.

Front Pump B dy Bushing Replacement (Early Cars): *See "Tempest Automatic Transmission Front Pump Bushing Production Change & Front Pump Drive Plate Thrust Washer Change" above.* Press out old bushing with Tool J-8885 and an arbor press. Install new bushing with Tool J-8884 and an arbor press.

Reassembly: Install rear bearing in extension housing using a suitable socket as an installer (do not drive on inner race), then install spacer and front bearing. Install retainer ring with Truarc pliers. Use a soft hammer and drive in new oil seal. Install a new square cut oil ring on outer diameter of oil pump cover (extension housing). *NOTE - Further assembly will be completed when transmission is reassembled.*

PLANET CARRIER: Service by replacing as a complete unit.

TURBINE SHAFT: Insp cti n - Check shaft for nicks and cracks and check splined area for wear. Check to make sure that the two lubrication holes are open. Inspect bushing, and if necessary, replace.

Bushing Replacem nt: *NOTE - Both shaft bushings are identical, however, the rear bushing is installed deeper than the front.* To remove old bushing, cut out with chisel, Tool J-8400-1 being careful not to damage bore. Install new bushings with Tool J-8886-1 (front), J-8886-2 (rear).

PUMP SHAFT: Insp cti n - Inspect splines for wear or damage and drive lugs for wear or peened edges.

CONVERTER: *NOTE* - Internal repairs cannot be made. If seams are cracked or broken, either weld or replace unit. Check converter hub bushing for wear or damage.

C nvert r Bushing Replac ment: Chisel out old bushing with Tool J-8400-1. Install bushing with Tool J-9229 and arbor press.

REASSEMBLY

1) With transmission installed in holding fixture, install two guide pins, Tool No. 3387-2 in rear pump bolt holes, then install rear pump wear plate on pins, using a small amount of petroleum jelly to hold plate in position. Insert rear pump and reverse piston with guide pins into case, then insert a length (½" to ¾" wide) of .010-.015" thick shim stock between piston outer seal and case. With rear of case downward, running the shim stock around entire diameter of seal will seat seal quickly. Remove guide pins and install rear pump mounting bolts and tighten to 9-11 ft. lbs.

2) Install reverse clutch drive and reaction plates alternately starting with a reaction plate (steel) and finishing with a drive plate (faced). *NOTE - Notched lug in each steel reaction plate is installed so it is at TOP of the groove at the "4 o'clock" position in case.* Then install thick reaction plate retainer ring in such a manner so that open ends of ring are at the "12 o'clock" position. Install retainer ring clip on thick reaction plate between ends of snap ring.

3) With rear of transmission case downward, align internal lands and grooves of reverse face plates. Engage ring gear to reverse drive plates. *NOTE - Engagement must be made by "feel" while jiggling drive plates laterally.*

4) Install planetary unit with a slight twist to engage planet gears with ring gear. Be sure to engage the two rear pump drive lugs on planet hub with grooves in rear pump drive gear.

5) On early transmissions without later type needle thrust bearing in planet carrier assembly *(See "Tempest Automatic Transmission Sun Gear Thrust Washer Production Change & Service Installation Caution" above),* install thrust washer on captive input sun gear in planetary gear set with flange of thrust washer toward front of transmission. *NOTE - If necessary, use a small amount of petroleum jelly to keep thrust washer centered.* Install clutch drum assembly, using a slight twist to engage low sun gear to planetary gears.

6) Turn transmission to a horizontal position, then install low band, apply strut and reaction strut. When low band linkage is completely installed, tighten low band adjusting screw to prevent struts from falling out of place. Shake clutch drum slightly to center band and linkage. Replace original thrust washer (selective) or a new washer of same size if original is damaged. *NOTE - Final endplay adjustment will be made later in reassembly.*

7) Install front pump body and gasket, being careful not to damage cast iron oil rings on pump body hub when they are indexed to clutch drum. Install inner and outer pump gears with drive notches on inner gear facing up, and outer gear with same face upward as removed. Install thrust washer in pump body. *CAUTION - Make sure correct thrust washer is installed. See "Tempest Automatic Transmission Front Pump Bushing Production Change & Front Pump Drive Plate Thrust Washer Change" above.*

8) Install converter pump drive shaft, being careful when inserting shaft not to damage bushing of transmission components already installed. Position coupling on end of pump drive shaft, then position coupling thrust washer in extension housing (light press fit).

9) Install a new square cut seal ring in extension housing, then position extension housing on transmission case. Dip mounting bolt heads in sealing compound and install mounting bolts loosely. Tighten outer bolts in a criss-cross pattern to 15-20 ft. lbs., then tighten five inner bolts to same torque. Check pump for freeness.

10) Adjust low band by first tightening adjusting screw to 40±5 inch pounds, **then back off four full turns exactly.** Hold adjusting screw and tighten locknut. To install governor assembly, vacuum modulator, control valve, servo, pick-up pipe, screen and oil pan, *see "Transmission Unit Removal & Installation - Transmission in Car" above.*

DIFFERENTIAL CARRIER

►*FRONT PINION BEARING ADJUSTING NUT SEAL INSTALLATION CAUTION:* Tool J-8340-01 must be used when installing seal to properly position it in nut. If seal is installed too deep it will strike end of bearing rollers.

►*DIFFERENTIAL CARRIER COMPONENT SERVICING NOTE: The following differential carrier components can be removed with the carrier in its installed position in car.*

AXLE SHAFT: Removal & Installation - *See "Removal & Installation" above.*

Axle Shaft Bearing Replacement: Place axle shaft in a press with Tool J-9816-1 puller plate **below** the puller ring, then remove oil deflector, bearing and puller ring. To install a new bearing assembly, place a new puller ring, bearing assembly and oil deflector on axle shaft. *NOTE - To prevent damaging bearing assembly during installation, place the old puller ring with flat side against bearing inner race.* Press new puller ring and bearing assembly onto axle shaft using Tool J-8916-2 and an arbor press. Remove old puller ring and install oil deflector with closed side of deflector toward bearing.

SIDE BEARING ADJUSTING SLEEVE OIL SEAL REPLACEMENT: With axle shaft pulled outward far enough to remove universal joint from differential carrier, pry side bearing oil seals out with a screwdriver. Apply a bead of sealing compound to new seal, then install seal with Tool J-8889. Coat lip of seal with hypoid lubricant, then install axle shaft.

OVERHAUL

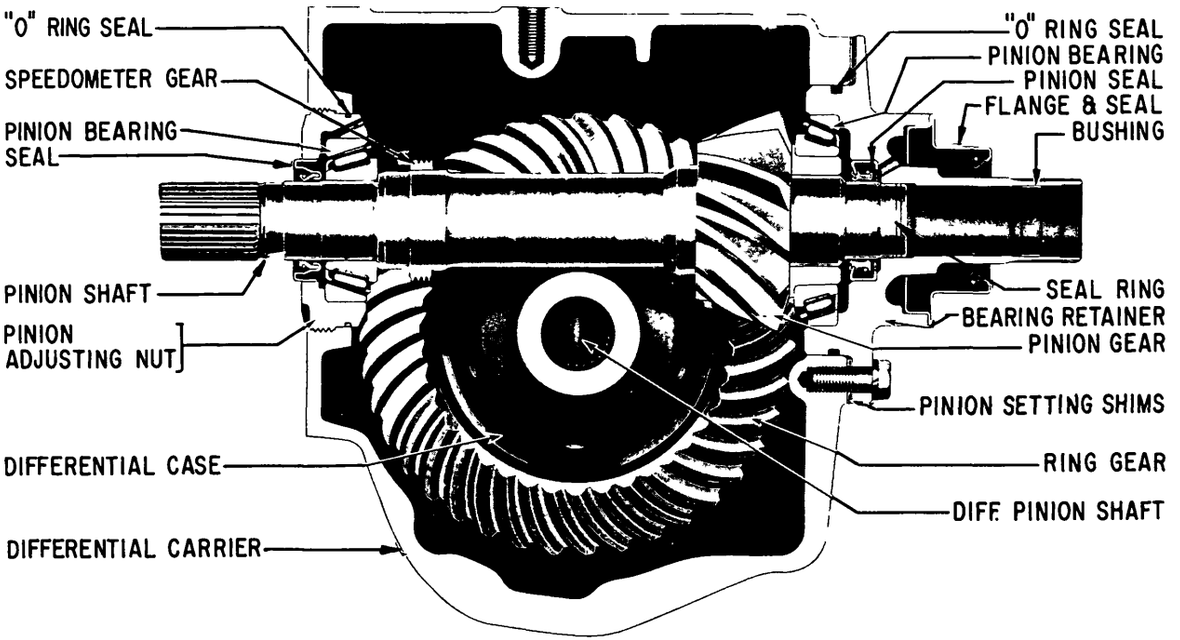
DIFFERENTIAL CARRIER: Disassembly - With differential carrier assembly separated from transmission, drain lubricant from carrier housing, then mount differential carrier in Fixture J-7896-01. On automatic transmission cars, pull governor drive gear and spacers from pinion shaft. On all models, pry differential side bearing oil seals from side cover and housing, then remove differential carrier side cover (bearing retainer) from carrier. *CAUTION - Differential case and ring gear assembly are held in position by side cover and will be free when side cover removed.* Remove differential case and ring gear assembly, then remove pinion rear bearing retainer and shim pack. On automatic transmission cars, remove rubber oil passage sleeve. *NOTE - If necessary, rear bearing retainer can be tapped out from front of case.* Remove front pinion bearing adjusting locknut, then remove adjusting nut with Tool J-8890. Remove pinion and shaft assembly from carrier. Remove left hand side bearing adjusting

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (Continued)

nut and lockscrew, then remove side bearing race from carrier. *NOTE - If necessary, adjusting nut can be screwed in until race is pushed from carrier.* Remove adjusting screw, lockscrew, bearing race and "O" ring seal from side cover.

DIFFERENTIAL CASE & RING GEAR: Disassembly - *NOTE* - If side bearing or differential case is to be replaced, remove bearings with Tools J-8900 and J-8614. Place differential case in soft jawed vise and remove ring gear attaching bolts, then install two ring gear attaching bolts partially into ring gear and tap ring gear off differential case. Separate cover from differential case (noting the scribed mark across parting line of case and cover). Remove side gear and thrust washer from cover half, then drive out roll pin retaining cross shaft in case and drive out cross shaft. Remove pinions, thrust washers, and side gear from case.



Inspection: Clean all parts in solvent, then inspect all castings for cracks or other damage. Inspect bearings for loose rollers, flaked or pitted rollers, and locking of bearings. Inspect gears for nicks and scoring. Replace all excessively worn or damaged parts.

Reassembly: Install side gear and thrust washer in case, then install two pinion gears and thrust washers in case. Drive cross shaft into case, being sure to align holes for pin, then install roll pin through cross shaft. Install side gear and thrust washer in cover, then install cover on differential case being sure to align scribe marks across parting line. Position ring gear on differential case and install ring gear attaching bolts. Tighten bolts to 55-65 ft. lbs. Press side bearings on differential case and cover using Tools J-8901, J-8092 and an arbor press.

PINION GEAR & SHAFT: Disassembly - On automatic transmission cars, remove oil ring from pinion shaft, On all cars, press off front pinion bearing using Tool J-8891 in Holder Tool J-6407, and Handle, J-8092. *CAUTION - Be sure speedometer drive gear is clear of yoke of press.* Press off speedometer gear with same tools used to press off bearings. Press off rear pinion bearing using Tool J-8893 in Holder, Tool J-6407. *NOTE - When pressing off rear pinion bearing, place Tool J-8901 (Synchro-mesh Trans.); J-8901 and J-8980 (Automatic Trans.) on end of pinion shaft and press against tool with arbor press. This will prevent damage to end of shaft with arbor press.*

Reassembly: Press on rear pinion bearing using Tool J-8894 and J-8092, then press on speedometer drive gear with Tools J-8980, J-8892 and J-6407. *NOTE - On Automatic transmission cars, use Tool J-8887 installed on end of pinion shaft in addition to the above tools.* Press on front pinion bearing with Tools J-8892, J-6407 and J-8092. On Automatic transmission cars, install oil ring on shaft.

REAR PINION BEARING RETAINER (SYNCHRO-MESH TRANS.): Disassembly - Remove "O" ring seal from retainer, then remove rear pinion bearing outer race with Tool J-8855 and Tool J-8855-4.

1961 PONTIAC TEMPEST DIFFERENTIAL CARRIER

Reassembly: Install rear pinion bearing outer race with Tool J-8898 and Tool J-8092, then install a new "O" ring seal.

REAR PINION BEARING RETAINER (Automatic Trans.): Disassembly - Remove "O" ring seal from retainer, then secure retainer in a soft jawed vise being careful not to damage splined shaft. *CAUTION - Clamp vise on outer diameter of retainer or on flange that supports stator oil seal. Do not clamp on splined stem that supports turbine.* Remove rear oil seal using a small chisel or other suitable tool, then remove bearing outer race with Tools J-8855 and J-8855-4. Pry off rear flange and stator oil seal with a screwdriver. Remove stator shaft bushing using Tool J-8400-1 or a suitable chisel.

Reassembly: Install new bushing with Tool J-8888 and Tool J-7079, then apply a uniform bead of sealing compound and install new rear flange and oil seal with Tool J-8899. Install new inner seal with Tool J-7137 and Tool J-8092 (lip of seal toward pinion gear). Install pinion bearing race with Tool J-8898 and Tool J-8092, then install new "O" ring seal on bearing retainer.

FRONT PINION BEARING ADJUSTING NUT: Disassembly - On automatic transmission cars remove "O" ring seal from nut and remove oil seal by tapping out from rear of nut. To remove bearing race, place nut in a soft jawed vise and drive race out of nut with a drift. On Standard transmission cars support nut on Tool J-7576, then press race out with Tool J-8897 and Tool J-8092.

Reassembly: On all models, install front bearing race in nut with Tool J-7137 and Tool J-8092. On automatic transmission cars, apply a uniform bead of sealing compound and install front oil seal with Tool J-8340-01, then install new "O" ring seal.

PINION DEPTH SETTING: *NOTE - If rear bearing race is to be replaced, install in rear bearing retainer before checking pinion depth setting.* Place rear pinion bearing in rear bearing retainer, then install Tool J-8919 over bearing. Measure distance between rear bearing retainer flange & lower side of Tool J-8919 with a feeler gauge, then refer to "Shim Chart" for correct thickness of shims required between differential carrier & rear bearing retainer flange. *NOTE* - If pinion shaft is marked with a "plus" (+) or "minus" (—) sign and a single digit (1 through 4), refer to "Pinion Correction Chart" for adjustments to be made to shim pack thickness. As an example: If feeler gauge thickness was .029" and carrier assembly was marked "—3" *(see "Differential Carrier Marking Note" below for location of marks on carrier)*, reference to the table would indicate that a shim pack .021" thick would be required (with an unmarked pinion shaft). If pinion shaft is marked "—3" (for example), reference to "Pinion Correction Chart" would indicate that shim must be increased .003". As a result, total shim pack required between differential carrier and rear bearing retainer would be .024" (.021" plus .003").

►*DIFFERENTIAL CARRIER MARKING NOTE:* Carrier housing is marked with a "plus" or "minus" sign and a single digit (1 through 3) on machined surface of cover side of carrier housing for use in adjusting pinion depth.

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST TRANSAXLE (C ntinu d)

PINION CORRECTION CHART

Pini n Mark	Shim Pack Correction
–4	Add .004"
–3	Add .003"
–2	Add .002"
–1	Add .001"
No Mark	No Change
+1	Subtract .001"
+2	Subtract .002"
+3	Subtract .003"
+4	Subtract .004"

DIFFERENTIAL CARRIER: Reassembly - Install side bearing races in carrier and in side cover, then install adjusting nuts. *NOTE - Do not exceed four turns of adjusting nut in carrier housing.* Position ring gear and differential assembly in carrier, then place side cover, without oil seal, on case and retain with four bolts. *NOTE - Be sur the two aligning bolts are installd in correct hols.* Tighten adjusting nut in cover finger tight, then install Tool J-8903 in end of differential case splined bore through side cover. Adjust side bearing preload to 10-20 inch pounds by turning adjusting nut with Tool J-8902. Check preload with a torque wrench installed on end of Tool J-8903. When preload is correct, install adjusting nut lock screws and washers in side cover, then remove side cover from differential carrier. Remove differential case and ring gear assembly. Install original shim pack (or shim pack thickness determined when pinion depth setting checked) on rear bearing retainer. On automatic transmission cars, install a new rubber oil passage seal. On all models install a new "0" ring seal on bearing retainer, then install retainer on carrier and tighten bolts to 20-35 ft. lbs. Invert carrier and position pinion shaft assembly in carrier, being careful not to damage oil ring on shaft or seal on automatic transmission models. Install pinion adjusting nut assembly (and "0" ring seal on automatic transmission models), then tighten adjusting nut until all play in pinion shaft is eliminated, using Tool J-8890. Install Tool J-8362 inside pinion shaft and tighten nut on tool (used to rotate pinion shaft). Adjust pinion bearing preload to 10-16 inch pounds by turning adjusting nut. Position ring gear and differential assembly in carrier, then install cover, without "0" ring seal, and retain with four bolts. Remove side bearing adjusting screw locknuts and install Tool J-8903 in end of differential case splined bore through side cover. Set up a dial indicator (J-8001) on support, Tool J-3387-3 and secure in cover bolt hole so that indicator button contacts handle of Tool J-8903 squarely on line scribed on handle of tool. Insert a large screwdriver in opposite differential case splined bore to rotate differential assembly, then adjust ring gear backlash to .004-.009" by loosening one adjusting nut and tightening the other one notch at a time. Move ring toward pinion to decrease backlash and away from pinion to increase backlash. *CAUTION - Do not rotate pinion while checking backlash.* Remove dial indicator and support. Install side bearing adjusting nut lockscrews and tighten to 10-20 inch pounds. *NOTE - At this point check ring gear and pinion tooth contact pattern with red lead and make necessary adjustments to obtain correct pattern.* Remove side cover and install a new "0" ring seal, then install cover and tighten attaching bolts to 10-20 inch pounds. Apply a bead of sealing compound and install new differential side bearing oil seals with Tool J-8889. Install drain and filler plug. On automatic transmission models, install governor drive gear and spacers.

PINION SHIM CHART

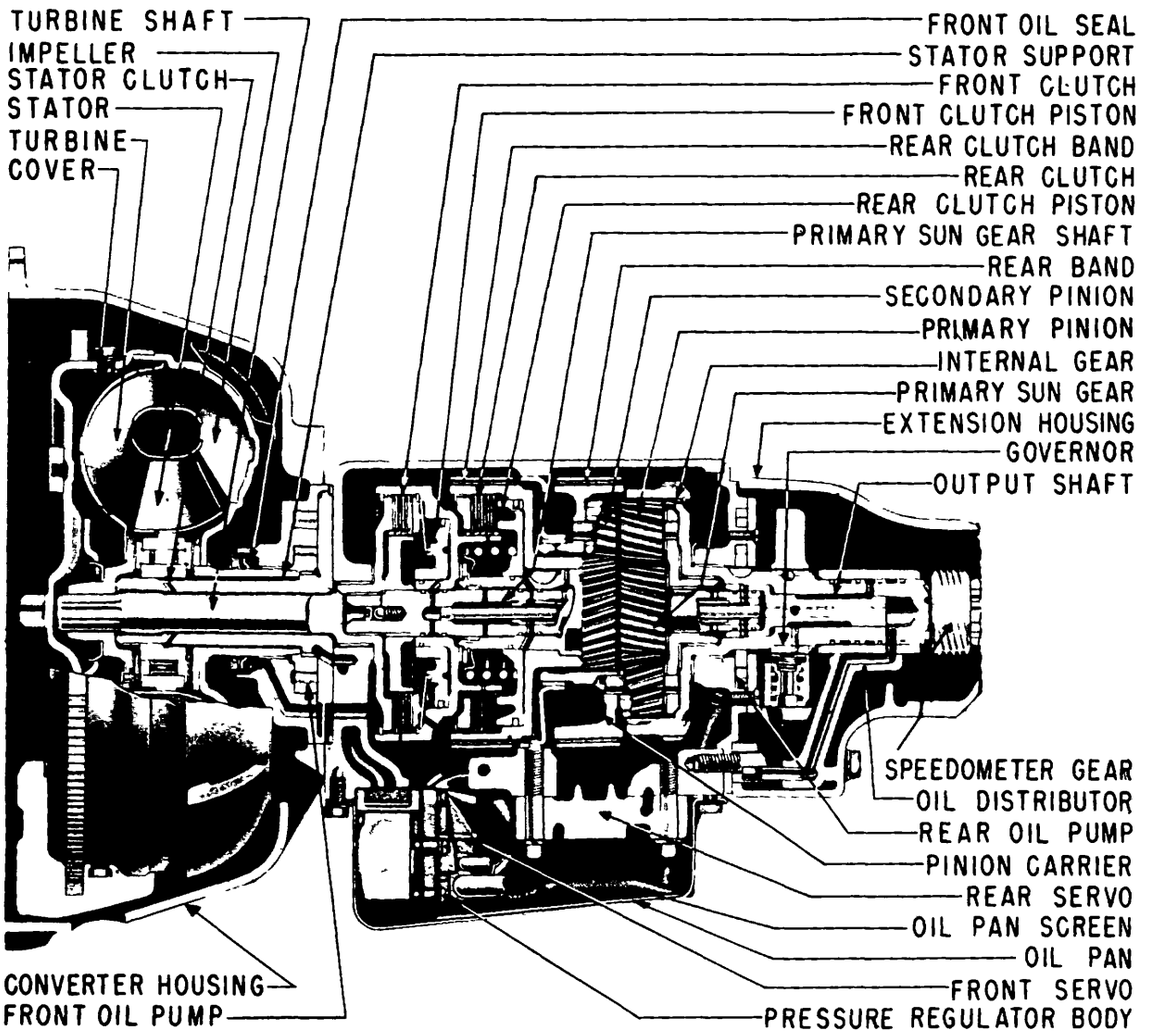
RAMBLER & CHECKER SUPERBA AUTOMATIC TRANSMISSION

DRIV-ER-MATIC & DUAL-RANGE
Checker Superba (1961)
FLASH-O-MATIC
Rambler American 6101 Series (1961)
Rambler 6110, 6120, 6180 Series (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING THE ENGINE BY PUSHING CAR: NOTE -* Pushing rather than towing is recommended (to avoid possibility of car ramming towing vehicle). Place selector lever in Neutral "N" position. When speed of 15-20 MPH is reached, turn ignition "on" and move selector lever to "D-1" or "D-2" position.

►*TOWING THE CAR:* If transmission inoperative, always tow car with rear wheels raised or with propeller shaft disconnected. If transmission operating properly car can be towed for **short distance** with selector lever in Neutral "N". Prolonged towing may cause damage to transmission.



►*1961 RAMBLER AMERICAN ("L" HEAD ENGINE) AUTOMATIC TRANSMISSION VACUUM & OIL PRESSURE SPECIFICATION CHANGE:* The new specification is 110 lbs.±3 lbs. at 10.5" of vacuum (same as for Rambler American models with OHV. Engine). This new specification supersedes previous specification of 85 lbs. ±3 lbs. at 8.6" vacuum. *See "CONTROL UNIT ADJUSTMENT" below.*

►*1961 RAMBLER AMERICAN ("L" HEAD ENGINE) AUTOMATIC TRANSMISSION "HUNTING" BETWEEN SECOND & THIRD SPEED GEARS:* This condition occurs under normal throttle pressure between 30 and 50 MPH and can be corrected by adjusting vacuum and oil pressures to later specifications (see "Specification Change" above). If "hunting" continues to exist with vacuum and pressure at specified limits, reduce pressure 5 to 10 lbs. by resetting vacuum and solenoid unit approximately ½ turn out from case. *CAUTION- Do not exceed 1 full turn from specified setting.* If the above changes do not correct the condition, replace throttle valve spring between throttle valve and kickdown valve with Part No. 3151124, then readjust oil pressure to 110 lbs. ±3 lbs. at 10.5" of vacuum.

DESCRIPTION

RAMBLER

Flash-O-Matic transmission consists of a hydraulic torque converter and a hydraulically controlled automatic 3-speed planetary transmission which provides automatic operation in "D1" & "D2" ranges. Additional "L" (Low), "R" (Reverse), and "P" (Park) ranges are controlled manually. In "D1" range, the car starts in low and upshifts to intermediate and then to direct. In "D2", the car starts in intermediate, then shifts to direct. Downshifts follow the same pattern (in reverse) in relation to car speed and throttle position. On Series 10, 20, & 80, throttle valve pressure is controlled by a vacuum and solenoid unit located at left rear of transmission. This unit operated by a vacuum line from intake manifold. A forced downshift (kickdown) from direct to intermediate can be made by fully depressing the accelerator pedal. On Rambler American, a transmission range selector lever located on steering column and connected to transmission manual lever by linkage positions manual valve in transmission. A neutral safety switch, operated by shift levers at lower end of steering column permits starting engine when selector lever is in either "P" (Park) or "N" (Neutral) position. On other series, a push button transmission range selector control located at left of instrument panel consists of five buttons operating a cable connected to manual lever on transmission. A "Park" lever mounted directly below push buttons operates amechanical parking pawl which engages external teeth on rear internal gear. When "Park" lever is pushed in, all buttons except "N" (Neutral) are locked and cannot be operated. With either of the forward or reverse buttons pushed in, "Park" lever is locked and cannot be operated. A back-up light switch operated by the "R" (Reverse) button and a starter switch, operated by the "N" (Neutral) button, are also located on the push button gear selector control assembly. Planetary transmissions on all models are similar except for the pinion carrier assembly used in transmissions on Series 10, 20 & 80. The pinion carrier assembly on these models incorporates a sprag type free wheel clutch that performs the function of rear band while in "D-1" range. A transmission oil cooler is incorporated in lower tank of radiator on Rambler Series 20 & 80, and Checker Superba.

FLASH-O-MATIC TRANSMISSION SECTIONAL VIEW

CHECKER SUPERBA

Design of the "Driv-er-matic" & "Dual-Range" automatic transmissions used on these models is the same

CONTINUED ON NEXT PAGE

RAMBLER & CHECKER SUPERBA AUTOMATIC TRANSMISSION (Cont.)

as used on Rambler American (see above), except that the "Driv-er-matic" transmission is a single range type and does not have a "P" (Park) position.

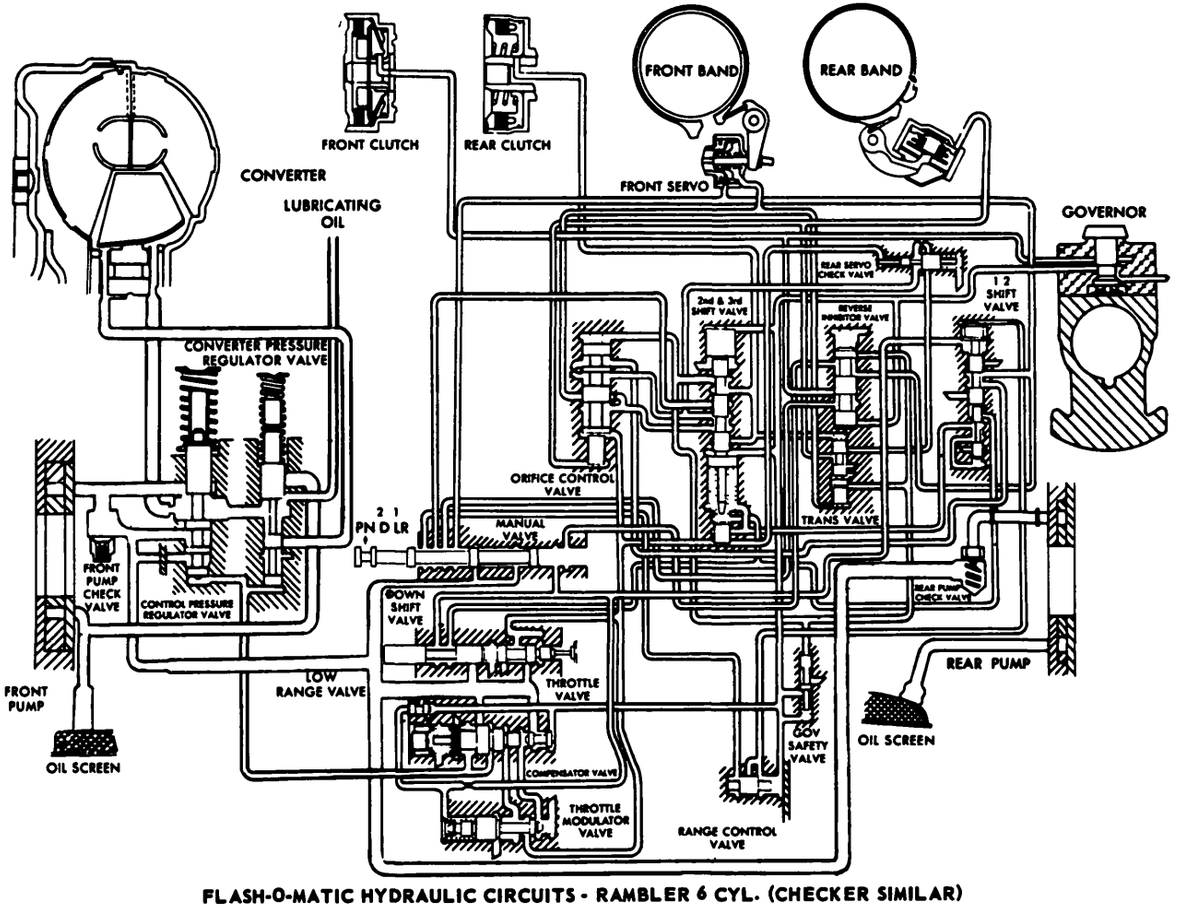
LUBRICATION

►*CAUTION: Ch ck fluid at 1000 mile intervals. Drain and r fill at 15,000 mil intervals, using Automatic Transmissi n Fluid Typ "A" (Suffix "A"). The dipstick is l cat d on right rear of engine under hood.*

Capacity - (Drain & R fill) Approximately 8½ qts. (Rambler), 10 qts. (Checker Superba).

►*NOTE: Aft r ov rhaul, 10 qts. (Rambler, except Series 80), 11 qts. (Rambl r Series 80), will be required to fill transmission.*

Ch cking Fluid L v l - With engine and transmission at normal operating temperature and running at idle speed, operate transmission through all ranges. Place transmission in "N" (Neutral), then check fluid level on dipstick and add fluid as required to bring level to "F" (Full) mark. *NOTE - Approximately 1½ pints of fluid are r quired to rais fluid level from "L" to "F" mark.*



Draining & R filling - With transmission at normal operating temperature, rotate converter until one of the drain plugs is visible through square opening in converter bell housing. Remove plug and then turn converter 180° and remove second drain plug. Remove drain plug at rear of transmission oil pan. After draining, replace the drain plugs and tighten converter plugs to 7-10 ft. lbs. Install 5 qts. (Exc. Rambler Series 80), 6 qts. (Rambler Series 80), of Automatic Transmission Fluid Type "A" (Suffix "A"). Set hand brake and run engine with transmission selector lever in "N" position. Add 3½ qts. (Rambler Models), 4 qts. (Checker Superba) of fluid and move selector lever through all ranges. Check oil level, and if necessary, add sufficient fluid to bring level to "F" mark on dipstick. *CAUTION - D n t ov rfill transmission as this will cause foaming when transmission is warm.*

LINKAGE ADJUSTMENT

RAMBLER AMERICAN

Manual Linkage Adjustment (Rambler American): Disconnect gearshift rod at transmission lever and place transmission lever in third detent from top (D-1 position). Place gearshift selector lever (on steering column) in "D-1" position. *NOTE - Make sure selector operating shaft lev r at lower end of steering column strik s against stop gate located on bearing housing.* Adjust trunnion on gearshift rod to enter hole in lever on transmission freely, then remove trunnion from lever and l ngthen n turn. Install trunnion in hole and install washer and cotter pin. If selector lever pointer does not line up with "1" on gear selector dial, use an Allen wrench and adjust pointer as necessary. Check lever pointer in all positions.

N utral Saf ty Switch Adjustm nt: Place selector lever in "N" (Neutral) and set parking brake. Loosen nuts on operating lever-to-switch rod (at lower end of steering column) and adjust switch contact arm to a point where switch contact is made when ignition switch is turned to start position. Engine should start. Locate selector lever in "D-2" position. Engine should not start. Tighten adjusting nuts.

FLASH-O-MATIC HYDRAULIC CIRCUITS - RAMBLER 6 CYL. (CHECKER SIMILAR)

CHECKER SUPERBA

Manual Linkage Adjustment: Disconnect manual shift rod from selector lever on steering column and from lever on transmission. Position transmission selector lever so indicator is down against stop in "D" (Drive) position. Place transmission manual lever in the "D" (Drive) detent (second from top of transmission), then adjust length of manual shift rod so it fits into ball joint on steering column and into shift lever on transmission without changing position of selector lever or transmission shift lever. Tighten ball joint nut at steering column and install washer and cotter pin at transmission lever. Move selector lever through all positions and check operation.

Neutral Saf ty Switch Adjustm nt: Starter circuit must be open in all positions except "N" (Neutral). To adjust, loosen neutral switch-to-steering column screws and position switch so starter circuit is closed when selector lever is at "N" (Neutral).

Kickd wn Switch Adjustment: Loosen the two nuts on kickdown switch (one above and the other below toeboard) and rotate the upper nut to obtain a clearance of ¼" between switch and accelerator pedal when carburetor throttle valves are in a wide open position.

PUSHBUTTON CONTROL
RAMBLER SERIES 10, 20 & 80

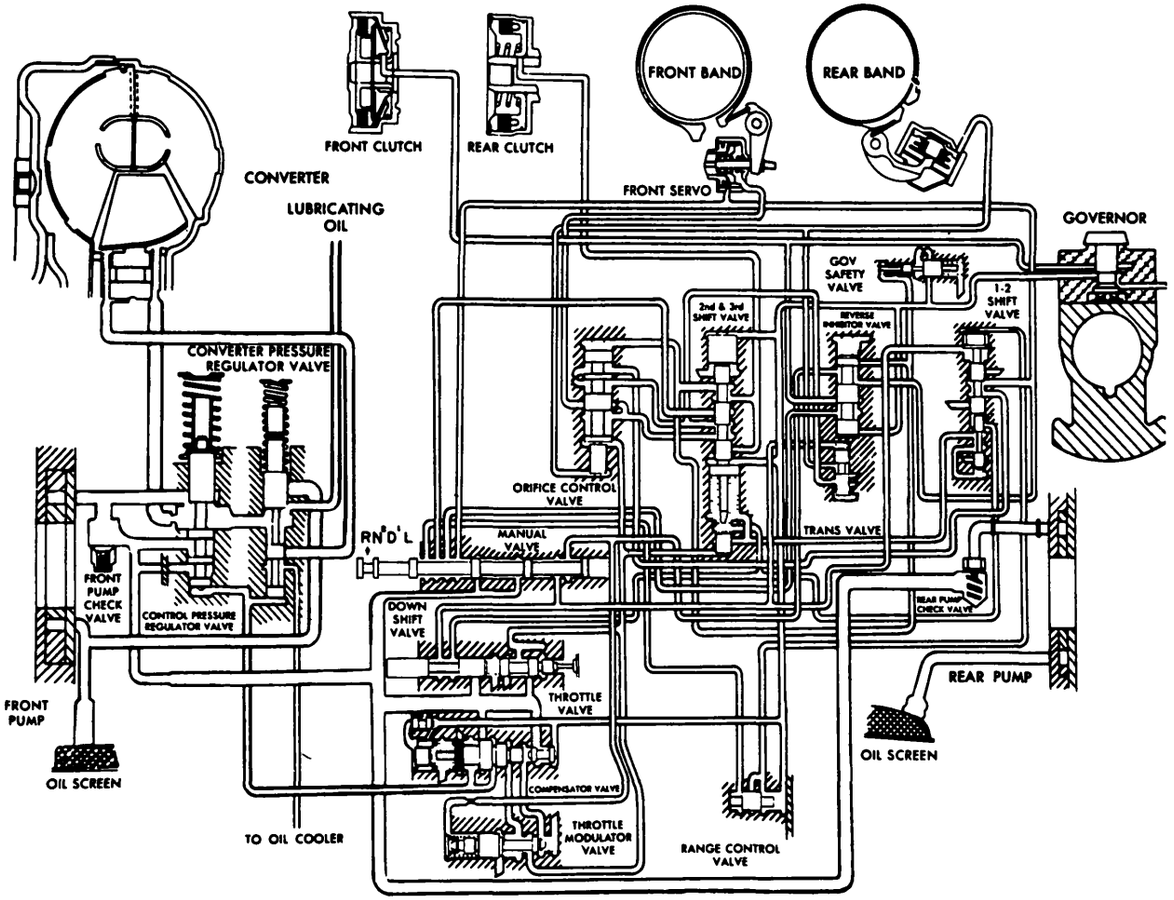
Gear Selector Pushbutton Control Adjustment: Disconnect cable at transmission lever, then push "L" (Low) button in and move selector lever on transmission all the way to rear. Adjust cable linkage at clevis to align holes in clevis and lever. Install clevis pin and washer and tighten clevis securely. Check adjustment in all five positions.

Parking Lever Adjustment: Pull "Park" lever handle out and disconnect cable at transmission (transmission outer lever will be in its off position and inner lever will lay against toggle lever pin). Adjust clevis on cable to index perfectly with hole in lever. Install clevis, pin and washer and tighten.

Gear S lector Ass mbly Removal: Disconnect battery, then disconnect back-up light wire at connector and

CONTINUED ON NEXT PAGE

RAMBLER & CHECKER SUPERBA AUTOMATIC TRANSMISSION (Cont.)



from junction block at firewall. Disconnect control light bulb from connector under instrument panel, then disconnect neutral safety switch wire from junction block and relay at left wheelhouse panel and pull wires through wall. Remove gear selector escutcheon from instrument panel, then remove the three screws retaining gear selector control and move the unit forward to clear pushbuttons from instrument panel. Lower unit and move it toward rear and remove retainer nuts from both cable attaching pins. Pry cable outer looms from brackets of control unit. *NOTE - If safety switch or back-up light switch require replacing, bend prongs of switch up with a screwdriver. When installing switch, bend prongs down carefully.* To install the assembly, reverse removal procedures.

CONTROL UNIT ADJUSTMENT
RAMBLER

Adjustment: *NOTE - The following instructions supers de all previous testing procedures.* Remove pressure test plug at left front side of transmission and install the 1/8" pipe plug extension provided with Tool J-8773 (Vacuum & Solenoid Control Adjusting Kit), then connect an oil pressure gauge to the extension. Disconnect vacuum line at vacuum and solenoid unit and attach vacuum gauge to "T" fitting on test line. Start engine and bring to normal operating temperature with transmission in neutral. At engine idle speed of 475 RPM, transmission in neutral, turn needle valve on test line to lower vacuum reading on gauge to obtain a vacuum reading as follows: 10.5" Hg (American and Series 10); 12.1" Hg (Series 20); 13.8 Hg (Series 80). With correct vacuum reading, oil pressure reading should be as follows: 110 lbs. (American). *NOTE - S e "Rambler American ("L" Head Engine) Vacuum & Oil Pressure Specification Change" above.* 100 lbs. (Series 10); 85 lbs. (Series 20 & 80). *NOTE - Oil pressures are plus or minus 3 lbs.* If oil pressure readings are not correct, loosen vacuum and solenoid unit locknut and turn unit in toward case if pressure is too low; away from case if pressure is too high. After correcting adjustment, cover the bleed holes provided in needle valve to stop atmospheric pressure entering test line. This will bring vacuum reading on test gauge to highest engine vacuum and oil pressure gauge should then read 55-65 lbs. With rear wheels raised off floor, place transmission in "D-2" position, then cover bleed hole in needle valve. Accelerate engine until transmission shifts into direct drive. Pressure gauge should read 25-35 lbs.

SUPERBA

Adjustment: *NOTE - After unit is installed on transmission case, it should be initially adjusted by screwing it in or out so the distance between front edge of unit and transmission case is 3/8".* Remove 1/8" pipe plug from lower left corner of transmission case and install a 300 lb. pressure gauge. Remove fitting at rear of vacuum solenoid unit and install a vacuum gauge using a "T" fitting. Install vacuum line so unit will operate and vacuum gauge will register. Connect a tachometer to engine, then start engine and run several minutes to bring to normal operating temperature.

FLASH-O-MATIC HYDRAULIC CIRCUITS - RAMBLER V8

Place selector lever in "D1" ("D" on Superba A1OL)and apply parking and service brakes. Accelerate engine until a reading of 10.5" HG is obtained on vacuum gauge. Reading on pressure gauge should be 90-105 lbs. If pressure is below specifications, turn vacuum and solenoid unit inward to increase pressure;outward to decrease pressure. When correct pressure has been obtained, tighten locknut. *NOTE - It is recommended that vacuum and solenoid unit not be turned more than 1/2 turn either way from initial setting of 3/8".*

►*CAUTION: When making the above tests, do not operate engine for more than 10 seconds at any one interval.*

BAND ADJUSTMENT

►*TORQUE WRENCH DIAL READING NOTE:* To obtain correct dial reading on wrench, compensate for the additional length of adapter Tool J-7847 as follows: Multiply "9" (torque required on adjusting nut) by lever length of wrench (middle of handle to center of wrench socket drive). Record the product of this multiplication. Add length of torque wrench to length of adapter, Tool J-7847 (6"). Record sum of this addition. Divide product of the multiplication by the sum of the addition. The quotient of this division will be the reading on torque wrench dial which will be required to obtain 9 ft. lbs. on rear band adjusting nut.

Front Band: Remove transmission oil pan, gasket, and screen. Use Tool J-5880 (Rambler), Tool No. 7195 (Checker Superba) and loosen adjusting screw, then insert gauge block (part of tool) between end of adjusting screw and servo piston rod. Turn screw in until it overruns and remove gauge block. *NOTE* - It may be necessary to back adjusting screw off slightly to remove gauge block. If so be sure to tighten screw the same amount after block is removed. Tighten locknut to 20-25 ft. lbs. and install screen, gasket, and transmission oil pan. Refill transmission.

Rear Band: Rambler - Loosen locknut on adjusting screw located on left side of transmission case and install Tool J-7847 on adjusting screw. Tighten screw with torque wrench to 9ft. lbs. *(s "Torqu Wr nch Dial R ading Not " abov).* Mark adjusting screw with a reference point and **back ff adjusting scr w 1½ turns.** Tighten locknut securely.

CONTINUED ON NEXT PAGE

RAMBLER & CHECKER SUPERBA AUTOMATIC TRANSMISSION (C nt.)

Ch ck r Sup rba - Remove cover plate from floor pan and position Tool No 7225 on adjusting screw and loosen locknut Using "T" handle of tool, tighten adjusting screw until wrench overruns (10 ft lbs), then **back ff adjusting screw 1½ turns.** Hold adjusting screw stationary and tighten locknut to 35-40 ft lbs

TESTING

STALL TEST: Connect tachometer to engine and place it where it can be easily read from driver's seat Set hand brake and start engine Place selector lever in "D1" position, apply service brakes and operate engine at full throttle. Note tachometer reading. *(CAUTION - Do not operate ngine at high speed while selector lever is in one of the driving ranges, with rear wheels held stationary, for mor than 10 seconds at a time to pr v nt ov rheating transmission)* Normal stall speeds are as indicated in table below If stall speed is greater than normal, slippage in transmission is indicated If stall speed is below normal, poor engine performance is indicated

Stall Speeds

M d l	Engine RPM
merican	1400
Series 10	1400
Series 20	1575
Series 80	1600

SHIFT SPEEDS

(Rambl r American)

Upshift	Light Thr ttl	Full Throttle	Kickdown

2-3	10-13 MPH	41-50 MPH	
Downshift	**Closed Throttle**	**Full Throttle**	**Kickdown**
3-2	7-11 MPH		35-49 MPH
2-1	3-7 MPH		

AIR PRESSURE TEST (Transmission in Car): Raise car on hoist and remove transmission oil pan and control valve assembly The front servo tubes should remain in front servo and the servo attaching screw must be tight *NOTE - When making air pressure tests, hold a clean towel over transmission opening to prevent excessive oil spray*

Front Clutch· Apply air pressure to front clutch passage (on transmission case rear flange). Listen for a dull thud indicating clutch is operating. Retain air pressure in this passage for several seconds to check for leaks in this circuit

Governor Valve Remove governor inspection hole cover and apply air pressure to front clutch passage (see above). Listen for a click and watch valve snap inward. Replace inspection hole cover.

Rear Clutch· Apply air pressure to rear clutch passage (on transmission case rear flange). Listen for a dull thud indicating clutch is operating. Retain air pressure in this passage for several seconds to check for leaks in this circuit.

Front Band & Servo: Apply air pressure to front servo apply tube (rear tube) and observe band application.

Rear Band & Servo: Apply pressure to rear clutch oil passage (transmission case rear flange), and observe band application.

► *TESTING NOTE If servos, bands, clutches, and governor operate with air pressure, then the no-drive problems, erratic shift, or no-upshift conditions indicate that the control valve assembly and pressure regulator valve assembly is the cause of the trouble See "Control Valve" and "Pressure Regulator Valve" below*

TROUBLE SHOOTING & DIAGNOSIS

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high. Control pressure may be too high caused by improper adjustment of throttle control vacuum unit. Regulator control valve may be dirty

INITIAL ENGAGEMENT DELAYED: Check fluid level On Series 10 or Rambler American, adjust rear band as it may be loose Control pressure may be too low at idle speed Clean control valve assembly and pressure regulator assembly Check front pump for wear Check fluid circuits for leaks and correct as necessary

INOPERATIVE IN ALL RANGES· Check fluid level. Manual linkage may be disconnected. No control pressure, which may be caused by trouble at front pump. Check rear band adjustment Check rear servo action with air pressure Inspect and clean control valve assembly Check engine stall speed, as converter may not be operating properly

NO DRIVE IN "D" OR "L" POSITION: Check fluid level Manual linkage not properly adjusted Control pressure may be low Adjust vacuum control unit Clean control valve and pressure regulator valve assemblies Check front clutch action with air pressure. On Series 10 and Rambler American, check rear servo and band with air pressure Check transition valve in control valve assembly as it may be stuck

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be too low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly.

LOCKS UP IN "D" POSITION: Rear clutch or front band may be applied. Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failure.

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo or "one-way" clutch for mechanical failure Check rear clutch Clean control valve assembly assembly

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band, or "one-way" clutch may be applied Clean control valve assembly

LOCKS UP IN "R" POSITION: Check front clutch and band and front servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited, check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Control pressure may be too high. Check and correct vacuum and solenoid adjustment. Check and adjust bands. Clean governor valve assembly.

1-2 UPSHIFT SLIPPAGE (LIGHT THROTTLE): This condition may be caused by an unbalanced vacuum condition due to clogged vacuum ports or vacuum leakage at carburetor *(See "Carter (AS) Carburetor" in Carburetor Section)* Check adjustment of Vacuum & Solenoid Control Unit on transmission *(See "Throttl Control Adjustment" above)*

1-2 UPSHIFT SLIPS: Adjust vacuum and solenoid unit. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.

NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Adjust vacuum solenoid unit.

2-3 UPSHIFT ROUGH: Control pressure may be too high, adjust vacuum solenoid unit. Clean control valve assembly and adjust front band. Check for stuck governor valve.

CONTINUED ON NEXT PAGE

RAMBLER & CHECKER SUPERBA AUTOMATIC TRANSMISSION (C nt.)

2-3 UPSHIFT "PILE-UP" (LIGHT THROTTLE): *See "1-2 Upshift Slippage (Light Throttle)" above.*

2-3 UPSHIFT SLIPS: Control pressure may be too low; adjust vacuum solenoid unit. Clean control valve assembly and adjust front band. Check for internal leaks and stuck governor valve.

NO 2-3 UPSHIFT: Governor valve or 2-3 shift valve may be stuck.

2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit. Adjust vacuum solenoid unit.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust vacuum solenoid unit. Orifice control valve may be stuck.

3-2 KICKDOWN (EARLY): Check for stuck governor valve.

2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust vacuum solenoid unit. Rear servo check valve may be stuck.

WILL NOT START BY PUSHING: Rear pump not operating. Pressure regulator valve may be stuck.

NO PARK POSITION: Adjust vacuum solenoid unit. Check for damaged internal linkage or pawl.

TRANSMISSION REMOVAL & INSTALLATION

RAMBLER (EXCEPT RAMBLER AMERICAN CONVERTIBLE)

►*RAMBLER SERIES 20 & 80 (WITH SINGLE EXHAUST) TRANSMISSION REMOVAL NOTE: Disconnect crossover (right) exhaust pipe at manifold flange and "U" clamp connection at left exhaust pipe.*

REMOVAL: Disconnect battery cable, then raise car on a hoist and place jack stands under rear of car at body sills. Disconnect oil filler tube at oil pan and drain transmission. On Series 20 & 80, disconnect oil cooler lines at transmission. On all models, disconnect vacuum line and wire terminal at vacuum unit located at rear of transmission. Disconnect speedometer cable at transmission and rear brake hose bracket from floor panel. Disconnect manual shift linkage or cables from levers at transmission, then disconnect rear shock absorbers from rear axle. On Rambler American, disconnect rear spring front brackets from body floor pan, then slide rear axle to rear to disengage front universal joint from transmission shaft. On other models, disconnect torque tube, propeller shaft, and parking brake cable, then lower rear axle and move rearward to separate torque tube and propeller shaft from transmission. On all models, place a hydraulic hoist with a suitable cradle in position under transmission oil pan, then remove transmission case-to-converter housing upper capscrews. On all cars except Rambler American, remove shift cable bracket. On all cars, install two guide pins, Tool J-1434 into capscrew holes, then remove lower capscrews and lockwashers. With hydraulic hoist and cradle adjusted so transmission is in alignment with converter housing, pull transmission to rear to disengage it from housing and converter assembly. Lower assembly and remove from car.

►*TRANSMISSION, BELL HOUSING & CONVERTER ASSEMBLY REMOVAL NOTE:* These parts may be removed as an assembly as follows: In addition to transmission removal procedure (see above), remove the starter attaching bolts and remove starter. Support transmission and remove crossmember at side sill bolts. Lower engine and block engine on both sides from the top ledges of oil pan to side sill crossmember (these blocks should be 5" long and 2" square). Remove bell housing-to-engine bolts and bell housing lower mud pan. Remove six capscrews attaching torque converter to drive plate. Complete removal as outlined above.

INSTALLATION: Reverse the removal procedure and note the following: If transmission removed separately, position front pump drive tangs on converter in a horizontal position and position the front pump external tooth gear drive lugs in a vertical position. Tighten transmission-to-bell housing attaching bolts to 40-45 ft. lbs. If converter has been removed, converter-to-drive plate attaching capscrews must be tightened to 23-28 ft. lbs.

(RAMBLER AMERICAN CONVERTIBLE)

►***TRANSMISSION REMOVAL NOTE:* Transmission and converter cannot be removed as an assembly. Transmission must be removed separately, then the converter and bell housing can be removed.**

►***1961 (EARLY MODEL) TRANSMISSION REMOVAL NOTE: On some early models, it is necessary to remove transmission oil pan before transmission can be removed from car. On later cars, modifications were made in auxiliary crossmember to allow removal of transmission without removing oil pan.***

REMOVAL: Disconnect vacuum line and remove solenoid vacuum unit, then disconnect shift rod from transmission. Disconnect parking brake at front end of adjusting rod and push rod through hole in crossmember (toward rear). Disconnect parking brake bellcrank and bracket from crossmember. Disconnect and remove speedometer cable, then remove cable and gear from transmission extension housing. Disconnect brake tube and gas line brackets from under floor pan to permit moving axle toward rear, then disconnect rear brake cables from brackets at side sills and disconnect rear shock absorbers at rear axle. Place stands under rear of body and lower rear axle far enough to relieve tension on rear springs. Disconnect and remove rear axle "U" bolt brackets. Raise rear axle to clear spring center bolts and slide rear axle on rear springs to remove universal joint from transmission output shaft. Remove four capscrews retaining transmission to bell housing, then place transmission jack (having a tilting attachment) under transmission oil pan and secure transmission to jack. Move transmission to rear far enough to clear input shaft from bell housing. Lower front of transmission and tilt transmission to right side. Keep lowering front end and tilting to right side until transmission input shaft clears bell housing and rear of case clears slot in crossmember.

INSTALLATION: Reverse removal procedure and note the following: Position front pump drive tangs on converter in a horizontal position and position front pump external tooth gear drive lugs in a vertical position. Tighten transmission-to-bell housing attaching bolts to 40-45 ft. lbs.

CHECKER SUPERBA

REMOVAL: Raise car and drain transmission fluid, then loosen tube clip capscrew at extension on starter motor and rotate filler tube out of the way. Disconnect vacuum line at vacuum unit (rear of transmission), then disconnect hand brake cable at drive shaft if chassis is so equipped. Disconnect manual shift linkage at shift lever on transmission, then disconnect the two oil cooler lines on right side of transmission (if so equipped). Disconnect propeller shaft at transmission companion flange and wire propeller shaft out of the way. Place a hydraulic hoist with a suitable transmission lift cable in position under transmission oil pan and adjust hoist to align cradle with oil pan flange, then hoist enough to support transmission. Remove transmission case to converter housing upper capscrews and lockwashers and install two pilot studs into screw holes. Remove lower transmission case to converter housing capscrews. Pull transmission straight toward rear of car to disengage it from converter housing and converter assembly.

INSTALLATION: Reverse removal procedure, being careful to align turbine shaft splines with turbine hub splines and the converter impeller lugs with slots in front pump drive gear.

TRANSMISSION OVERHAUL

►*CONVERTER OVERHAUL NOTE:* Torque converter is a sealed assembly (case is welded together during manufacture) and cannot be disassembled for service.

TRANSMISSION OVERHAUL: *See "Warner Automatic Transmission" in 1960 Annual Data or later Manual edition.*

STUDEBAKER FLIGHTOMATIC

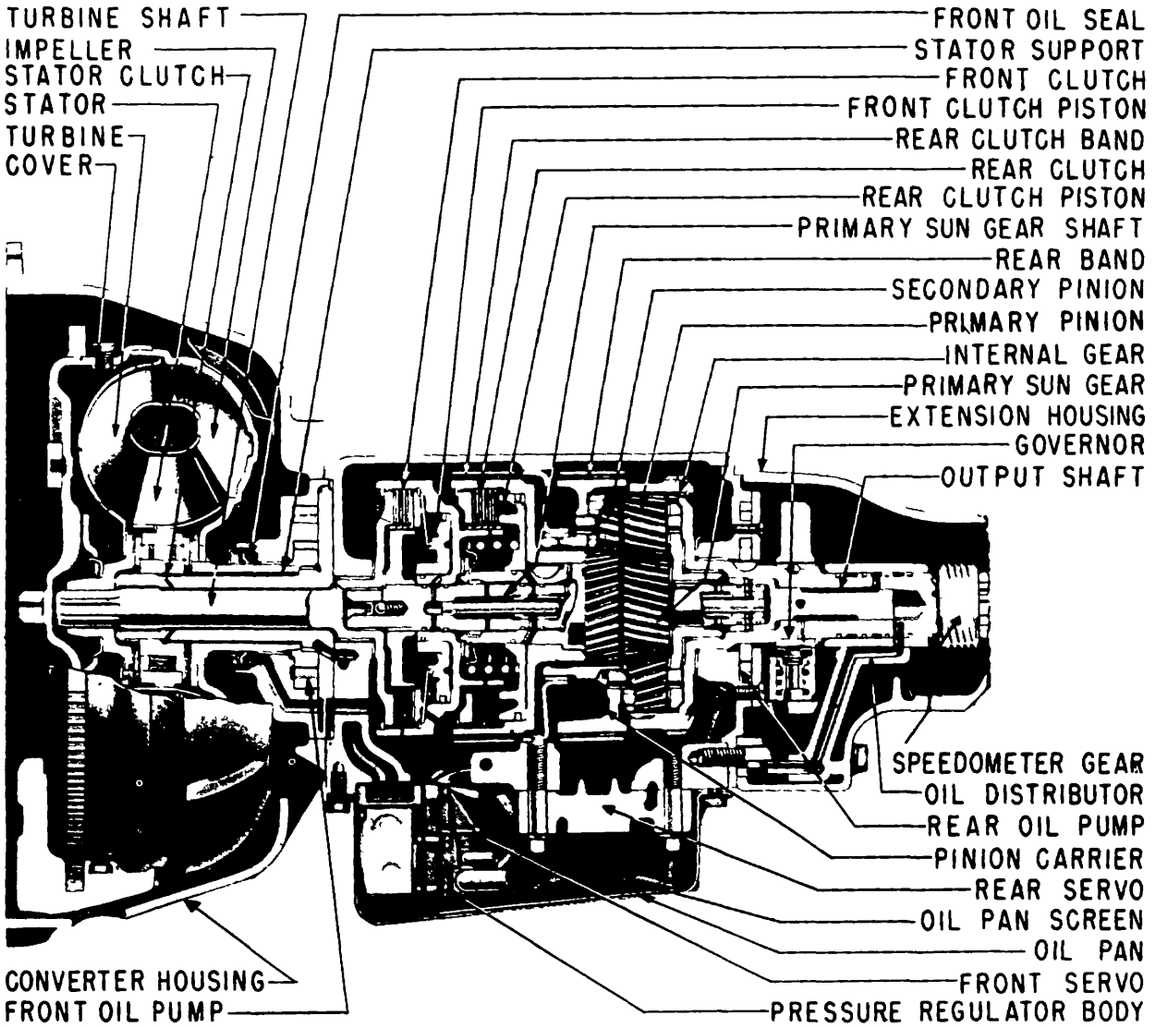
Studebak r, All Models (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR:* Move selector lever to "N" (Neutral) position. When car speed reaches 20 MPH, turn the ignition switch on and move transmission selector lever to the "L" (Low) position. It is recommended that the car be pushed to start it rather than be towed.

►*TOWING CAR CAUTION:* Car can be towed for very short distances with the transmission selector lever in the "N" position. Prolonged towing will result in damage to the transmission unless the drive shaft is disconnected or the rear wheels are off the ground.

►*1961 STUDEBAKER SIX TRANSMISSION SLOW ENGAGEMENT OR "BUMP" CORRECTION & PRODUCTION CHANGE:* On transmissions after Serial No. 19163 (Exc. Taxi); 10500 (Taxi), slow engagement or "bump" when shifting into "D" or "L" can be corrected as follows: Replace the three front clutch discs with three new discs, Part No. 1554230, (four on Taxi and Heavy Duty transmission). On standard transmissions (except Taxi and heavy Duty), install Pressure Plate, Part No. 1554179. On all transmissions, drill out front clutch inlet hole located in front clutch cylinder (this hole is located in mainshaft bore of clutch hub) to a 5/32" diameter hole (present hole is .075-.081"). Transmissions built after the above serial numbers have these corrections made in production. *NOTE - It is suggested that whenever it is necessary to replace front clutch parts in these transmissions, the above parts should be installed plus a new Front Clutch Cylinder, Part No. 1554227.*



►*1961 STUDEBAKER SIX (EXCEPT TAXI) HEAVY DUTY TRANSMISSION NOTE:* This transmission is identical to transmission used on taxicab models except that a different governor assembly and speedometer drive gear is used. The shift points of this transmission are similar to transmissions used on standard models. A plain aluminum identification plate on transmission case identifies this transmission.

►*1961 TRANSMISSION FRONT PUMP PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* A new helical gear front pump, Part No. 1552576 is used in production on later cars and may be used for service replacement on early models. The later pump cover and stator hub, Part No. 1552577, may be used for service replacement on the earlier spur gear type pump.

►*1961 TRANSMISSION DIPSTICK TUBE BRACKET PRODUCTION CHANGE & SERVICE INSTALLATION NOTE:* A new dipstick tube positioning bracket, Part No. 1553453 is being used in production to insure proper positioning of dipstick tube. It is suggested that whenever oil pan is removed on early transmissions without the bracket, that the service bracket, Part No. 1553453, be installed. Attach to second oil pan capscrew from rear on right side of transmission.

DESCRIPTION

DESCRIPTION: Transmissions used on all models except with 170" Over-Head-Valve engine are similar to transmissions used on previous models. Heavy duty and Taxicab transmissions are water cooled by circulating transmission fluid through an oil cooler located in car radiator. The transmission used on 170" Over-Head-Valve engines is similar to the other transmissions except that a one-way (sprag) clutch is used in the planetary gear train to eliminate application of rear band when transmission is operating in "D" (Drive) range. *NOTE - Rear band is applied only when selector lever is in "L" (Low) or "R" (Reverse).* In conjunction with the addition of a sprag clutch, the control valve assembly was also changed to eliminate the rear servo check valve and spring.

STUDEBAKER FLIGHTOMATIC TRANSMISSION SECTIONAL VIEW

LUBRICATION

►*CAUTION: Check fluid l vel at 1000 mil intervals. Drain and r fill at 15,000 mil int rvals, using Automatic Transmissi n Fluid Typ "A" (Suffix "A").*

Capacity - 9 qts. (Exc. Taxicab & Heavy Duty Trans.). 9½ qts. (Taxicab & Heavy Duty Trans.).

Checking Fluid Level—Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission have reached normal operating temperature. Roll up the floor mat from right side until oil level inspection hole cover in floor pan is accessible, and remove cover. Clean all dirt and foreign material from around transmission fluid dipstick. Apply the parking brake and foot brake and move selector lever slowly from "P" position to "R" position and then back to "D" position. Remove dipstick and wipe clean, then install it in transmission and turn clockwise to the lock position. Remove dipstick and check fluid level. Add fluid through dipstick hole to raise level to the "F" mark on dipstick. *NOTE*—The amount of fluid re-

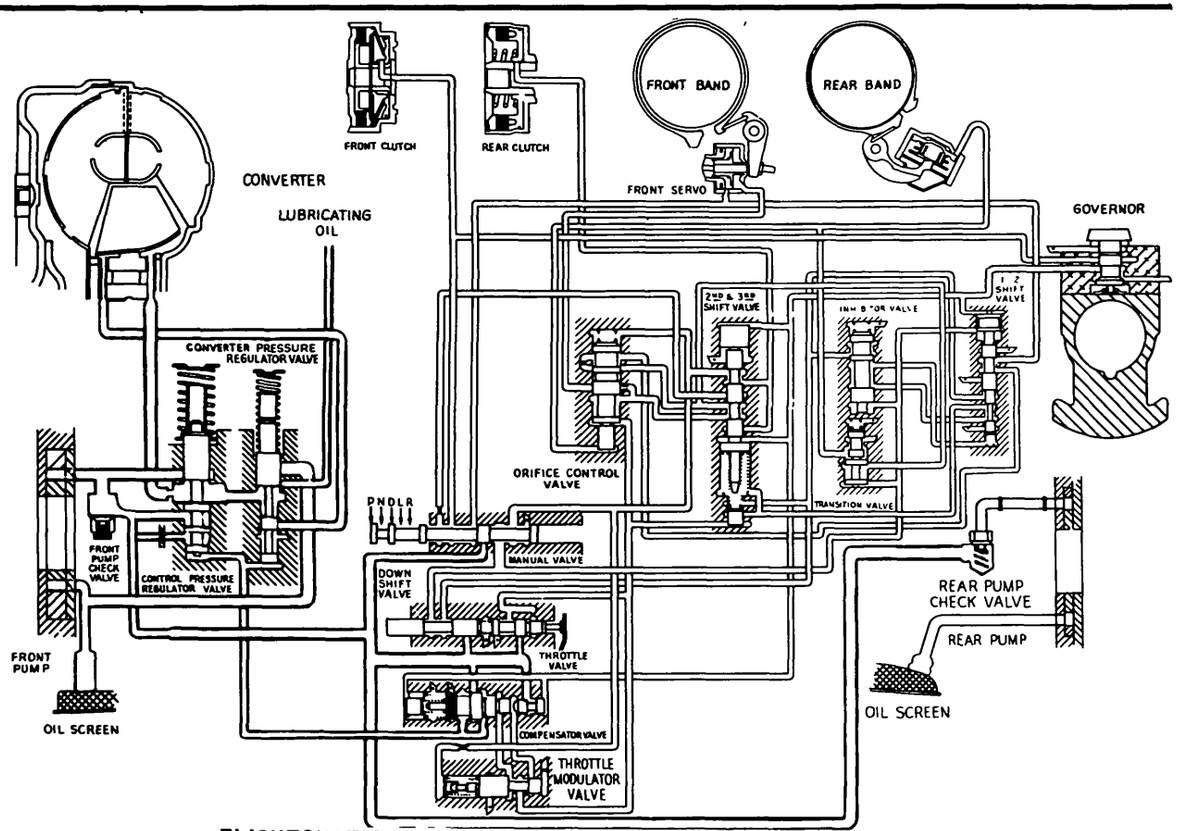
CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinu d)

quired to raise the level from "L" mark on dipstick to "F" mark is approximately 1½ pints.

Draining & Refilling—Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission are at normal operating temperature. Stop engine and raise car on hoist. Remove transmission dipstick (*see "Checking Fluid Level" above*). Remove transmission drain plug. Rotate the converter until one of the drain plugs is visible through hole in converter housing, remove drain plug and quickly rotate converter 180°, and remove the other converter drain plug. After fluid has drained from transmission and converter, install transmission drain plug using a new gasket, and the two converter drain plugs. Lower the car to floor and install three quarts of Automatic Transmission Fluid Type "A" (Suffix "A") through dipstick hole. Apply parking brake and foot brake, then start engine and operate it with selector lever in "N" (Neutral) position. Slowly pour four quarts of fluid into transmission. Move selector lever through all ranges. Check oil level on dipstick (see "Checking Fluid Level" above). Add sufficient oil to bring level up to "F" mark on dipstick.

LINKAGE ADJUSTMENT



Thr ttle Linkage Adjustment: *See CARBURETOR on Car Model Pages.*

Manual Linkage Adjustment: Disconnect shift lever-to-transmission manual valve lever rod at transmission manual valve lever by removing the ball joint assembly. Place selector lever in "D" (Drive) position and place the manual lever on transmission in the "D" (Drive) position (this is center of manual valve lever travel). Adjust the shift lever-to-manual valve lever rod until the ball joint stud will slip freely through the hole in the manual valve lever. Install ball joint stud locknut and lock to rod.

N utral Safety Switch Adjustment: Place transmission selector lever in "N" (Neutral), then loosen switch bracket on steering column jacket. Align pin hole in switch lever with corresponding hole in switch body and install pin to maintain alignment. Tighten bracket attaching screws. Test operation of switch. Engine should start only with selector lever in "P" (Park) or "N" (Neutral) position.

BAND ADJUSTMENT

Fr nt Band: Remove transmission oil pan, gasket and screen. Loosen the front servo adjusting screw locknut two full turns with a 9/16" wrench. Check the adjusting nut for free rotation in the actuating lever and free the adjusting screw if necessary. Install the gauge block of the adjusting tool (J-5880) between the servo piston rod and the adjusting screw. Place the Front Band Adjusting Tool J-5880, on the adjusting screw and tighten until the tool overruns. **Back ff th adjusting scr w ne full turn,** and tighten locknut to 20-25 ft. lbs. Place the screen over the rear pump inlet first then over the front pump inlet, and install the screen retaining clip. Position a new oil pan gasket on transmission oil pan flange and hold it in place with petroleum jelly. Align oil pan on transmission flange and install capscrews and lockwashers. Tighten to 10-13 ft. lbs. Install drain plug and fill transmission *(see "Lubrication" above).*

FLIGHTOMATIC TRANSMISSION HYDRAULIC CIRCUITS (6 CYL. MODELS)

Rear Band: Remove inspection cover in center of front compartment floor and clean all dirt and foreign material from around rear band adjusting screw and locknut. Oil adjusting screw threads, then using Tool J-5883, tighten screw until tool overruns. **Back off adjusting screw 1½ turns** and tighten locknut to approximately 35-40 ft. lbs. *CAUTION - It is very important that the adjusting screw be backed off 1½ turns to avoid damage to band and servo.*

THROTTLE VALVE STOP ADJUSTMENT

Throttle Valve Stop: Remove oil pan and screen, then remove compensator tube and bellcrank-to-throttle valve lever rod from throttle valve lever. Hold throttle valve lever against throttle valve stop and measure distance from center of hole in throttle valve lever to machined surface on rear of transmission case. This distance should be a minimum of 4 7/32" and not to exceed 4 5/8". If not within specifications, bend throttle valve stop as necessary. To bend the stop, remove compensating pressure tube from pressure regulator valve assembly and control valve assembly and bend stop with Tool J-5887.

TESTING

STALL TEST: Connect tachometer to the engine and place it where it can be easily read from the drivers seat. Set the hand brake and start the engine. Place selector lever in "D" (Drive) position, apply service brakes and operate the engine at full throttle. Note tachometer reading. Repeat this procedure with selector lever in "L" and "R" positions. *(CAUTION—Do not operate the engine at high spe d whil th s l ctor lever is in one of the driving rang s, with the r ar wheels held stationary, for mor than 10 sec nds at a time or for a total time greater than n minut in any half-hour period).* Normal stall speeds are 1450-1550 RPM (6 Cyl.), 1550-1650 RPM (259" V8 Eng.), 1750-1850 RPM (289" V8 Eng.). If stall speed is greater than normal, slippage in transmission is indicated. If stall speed is between 900-1000 RPM (if engine is normal), slippage is indicated in torque converter stator freewheel unit.

ROAD TEST: A thorough test must be made to determine the shift speed and transmission performance. The initial application of the various bands and clutches should be checked in all driving ranges by stopping the car and moving the selector lever to "D", "Lo", & "R"

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinued)

ranges. A driving test should be made in the "D" range to check the shift speeds. *See "Shift Speeds" below.*

FLUID PRESSURE TESTS: Fluid pressure tests should be made to ascertain whether or not the pressure regulator system is functioning correctly and to determine if there is fluid leakage in the clutch circuits. Remove the 1/8" pipe plug located near throttle lever and manual lever, and install pressure gauge hose (pressure gauge should be in drivers compartment). Connect a tachometer to engine and position it so it can be read from driver's compartment Make the following tests·

►*FLUID PRESSURE TEST CAUTION (CARS WITH CLOSED CRANKCASE VENTILATION):* Disconnect airflow valve from carburetor or manifold, and temporarily plug carburetor or manifold vacuum port during pressure tests or adjustments.

1) Idle Pressure T st - With engine and transmission at normal operating temperature, and with engine at normal idle speed, move selector lever to "D", "L" & "R" positions. The pressure reading should be approximately 50-60 lbs. (6 Cyl), 50-80 lbs. (V8, Exc Taxicab), 59-95 lbs. (V8 Taxicab), in all ranges If pressure is low in any one range, a fluid leak in that circuit is indicated. If pressure is high, the throttle linkage should be checked and adjusted. *See CARBURETOR on Car Model pag s.*

2) Pressur R gulati n Test - Move selector lever to "D" (Drive) range and firmly set hand brake and foot brake. Run engine at 1000 RPM and check pressure gauge. Pressure should be approximately 70-75 lbs. (6 Cyl.); 80-85 lbs. (V8, Exc. Taxicab), 95-100 lbs. (V8 Taxicab). If pressure is less, it indicates the throttle linkage is too long and must be adjusted. If pressure is greater, it indicates throttle linkage is too short.

3) Stall Pressur T st - Firmly set hand and foot brakes and operate engine at full kickdown position. Move selector lever to "D", "L", "R" ranges and check pressure gauge. Pressure in "D" & "L" should be 100-130 lbs. (6 Cyl.), 130-175 lbs. (V8, Exc. Taxicab), 132-184 lbs. (V8 Taxicab). In "R" range, the pressure should be 160 lbs. minimum (6 Cyl.); 170-190 lbs. (V8, Exc. Taxicab), 184-203 lbs. (V8 Taxicab). If pressure is not within limits, control valve assembly and pressure regulator valve assembly must be removed and cleaned.

FLIGHTOMATIC SHIFT SPEEDS

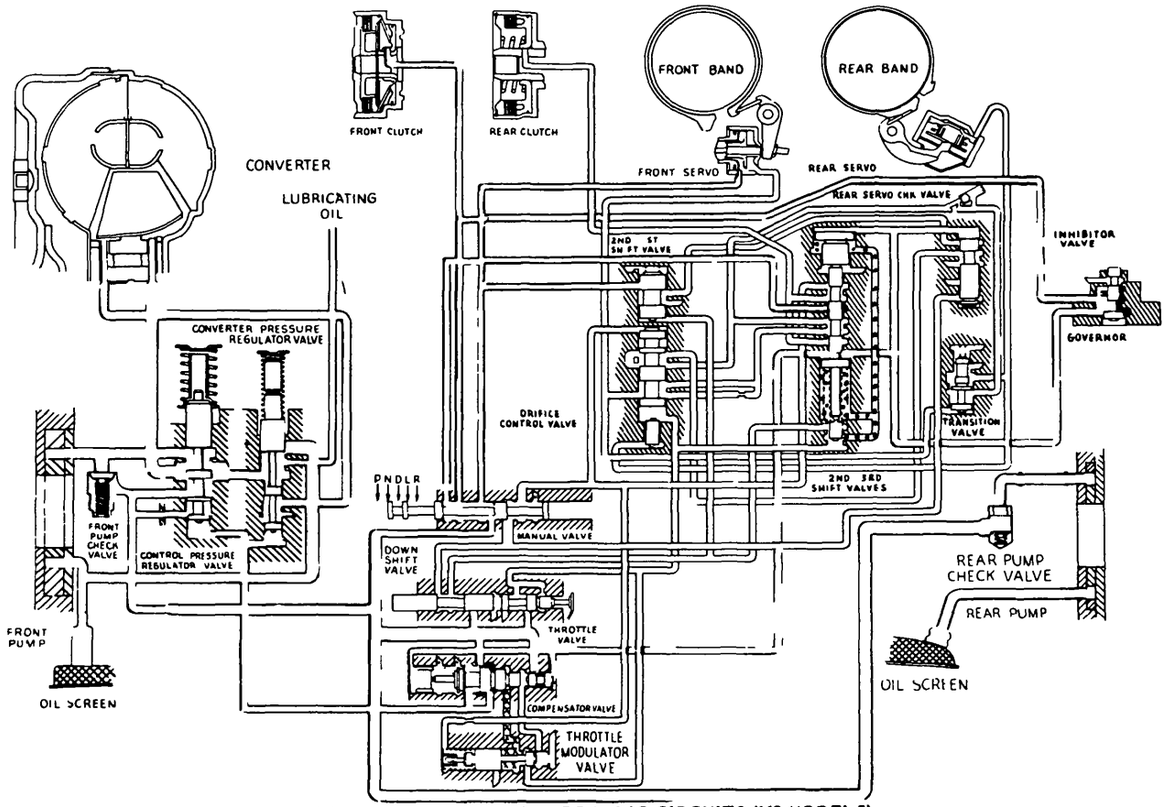
Minimum Throttle Upshift

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
1-2	7-9 MPH	6-8 MPH	
2-3	16-19 MPH	14-17 MPH	12-18 MPH

Maximum Throttle Upshift

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
1-2	35-38 MPH	28-32 MPH	34-42 MPH
3-2	59-64 MPH	41-46 MPH	63-73 MPH

Maximum Kickdown



Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
3-2	50-55 MPH	34-39 MPH	60-70 MPH
3-1	15-19 MPH	10-14 MPH	20-26 MPH
2-1	10-14 MPH	6-10 MPH	12-18 MPH

Cl s d Throttle Downshift

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
3-2	7-11 MPH	6-10 MPH	3-8 MPH

Inhibited D wnshift (Selector Lever in "L")

Shift	6 Cyl. (Std.)	6 Cyl. (Taxi)	V8
2-1	15-22 MPH	14-18 MPH	15-21 MPH

FLIGHTOMATIC TRANSMISSION HYDRAULIC CIRCUITS (V8 MODELS)

AIR PRESSURE TEST (With Transmission in Car): Raise car on hoist and remove transmission oil pan and control valve assembly. Proceed as follows

Front Clutch: Apply pressure to front clutch and governor input passage (case rear flange). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of the system.

Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

R ar Clutch; Apply air pressure to rear clutch oil passage (case rear flange). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

Rear Band & Serv : Apply pressure to rear servo oil passage (case rear flange), observe band application.

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

►*TESTING NOTE: If servos, bands, clutches and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" below.*

TROUBLE SHOOTING

►***DIAGNOSIS OF TRANSMISSION SLOW ENGAGEMENT OF FRONT & REAR CLUTCHES: This condition noted*** at times when manual selector lever is shifted to a position that requires application of either front or rear clutch with car standing still, and at idle (transmission at normal operating temperature) Check as indicated below.

1) Perform "Initial Engagement Delay" below

2) Check control pressure at 1000 RPM and at idle during time complaint condition is noticeable Make comparative readings in all ranges.

3) Isolate rear clutch or rear band areas by adjusting rear band so it mechanically locks rear drum If trouble is corrected, leakage within rear band servo is indicated If complaint remains, it indicates that problem is in rear clutch circuit

4) If the above procedures do not correct the complaint,

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (Continued)

but indicate a pressure leak in either front or rear clutch circuits, remove and disassemble transmission, then inspect all parts for nicks, scores and wear Check all seal rings and grooves Check all valves and valve bores

►*CONTROL VALVE BUZZ (PARK & REVERSE RANGES) CORRECTION* This condition may be due to highly aerated oil in the transmission which could be caused by a leak in the transmission When abnormally severe valve buzz is encountered, remove the dipstick and check for indications of air bubbles in the oil If air is present, check and correct as follows

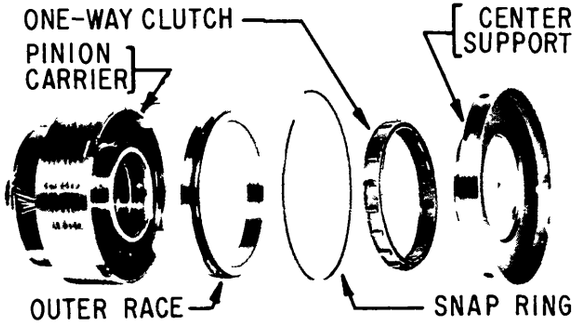
1) Sand holes or porosity in transmission case

2) Leakage between pressure regulator valve assembly and the machined surface of case This condition can be due to nicks or other damage on either of the mating surfaces, or by improper torqueing of the capscrews

3) Leakage between front pump and transmission case due to damaged gasket or improper torqueing of capscrews

4) Incorrect control pressures or sticking valves

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high. Control pressure may be too high caused by improper throttle valve linkage or dirt in control valve assembly or regulator valve assembly. Check throttle valve stop and reset if necessary.



INITIAL ENGAGEMENT DELAYED: Check fluid level Adjust rear band as it may be loose. Control pressure may be too low at idle speed. Clean control valve assembly and pressure regulator assembly. Check front pump for wear. Check fluid circuits for leaks and correct as necessary.

INOPERATIVE IN ALL RANGES: Check fluid level. Manual linkage may be disconnected. No control pressure which may be caused by trouble at front pump. Check rear band adjustment. Check rear servo action with air pressure. Inspect and clean control valve assembly. Check engine stall speed, as converter may not be operating properly.

NO DRIVE IN "D" OR "L" POSITION: Check fluid level. Manual linkage may be disconnected. Control pressure may be low. Adjust throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Check front clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly as it may be stuck.

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be low. Check and adjust throttle valve linkage, and clean control valve and regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo action with air pressure. Check transition valve in control valve assembly.

LOCKS UP IN "D" POSITION: Rear clutch or front band may be applied. Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failures.

1961 STUDEBAKER 6 CYL. AUTOMATIC TRANSMISSION ONE-WAY CLUTCH

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo, and rear clutch for mechanical failure.

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band may be applied. Check bands and servo for mechanical failure. Clean control valve assembly.

LOCKS UP IN "R" POSITION: Check front clutch and band and front band servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Check throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited, check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

SLIPS IN "R" POSITION: Check fluid level. Check and adjust throttle control linkage. Clean control valve and regulator valve assemblies. Check rear servo for limited travel. Check front clutch for mechanical failure as it may be slipping. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Check and correct throttle control linkage as control pressure may be too high. Clean and adjust bands. Governor valve may be stuck.

1-2 UPSHIFT SLIPS: Check and adjust throttle control as control pressure may be too high. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.

NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Check and adjust throttle control linkage. Clean control valve assembly.

2-3 UPSHIFT ROUGH: Control pressure may be too high, adjust throttle control linkage and clean control valve assembly. Adjust front band. Check for stuck governor valve.

2-3 UPSHIFT SLIPS: Control pressure may be too low, adjust throttle control linkage and clean control valve assembly Adjust front band. Check for internal leaks and for stuck governor valve.

NO UPSHIFT 2-3: Governor valve or 2-3 shift valve may be stuck.

2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit. Adjust throttle control linkage.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Orifice control valve stuck

3-2 KICKDOWN (EARLY): Adjust throttle control linkage.

NO KICKDOWN: Adjust throttle control linkage.

2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Rear servo check valve may be stuck.

WILL NOT START BY PUSHING: Rear pump not operating. Pressure regulator valve may be stuck.

NO PARK POSITION: Adjust throttle control linkage. Check for damaged internal linkage or pawl.

TRANSMISSION REMOVAL & INSTALLATION

REMOVAL: Raise car on hoist, and remove transmission drain plug and converter drain plug. On coupe and hardtop models, remove body front pillar support crossmember. On cars with dual exhaust system, remove the left hand exhaust system. Remove complete propeller shaft assembly. Disconnect shift lever-to-transmission manual valve lever rod from manual valve lever. Disconnect bellcrank-to-throttle valve lever rod at throttle valve lever. Remove speedometer cable retaining screw and remove pinion and cable. Place transmission lift with the saddle as far forward in the tracks as possible, in position on transmission oil pan flange and align saddle on oil pan flange. Remove the four transmission-to-converter bell housing capscrews. Install transmission-to-converter housing guide pins, Tool J-4284, into upper capscrew holes. Remove transmission assembly by sliding it rearward on saddle out of converter bell housing and converter.

INSTALLATION: Position front pump drive tangs on converter hub in horizontal position. Using a thin screwdriver, position the front pump external tooth gear drive lugs in vertical position. Install transmission-to-converter housing guide pins, Tool J-4284 (if they were removed). Raise transmission to proper height and angle and carefully slide transmission assembly into torque converter and bell housing, using the pilot studs as guides Do not force transmission into converter by using transmission retaining screws to draw transmission into position, as this may damage converter or front pump. Make sure transmission fits snugly against converter bell housing. When transmission is in contact with bell housing, install the two lower transmission-to-bell housing retainer capscrew and lockwashers. Remove guide pins and install remaining capscrews and lockwashers. Tighten capscrews to 40-45 ft. lbs. Remove transmission hoist and saddle. Install speedometer pinion and cable and install retaining screw. Install shift lever-to-transmission manual valve lever rod. Install bellcrank-to-transmission throttle valve lever rod. On coupes and hardtops, install the body front pillar support cross-member. On cars with dual exhaust, install left exhaust pipe. Install propeller shaft assembly. Fill transmission to proper level (see "Draining & Refilling" above).

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinued)

TORQUE CONVERTER REMOVAL & INSTALLATION

REMOVAL: Remove transmission (see above), and starter. Disconnect tail pipe support and remove the "U" bolt from exhaust pipe support at converter housing. Disconnect rear exhaust pipe from front exhaust pipe and pull muffler and pipe assembly rearward. Move assembly to one side out of the way. Using a suitable support for engine (support must be shaped to support weight of engine at oil pan flanges and not under oil pan) and a hydraulic jack, remove rear insulator studs and raise engine just enough to have a separation between insulators and crossmember. Remove rear engine support crossmember. Remove converter bell housing-to-engine capscrews and remove bell housing, being careful not to damage dowels or distort converter blower. Lower rear of engine, being careful not to pull off water outlet hose (if additional clearance is required) drain cooling system and disconnect water outlet hose). Remove capscrews and washer holding converter assembly to the crankshaft-to-converter drive plate, and remove converter assembly.

INSTALLATION: Install converter assembly on the crankshaft-to-converter drive plate and loosely install retaining screws and lockwashers. Clean engine rear plate and mating surface on bell housing and install bell housing, taking care not to damage dowels or converter blower. Be sure bell housing is installed on dowels. Install bell housing retaining capscrews and tighten to 23-28 ft. lbs. If engine has been lowered, raise it to normal position. Position converter aligning tool, J-6310, into bore of bell housing and over pump drive fingers on torque converter assembly. Install the two upper transmission capscrews to hold aligning flange in position, and rotate converter assembly through two complete revolutions to center the torque converter assembly. Tighten converter-to-drive plate capscrews to 23-28 ft. lbs. Remove aligning tool. Install rear engine support crossmember. Install exhaust pipe, muffler and tail pipe assembly, making sure that proper alignment exists between assembly and the supports. Install transmission (see above), and starter.

TRANSMISSION OVERHAUL

CONVERTER OVERHAUL: Converter assembly is welded together and cannot be disassembled for servicing or overhaul.

TRANSMISSION OVERHAUL: *Se "Warner Automatic Transmission" in 1960 Final Data or later Manual edition and note the following:*

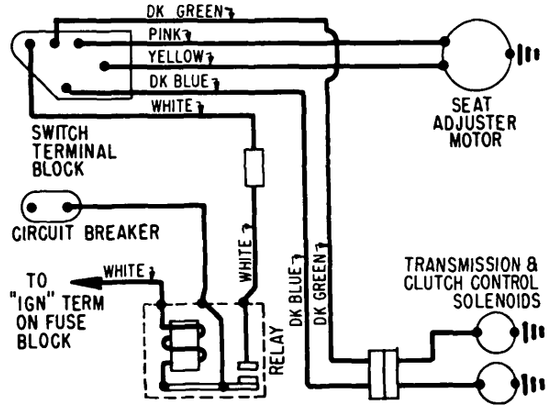
Control Valve Assembly (6 Cyl. Models): Lower Valv Body Cover - Rear Servo Check Valve and Spring not used. The only valve at this location is the 1-2 shift valve and spring.

Pinion Carrier & One-Way (Sprag) Clutch: Disassembly - *NOTE - Pinion Carrier cannot be disassembled except as follows:* The one-way clutch may be removed by slipping it out of outer race, then the outer race can be remove by removing the snap ring. *NOTE - Do not r - move outer race unless replacement is necessary.*

Reassembly - Install one-way clutch outer race and secure in position with snap ring. Install one-way clutch into pinion carrier and outer race assembly with flanged end of one-way clutch towards pinion carrier. Properly assembled, the brass drag strips attached to inner cage of one-way clutch will be located away from pinion carrier

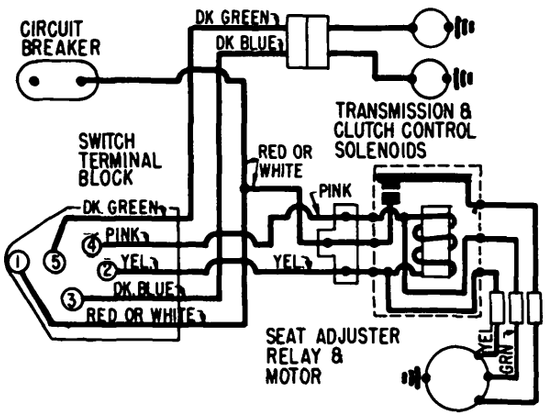
G.M. 4-WAY SEAT CONTROL

Buick (1961)
Oldsmobile (1961)



DESCRIPTION & OPERATION: Similar in design and operation to previous models. Either shunt-wound or series-wound motor used. Ignition switch must be on for seat operation with series-wound motor. *See wiring diagrams for circuits with each type motor.*

TROUBLE SHOOTING & DIAGNOSIS: *See "G.M. 4-Way Seat Control" in 1960 Final Data or later Manual edition.*



TESTING: *See "G.M. 4-Way Seat Control" in 1960 Final Data or later Manual edition and note the following:*

Checking Relay Assembly (Series-Wound Motor Type): Check for current at circuit breaker side of relay with a test light. If test light does not light, short or open circuit exists between circuit breaker and relay. With ignition switch turned on, check for current at control switch side of relay with a test light. If test light does not light, relay is faulty or short or open circuit exists between ignition switch and relay.

REMOVAL & INSTALLATION: *See "G.M. 4-Way Seat Control" in 1960 Final Data or later Manual edition.*

G-M 4-WAY SEAT (SERIES MOTOR)

G-M 4-WAY SEAT (SHUNT MOTOR)

G.M. 6-WAY SEAT CONTROL

Buick (1961)
Cadillac (1961)
Chevrolet (1961)
Oldsmobile (1961)
Pontiac (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 LEFT FRONT VERTICAL CABLE WHIPPING CORRECTION:* Whipping is indicated by cable hitting rubber coupler of motor at any time during operation. To correct, form a wire hook from stiff wire and hook over cable about 3" from cable transmission and into a slot in seat frame.

DESCRIPTION & OPERATION: Similar in design and operation to previous models except as noted below:

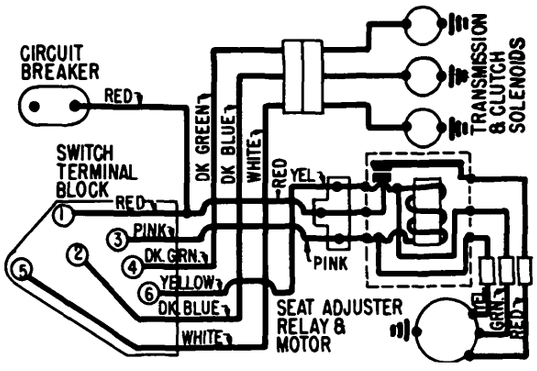
Cadillac - When seat control switch is mounted in door arm rest, pink wire at No. 3 position controls seat forward and up cycle, and yellow wire at No. 6 position controls seat rearward and down cycle as shown in wiring diagram. When seat control switch is mounted in seat side panel, No. 3 and No. 6 switch position operations are reversed so that No. 3 position controls seat rearward and down cycle and No. 6 position controls seat forward and up cycle. This change is accomplished by reversing green and yellow leads from relay to seat motor.

Oldsmobile - Switch control circuit is from ignition switch through control relay to control switch, and power circuit is through seat circuit breaker and control relay to seat relay and motor. Ignition switch must be on for both motor and switch operation.

TROUBLE SHOOTING & DIAGNOSIS: *See G.M. 6-Way Seat Control (One Motor Type)" in 1960 Final Data or later Manual edition.*

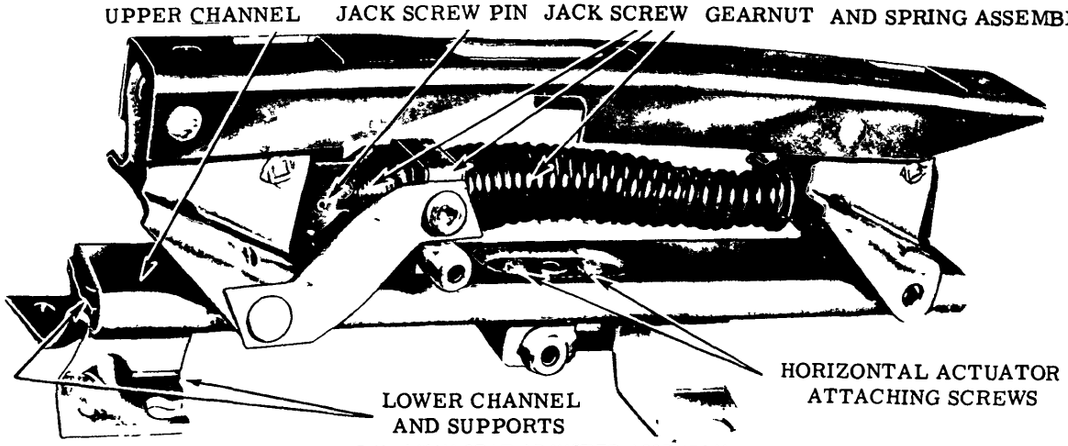
TESTING: *See "G.M. 6-Way Seat Control (One Motor Type)" in 1960 Final Data or later Manual edition and note the following:*

►*OLDSMOBILE NOTE:* Ignition switch must be on before making any electrical tests.



Checking Seat Control Switch: Substitute known good switch or use a 3-way jumper wire and connect to switch block as listed below.

Three-Way Jumper Wire - Join two pieces of 12 gauge wire together at one end and insert joined end into feed location (No. 1 on diagram) in switch block. Insert other ends of wires into a field and a solenoid location (Nos. 2 through 6 on diagram) in switch block.



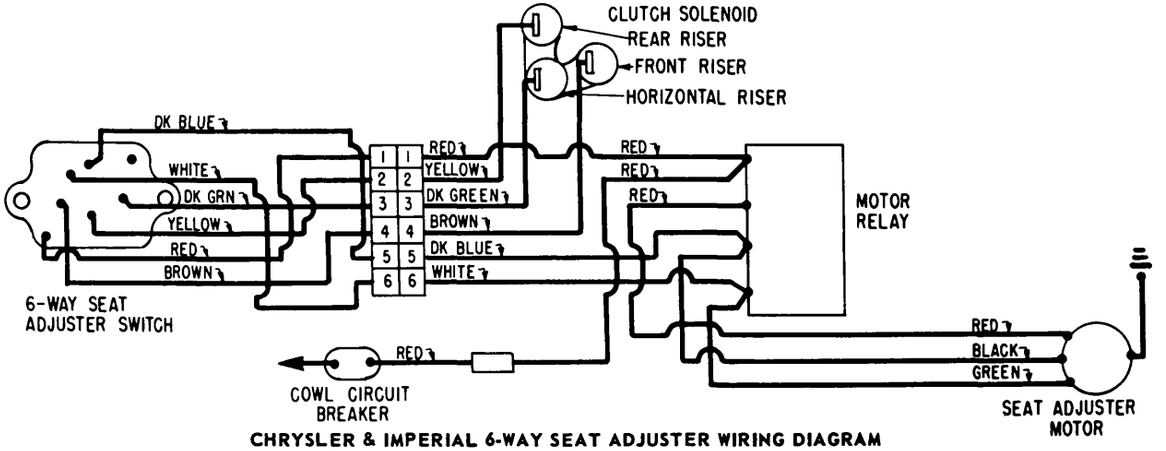
With Switch In Seat Side Panel -
1) To raise front edge, jumper in 6 & 5.
2) To lower front edge, jumper in 3 & 5.
3) To raise rear edge; jumper in 6 & 4.
4) To lower rear edge, jumper in 3 & 4.
5) To move seat forward, jumper in 6 & 2.
6) To move seat rearward, jumper in 3 & 2.

With Switch In Door Arm Rest -
1) To raise front edge, jumper in 3 & 5.
2) To lower front edge, jumper in 6 & 5.
3) To raise rear edge, jumper in 3 & 4.
4) To lower rear edge, jumper in 6 & 4.
5) To move seat forward, jumper in 3 & 2.
6) To move seat rearward, jumper in 6 & 2.

REMOVAL & INSTALLATION: *See "G.M., 6-Way Seat Control (One Motor Type)" in 1960 Final Data or later Manual edition.*

6-WAY SEAT CONTROL WIRING DIAGRAM

G.M. 4-WAY SEAT ADJUSTER ASSEMBLY



CHRYSLER CORP. 6-WAY SEAT CONTROL

Chrysler, Imperial, D Soto (1961)
Dodge & Dodge Dart (1961)
Plymouth (1961)

DESCRIPTION: 6-Way Power Seat operated by a single reversible electric motor located under the front seat. The motor drives a gear assembly which transmits power to slave units located in the seat tracks. Solenoid clutches in the gear assembly, when energized by actuation of the control switches on left side of front seat, engage the flexible drive cables with the gear assembly to operate the seat horizontally, up and down, and tilt it.

FRONT SEAT ASSEMBLY: Removal - Disconnect battery and remove front seat assembly *(NOTE* - On hardtop models, remove front seat and cushion as an assembly). Disconnect control wires at switch and disconnect seat adjuster battery wire at circuit breaker in cowl. Remove seat guide attaching stud nuts and remove adjuster. *CAUTION - Do not damage flexible tubing during removal.*

Installation: Install adjuster and stud nuts. Connect seat adjuster battery wire to circuit breaker on cowl. Form a loop in the wires from relay to clip on floor for horizontal travel. Install front seat assembly. Connect control wires to switch and install front seat cushion of four-door models. Connect battery.

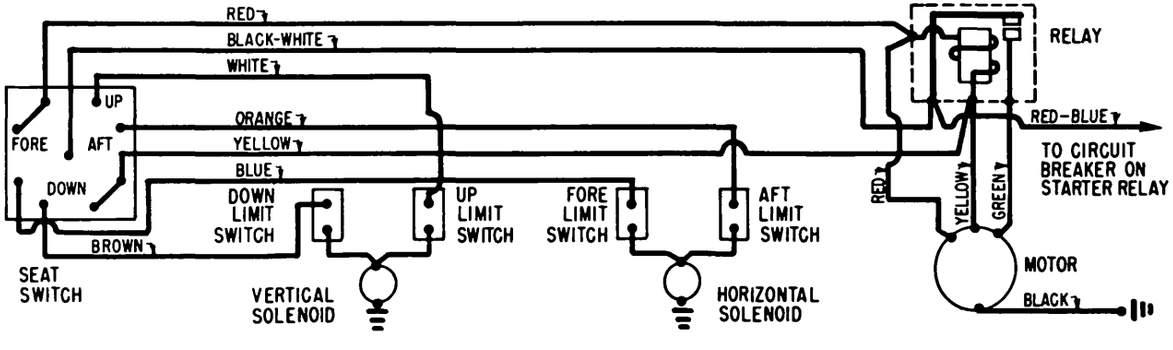
CHRYSLER & IMPERIAL 6-WAY SEAT ADJUSTER WIRING DIAGRAM

FORD THUNDERBIRD 4-WAY SEAT CONTROL

Ford Thunderbird (1961)

DESCRIPTION & OPERATION: Four-way power seat mechanism consisting of a reversible electric motor, control switch, motor control relay, gear housing and screw shaft, four limit switches, and two solenoid actuated nuts. Two duplicate assemblies are used, one for each front seat. Gear housing and screw shaft has a driving worn gear connected to motor by a rubber coupling and a driven gear which rotates screw shaft. horizontal and vertical nut and solenoid assemblies are meshed to screw shaft and connected to seat track. When solenoid is energized, internally threaded nut is locked by solenoid pawl (ball), engaging a notch on nut. When screw shaft is rotated through locked nut, nut and solenoid move along shaft and move seat track. When seat reaches any extreme position, limit switch disengages operating nut and solenoid assembly from screw shaft.

TROUBLE SHOOTING & DIAGNOSIS: Seat Will Not Operate - Check for properly grounded system at main (black) ground wire. Check for voltage to circuit breaker, at circuit breaker, and to main junction block at console panel. Check for voltage from junction block to control to control relay. Check for voltage from relay to control switch, and at each terminal of control switch. Check relay, motor, and wiring for voltage.



Motor Runs But Seat Does Not Move: Check for loose or broken motor coupling; faulty seat regulator worm, gear, or screw shaft; faulty wiring from control switch to solenoid; faulty solenoid and nut assembly; open limit switch.

Seat Moves In One Plane Only: If no voltage present at any switch terminal, switch is faulty. Check for inoperative solenoid or limit switches.

Seat Ratchets At End Of Travel: Faulty solenoid and nut assembly; faulty limit switch.

REMOVAL & INSTALLATION: Seat Mechanism - Remove seat track retaining nuts and washers and disconnect wiring to junction block. Remove seat assembly from car. Remove seat track-to-seat assembly retaining bolts, disconnect wiring at control switch, and remove seat track mechanism. To install, reverse removal procedure.

Seat Motor: Remove motor-to-drive assembly retaining nuts and washers and remove motor. Remove rubber coupling from motor shaft, and wiring from motor. To install, reverse removal procedure.

THUNDERBIRD 4-WAY SEAT CONTROL WIRING DIAGRAM

CADILLAC VACUUM DOOR LOCK

Cadillac (1961)

DESCRIPTION & OPERATION: Consists of vacuum storage tank, vacuum lock remote control valve assembly, selector valve, and actuator assemblies.

Vacuum Tank - Attached to front of power brake mounting support on left side of body. Connect by hose to engine manifold with check valve in the line. A minimum of three complete cycles of operation (lock and unlock) is available immediately after engine has been shut off.

Remote Control Valve - Attached with screws below right hand defroster duct. Supplies vacuum from tank to lock actuators when selector valve is actuated.

Selector Valve - Located on each front door trim assembly.

Actuator Assemblies - Located in each door are double acting vacuum diaphragms with vacuum supplied to each side. Diaphragm moves a linkage or bell crank connected to locking lever of lock.

►*NOTE:* All vacuum hoses and corresponding actuator ports are color coded, see diagram.

TROUBLE SHOOTING: Condition and cause as follows:

System Inoperative - Hoses crossed at vacuum supply tank, vacuum supply hose pinched at remote control valve, door valve supply hose pinched at remote control valve, vacuum supply hose disconnected at tank, remote valve or engine, remote valve diaphragm leaking.

All Doors Can Be Locked But Not Unlocked - Main supply hose crossed with lock supply hose at remote control valve, unlock selector hose or supply hose disconnected at remote valve.

All Doors Can Be Unlocked But Not Locked - Main supply hose crossed with unlock hose on remote control valve, lock selector hose or supply hose disconnected at remote valve.

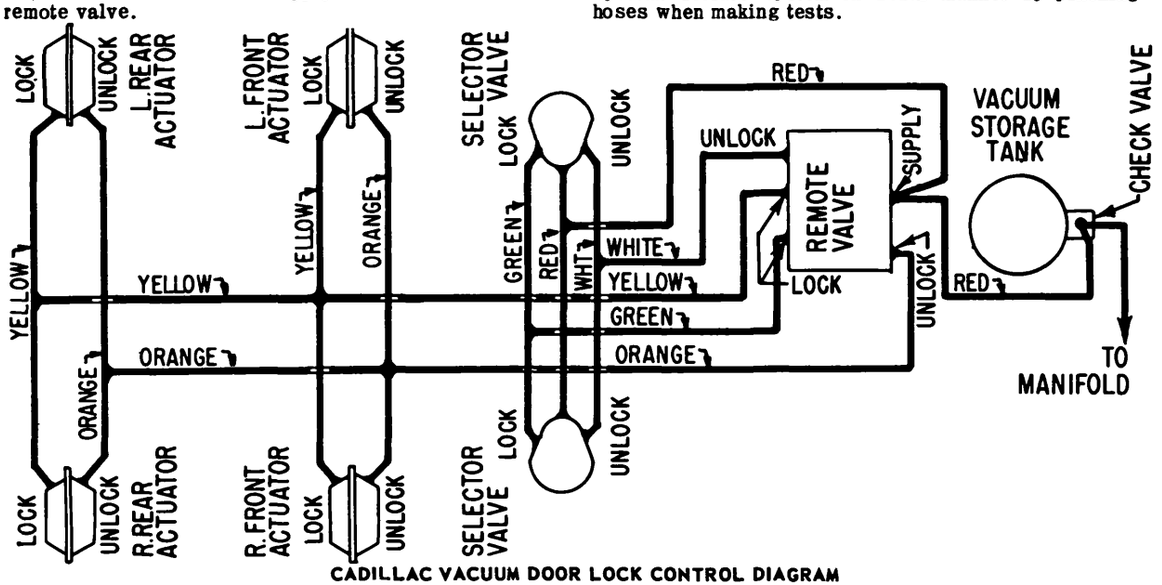
Moving Either Door Valve to Unlock or Lock Produces the Opposite Action of All Locks - Door lock selector valve hoses (small) crossed at remote control valve, actuator supply hoses (large) crossed at remote valve.

Moving One of Door Valves to Lock or Unlock Produces the Opposite Action of the Lock-Valve selector hoses crossed at one door valve, door selector valve reversed in trim assembly

System Will Not Lock From Door Valve or System Will Not Unlock From One Door Valve - Lock or unlock selector valve hose pinched or disconnected from affected door valve.

Lock Movement on Any Door Not Synchronized with Other Doors - Hoses crossed at affected door lock actuator.

One Door Lock Lags Behind Others When Locked or Unlocked - Lock or linkage binding.



System Inoperative from One Door Valve - Vacuum supply hose pinched or disconnected at affected door valve.

One Door Lock Will Not Lock or Unlock - Actuator hoses pinched or disconnected.

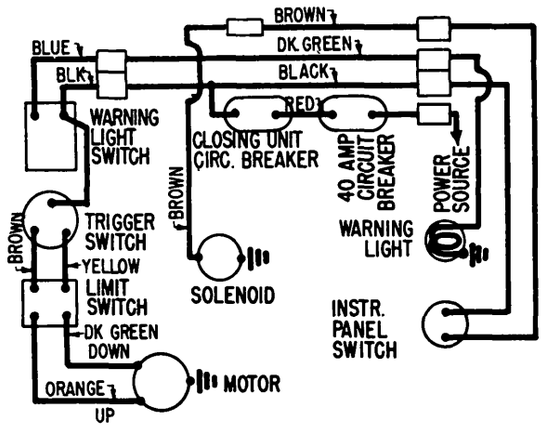
System Will Not Hold Vacuum for 48 Hours - Leak at remote control valve, any two door locks, storage tank and check valve, any part of harness connections.

Locks Inoperative with Front Door Closed, But Operative with Door Open - Door valve vacuum supply hose pinched at front body hinge pillar on side affected.

TESTING: For leaks not severe enough to be heard, use a suitable water testing device made from a quart jar and flexible tubing. I.D. of tube connected to remote control valve should be 7/32", and I.D. of tube connected to storage tank should be 5/32", Install tester hose not protruding into the water on bottom of check valve on tank. Install hose with end in the water to hose leading to remove control valve. After pressures in system normalized, a bubble will appear in water every 15 seconds or faster if there is an appreciable leak in system. Isolate system in usual manner by pinching hoses when making tests.

CADILLAC VACUUM DOOR LOCK CONTROL DIAGRAM

CADILLAC TRUNK LID LOCK



Cadillac, All Series (1961)

DESCRIPTION: Unit consists of a power closing unit located in rear end panel and a solenoid operated lid lock on trunk lid with a control switch in glove box which enables trunk lid to be opened from inside car. Trunk can be opened also with a key in the usual manner.

REMOVAL & INSTALLATION: Closing Unit - Remove unit guard and disconnect wiring harness plug. Mark position of closing unit on support and remove unit. To install, reverse removal procedure.

Lock Assembly - Remove trunk lid inner panel access hole cover plate. Disconnect lock solenoid wire at connector, then remove attaching screws and remove power lock assembly from lid. To install, reverse removal procedure.

CHECKING & ADJUSTMENTS: *See "Cadillac Electric Trunk Lid Lock" in 1959 Final Data or later Manual edition.*

CADILLAC TRUNK LOCK DIAGRAM

BUICK TRUNK LID LOCK

Buick (1961)

DESCRIPTION & OPERATION: Vacuum operated trunk unlocking device consists of control lever in glove box, vacuum reserve tank on left inner fender skirt, and vacuum power unit in trunk lock mechanism. Vacuum reserve tank vacuum supply line located in "T" fitting in distributor vacuum advance line near carburetor. A check valve in tank prevents vacuum loss when intake manifold vacuum drops. If vacuum unit fails, trunk can be unlocked in the usual manner.

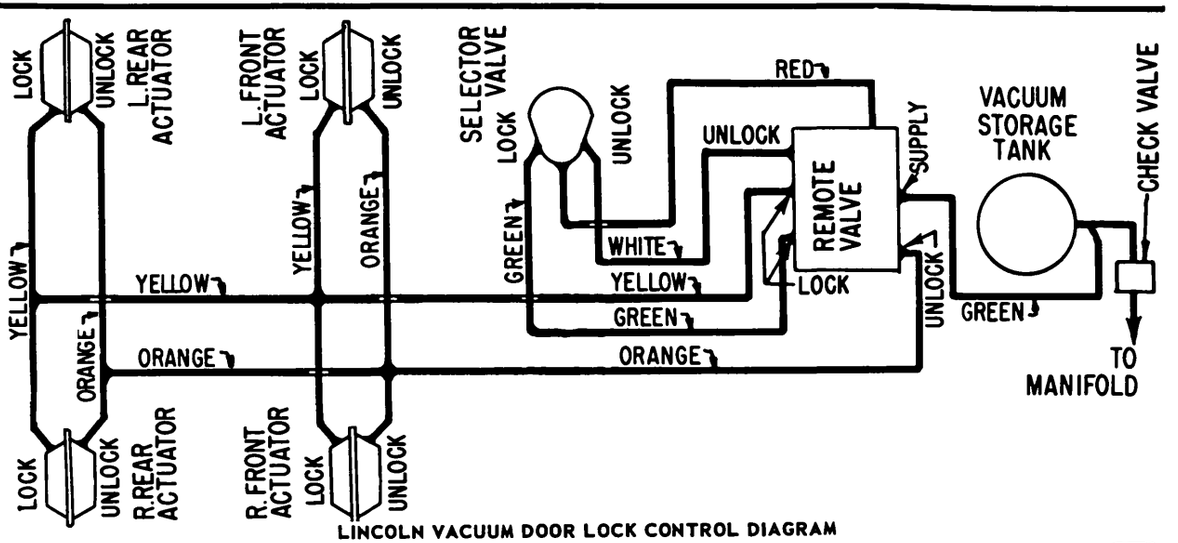
►*TRUNK LOCK & DISTRIBUTOR CAUTION:* To restore vacuum to supply tank, engine must be run above idle speed as there is no distributor vacuum advance at idle speed. Also, make sure that vacuum line from "T" fitting to reserve tank is in good condition and that there are no leaks at fittings or distributor vacuum advance will fail to operate.

LINCOLN CONTINENTAL DOOR LOCKS

Lincoln Continental (1961)

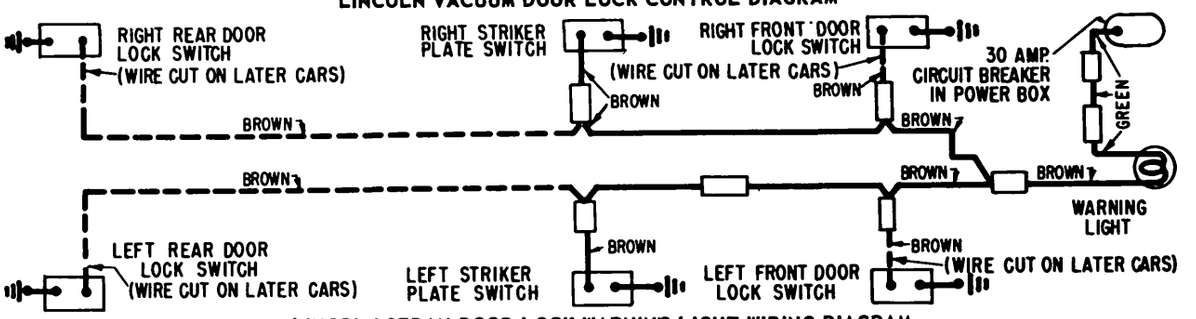
►CHANGES, CAUTIONS, CORRECTIONS

►*1961 DOOR LOCK WARNING LAMP NOTE:* Either Bulb No. 257 (flashing type) or Bulb No. 1445 (non-flashing type) may be used.



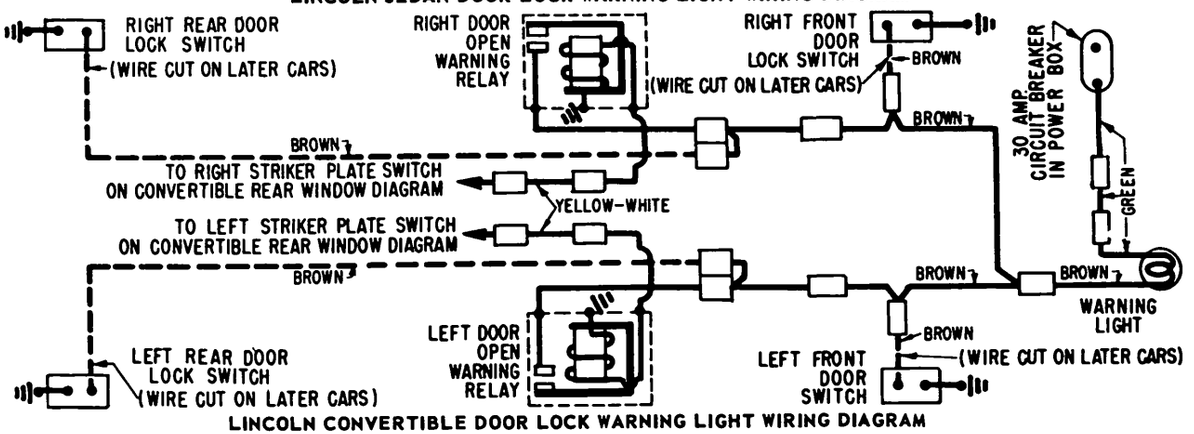
►*1961 INSTRUMENT PANEL SWITCH BREAKING CORRECTION & BEZEL REWORK NOTE (Cars Before F bruary 1, 1961):* Toggle shaft breakage may be caused by pressure exerted by plastic control bezel. When installing a new switch or replacing control bezel, grind 1/16" off back side of bezel.

►*1961 DOOR LOCK SYSTEM INOPERATIVE CORRECTION:* If caused by vacuum hose at vacuum reserve tank being broken or pinched, make sure hose is routed under wide rubber seal between fender and fender apron with hose length as short as possible.



►*1961 INSUFFICIENT VACUUM RESERVE CORRECTION:* Make sure black (heater) and green (door lock) hoses are not reversed at vacuum reserve tank (heater vacuum chamber is smaller than door lock chamber). Green door lock hose must be on outboard nipple of tank.

►*1961 WARNING LAMP CIRCUIT PRODUCTION CHANGE:* On cars after April 28, 1961, the brown wires connecting the door lock and door open warning lamp circuit to the door lock actuators in each door have been disconnected. The warning lamp will now flash or glow only when a rear door is open or not completely closed. The door lock warning lamp part of circuit is thus inoperative. *See wiring diagram for details.*



DESCRIPTION: Consists of a vacuum storage tank, vacuum control valve, selector valve on instrument panel, and actuator assemblies in each door. Selector valve switch on instrument panel allows all four doors to be locked or unlocked at one time by the driver. Any individual door may be locked or unlocked at any time in the usual manner because of a "Bleed-through" feature of selector valve which neutralizes the vacuum after doors are locked. A warning lamp on instrument panel will flash or glow depending on type bulb used *(see "Warning Lamp N t " above)* when a rear door is open or not completely closed, or when all doors are not locked. The door lock warning lamp switches are part of the vacuum actuator assemblies in each door. *NOTE - Door l ck warning lamp feature not used on later cars, see "Circuit Production Change" above.* The door open warning lamp switches are mounted on rear door side of center pillar (sedans), part of the rear door striker plate switch (convertible). *NOTE - On convertibles, strik r plate switch is also part of the automatic window circuit, and to isolate door open warning light circuit operation (accomplished by closing th ground circuit), and still maintain the hot feed for automatic window circuit, a door op n warning r lay is included in ach striker plate switch circuit.*

LINCOLN VACUUM DOOR LOCK CONTROL DIAGRAM

LINCOLN SEDAN DOOR LOCK WARNING LIGHT WIRING DIAGRAM

LINCOLN CONVERTIBLE DOOR LOCK WARNING LIGHT WIRING DIAGRAM

REMOVAL & INSTALLATION: Vacuum Control Valve - For access, remove glove compartment.

S lector Valv Switch - Disconnect battery. Remove lower radio speaker and grille, and hood release handle and bracket from dash panel. Remove top control switch from dash panel. Remove lower left instrument panel cover, and the lower section of left fresh air vent. Remove door lock switch knob, bezel nut and both bezels. Remove hoses from switch and remove switch. Plug vacuum hoses to prevent dirt entry.

TESTING & TROUBLE SHOOTING: *CAUTION - DO NOT apply air pressur to system r actuator diaphragms will be damag d. P rform all t sts with engine running.*

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL DOOR LOCK (Continued)

Entire System Inoperative: Check for vacuum at manifold, check valve, and storage tank (attach a vacuum gauge to each component). Locks will be actuated at 6-8" of vacuum. Check vacuum to control valve by removing green supply hose. If no vacuum present, hose is damaged, restricted or improperly installed.

All Doors Will Not Lock: Unlock doors and disconnect red and green hoses from control valve. If no vacuum at red nozzle on control valve, control valve is faulty. If vacuum present, connect red and green nozzles of valve with a jumper hose. If doors lock, selector valve or hoses to valve are faulty. Remove green and yellow hoses from control valve and connect yellow hoses to green hose with jumper hose. If doors lock, control valve is faulty.

All Doors Will Not Unlock: With all doors locked, remove red and white hoses from control valve. If no vacuum present, control valve is faulty. If vacuum is present, connect red and white nozzles of valve with a jumper hose. If doors unlock, selector valve or red and white hoses to valve are faulty. Remove green and orange hoses from control valve and connect orange hoses to green hose with a jumper hose. If doors unlock, control valve is faulty.

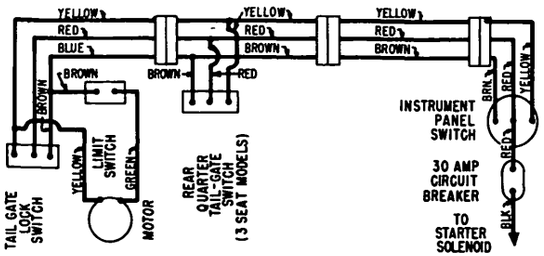
One or More Locks Inoperative: 1) Remove cowl trim panel, disconnect yellow (locking) or orange (unlocking) hose from tee. If no vacuum at hoses connected to control valve when selector valve actuated, control valve or hoses from valve are faulty.

2) **Front Doors** - Remove door trim panel and access cover and disconnect yellow or orange hose from actuator. If vacuum is present at hoses when selector valve operated, actuator or mechanical linkage is faulty.

3) **Rear Doors** - Remove rear seat cushion and back and disconnect yellow or orange hose at nipple in quarter panel. If no vacuum present at hoses when selector valve operated, hose from tee behind cowl panel or tee is faulty. If vacuum is present, disconnect yellow or orange hose from actuator in door. If vacuum is present at hoses when selector valve operated, actuator or mechanical linkage is faulty.

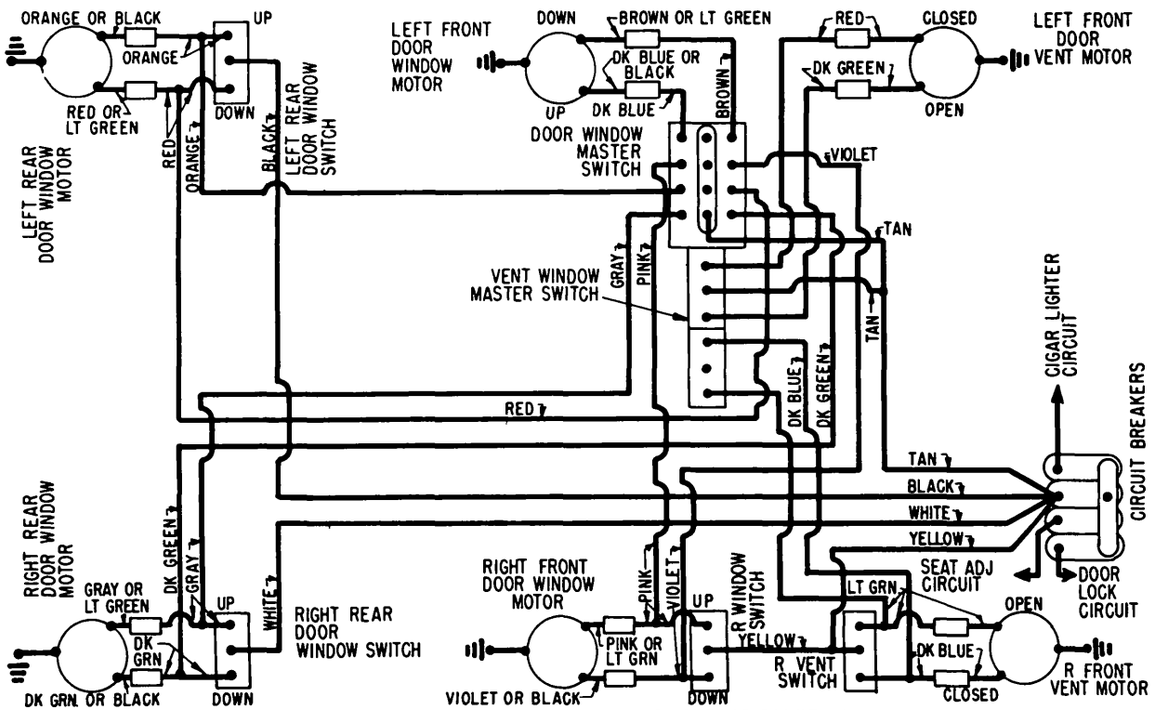
CHRYSLER CORP. ELECTRIC WINDOWS

Chrysler & Imperial (1961)
DeSoto (1961)
Dodge & Dodge Dart (1961)
Lancer (1961) Ⓒ
Plymouth (1961)
Valiant (1961) Ⓒ
Ⓒ - Suburban tailgate window only.



►CHANGES, CAUTIONS, CORRECTIONS

►*1961 TAILGATE WINDOW BINDING IN UP POSITION CORRECTION & PRODUCTION CHANGE:* Install a rubber hose, Part No. 2254553 (framed windows), No. 2254554 (unframed windows), between inner and outer lips of upper glass run to reduce upward travel limit of window. This change made on later cars.



DESCRIPTION: Door Windows - Similar in design and operation to previous models.

Tailgate Window - Electrically operated window controlled by a key operated switch in exterior locking handle, and by a switch on instrument panel. On 3-seat suburbans, an additional roof rail switch provided for passenger control of window. Optional "Child Guard" control for 3-seat suburbans consists of an up relay, a down relay, and a vacuum switch in one of the rear doors. Vacuum switch controls roof rail switch. When rear door is locked, vacuum switch is open, roof switch is not grounded, and is inoperative. However, window can be controlled from lock or instrument panel switches in usual manner.

WINDOW LIFT REPLACEMENT: Removal - Disconnect battery and remove garnish molding, then remove door trim panel and disconnect wires from switch. Remove clips from regulator pins holding lower glass channel.

SUBURBAN TAIL GATE WIRING (TYPICAL)

CHRYSLER CORP. ELECTRIC WINDOW WIRING DIAGRAM

Raise glass manually, then remove regulator attaching screws, pivot guide retaining pin and remove motor and regulator through opening in door. If necessary to replace gear box, first remove regulator counter-balance spring. *NOTE - The gear box is replaced only as a complete assembly and is permanently lubricated.*

Installation: Place regulator and motor through door opening and insert pivot arm pin into guide. Install regulator screws finger tight. DO NOT TIGHTEN at this time. Remove window prop and lower glass, then insert control arms into glass channel, using a leather washer on each side of channel and secure with a clip. Connect wires to motor and connect battery, then operate window several times and stop glass halfway. Tighten regulator screws. Check operation as follows: Connect an ammeter into circuit and operate window. Ammeter reading should be constant at approximately 14 amps. (all models except rear doors of 4-Door Hardtop models), 20 amps. (4-Door Hardtop models). If ammeter reading fluctuates, there is a bind in glass or linkage. Adjust glass down stop so window is flush with garnish molding. Install trim panel, garnish molding, and other parts.

FORD MOTOR CO. ELECTRIC TYPE

Ford Pass. Cars (1961)
Mercury (1961)
Thunderbird (1961)

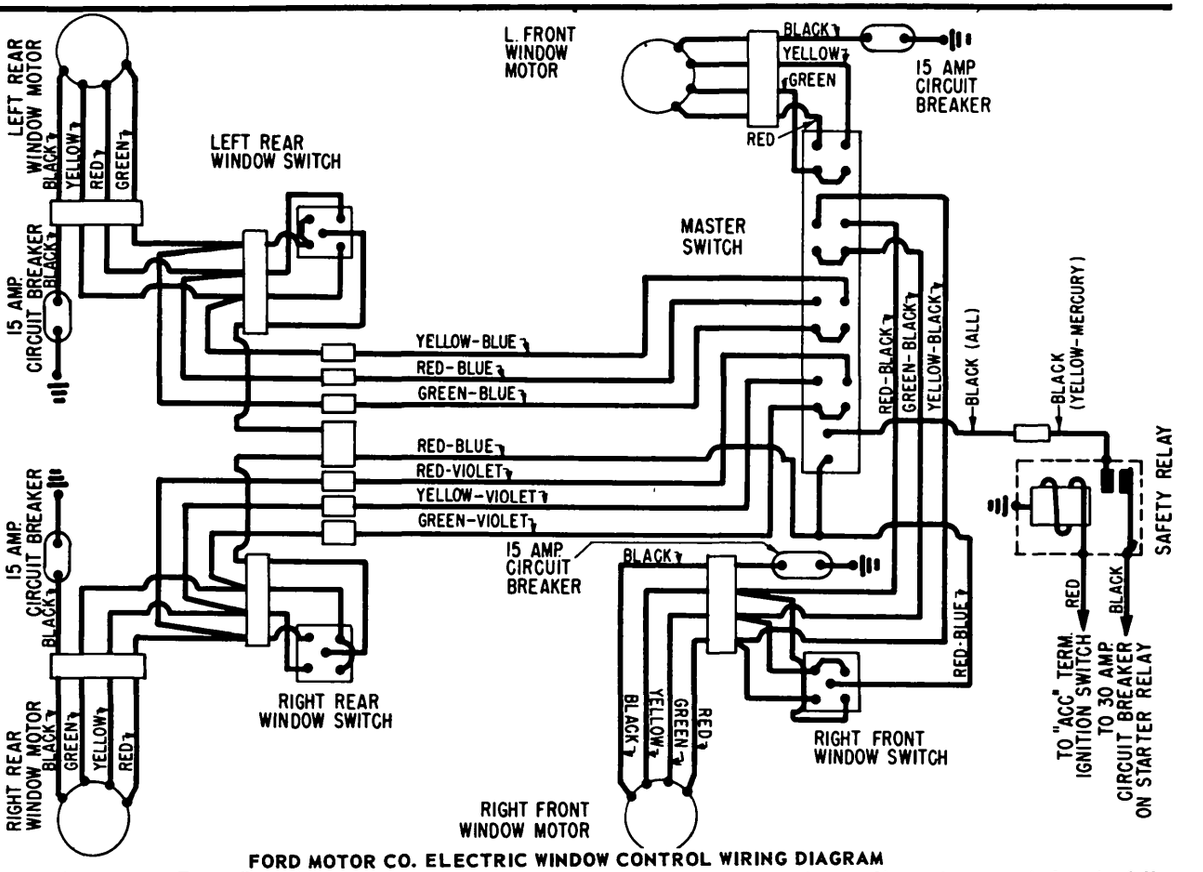
►CHANGES, CAUTIONS, CORRECTIONS

►*WINDOW SWITCH FAILURE PREVENTION:* If a switch has failed because of water entering switch, seal replacement switch with waterproof tape before installing.

DESCRIPTION: Electrically controlled windows operated a reversible type motor combined with each individual window regulator assembly. Individual switches located near each window for separate control, and a master control switch on left front door to control all windows. A lock-out switch on master control switch enables windows to be operated only by the driver of the car. A safety relay on right side of cowl prevents window operation except when ignition switch in ON or ACC positions. *NOTE - For electrically operated station wagon tailgat window, see "Ford Motor Co. Tailgate Window" in this section.*

TROUBLE SHOOTING & DIAGNOSIS: All Windows Will Not Operate In Either Direction - Trouble will be in main feed circuit breaker, safety relay, ignition switch, or lock-out switch; or any of appropriate control wiring. with a voltmeter or jumper wire, test for current at various parts of control circuit.

On Window Will Not Operate In Either Direction Through Either Switch Circuit: If motor runs freely, it is loose and pulled away from coupling. Check for defective motor circuit breaker, faulty wiring from switches to motor (or faulty switch feed wire), motor armature or field windings faulty.



On Window Operates In One Direction Through Either Switch: Check for faulty switch or faulty wiring between switch and motor. Check for faulty motor field coil.

Window Operates In Both Directions Through One Switch Only: Check for defective switch or faulty wiring between switch and motor.

Window Operates Opposite To Switch: Check for improperly mounted switch.

Window Operates Sluggishly: Check regulator and window runs for binding. Check for frayed insulation on wires which may cause partial ground. Check that paint does not insulate ground wires or ground circuit breakers. Check for loose connections or corrosion causing high resistance. Check motor current draw with an ammeter. Normal current draw during operation should not exceed 20 amperes. Current draw with mechanism against a stop should be 30-50 amperes. If current draw excessive, replace motor. Motor no-load current draw should not exceed 14 amperes at 12 volts.

REMOVAL & INSTALLATION: Motor (Ford & Thunderbird) - Remove door trim panel, disconnect wires, remove motor mounting nuts and motor brace. Pull motor free of rubber coupling and remove motor.

FORD MOTOR CO. ELECTRIC WINDOW CONTROL WIRING DIAGRAM

Motor (Mercury - Front Doors): Disconnect battery, remove door trim panel and trim water shield. Disconnect motor wires, and remove motor bracket attaching screw. Disconnect motor and coupling from regulator assembly, then remove motor.

Motor (Mercury - Rear Doors or Quarter): *Motor removed with regulator as an assembly. See "Regulator Removal" below.*

►*REGULATOR ARM TENSION SPRING REPLACEMENT NOTE:* Spring can be replaced after regulator removed. Regulator arm must be at point of maximum upward travel to reduce amount of spring tension to overcome.

Front Door Regulator: Ford - Remove door trim panel and loosen water shield. On 2-door and 4-door hardtop models, disconnect regulator at arm and plate. On other 4-door models, disconnect regulator from glass channel roller. Secure glass by hand in raised position. On 4-Door models (except hardtop), disconnect front run bracket from inner panel to provide access. On all models, remove regulator retaining screws and remove regulator. To install, reverse removal procedure.

Mercury - *NOTE - Procedure is for removal of regulator and motor as an assembly.* Disconnect battery, remove door trim panel and trim water shield. Remove window lower stop. Disconnect motor wires. With wire hook, remove retainers from window rollers and separate regulator arm pivots from rollers. Secure window in fully raised position. Remove regulator assembly attaching screws and remove regulator and motor assembly.

Thunderbird - Remove door trim panel and loosen water shield. Block window in fully raised position, and remove regulator arm from plate assembly. *NOTE - If arm and plate assembly are to be removed, lower window and disconnect arms from the two glass roller assemblies, then remove arm and plate assembly.* Remove regulator assembly retaining screws and remove regulator. To install, reverse removal procedure.

Rear Door Regulator: Ford - Remove door trim panel and loosen water shield. Lower glass about halfway and disconnect regulator arms, then support glass in fully raised position. Remove regulator retaining screws, slide equalizer arm out of bracket or guide, then remove regulator. To install, reverse removal procedure.

Mercury - With window fully raised, disconnect battery, remove door trim panel and trim water shield. On 4-door hardtop, remove window upper stop. On all models, disconnect motor wires, and remove retainers from window rollers with a wire hook. Separate regulator arms from rollers and prop window up. On 4-door hardtop, remove center guide assembly. On all models, remove regulator and motor bracket mounting screws.

CONTINUED ON NEXT PAGE

FORD MOTOR CO.
ELECTRIC TYPE (C ntinued)

Slide equalizer arm out of bracket and remove regulator and motor as an assembly. To install, reverse removal procedure.

Rear Quarter Regulator: Ford - Remove rear seat cushion and back, remove trim panel and pull water shield away from access holes. Lower window, disconnect regulator from glass channel rollers, and support window in fully raised position. Remove regulator retaining screws, slide regulator arm out of equalizer bracket, and remove regulator. To install, reverse removal procedure.

Mercury - Remove rear seat cushion, back and trim panel. Lower window, remove retainer clips from window rollers, separate regulator arms from rollers, then remove rollers. Secure window in fully raised position. Remove motor from regulator. Disconnect regulator from quarter panel, slide equalizer arm out of equalizer arm bracket and remove regulator assembly. To install, reverse removal procedure.

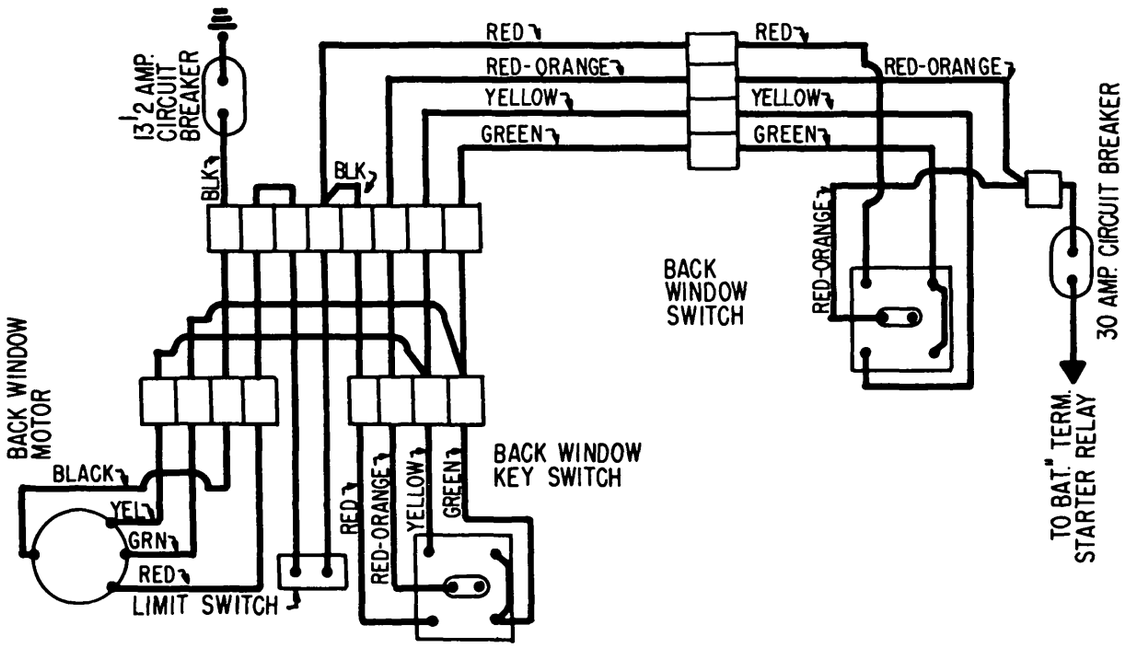
Thunderbird - Remove quarter trim panel and water shield. Remove window upper stop. Disconnect regulator arms from glass channel. Lower glass, lift glass from front guide, then remove glass assembly. Remove regulator retaining bolts, slide regulator equalizer arm roller out of bracket, and remove regulator. To install, reverse removal procedure.

FORD MOTOR CO. TAIL GATE WINDOW

Comet, Station Wagon (1961)
Falcon, Station Wagon (1961)
Ford, Station Wagon (1961)
Mercury, Station Wagon (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*WINDOW REGULATOR REPLACEMENT NOTE:* Manual type only furnished for replacement and must be reworked for electric type installation.



DESCRIPTION: Electrically controlled station wagon tailgate window operated by a reversible electric motor and a window regulator mechanism in tailgate. Control is through a key operated lock switch on upper center of tailgate outer panel, and a toggle switch on left front door for driver control. A limit switch located at right side of tailgate pillar post prevents operation of window when tailgate is open.

EMERGENCY MANUAL OPENING: Opening Tailgate If Window Is Fully Raised - Remove trim panel retaining screws, trip lock handle to relieve pressure, then remove trim panel by pulling up and forward to slide it out of lower retainer. Remove water shield and access hole cover from inner panel. Remove regulator arm roller retaining pins and disengage rollers from regulator arms. Push window into full down position and open tailgate.

Opening Tailgate If Window Is Partially Raised: Remove quarter window rear garnish moldings, and quarter window outside rear moldings. Remove tailgate window glass upper side run retaining screws. Open tailgate and window as an assembly by removing upper runs simultaneously.

TROUBLE SHOOTING & DIAGNOSIS: *CAUTION - When testing circuits with tailgate lowered and limit switch held closed, operate circuit only momentarily. Continuous operation of window in horizontal position will damage motor,*

Window Will Not Operate Through Either Switch Circuit: Check control circuit for continuity. Check feed and ground circuit breakers. Check all wiring for continuity. Motor armature or field coil windings may be faulty. Limit switch or wiring may be defective (down cycle).

FORD MOTOR CO. STATION WAGON TAILGATE WIRING DIAGRAM

Window Operates Through One Switch Only: The other switch is defective. Wiring from other switch faulty.

REMOVAL & INSTALLATION: Window - Lower tailgate, disconnect hinge supports at tailgate, remove trim panel and trim panel water shield. Remove retainers from window channel rollers and disconnect regulator arms from rollers. Remove window.

Motor: Remove window (see above), disconnect wiring from motor, and remove motor-to-regulator attaching nuts .Remove motor.

Regulator: *NOTE - Motor and regulator may be remov d as an assembly if desired.* Remove window (see above), disconnect motor wiring at motor, and remove regulator attaching nuts. Remove regulator and motor assembly.

Limit Switch: Lower tailgate. If switch not visible, remove access cover behind tail light or trim panel and water shield as necessary. Remove limit switch attaching screws and remove switch.

Lock Switch: Switch can be removed after window, motor, and regulator are removed.

LINCOLN CONTINENTAL ELECTRIC TYPE

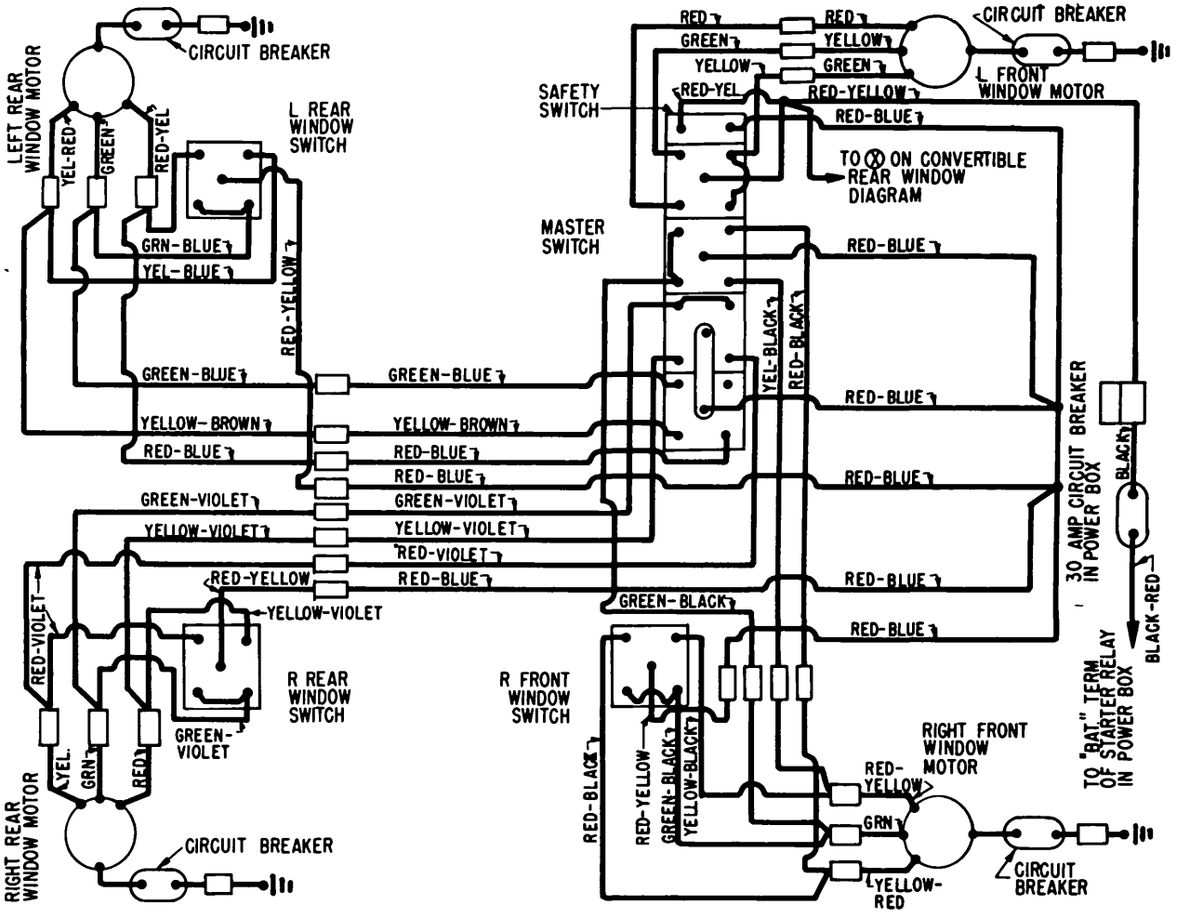
Lincoln C ntin ntal (1961)

DESCRIPTION: Two kinds of system used as follows: **C nventi nal Typ** - Single reversible electric motor in each door to operate each door window (front door vent windows not electrically operated). A single-pole, double-acting switch is installed on each door arm rest for individual window control, and a master control switch is installed on left front door arm rest for driver operation of all windows. Master switch also contains a lock-out switch so all windows can be operated from master control switch only.

Automatic Typ - This system used on Convertible rear door windows, and is built around conventional system. Consists of additional switches and relays which automatically lower rear door window approximately 5" when door is opened, hold window in position, then return window to fully raised position when door is closed. Window can be operated in the usual manner from either switch except that it cannot be raised manually after it has lowered automatically, see *"Manual Operation Note" under OPERATION below.*

OPERATION (AUTOMATIC TYPE): Window operation is divided into down and up cycles as follows:

Window D wn Cycl : 1) When door inside handle or outside pushbutton is moved to open door, cam on lock assembly actuates door handle switch to close switch contacts. Current flows through door handle switch, window stop switch, down relay coil and stop relay contacts. Down relay is now energized and down relay contacts are closed. When door handle or pushbutton released, down relay is kept energized by a "lock-in" circuit with current sipplied and recirculated from down relay contacts. Current flows through the same components except that door handle switch is not in the circuit.



2) When down relay contacts are closed, current flows through down relay contacts, to motor down field, to armature relay coil, and stop relay coil to ground. Energizing armature relay coil closes armature relay contacts and current flows from battery, through armature relay, motor armature, and stop relay coil to ground. Motor is then energized and window begins to lower.

3) When window is 4-6" down, window down stop switch will be opened to open down relay and motor down field circuits to stop motor.

4) No. 1 contacts of door striker plate switch are closed when door is open. Current now flows through door striker plate switch No. 1 contacts, window cut-off switch, up relay coil, stop relay contacts and coil, and bypass switch to ground. Up relay is now energized but window will not raise until striker plate switch is depressed when door closed to close motor up field circuit. As soon as up relay coil is energized a "lock-in" circuit is completed through the up relay contacts to keep the circuit functioning until door is closed.

Window Up Cycl : 1) When door is closed, striker plate switch is depressed to close striker plate switch No. 2 contacts. Current now flows through up relay contacts, striker plate switch No. 2contacts, motor up field, armature relay coil, stop relay coil, and bypass switch to ground. Energizing armature relay coil closes armature relay contacts and current flows from battery, through armature relay, to motor armature, and stop relay coil to ground. Motor is then energized and window begins to rise.

2) About ¼" before window reaches closed position, window actuates bypass switch to open switch contacts. Current now flows only through stop relay coil to ground. Stop relay coil now carries full motor current (becomes an overload cutout). When window is fully closed, motor stalls and draws maximum current. This current energizes stop relay coil to open stop relay contacts which open complete window up circuit and deactivate the system.

LINCOLN CONTINENTAL CONVENTIONAL WINDOW WIRING DIAGRAM

►*MANUAL OPERATION & CUT-OFF SWITCH FUNCTION NOTE:* 1) If window has been lowered more than 6" before door is opened, cut-off switch is actuated (contacts open) and relay circuit is disconnected so no automatic window operation will take place.

2) When window has been lowered automatically and door is open, motor up field can be completed only through No. 2 contacts of door striker plate switch when door is closed. Therefore window cannot be raised manually.

3) With door open and window lowered automatically, either switch can be operated to lower window completely. However cut-off switch contacts will be opened and window will not raise automatically when door is closed. Window must be raised manually after door is closed to reset circuit for automatic operation.

EL ECTRICAL COMPONENTS & LOCATIONS (AUTOMATIC WINDOWS): Following list of electrical components and their locations will aid in testing and in trouble shooting.

30 Ampere Circuit Breaker: Main power window feed. In power box.

10 Ampere Circuit Breaker: Protects relay and motor field circuits. On relay panel behind rear seat.

Motor: In lower inner door panel.

Window Stop Switch: On plate inside door panel above door lock.

Window Cut-Off Switch: On plate inside door panel above door lock.

D r Handle Switch: On door lock assembly inside door panel.

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL ELECTRIC TYPE (Continued)

D r Striker Plate Switch: In door latch striker plate.
Window Bypass Switch: Inside door panel at top of door on window rear up-stop bracket.
Armature Relay: Relay panel behind rear seat.
Stop Relay: Relay panel behind rear seat.
Up Field Relay: Relay panel behind rear seat.
D wn Field Relay: Relay panel behind rear seat.

TROUBLE SHOOTING & DIAGNOSIS (CONVENTIONAL WINDOWS): Bypass switches and relays as necessary when making tests. Use a continuity light for checking circuits.

On Window Operates In One Direction Only Through Either Switch: Motor field or field circuit wiring open or shorted

Window Operates In Both Directions Through One Switch Only: Switch defective or open wiring.

On Window Totally Inoperative: Motor armature and/or field windings, or circuit wiring open or shorted. Motor circuit breaker improperly grounded or faulty.

All Windows Totally Inoperative: 30 ampere main feed circuit breaker or main feed wiring defective.

TROUBLE SHOOTING & DIAGNOSIS (AUTOMATIC WINDOWS): *NOTE - Since automatic window circuit is built around conventional electric window system, check that conventional part of system is in proper operating condition before checking automatic window circuits. Use the following guide for automatic window checks.*

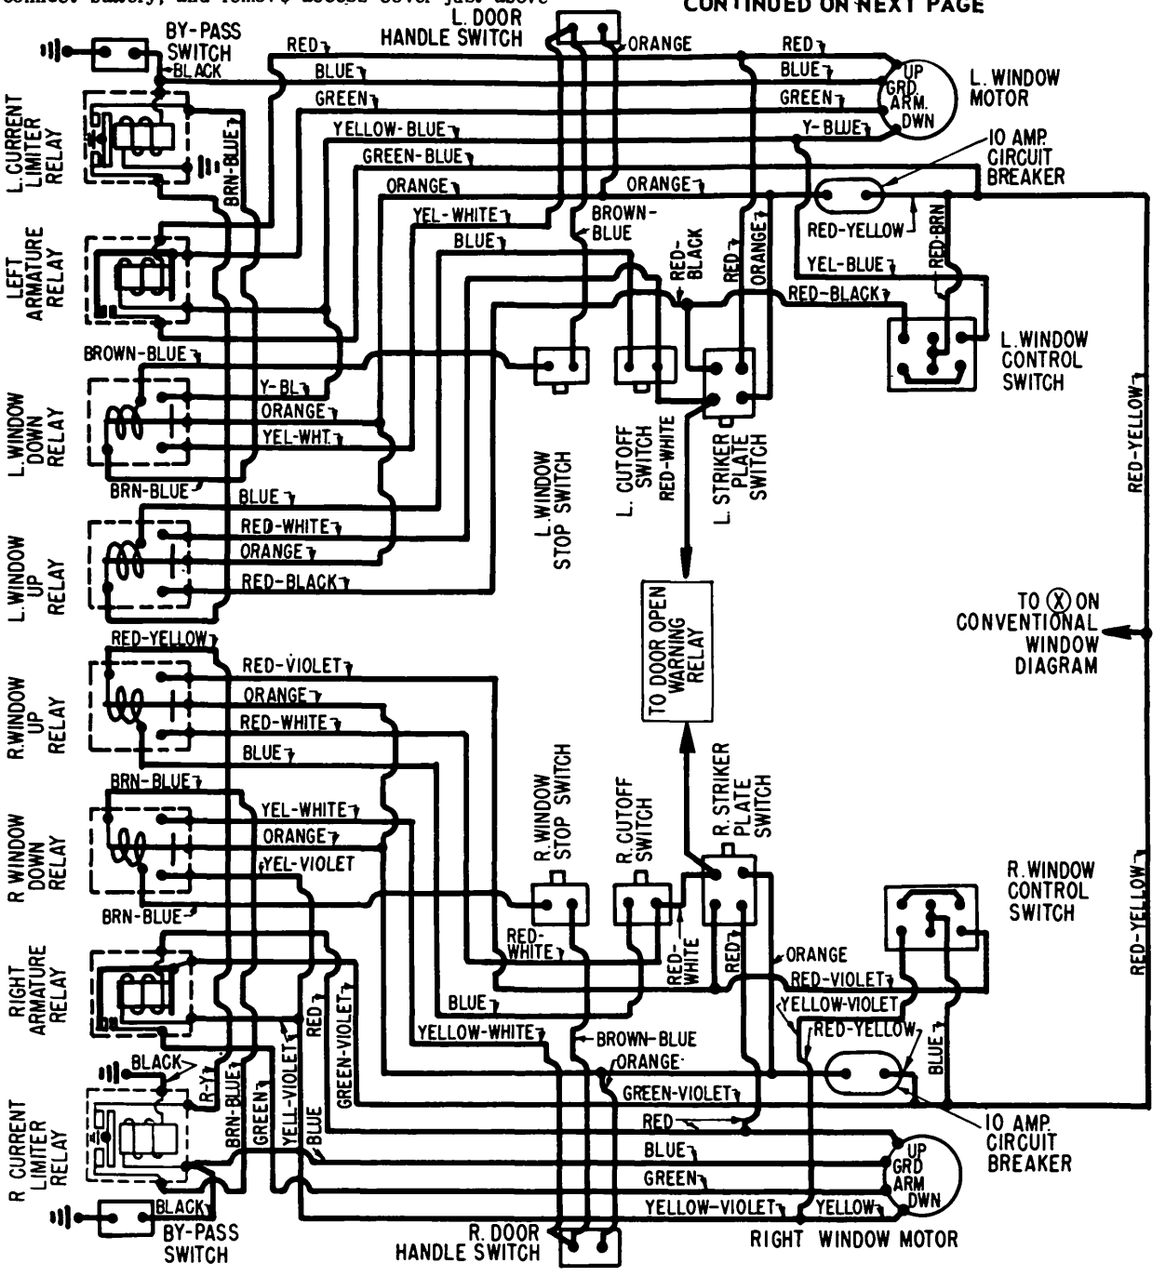
Window Will Not Lower Automatically: Check 10 ampere circuit breaker, motor down relay, door handle switch, window stop switch.

Window Lowers Completely: Check stop switch actuator lever spring, window stop switch, motor down relay.

Window Will Not Raise: Check 10 ampere circuit breaker, motor up relay, window cut-off switch, door striker plate switch.

Window Closes But Motor Does Not Stop: Check window stop relay and window bypass switch.

SWITCH ADJUSTMENTS (AUTOMATIC WINDOWS): Door Handle Switch - Open rear door, raise window (depress striker plate switch), and disconnect battery. Remove trim panel, disconnect door handle switch wires, and remove door lock assembly. Engage door lock locking pawl and loosen switch adjusting screws. Hold locking lever tightly against locking pawl and adjust door handle switch so switch roller just touches switch actuating cam. Tighten adjusting screws. *NOTE - Make sure switch cannot be actuated when door lock is in l ck position. Lower window before closing door.*



Bypass Switch: Open door, remove trim panel, disconnect battery and switch leads. Mark window up stop position and remove stop and bypass switch as an assembly. Adjust switch so threaded part of switch is flush with lower surface of window stop bracket. *NOTE - Threaded part must not protrude beyond bracket.* Reinstall switch and window stop.

Striker Plate Switch: Open door, remove center pillar trim, disconnect battery and switch leads. Mark striker plate position and remove striker plate and switch assembly. Adjust switch so threaded part of switch is flush with inner surface of striker plate. *NOTE - Threaded part must not protrude into l ck throat of strik r plate.* Install striker plate and switch assembly.

Window Cut-Off & Stop Switches: *NOTE - Both switches mounted on a singl mounting plate and two types of mounting plat have b n used. Type 1 us s hairline method for cut-off switch adjustment. Type 2 uses gauge pin hole method for cut-off switch adjustment.* Adjust switches as follows: Open door, lower window, disconnect battery, and remove access cover just above door lock. Remove outer switch plate mounting screws, pull on switch plate, and remove inner screw and switch plate together (prevents dropping inner screw inside door). Disconnect switch leads and remove assembly.

Cut-Off Switch Type 1 - Loosen cut-off switch (switch

CONTINUED ON NEXT PAGE

CONVERTIBLE AUTOMATIC REAR WINDOW WIRING DIAGRAM

LINCOLN CONTINENTAL
ELECTRIC TYPE (Continued)

without roller) on mounting plate and align switch actuator lever surface contacting switch with vertical hairline scribed on switch. Move switch toward actuator until contacts click, then tighten switch retaining screws. Check adjustment by moving actuator arm against switch. Click should occur when actuator is in line with hairline.

Cut-Off Switch Typ 2 - Insert 1/8" diameter pin into aligning hole in switch mounting plate and swing switch actuator against pin. Hold actuator lever against pin and move switch toward actuator until contacts click. Tighten switch mounting screws. Check adjustment by moving actuator arm against switch. Click should occur just as actuator contacts gauge pin.

Stop Switch - Loosen switch retaining screws and place actuator arm so it just touches cut-off switch blade. Hold actuator in this position and adjust switch tightly against actuator until no free travel is present, then tighten switch retaining screws. When installing assembly in door, position actuator lever on top of window mechanism actuating pin.

REMOVAL & INSTALLATION: Motor - Remove door trim panel, access cover, and rear guide on rear doors. With window in fully raised position, remove motor-to-regulator attaching nuts, disconnect wiring, and remove motor. To install, reverse removal procedure.

Window Cut-Off & Stop Switches - *See "Switch Adjustments" above for removal.*

Door Handle Switch - Remove trim panel and door access cover plate. Raise window completely, disconnect switch wiring, remove retaining screw and remove switch.

Bypass Switch - *See "Switch Adjustments" above for removal.*

Striker Plate Switch - *See "Switch Adjustments" abov for removal.*

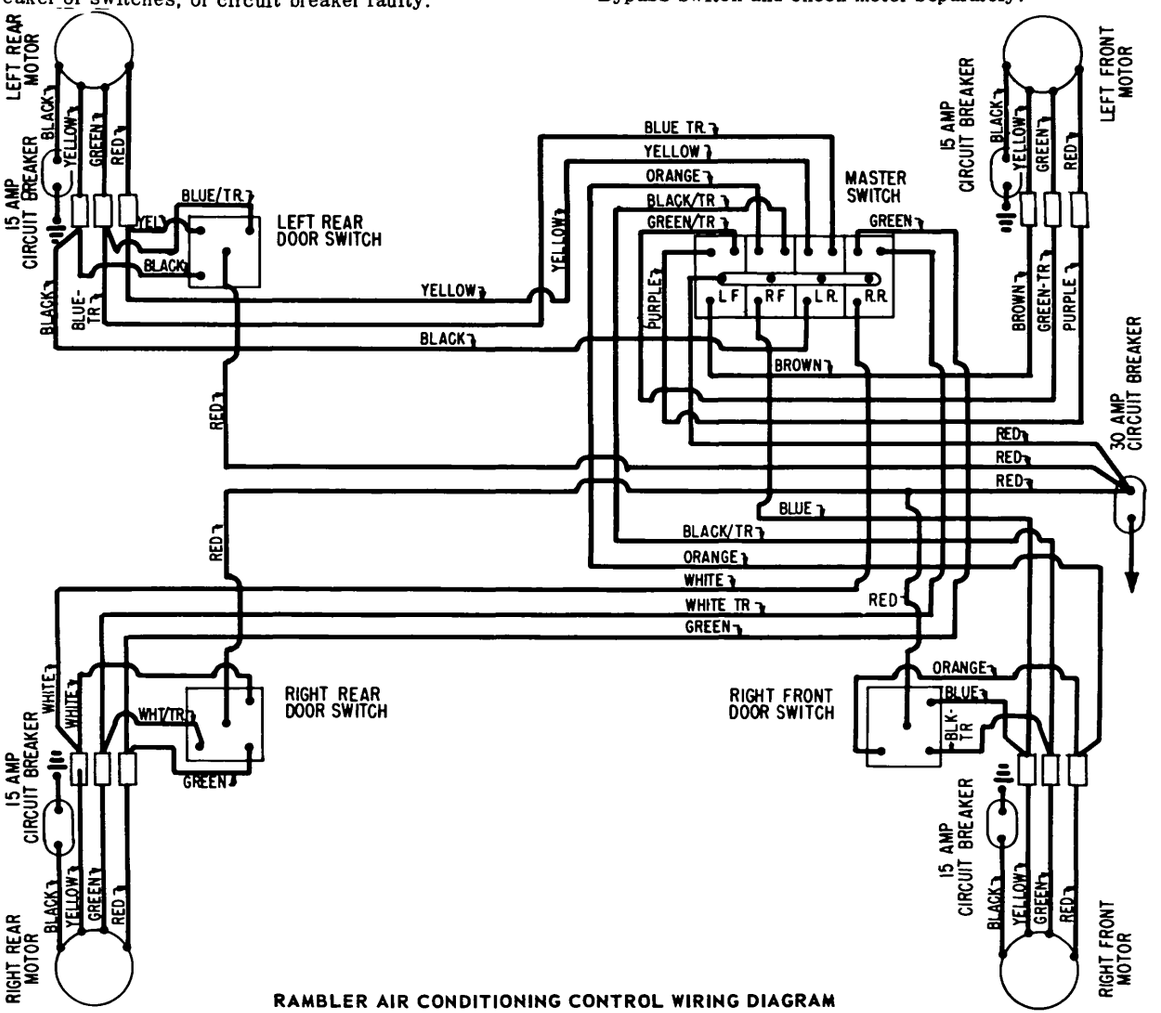
RAMBLER

Rambl r (Except Am rican) (1961)

DESCRIPTION: Window regulators are individually powered by electric motor in each door. Motors are controlled by individual switches on each door panel and a master switch mounted on the left front door panel. All switches are retained to trim panel by spring type retaining clips at top and bottom sides of switch. A 30 ampere circuit breaker mounted under instrument panel protects wiring harness and a 15 ampere circuit breaker is used to protect motor.

REMOVAL & INSTALLATION OF REGULATOR ASSEMBLY: *NOTE* - Regulator and motor must be removed as an assembly.

Fr nt Do r Wind w R gulator: *Ignition key must be in off position.* Remove window control switch assembly and door trim panel. Disconnect regulator arm from cross arm assembly by removing key slotted retainer from grooved stud riveted to cross arm assembly. Move glass to fully raised position and remove circuit breaker to inner panel screw. Disconnect motor to switch wires and remove mounting stud at lower end of center division bar. Remove regulator to door screws, hold division bar toward inner door panel (for clearance), and remove regulator and motor assembly through large opening in inner door panel. To install, reverse removal procedure.



R ar D r Wind w R gulator: *Ignition key must be in off position.* Remove window control switch and door trim panel. Disconnect regulator arms from glass bottom channel by removing retainers and raise glass to fully raised position. Move regulator arms to horizontal position. Disconnect motor wires at connectors and remove circuit breaker from inner door panel. Remove regulator mounting screws and remove regulator and motor assembly through lower rear corner of cutout keeping regulator arms together. Use slight pressure if necessary.

Mast r Switch: *Ignition switch must be in off position.* Insert putty knife or similar tool at top of switch between switch housing and mounting plate and depress retaining spring by pushing downward on both springs top and bottom. Tilt switch away from panel at top of switch and insert putty knife at retainer locations. When removing switch, tag each wire and mark terminal for proper reassembly.

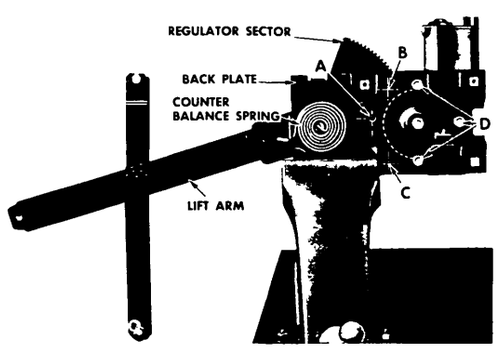
TROUBLE SHOOTING: All Wind ws Fail T Operat In Eith r Directi n r Op rat Sl wly - Battery low or dead, circuit breaker faulty. Battery ground loose, or terminal in control circuit loose or corroded.

Windows Operate Intermittently - Loose wires on circuit breaker or switches, or circuit breaker faulty.

One Window Fails To Operate - Loose or broken connections at dash circuit breaker and switch in door. Bypass switch and check motor separately.

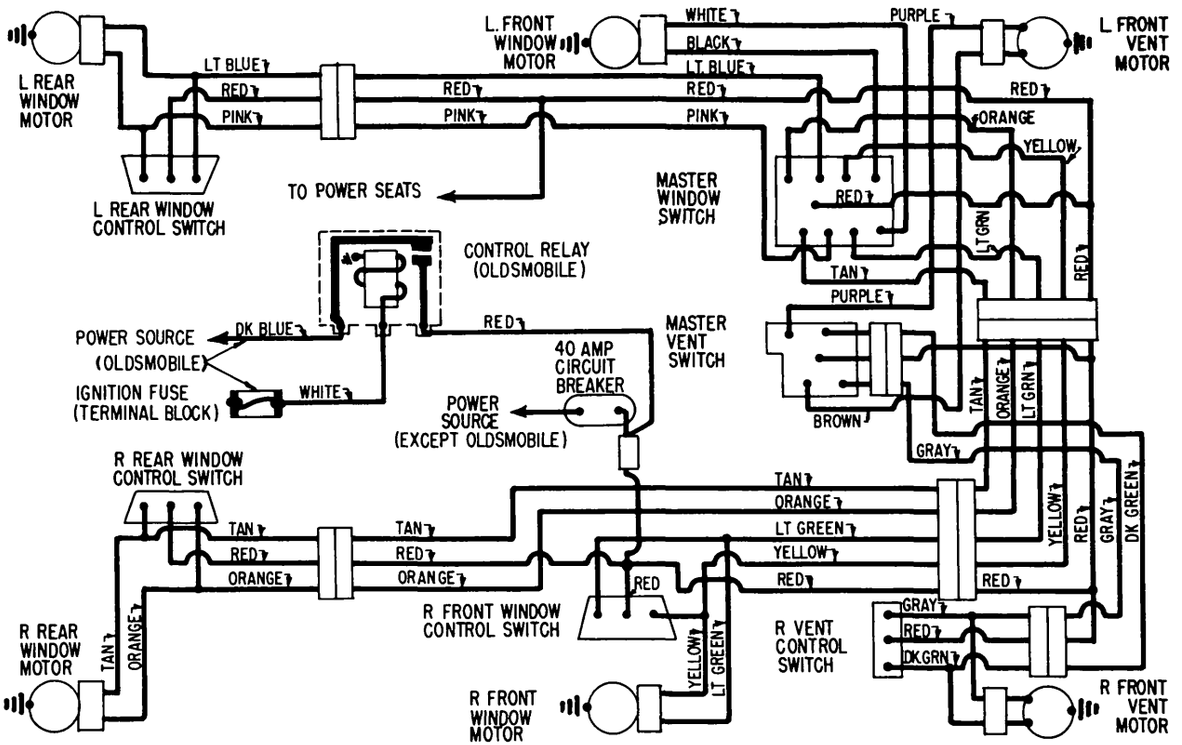
RAMBLER AIR CONDITIONING CONTROL WIRING DIAGRAM

G.M. ELECTRIC TYPE



Buick & Buick Special (1961)
Cadillac (1961)
Chevrolet Pass. Cars (1961)
Oldsmobile & Oldsmobile F-85 (1961)
Pontiac & Pontiac Tempest (1961)

►*1961 TAILGATE WINDOW SHORTING CORRECTION:* May be caused by contacts on contact switch plate on rear door pillar post and on tailgate side rail being bent out of shape or pivoting and causing circuit to ground to body. To correct, curl contact prongs back to original positions, or pivot prongs back into alignment and cement with a drop of clear lacquer.



DESCRIPTION: Door Windows - Window regulators individually powered by reversible electric motors in each door which are geared directly to regulator assembly. On Cadillac, vent windows in both front and rear doors are also power operated. On Buick and Oldsmobile, front door vent windows are also power operated. Two-way switches on each door and a master control switch on left front door control window operation. On Oldsmobile, a control relay wired to power source and to ignition switch prevents window operation until ignition switch is in ON or ACC positions. **Tailgate Window** - Dropping type window in tailgate operated by a reversible electric motor in tailgate. Control is by a switch on instrument panel. Tailgates which are hinged at the bottom have a lock switch in center of tailgate outer panel. Three-seat station wagons have additional passenger control switch at rear of rear quarter inner panel trim.

EMERGENCY OPENING OF TAILGATE: On tailgates hinged at bottom, safety switch may fail and prevent window being lowered to open tailgate. Proceed as follows: Remove spare tire cover and all accessible screws from tailgate inner panel. Pull panel forward, cut water deflector over right hand access hole, remove access cover upper screws, and remove cover. Reach into bottom of tailgate and remove green wire from retaining clip and pull up far enough to pierce wire with pick or knife. Ground pick and lower window by means of control switch.

TROUBLE SHOOTING & DIAGNOSIS (DOOR WINDOWS): **All Windows Inoperative** - Power feed circuit faulty. Check feed wires, feed circuit breaker, and control relay (where equipped).

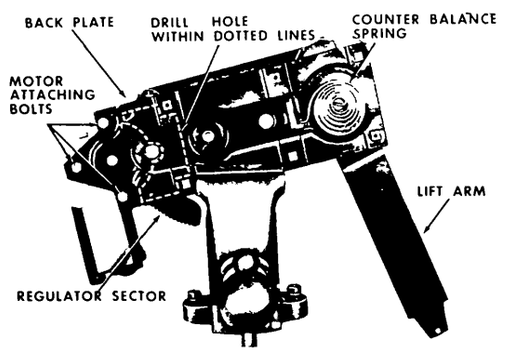
FRONT DOOR REGULATOR ASSEMBLY

G.M. (EXC. CADILLAC) WINDOW CONTROL WIRING DIAGRAM

One Window Inoperative From Both Switches: Faulty circuit wiring; both switches faulty; motor defective; mechanical bind or failute in linkage.

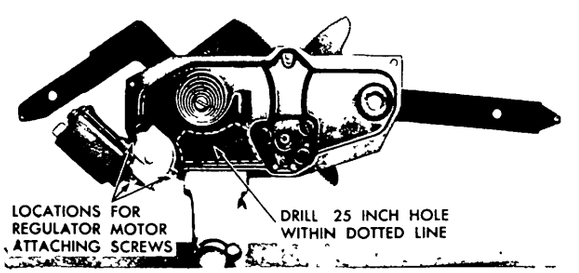
One Window Inoperative From One Switch Only: The other switch or wiring from that switch is defective.

TROUBLE SHOOTING & DIAGNOSIS (TAILGATE WINDOW): *NOTE - On Oldsmobile, instrument panel and third seat control switches are wired through window control relay. Rear window can be operated through these switches only if ignition switch is in ON or ACC positions.*



Window Inoperative From All Switches: Power feed circuit or control relay defective. Safety switch faulty or motor not grounded. Motor faulty. Mechanical bind or failure in linkage.

Window Inoperative From On Switch Only: Circuits to or from affected switch are defective. Affected switch is faulty. If both instrument panel and rear quarter switches are inoperative, check for faulty control relay.



Window Cannot Be Raised From Any Switch: Up cycle feed wire defective. Motor defective.

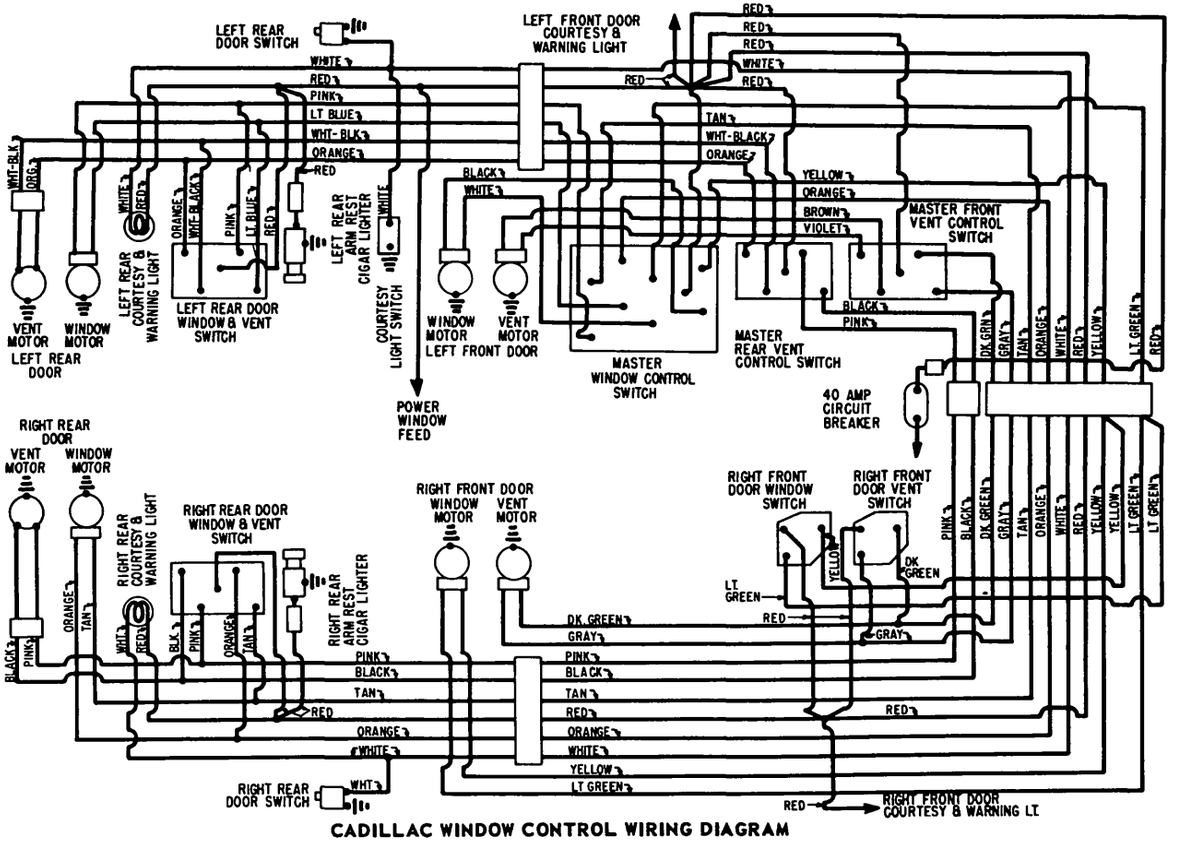
REGULATOR ASSEMBLY REMOVAL & INSTALLATION: *CAUTION - Do not operate regulator motor after window assembly is disengaged from regulator. Operation with load removed will damage motor.*

CONTINUED ON NEXT PAGE

REAR DOOR AND QUARTER WINDOW REGULATOR ASSEMBLY

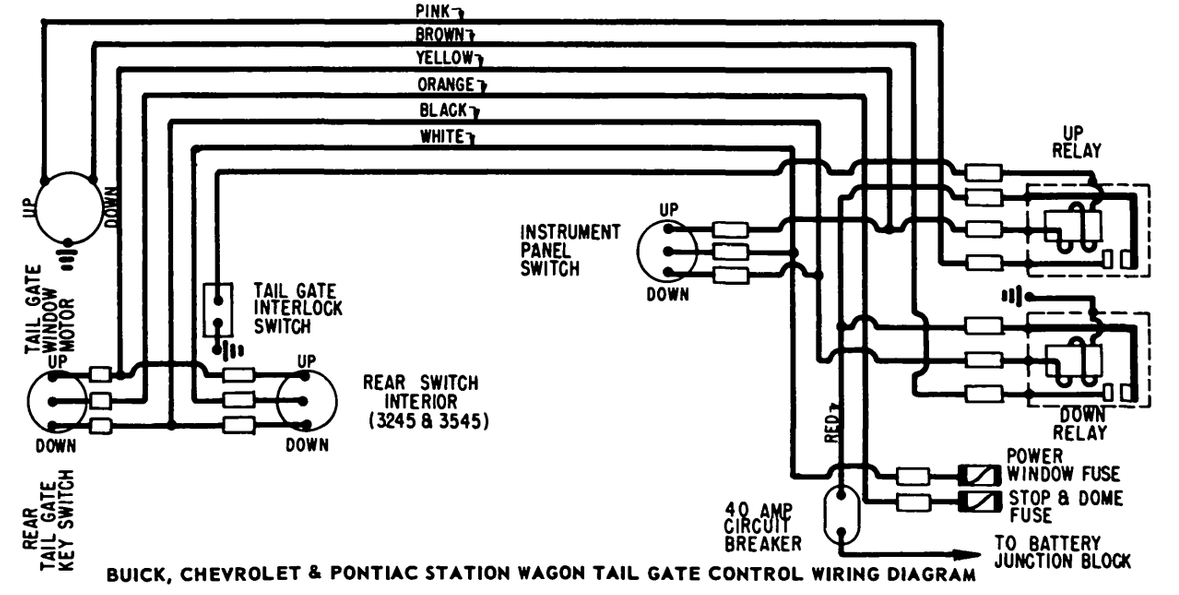
TAIL GATE REGULATOR ASSEMBLY

G.M. ELECTRIC TYPE (C ntinu d)



Front D rs (All M d ls): Lower door window, then remove door trim panel assembly and detach inner panel water deflector. Disconnect wiring harness feed wires from regulator motor at connector. Remove ventilator division channel lower adjusting stud and nut, then remove window lower sash channel cam attaching screws. Disengage window assembly from lower sash channel cam, then raise window and prop in "up" position. Remove inner panel cam attaching screws (where present). Detach cam from regulator arm and remove from door. Remove window regulator attaching screws, then carefully work regulator assembly through rear access hole and remove from door. To install, reverse removal procedure.

R ar Doors (All M dels): Lower door window, then remove door trim panel assembly and detach inner panel water deflector. Disconnect wiring harness feed wires from regulator motor at connector. Remove door window lower sash channel cam attaching screws, then carefully detach cam from regulator lift arm and remove through access hole. Lift window assembly and prop in "up" position. On some models (where present), remove inner panel cam attaching screws, then detach cam from regulator balance arm and remove through access hole. Remove regulator attaching screws and remove regulator assembly through access hole. To install, reverse removal procedure.



R ar Quart r Wind w (2-Do r Sedan): Lower rear quarter window and remove rear seat cushion and back, then remove rear quarter window garnish molding, rear quarter arm rest and rear quarter trim assemblies. Detach inner panel water deflector sufficiently to gain access to window lower sash channel cam attaching screws and window regulator attaching screws. Remove arm rest support, then disconnect feed wire plug from motor. Remove window lower sash channel cam attaching screws, then detach cam from roller on regulator lift arm and remove cam. Lift window to "up" position and prop in place. Remove front guide attaching screws and move guide rearward to allow upper end of guide to be started out through access hole, then remove guide assembly. Remove window regulator attaching screws and remove regulator assembly through large access hole. To install, reverse removal procedure.

2-Do r Hardt p - Lower rear quarter window, then remove rear seat cushion and back assemblies and rear quarter arm rest and trim assemblies. Remove rear quarter inner panel access hole cover and disconnect the feed wire plug from the motor, then remove the window lower sash channel cam attaching screws. Detach cam from roller on regulator lift arm and remove cam. Lift window and prop in the "up" position. Remove rear quarter window regulator attaching screws, then lower and rotate regulator assembly to maneuver lift arm around front guide assembly. Remove assembly through access hole. To install, reverse removal procedure.

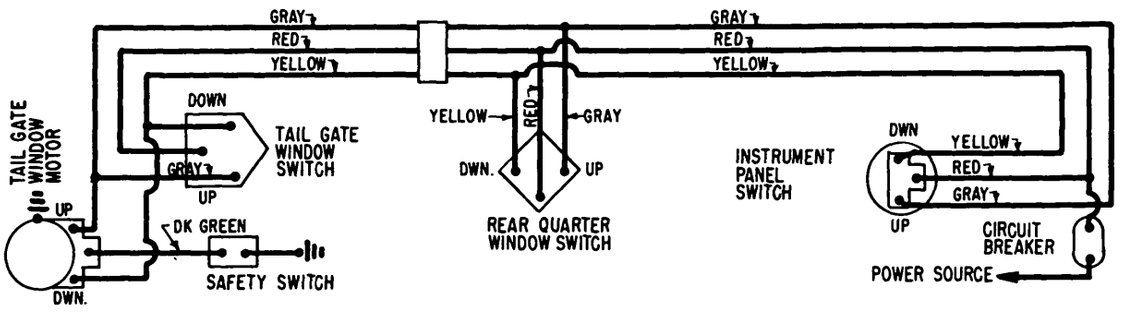
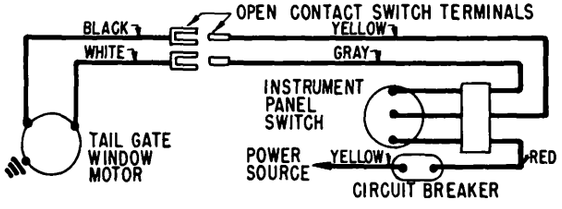
CADILLAC WINDOW CONTROL WIRING DIAGRAM



BUICK, CHEVROLET & PONTIAC STATION WAGON TAIL GATE CONTROL WIRING DIAGRAM

G.M. ELECTRIC TYPE (Continued)

Convertible - Remove rear seat cushion and back, top compartment side trim panel and rear quarter trim assembly. Remove inner panel access hole cover, then operate window to full "up" position and prop in place. Disconnect feed wire plug from motor, then remove regulator attaching screws. Disengage regulator lift arm roller from lower sash channel cam and remove regulator assembly through access hole.



Door Ventilators: Raise the door window, then remove the door trim assembly and detach inner panel water deflector to gain access to regulator attaching screws. Disconnect regulator motor feed wires at connector, then remove ventilator tee shaft attaching bolt and ventilator regulator attaching screws. Disengage ventilator regulator shaft from ventilator tee shaft and remove regulator and motor assembly from door through front access hole. To install, reverse removal procedure.

Tail Gate Window (Station Wagons): Remove inner cover panel lower retainer and inner cover panel, then remove tail gate skid strips, tail gate inner cover panel finishing moldings and tail gate inner cover panel. Detach or cut gate inner panel water deflector sufficiently to gain access to lower sash channel cam attaching bolts. Remove tail gate inner panel access hole cover. Carefully operate window upward until window sash channel right and left cam attaching bolts are accessible through access holes. Remove sash channel cam attaching bolts, then disengage cams from sash channel and carefully pull window out of gate. Detach tail gate lock remote control right connecting rod from remote control (work through a hole near center of tail gate adjacent to large access hole), then disconnect harness connector from motor. Remove regulator attaching screws and remove regulator through large access hole. To install, reverse removal procedure.

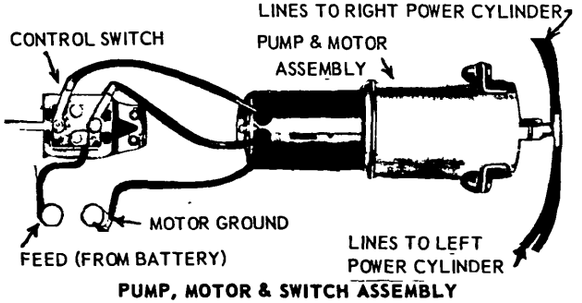
OLDSMOBILE STATION WAGON TAIL GATE CONTROL WIRING DIAGRAM

REGULATOR MOTOR REMOVAL (WITH REGULATOR ASSEMBLY REMOVED FROM CAR): Clamp regulator and motor assembly securely in a vise, then drill a ¼" hole through back plate at the location indicated in illustrations. *NOTE - Drill the ¼" hole in front door window regulators at either "A", "B" or "C" (see illustration), depending on position of lift arm. On other regulator assemblies, drill the hole within the area outlined by dotted lines in illustration. Do not locate hole less than ½" from edge of back plate or sector.* Insert a 3/16" bolt through hole in back plate and sector and install a nut but do not tighten. Remove motor attaching bolts and remove motor assembly from regulator. Clean all chips from regulator and motor pinion gear after drilling. To install, reverse removal procedure. *CAUTION - Be sure to remove temporary nut and bolt from regulator befor installing in car.*

BUICK SPECIAL, OLDSMOBILE F-85 & PONTIAC TEMPEST TAIL GATE WINDOW CONTROL WIRING DIAGRAM

1961 POWER TOP CONTROLS

HYDRAULIC-ELECTRIC TYPE



Buick (1961)
Cadillac (1961)
Chevrolet Pass. Cars (1961)
Chrysler & Imperial (1961)
Dodge & Dodge Dart (1961)
Ford Pass. Cars (1961)
Mercury (1961)
Oldsmobile (1961)
Plymouth (1961)
Pontiac (1961)
Rambler American (1961)
Studebaker (1961)

DESCRIPTION: Similar in design and operation to models previously used. System is a sealed unit and is not vented to the atmosphere, making it unnecessary to replace hydraulic fluid periodically. System is "self-air bleeding".

CHECKING FLUID LEVEL: With top in raised position, disconnect positive or negative battery cable. Remove pump and motor shield, in rear compartment, and place absorbent material below reservoir. Remove filler plug from reservoir. On motor and pump assemblies installed horizontally, fluid should be at lower edge of filler cap hole. If fluid low, add hydraulic fluid Delco No. 11 (GM Hydraulic Brake Fluid Super No. 11).

REPLACING FLUID (After Repairs): Cylinders and hydraulic system contains more fluid than one filling of reservoir will supply. Check reservoir frequently during refilling of system. Air in system will automatically bleed out with a few operations of top.

CHECKING HYDRAULIC PRESSURES: Remove motor and pump assembly. Install plug in one port and pressure gauge in port to be checked. Actuate motor with an applied terminal voltage of 9.5-11.0 volts. Gauge should show a pressure as specified below. Check pressure in other port. *NOTE* - A difference in pressure readings may exist between pressure port for top of cylinders and port for bottom of cylinders. This condition is acceptable if both readings are within limits specified. If pressure not within specified limits, unit is defective and should be repaired or replaced.
Hydraulic Pressure - 240-280 PSI (General Motors Cars, Rambler, Studebaker).

PUMP, MOTOR & SWITCH ASSEMBLY

CHECKING OPERATION OF LIFT CYLINDERS: Remove rear seat cushion and folding top compartment side panel assembly. Operate folding top control switch and observe lift cylinders during up and down cycles for these conditions:
1) If movement of cylinder rods is not coordinated or sluggish when motor is actuated, check hydraulic hoses from the motor and pump to cylinders for kinks.
2) If one cylinder rod moves slower than other, cylinder with slow moving rod is defective and should be replaced.
3) If both cylinder rods move slowly, or do not move at all, check pressure of pump. See "Checking Hydraulic Pressure" above.

MOTOR & PUMP ASSEMBLY: *See "Power Operated Top Motor & Pump (Rotor Type)" in Miscellaneous Section of Manual.*

LINCOLN CONTINENTAL TOP CONTROL

Linc In Continental (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 DECK OPEN LIMIT SWITCH NO. 1 MALFUNCTION CORRECTION:* On cars before March 1, 1961, if Deck Open Limit Switch No. 1 fails, trouble may be due to switch wiring being pinched between lower back panel flange and trunk lid. To correct, route switch wiring through the left hand clip holding rear lamp wiring.

►*1961 SWITCH, CIRCUIT, WIRING & TOP OPERATION PRODUCTION CHANGES:* Four changes made in production as follows: *NOTE - See wiring diagram for change details.*

1) Cars Between Serial Nos. 400024 and 403100 & All Cars After January 10, 1961 - A Top Lock Cut-Off Switch added to top erect cycle for better sealing of No. 1 bow to windshield header and for better cycle continuity. Switch is attached to back panel left hand hinge. Switch holds top lock motor energized until back panel is folded under deck lid. *NOTE - Back Panel Erect Limit Switch changed from 6-terminal to 4-terminal switch when Top Lock Cut-Off Switch added.*

2) Cars B ginning December 5, 1960 - On top erect cycle, the top up relay and motor energized through Top Up Limit Switch instead of through Top Lock Limit Switch as on previous cars. Wiring for operation through Top Lock Limit Switch is similar to that for operation through Top Up Limit Switch *See text below for sequence of operation.*

3) Cars Aft r December 21, 1960 - Yellow & White wires attached to lower contacts of Deck Lock Limit Switch are removed from switch and taped to the harness. Hydraulic pressure in the top cylinders is no longer relieved when top is raised and locked and provides for greater rigidity and better back panel fit.

4) Cars After June 6, 1961 - A new Top Up Limit Switch installed on main pivot casting of top linkage to permit top motor to operate until rear edge of top and finish panel are properly seated. Control of top up motor circuit is through this new switch. The existing Top Up Limit Switch in right side of No. 1 bow will control top lock motor circuit only, and this switch has been renamed Top Lock Limit Switch No. 1.

DESCRIPTION: Completely automatic convertible power top mechanism which unlocks and opens the trunk deck lid, raises the top and locks it to the windshield header, then closes and locks the deck lid. The cycle is reversed for lowering the top. The system consists of an electric-hydraulic system for raising and lowering the top and deck lid, and three electric systems with drive cables, locking rods, and transmission for locking and unlocking deck lid, locking and unlocking top to windshield header, and for folding and unfolding upper back panel. All basic systems have appropriate switches, relays, and solenoids for electrical and mechanical continuity.

OPERATION: Top operation is divided into retract and erect cycles as follows: *CAUTION - Before operating the top, engine must be running, transmission in "N" or "P", and all windows lowered.*

C ntrol Circuit: *NOTE - Control circuit to top control switch is the same for both retract and erect cycles.* With ignition switch in ACC or ON positions, and transmission selector lever in N or P (neutral safety switch contacts closed), current flows from ignition switch, through top control neutral relay, neutral safety switch, and starter motor relay to ground. Top control neutral relay is energized (relay contacts closed), and current flows from 10 ampere circuit breaker through top control neutral relay, to top control switch.

Top Retract Cycle: Following operatings take place with top erected and locked to windshield header and deck lid closed and locked.

Deck Lid Unlocking - Current flows from control switch through lower contacts of back panel retract limit switch, and upper contacts of deck open limit switch No. 1, to deck unlock relay which energizes deck lock motor. Deck lock motor unlocks deck lid through two flexible drive cables.

Deck Lid Opening - When deck lid unlocks, deck lock limit switch is released to complete deck lid open circuit. Current flows through lower contacts of back panel retract limit switch, upper contacts of deck open limit switch No. 1, center contacts of deck lock limit switch to deck open relay which energizes top and deck motor and deck lid solenoid. When deck lid solenoid valve opens, hydraulic pressure flowing to both deck lid hydraulic cylinders raises deck lid.

Back P nel Unfolding - When deck lid is fully raised, bracket on deck lid left hydraulic linkage depresses deck open limit switch No. 1 to open deck lid unlock and opening circuits and at same time complete back panel unfolding circuit. Current now flows through lower contacts of deck open limit switch No. 1, and upper contacts of back panel erect limit switch, to back panel erect relay which starts back panel motor to unfold back panel.

Top Unlocking - When back panel is completely unfolded, bracket on back panel hinge mounting plate depresses back panel erect limit switch to open back panel motor circuit and at same time close top unlock motor circuit. Current now flows through upper contacts of top unlock limit switch, and lower contacts of back panel erect limit switch, to top unlock relay which energizes top lock motor to unlock top from windshield header through two rods.

Top Retracting - When left top lock rod unlocks top, the rod depresses top unlock limit switch to open top unlock motor circuit and at same time close top retract circuit. Top lock limit switch is released at same time. Current now flows through lower contacts of top unlock limit switch, and upper contacts of top down limit switch, to top down relay which energizes top and deck motor and both top solenoids. Top solenoid valves open, and hydraulic pressure to both top hydraulic cylinders lowers the top.

Deck Lid Closing & Locking - When top is fully lowered, right rear side rail depresses top down limit switch which opens top retract circuit and closes deck lid close and lock circuits. Current now flows through center contacts of top down limit switch, to deck lock relay which starts deck lock motor. Current also flows through upper contacts of deck lock limit switch to deck close relay which causes top and deck motor to continue operation and also energizes deck lid solenoid. When deck lid solenoid valve opens, hydraulic pressure to both deck lid hydraulic cylinders closes deck lid. When deck lid is closed, deck lid lock limit switch is depressed and opens deck lid close circuit. Deck lock motor (which was started when deck lid began to lower) locks deck lid. After deck lid locked, deck lock circuit is opened by releasing top control switch on instrument panel.

Top Erect Cycle: Following operations take place with top stacked in luggage compartment and deck lid closed and locked.

Deck Lid Unlocking - Current flows from top control switch through lower contacts of top down limit switch, and upper contacts of deck open limit switch No. 2 to deck unlock relay which energizes deck lock motor. Motor unlocks deck lid through flexible cables. *NOTE - On Cars before December 21, 1960 (see "Production Changes" above), the following also happens:* Current flows through lower contacts of deck lock limit switch to both top solenoid valves which open to relieve hydraulic pressure and remove tension in top stack linkage.

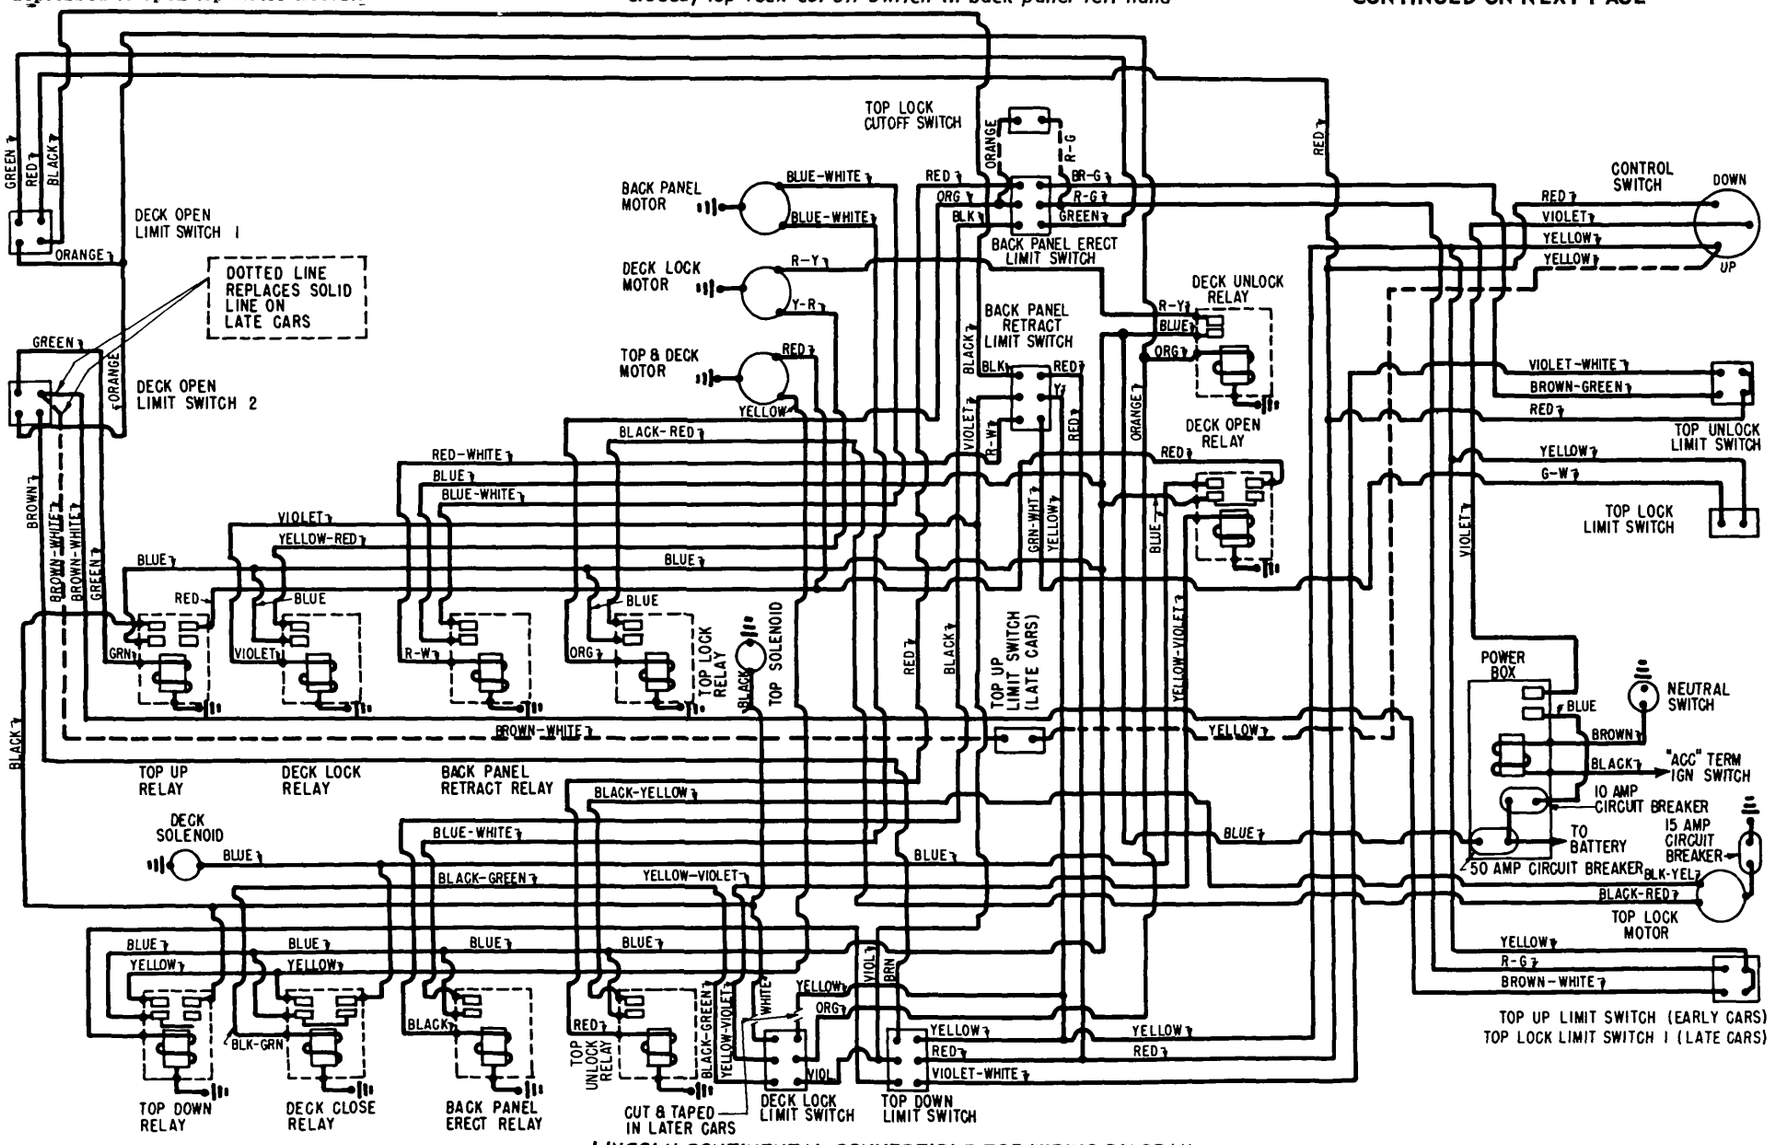
Deck Lid Opening - When deck lid unlocks, deck lock limit switch is released and completes the deck opening circuit. *NOTE - At same time circuit to both top solenoids is opened to close solenoid valves on early cars (see "Deck Lid Unlocking" and "Production Changes" above)* Current now flows through lower contacts of top down limit switch, upper contacts of deck open limit switch No. 2, and center contacts of deck lock limit switch to deck open relay which energizes top and deck motor and deck lid solenoid. Deck lid solenoid valve opens and hydraulic pressure to both deck lid hydraulic cylinders raises deck lid. *NOTE - Deck lock motor continues to operate as circuit is still closed.*

Top Erecting - When deck lid is raised, deck open limit switch No. 2 is depressed by bracket on deck lid right hydraulic linkage, and deck lid unlocking and opening circuits are opened, while at the same time the top erect circuit is closed. Current now flows through upper contacts of top lock limit switch (early cars), upper contacts of top up limit switch (later cars - *see "Production Changes" above),* and through lower contacts of deck open limit switch No. 2 to top up relay which energizes top and deck motor and both top solenoids. Top solenoid valves open and hydraulic pressure to both top hydraulic cylinders raises the top.

Top Locking (Early Cars - Before June 6, 1961) - When No. 1 bow contacts windshield header, nylon lever arm in bow depresses top up limit switch to complete top lock circuit. *NOTE - On cars after December 5, 1960, top motor circuit is opened when top up limit switch is depressed.* Current flows through lower contacts of top up limit switch, and center contacts of back panel erect limit switch, or through top lock cut-off switch *(see "Production Changes" above, and wiring diagram),* to top lock relay which energizes top lock motor and locks top to windshield. *NOTE - On cars before December 5, 1960, as top begins to lock, lock rod in No. 1 bow depresses top lock limit switch to open top motor circuit.*

T p L cking (Later Cars - Aft r Jun 6, 1961) - When No. 1 bow contacts windshield header, nylon lever arm in bow depresses top lock limit switch No. 1 *(formerly*

CONTINUED ON NEXT PAGE



LINCOLN CONTINENTAL TOP CONTROL (C ntinu d)

Top Up Limit Switch - See "Production Changes" above) to complete top lock circuit. Current flows through top lock limit switch No. 1 and top lock cut-off switch, to top lock relay which energizes top lock motor and locks top to windshield. While top is locking and after rear edge of top and finish panel are properly seated, top up limit switch in main pivot casting of linkage is depressed to open top motor circuit.

Back Pan l Cl sing - *NOTE - See "Production Changes" abov for cars with and without Top Lock Cut-Off Switch.* When lock rod in No. 1 bow depresses top lock limit switch, back panel closing circuit is completed. *NOTE - On cars without top lock cut-off switch, top locking circuit is opened at the same time.* Current now flows through lower contacts of top lock limit switch, and upper contacts of back panel retract limit switch, to back panel retract relay which energizes back panel motor and closes back panel. *NOTE - On cars with top lock cut-off switch, when back panel is closed, top lock cut-off switch in back panel left hand hinge is depressed and top lock motor circuit is opened.*

D ck Lid Cl sing & Locking - When back panel has folded, back panel retract limit switch is depressed to open back panel motor circuit and to complete deck lid close and lock circuits. Current flows through center contacts of back panel retract limit switch, and upper contacts of deck lock limit switch, to deck close relay which energizes top and deck motor and deck lid solenoid. When deck lid solenoid valve opens, hydraulic pressure to both deck lid hydraulic cylinders closes deck lid. At same time deck close circuit is completed,

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL CONVERTIBLE TOP WIRING DIAGRAM

LINCOLN CONTINENTAL TOP CONTROL (C ntinu d)

current also flows from center contacts of back panel retract limit switch to deck lock relay which energizes deck lock motor. When deck lid is closed, deck lock motor locks deck lid. Also, then deck lid is closed, deck lock limit switch is depressed to open deck lid closing circuit. *NOTE - On cars after December 21, 1960 (see "Production Changes" above), depressing deck lock limit switch also completes circuit to both top sol noids so hydraulic pressure is relieved and top is permitted to settle.* Releasing top control switch opens deck lock circuit and cycle is completed.

EMERGENCY MANUAL OPERATION: Manually Unlocking Top - Remove No. 1 bow access cover and turn motor coupling manually to unlock top.

Manually Unlocking D ck Lid - Raise car and remove each deck lid lock nut attaching screw from underside of each wheelhouse. Remove rear seat cushion and disconnect deck unlock relay to prevent damage to lock nut assembly. Lift forward edge of deck lid about 1", then actuate top control switch to open deck lid.

Manually Opening Deck Lid - Unlock deck lid manually (see above), or with control switch. Remove deck lid hydraulic cylinder attaching screws from under rear crossmember. Lift deck lid manually. *NOTE - If deck lock nuts have be n released from wheel housings, nut and housing part of locks will remain attached to deck lid lock scr ws.*

EL ECTRICAL COMPONENTS & LOCATIONS: Following list of electrical components and their locations will aid in testing and trouble shooting.

50 Amper Circuit Br aker: Motor relay feed (power circuit). On right hand dash trough on instrument panel above power box.

10 Amper Circuit Breaker: For control feed circuit. In power box.

15 Amp r Circuit Br aker: Top lock motor ground. In right quarter panel.

15 Amp r Circuit Breaker: Back panel motor ground. At center of deck lid.

15 Amp r Circuit Break r: Deck lock motor ground. At center of deck lid.

Top Control N utral R lay: In power box.

Deck L ck Motor: At center of deck lid.

T p & D ck M tor & Pump: In right quarter panel.

Upper Back Panel M tor: Forward left side of deck lid.

T p L ck M tor: No. 1 bow, right center.

T p L ck Limit Switch: No. 1 bow, left side (inboard switch).

T p L ck Cut-Off Switch: Upper back panel left hinge mounting plate (inboard).

T p Unlock Limit Switch: No. 1 bow, left side (outboard switch).

T p Up Limit Switch/T p Lock Limit Switch No. 1: *See "Production Chang s" above for switch designation Change.* No. 1 bow, right side.

Top Up Limit Switch (Cars After June 6, 1961): *See "Production Chang s" above.* On main pivot casting of top linkage.

Back Panel Erect Limit Switch: Back panel left hinge mounting plate.

Back Pan l Retract Limit Switch: Back panel right hinge mounting plate.

D ck Op n Limit Switch N . 1: Deck lid actuator, left side.

Deck Open Limit Switch N . 2: Deck lid actuator, right side.

Deck Lock Limit Switch: Deck lock nut assembly, right side.

Deck Open Relay: Rear seat-back support, right side outboard.

Deck Unlock Relay: Rear seat-back support, right side inboard.

►*OTHER RELAYS:* Following relays are located in a panel on right quarter panel: Top Up Relay, Top Down Relay, Deck Close Relay, Deck Lock Relay, Top Lock Relay, Top Unlock Relay, Back Panel Erect Relay, Back Panel Retract Relay. *See wiring diagram for correct locations.*

Top Down Limit Switch: On right main pivot bracket.

Deck Lid Solenoid Valve: On right quarter panel to rear of top and deck motor and pump.

Top Solenoid Valves: On right quarter panel forward of top and deck motor and pump.

TESTING & TROUBLE SHOOTING: Operate any of the twelve circuits by energizing the applicable relay by a jumper wire from hot or common relay terminal to relay actuating terminal (bypasses all appropriate limit switches and operates motor directly). Check for a motor stalled against a jammed deck lid lock screw or running freely due to broken drive cable. Check locking mechanism in No. 1 bow for proper operation. If a motor continues to run after its circuit is opened, a power relay is faulty. If a motor operates when control circuit bypassed, check control circuit continuity. *NOTE - Be sure to test main circuit breaker, top control neutral relay, and top control switch.* If there is no current at top control neutral relay, check control circuit 10 ampere circuit breaker and neutral safety switch. Make a continuity test of switches and make sure switches are properly adjusted.

►*TROUBLE SHOOTING NOTE:* Following are probable causes of top malfunction for retract and erect cycles.

Retract Cycle: Deck Lid Will Not Unlock - Deck unlock relay; Back panel retract limit switch; Deck open limit switch No. 1; Deck lock motor or circuit breaker.

Deck Lid Will Not Open - Deck open relay; Deck lock limit switch; Deck solenoid; Top and deck motor.

Deck Lid Will Not Close - Top down limit switch; Deck lock limit switch; Deck close relay; Deck solenoid; Top and deck motor.

Deck Lid Will Not Lock - Deck lock relay; Deck lock motor or circuit breaker.

Back Panel Will Not Unfold - Deck open limit switch No. 1; Back panel erect limit switch; Back panel erect relay; Back panel motor or circuit breaker.

Top Will Not Unlock - Top unlock limit switch; Back panel erect limit switch; Top unlock relay; Top lock motor or circuit breaker.

Top Will Not Retract - Top unlock limit switch; Top down limit switch; Top down relay; Top solenoids; Top and deck motor.

Erect Cycle: Deck Lid Will Not Unlock - Deck lid; Top down limit switch; Deck open limit switch No. 2; Deck unlock relay; Deck lock motor or circuit breaker.

Deck Lid Will Not Open - Deck lock limit switch; Deck open relay; Deck solenoid; Top and deck motor.

D ck Lid Will Not Clos - Back panel retract limit switch; Deck lock limit switch; Deck close relay; Deck solenoid: Top and deck motor.

Deck Lid Will Not L ck - Deck lock relay; Deck lock motor or circuit breaker.

T p Will N t Erect - Top lock limit switch or top up limit switch; Deck open limit switch No. 2; Top up relay; Top solenoids; Top and deck motor.

Top Will Not "Settle" Into Position - Top solenoids; Top up limit switch; Deck lock limit switch.

Top Will Not Lock - Top up limit switch or top lock limit switch No. 1; Top lock cut-off switch; Back panel erect limit switch; Top lock relay; Top lock motor or circuit breaker.

Back Panel Will Not Fold - Top lock limit switch; Back panel retract limit switch; Back panel retract relay; Back panel motor or circuit breaker.

SWITCH ADJUSTMENTS: Deck Lock Limit Switch - With a test lamp attached to the two top terminals of switch, adjust switch so test lamp is lighted when deck lock screws contact deck lock nuts but goes out after lock screws engage lock nuts by one or two threads.

Top Down Limit Switch: With top fully retracted and a test light attached to upper terminals of switch, loosen switch so plunger is not depressed by top side rail. Then adjust switch against side rail until plunger is depressed and light goes out. Move switch upward an additional 1/16" and tighten mounting screws.

Back Panel Erect Limit Switch: With top erected, deck lid raised, and back panel partially open, loosen switch mounting screws so switch plunger is not depressed when back panel fully open. With test light attached to two upper terminals of switch and back panel fully open, move switch against actuator until plunger is depressed and test light goes out. Tighten mounting screws.

Back P nel Retract Limit Switch: With top erected, deck lid raised, and back panel partially open, loosen switch mounting screws so switch plunger is not depressed when back panel fully folded. Attach test light to top terminals of switch. Fold back panel until rubber pads underside of deck lid are compressed and back panel motor stalls. Move switch against actuator until plunger is depressed and test light goes out, then move switch an additional 1/16" against actuator and tighten mounting screws.

Top Lock Limit Switch: With top erected, but unlocked, remove access cover in No. 1 bow and move switch so plunger will not be compressed when top is locked. Operate top motor until top locks and motor stalls, then release control switch. With a test light attached to two inboard (rear) terminals of switch, adjust switch plunger against actuator until test light goes out, then move switch an additional 1/16" against actuator and tighten mounting screws.

Top Unlock Limit Switch: With top erected and No. 1 bow access cover removed, raise deck lid and back panel until top just starts to unlock. Loosen switch so plunger will not be depressed when top is unlocked. Insert a 1/8" shim between left hand end of lock linkage and linkage stop, then unlock top fully. Shim should be held in place by lock linkage. With a test light attached to two outboard (rear) terminals of switch, adjust switch plunger against actuator until light goes out. Tighten mounting screws. *CAUTION - Lock linkage stop must b adjusted so switch actuator will n t hit switch body.*

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL TOP CONTROL (Continued)

Top Up Limit Switch/Top Lock Limit Switch No. 1: With top erected and locked, No. 1 bow access cover removed, and switch loosened, attach a test light to switch terminals and adjust switch plunger against nylon actuator until light goes out, then move switch an additional 1/16" and tighten mounting screws.

T p Up Limit Switch (In Main Pivot Casting): With deck lid opened, slide switch down so plunger will not be depressed when top fully erected. Raise top until No. 1 bow almost contacts windshield header. Disconnect double connector from switch, attach a test light to switch terminals, and slowly raise top until No. 1 bow contacts windshield header and package tray reaches proper position. *NOTE - Make sure best weather seal at package tray and rear side rail weatherstrips is is obtained.* Move switch against top linkage until test light just goes out, then tighten switch mounting screws.

Deck Open Limit Switches No. 1 & 2: With deck lid partially opened, move switches so they will not be activated when deck lid fully open. Insert a 1/8" shim between both deck lid hinges and their opening stops, then open deck lid. Shims should be held **in place by deck lid hinges.** With a test light attached to rear two terminals of either switch, adjust switch plunger against actuator until test light goes on. Tighten switch mounting screws. Repeat for other switch.

Top Lock Cut-Off Switch: With deck lid fully raised and back panel completely folded under so it contacts rubber pads, loosen switch adjusting screws and move switch against actuator until switch fully depressed. Tighten adjusting screws.

HYDRAULIC FLUID LEVEL CHECK: Loosen filler plug in end of reservoir. Start engine and run at fast idle while cycling top three times to bleed air from system. With top erected and deck lid open, remove filler plug. If fluid does not run out of opening, add heavy duty brake fluid so fluid is level with edge of filler plug hole. Install filler plug.

FORD THUNDERBIRD TOP CONTROL

Ford Thunderbird (1961)

DESCRIPTION & OPERATION: *See "Ford Thunderbird Top Control" in 1960 Final Data or later Manual dition and note the following:*

Relays - Deck solenoid power relay and top solenoid power relay have been eliminated. *See 1961 Wiring Diagram for details.*

EMERGENCY MANUAL OPERATION: Unlocking Deck Lid - If deck lock motor fails to operate, manually unlock deck lid to gain access to deck lock motor as follows: Place floor jack under frame rear crossmember and raise car approximately 10". Remove each deck lid lock retaining screw (underside of each wheelhouse). Lift front edge of deck lid about 1 inch and operate top control switch to complete opening of deck lid.

Opening Deck Lid - Unlock deck lid by operating top control switch or by using the above procedure. Loosen the two straps supporting the fuel tank and lower tank approximately 1 inch. DO NOT remove straps or tank. From beneath lower back panel, remove both deck cylinder retaining screws from each side. Complete opening of deck lid. If deck lid locks have been released from wheelhousings the nut and housing portion of locks will remain attached to deck lid.

Erecting Top - *NOTE* - It may be necessary to erect top manually if: Electric-hydraulic motor fails; there is an open circuit in motor feed; the top solenoid valves fail; there is an open circuit in the feed line; a top cylinder or linkage fails. Unlock and open deck lid. Energize both top solenoid valves using suitable jumper wires and 12 volt source. If either valve is inoperative, disconnect the hydraulic lines connected to the valves so that there will be no hydraulic block in top cylinders , then manually erect top.

TROUBLE SHOOTING & DIAGNOSIS

►*TESTING NOTE:* Usual cause of top malfunction is a defective or improperly adjusted switch. Make switch checks before making further tests.

SUPPLY CIRCUIT TESTING: Use a continuity light between ground and various points in supply circuit. With ignition switch in ON or ACC position and selector lever in N or P, check the following in sequence: Circuit breakers, neutral switch relay, actuator switch, and relay power bus bar.

SWITCH CIRCUIT TESTING: Check switch for improper adjustment by depressing switch stem. Check for electrical failure by bypassing switch with jumper wire directly at switch contact terminals or wire connectors. *NOTE - Continuity light cannot be used to test switch circuits as current draw required by light will not allow relay coils to energize.* To bypass switch circuit, connect jumper wire between relay bus bar and relay coil terminal. If motor or solenoid operates, check switch circuit for defects. If audible "click" of relay is heard, switch circuit troubles are indicated. If motor or solenoid fails to operate and relay operates, check for defective motor, solenoid, or respective circuits.

MOTOR & SOLENOID TESTING: Use a 12-volt power source and jumper wire directly to motor or solenoid, or bypass motor ground circuit breaker to isolate trouble.

UNIT & OPERATION TESTING: Use a 100 Ampere scale ammeter between main feed 50 ampere circuit breaker on starter relay and motor supply lead (black wire) supplying control relay bus bars. If a switch is improperly adjusted so it closes the relay circuit for any cycle but still does not open the cycle just finishing; or if switch is faulty, ammeter reading will indicate the trouble. *See "Electrical Test Specifications" below.*

ELECTRICAL TEST SPECIFICATIONS

Operation	Maximum Amperage Draw ① Amperes
Deck Lid Unlock	30
Deck Lid Open	90
Package Tray Extend	35
Package Tray Fold	30
Top Erect or Retract	75
Deck Lid Close	70
Deck Lid Lock	25

① - Battery must be 11.5-12.5 volts for these tests.

Unit	Electrical Unit Current Draw ② Amperes
Pump Motor (Normal)	32-48
(Bypassing)	58
Tray Motor (Normal)	30-35
(No Load)	18-21
(Stalled)	100
Lock Motor (Normal)	18-22
(No Load)	15-18
(Stalled)	50
Solenoids (Each)	10

② - With 100 ampere scale ammeter between 50 amp. circuit breaker and relay feed wire.

HYDRAULIC CHECKS

►*NOTE:* Faulty hydraulic system operation can be caused by lack of fluid, leaks, air in system, obstructions or kinks in hoses, or faulty operation of cylinder or pump.

Fluid Level: Retract top, remove filler plug and check fluid level (bottom edge of filler hole). If low, check for leaks, adding heavy duty brake fluid as necessary.

Lift Cylinder Operation: Operate top control switch and observe operation of lift cylinders. If movement of piston rods is sluggish or uneven, check hoses from pump to cylinders for kinks. If one piston rod moves more slowly than the other, the cylinder with the slower rod is defective and should be replaced. If both rods move slowly or not at all, disassemble and repair pump.

ADJUSTMENT

Top Down Switch: Lower top to full down position, place a .060" shim between end of switch shaft and roof hinge arm. Adjust switch firmly to the end of its travel against shim. Tighten mounting screws and remove shim.

Deck Closed Switch Adjustment: Use Tool T57P-15780-A. Pull apart the switch quick disconnect and attach a continuity test light to wires that go to bottom set of contact terminals. Press tool firmly into the lock nut and adjust switch upward until the test light attached to the bottom set of contacts just goes on, then tighten switch mounting screws and remove tool.

Deck Closed Switch Actuator Adjustm nt: Use Tool T57-15780-A. Position tool over lock screw, press tool firmly against lock screw shoulder. Pivot tool to line up with switch actuator. Bend actuator until it touches raised portion of tool.

Deck Closed Switch Actuator Adjustm nt: If operation of deck lid discloses that deck lid pops up when opening, the switch actuator may be bent very slightly away from deck lid.

Top Up Switch: Raise top to full up position. Place .060" shim between end of switch shaft and roof hinge arm. Adjust switch firmly to the end of its travel against shim. Tighten switch mounting screws and remove shim.

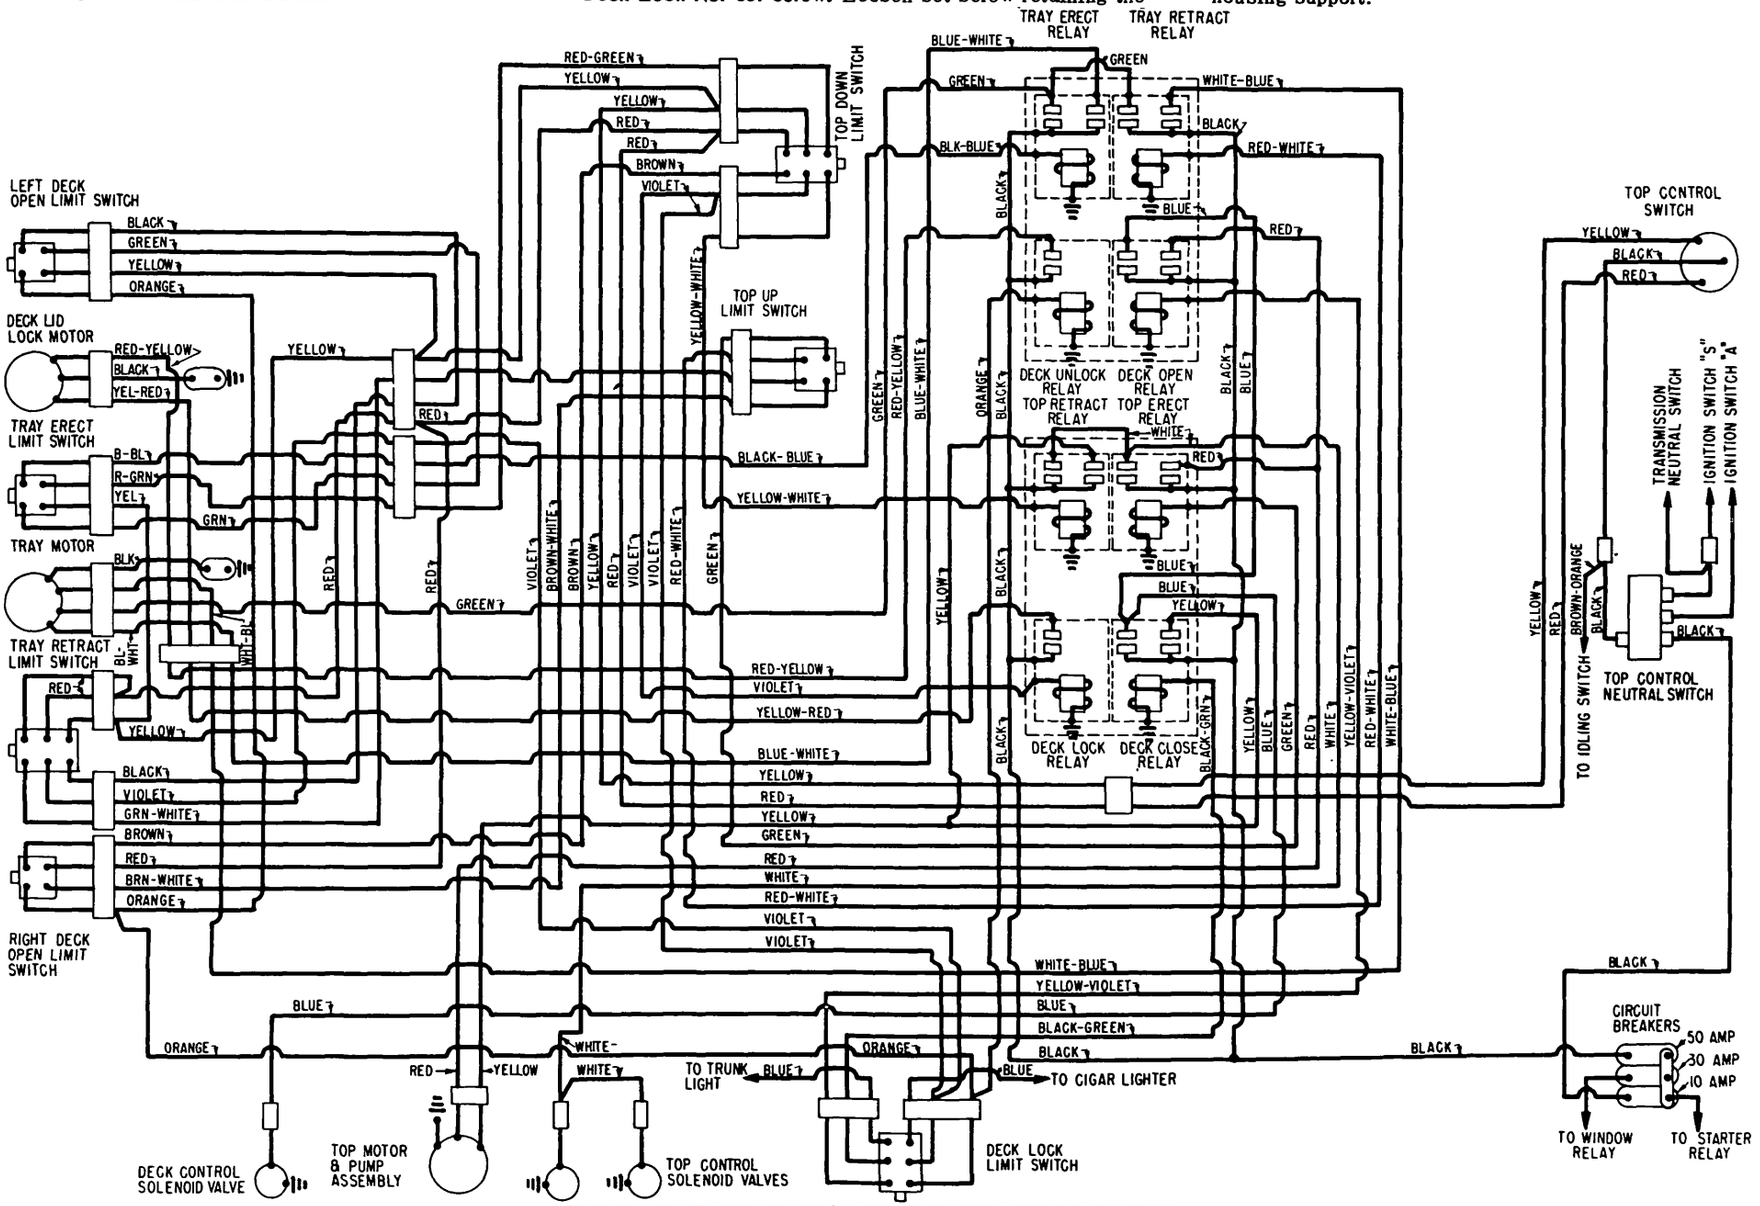
Tray Erect Switch: Extend package tray on the deck lid to end of its travel. Place .060" shim between end of switch shaft and switch actuator on the tray support arm. Adjust switch firmly to the end of its travel against the shim. Tighten switch mounting screws and remove shim.

Tray R tract Switch: Retract the package tray on the deck lid to the end of its design travel. Place .060" shim between end of switch shaft and the switch actuator on tray support arm. Adjust switch firmly to the end of its travel against shim. Tighten switch mounting screws and remove shims.

CONTINUED ON NEXT PAGE

FORD THUNDERBIRD TOP CONTROL (Continued)

Deck Open Switches: Both right and left deck open switches are adjusted in same manner. Raise deck lid to full open position, place .060" shim between end of switch shaft and actuator. Adjust actuator so that the switch shaft is fully depressed. Tighten actuator mounting screws and remove shim.



DECK LOCK ADJUSTMENT: *NOTE* - For adequate seal, deck lock screw assembly must be adjusted to engage properly with the lock nut assembly.

Deck Lock Screw Assembly: Loosen two nuts retaining lock screw assembly to deck lid and adjust the assembly fore and aft to align with lock nut assembly.

Deck Lock Nut Housing Support: Loosen two screws retaining lock nut housing support to quarter panel and adjust support side to side to align with lock screw.

Deck Lock Nut Set Screw: Loosen set screw retaining the locknut in housing assembly and turn lock nut in or out to the required position. The Tool T57P-53510-A may be used to turn lock nut as necessary. *CAUTION* - DO NOT attempt any trial locking of deck unless set screw is properly tightened.

Deck Lock Nut Housing Height: The foot of the lock nut housing assembly may be adjusted up or down from the wheelhouse to insure the correct positioning of the "O" ring. The "O" ring should be centrally located in housing support.

THUNDERBIRD CONVERTIBLE TOP CONTROL WIRING DIAGRAM

AIR CONDITIONING SERVICE CAUTIONS

HANDLING FREON: Though considered the safest and best refrigerant for use in Air Conditioning systems, the following precautions must be observed to avoid serious accidents or damage to the system

Drum: 1) Do not leave drum uncapped (metal cap furnished with drum is for protection of valve and safety plug) It should be replaced after each use of drum

2) Do not carry drum in passenger compartment of car Place drum in luggage compartment or, if in an open truck, cover drum to protect it from radiant sun heat If precaution not taken, resultant increase in pressure may cause safety plug to release or drum to burst

3) When charging system, do not subject drum to high heat Use water no warmer than 125°F (Hot rags will suffice) *Never place drum on radiator, stove, or use torches for heating during charging.* Keep drums upright

4) Never permit a drum to be dropped or strike another drum violently

5) Do not fill drum completely (when filling one drum from another) Leave space above liquid for expansion

Personal: 1) Do not discharge Freon into room with exposed flame because concentrations of this gas in contact with open flame will produce a toxic gas

2) Do not expose eyes to liquid *USE GLASSES OR GOGGLES. Liquid Freon will freeze anything with which it comes in contact* If Freon should strike eyeballs, splash water to area of eye to gradually get temperature above freezing point, apply a few drops of sterile mineral oil to eyes as an irrigator If irritation continues, wash eyes with a weak solution of boric acid *DO NOT RUB EYES See an eye specialist at once*

3) Do not inhale large quantities of Freon vapor as it will act an an anesthetic

4) If Freon comes in contact with skin, injury should be treated for frostbite

HANDLING REFRIGERANT LINES: 1) Keep refrigerant lines dry and clean. Whenever a connection or joint is broken, clean all dirt from joint or connection

2) Parts from stock are capped and dehydrated Caps should only be removed just prior to installation Lines removed from system to be used again, should be capped immediately, to prevent dirt and moisture from entering lines

3) Lines should be free of kinks, and should be carefully stored to avoid crushing or bending

4) Proper size wrenches should be used when tightening fittings Always use two wrenches to prevent twisting copper tubing

5) Tubing that is left free to vibrate will harden and crystallize the area of the tubing at flare sections so that it may become brittle and break

6) When using paint drying lamps, ovens, steam cleaners, or other heat producing devices, avoid heating any part of system If sufficient heat applied, pressure will increase to a point where some part of system will rupture

7) When undercoating, use care to see that undercoating does not plug evaporator drain Do not coat air conditioning joints and connections

8) Keep gauge set and lines free of moisture

9) Compressor lubricant container must not be left open longer than necessary as the special oil is moisture free and will absorb moisture from air if left uncapped

AIR CONDITIONING LEAK TESTS

LEAK TESTING CONFINED AREAS. For leak testing confined areas, such as sections of evaporator and condenser a torch or flame type detector must be used Two types are available One type uses anhydrous methyl alcohol under pressure for producing the testing flame The cylinder is refillable and must be preheated to pressurize cylinder The other type uses propane gas under pressure, to produce the testing flame The cylinder is replaceable and comes already pressurized making it unnecessary to pre-heat cylinder in order to produce testing flame Instructions for use of the detectors are furnished with the detector

Leak Testing: With flame adjusted, explore for leaks by moving end of hose or sampling tube around all points where a leak may be Especially check around bottom of connections, since Freon is heavier than air and will be more apparent at bottom of fitting Color of flame will turn to a yellow-green when a small leak is detected Large leaks will be indicated by a change in color to bright or brilliant blue or purple When hose or tube is moved away from leak flame will clear to an almost colorless pale-blue or green *CAUTION*–Do not use lighted detector in any place where combustible or explosive gases dust or vapors may be present Do not breathe fumes and black smoke that are produced if leak is a big one Before leak testing be sure car is thoroughly aired (particularly if Freon tank used or if system opened for any reason) and moved to a Freon-free area in order that false readings may be prevented

PIN-POINTING LEAKS: There are a number of fittings and places throughout the air conditioning unit where a leak detector solution or detergent may be used to pin-point leaks Apply solution to suspected area with swab that is attached to bottle cap Bubbles will form, within seconds if there is a leak

AIR CONDITIONING TROUBLE SHOOTING

►*CAUTION Do not disconnect refrigerant lines, replace parts, or attempt adjustments without complete instructions See "Air Conditioning Service Cautions"*

POOR COOLING: 1) Blowers Not Operating–Fuse blown or faulty circuit breaker, switch in "Off" position, defective switch, switch resistors or blower rheostats inoperative, broken wire or loose connections, blower motor defective, blower fans or motor improperly installed

2) Restricted Air Flow–Filters clogged, dirt or other obstructions in air ducts, evaporator fins or coils clogged or restricted with frost or ice

3) Refrigerant Flow to Cooling Coils or Fins Incorrect–Expansion valve improperly adjusted or defective, power element or temperature bulb does not contact pressure line properly, restriction in liquid line between receiver and cooling coils or fins, power element or temperature bulb discharged, insufficient refrigerant, by-pass valve, thermostatic switch or solenoid (if so equipped) not properly set or inoperative, modulator valve (if so equipped) defective, break in any part of closed refrigeration system

4) Refrigerant Not Condensing Properly–Air flow through condenser, restricted, high engine operating temperatures, air or excess refrigerant in system, restriction in high pressure side of compressor and condenser

5) Clutch (If So Equipped) Does Not Engage–Defective coil or relay, clutch plate lining worn or saturated with oil causing slippage, air conditioning "On" switch defective, thermostat inoperative, clutch adjustment incorrect

6) Compressor–Belts not adjusted properly worn or broken, operating above normal pressures, disconnect pulley bolts not in place, valves faulty, service valves not fully open

7) Electrical–Loose connections or broken wires between electrical units blown fuses or faulty circuit breakers

TOO COLD: 1) Clutch (If So Equipped) Does Not Disengage–Thermostat inoperative, relay stuck closed, air conditioning "On" switch inoperative

2) Blower Speed Cannot be Reduced–Defective blower switch

VIBRATION–NOISE: 1) Blowers–Loose on shaft, striking housing, foreign material, motor bearings or mounts loose or worn

2) Compressor–Mounting brackets loose, loose internal parts, insufficient oil, too much refrigerant

3) Air Flow–Foreign material in air system, small slits or openings in ducts

INCORRECT OPERATING PRESSURE: 1) Excessive Pressure on High Pressure Side–Air or excess refrigerant in system, air flow through condenser core restricted, kinks or restrictions in line on high pressure side, high engine temperature, shut-off valve on high pressure side of compressor not fully open, insufficient air flow through cooling coil, defective expansion valve or incorrect adjustment

2) Insufficient Pressure on High Pressure Side–Shortage of refrigerant, defective expansion valve or incorrect adjustment, leaky or broken compressor valves

3) Excessive Pressure on Low Pressure Side–Power element or temperature bulb not making correct contact with pressure line, expansion valve needle stuck open or leaking

4) Insufficient Pressure on Low Pressure Side–Restriction in lines shortage of refrigerant, expansion valve needle stuck shut, expansion valve not open far enough plugged or defective, dehydrator-filter (strainer-drier) plugged, power element or temperature bulb charge lost or line plugged, compressor valves faulty, blower fans inoperative, temperature control thermostat does not cut out, moisture or freeze-up

GENERAL MOTORS CARS

Buick & Buick Special (1961)
Cadillac (1961)
Chevrolet Pass. Cars (1961)
Corvair (1961)
Oldsmobile & Oldsm bile F-85 (1961)
Pontiac & Pontiac Temp st (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 BUICK COMPRESSOR NOISE AT LOW SPEED CORRECTION:* Install new compressor rear mounting bracket package, Part No. 1389756, which includes rubber insulators between compressor and bracket.

►*1961 BUICK SPECIAL AIR CONDITIONER PRODUCTION CHANGE NOTE:* On units produced after March 1, 1961 hot gas bypass valve control system is replaced by a clutch cycling temperature control system. Hot gas bypass valve, control wire, and pipes are eliminated and a "cold sensitive" temperature control switch is located in evaporator case. Other parts of system are basically unchanged. See *wiring diagram*

►*SHUT-OFF VALVE NOTE:* Hand operated or Schrader type valves used in intake and discharge lines. *CAUTION – Schrader type valves are opened by special adapters on charging hoses and hoses must be properly connected to th gauge set, and set manifold valves must be completely clos d before making connections to valves.*

►*SERVICE CAUTION: Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

LEAK TESTING & TROUBLE SHOOTING: *See "Leak Testing & Troubl Shooting" at beginning of Air Conditioning Section.*

►*1961 BUICK SPECIAL AIR CONDITIONER BUZZING NOISE CORRECTION:* May be caused by low pressure line behind windshield wiper motor contacting motor. Minimum clearance between hose and motor should be¼".

DESCRIPTION: Similar in design and operation to previous systems. All units are located in engine compartment or on front of dash. Cadillac Series 75 has an additional evaporator and blower assembly in trunk.

ADJUSTMENT

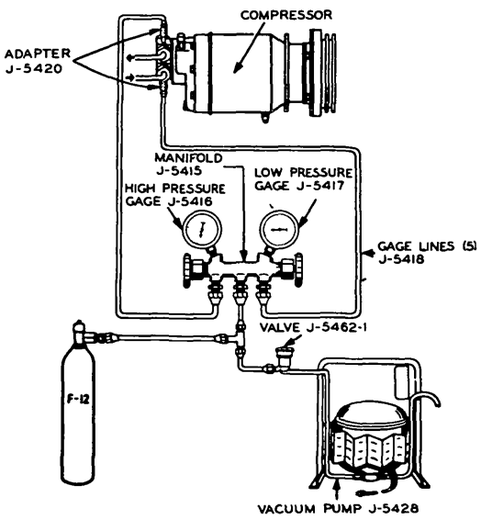
COMPRESSOR BELT: Adjust belt as follows:
Buick (Except Special): Adjust belt so strand tension gauge J-7316 reads 90.
Buick Special: Adjust belt so strand tension gauge J-7316 reads 72.
Cadillac: Adjust belt so strand tension gauge reads 90 (new belt), 45–60 (used belt).
Chevrol t & Corvair: ½–¾" deflection with 15 lbs. load applied midway between crankshaft and compressor pulleys.
Oldsmobile & Oldsm bile F-85: With Tension Gauge BT-33-70 installed on belt, adjust tension until pointers on gauge are even with line on gauge plunger.
P ntiac & Pontiac Tempest: Adjust belt with Burroughs Belt Tension Gauge to obtain 100–105 lbs. belt tension.

MAGNETIC CLUTCH: Energize clutch coil from a 12 volt source and check clearance between coil housing outer rim and face of **rotor plate** at three different locations. Clearance should be .025–.035". If not correct, remove pulley and rotor plate and adjust number of shims and spacers as necessary. Shims furnished in .010", .012", .015", .018", .020", .022", .025" thicknesses; and spacers furnished in .070", .093", .108" thicknesses.

EXPANSION VALVE: No adjustment. Valve is preset at the factory.

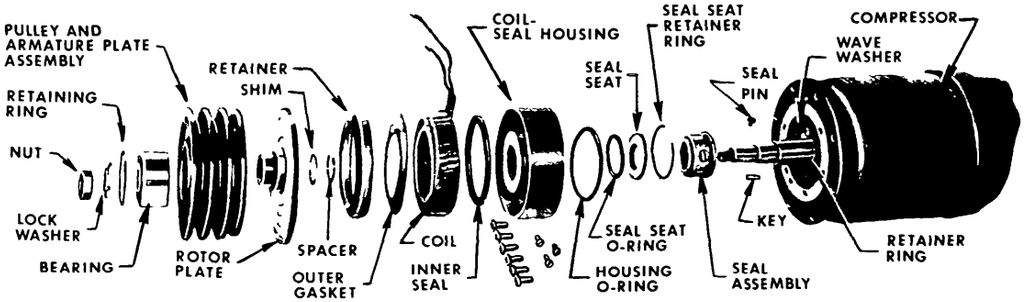
HOT GAS BYPASS VALVE: Adjust valve for each model as follows:

Buick (Except Special) 1961: Remove control valve lever, counterbalance spring and spacer. Connect service gauges to compressor, then close gauge set valves and open compressor valves to gauge position. Set engine speed to 1600 RPM, then turn unit on and allow for stabilization. Turn adjusting screw in or out with Tool J-7727 or a reworked screwdriver (1/8" wide notch 1/8" deep in center of blade) to adjust suction pressure to obtain a reading of 25–27 lbs. at 90–100°F ambient temperature. *NOTE – If valve has been rebuilt, it may be necessary to add or remove plunger shims to obtain proper adjustment.*



Buick Special 1961: Remove control valve lever, counterbalance spring and spacer. Connect high pressure gauge line to compressor outlet and low pressure gauge line to evaporator. Set engine speed to 1600 RPM, then turn unit on and allow for stabilization. Turn adjusting screw in or out with Tool J-7727 or a reworked screwdriver (1/8" wide notch 1/8" deep in center of blade) to adjust suction pressure to obtain a reading of 26–40 lbs. at 90°F ambient temperature. *NOTE – If valve has been rebuilt, it may be necessary to add or remove plunger shims to obtain proper adjustment.*

Cadillac 1961: Install high and low pressure gauges to compressor and purge gauge lines. Start engine and run at 2000 RPM. Move "Temp" levers to coldest setting and fan switch to "Low". Run system for approximately 5 minutes, then bring the high pressure to 200 lbs. by blocking air flow through radiator and condenser or by placing a fan in front of condenser. When high pressure is at 200 lbs., low pressure should be at 30 lbs. If not correct, remove diaphragm on front of bypass valve and use Adjuster Tool J-6389 to turn adjusting screw clockwise to increase pressure or counterclockwise to decrease pressure. *NOTE – Turn adjusting screw ¼ turn and allow time for gauge to settle. Repeat if necessary. This is important as gauge does not immediately indicate actual reading.* Install diaphragm.

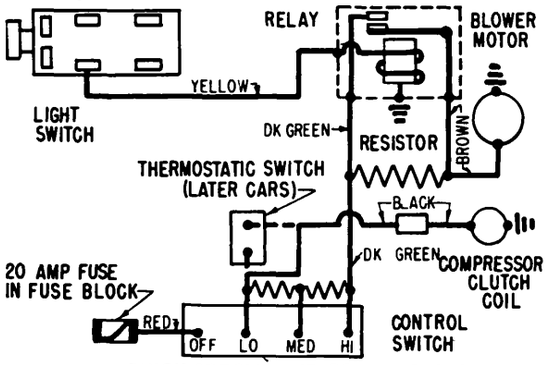


Chevrolet 1959–61: Connect gauge set to compressor, then turn compressor hand shut-off valves partially clockwise. Purge gauge lines by opening gauge set valves for a few seconds, then start engine and operate at 1500 RPM. Set controls for full inside air, maximum cooling, and high blower speed. Stabilize system by operating for about 10 minutes. When compressor head pressure reaches 130–225 lbs., reading on low pressure gauge should be 27 lbs. (1959–60), 26 lbs. (1961) if valve properly set. If pressure reading incorrect, disconnect return spring and cable from valve, and remove clip and pin, lever arm and nylon spacer from valve. Use Tool J-6389 or J-7727 and slowly adjust valve until low pressure reading is correct. Replace lever and other valve parts and adjust valve operating cable.

Oldsmobile & Oldsmobile F-85 1961: Remove cap from gauge fitting on low pressure line near evaporator assembly. Install Adapter J-5420 on low pressure gauge line and connect adapter to gauge fitting on low pressure line. Purge gauge and hose by opening low pressure gauge valve for a few seconds. Start engine and allow to run at 2000 RPM. Move temperature control lever to extreme right position, turn blower speed on "low" and engage "Recirculation" button (if equipped). Place paper in front of condenser to obtain a head pressure of 200 lbs. Check pressure on low pressure gauge and adjust only if pressure is not 23.5–24.5 lbs. (F-85), 29–30 lbs. (Others). To adjust, remove control cable,

CONTINUED ON NEXT PAGE

GAUGE SET INSTALLATION



AIR CONDITIONING COMPRESSOR (TYPICAL)

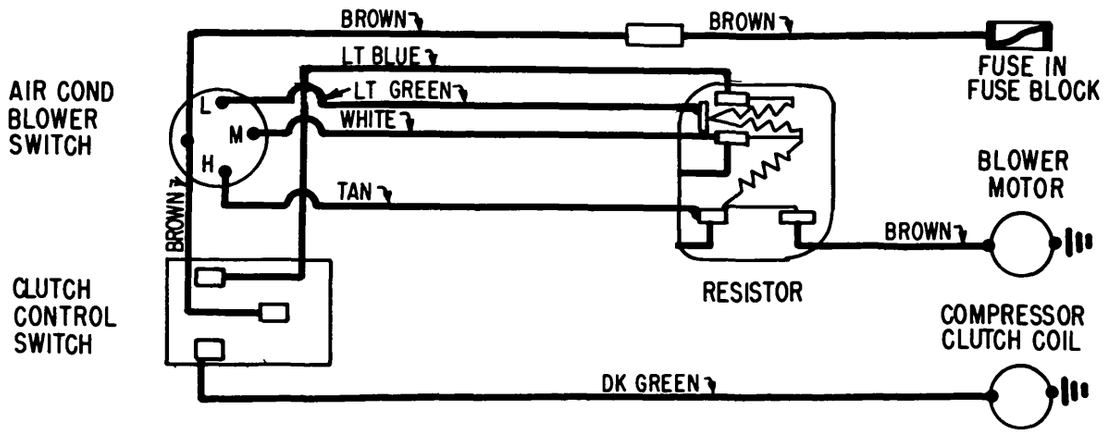
GENERAL MOTORS CARS (Continued)

lever and cam, then insert Tool J–6389 or J–7727 into valve. Adjust pressure to 24 lbs. (F–85), 29.5 lbs. (Others) by turning screw clockwise to increase pressure, counterclockwise to decrease pressure. Turn engine off, remove gauge hose from pressure fitting and replace cap. Reinstall cable and control lever assembly, then adjust control cable (See below).

Pontiac (Except Tempest) 1961: Connect gauge set to compressor, then push temperature control lever full down for maximum cooling (valve lever cam should just contact nylon plunger). Depress "Inside" button and position blower to "Hi". Close doors and windows, then start engine and run at 2900 RPM for 3 minutes. Reading on low pressure gauge should be 19–22 lbs. at 70–90°F ambient temperature. If not within this range, remove valve lever and nylon plunger and adjust valve with Tool J–6389. Turn screw clockwise to increase pressure and counterclockwise to decrease pressure. *NOTE – Make adjustments in small increments and allow time for pressure to stabilize.* Install and adjust control cable.

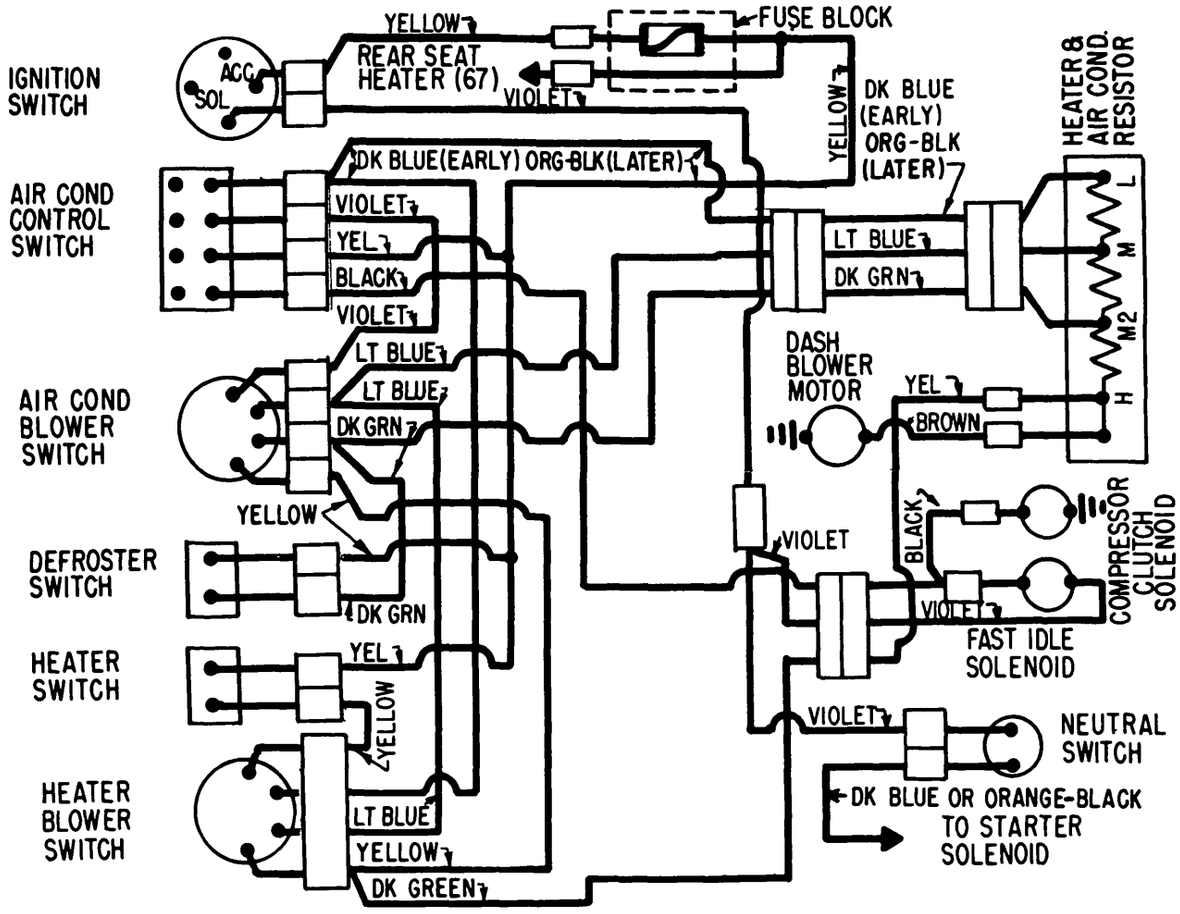
BUICK SPECIAL AIR CONDITIONING CONTROL DIAGRAM

Control Cable Adjustment (Hot Gas Bypass Valve): Adjust for each car model as follows:



Buick (Except Special) 1961 – Set "Cool" lever for maximum cooling (down position), and loosen control wire cable clamp at hot gas bypass valve. Push valve lever to extreme rearward position (toward instrument panel) and clamp control wire cable.

Buick Special 1961 – Set "Temp" lever for maximum cooling (extreme right), and loosen control wire sheath clamp at valve. Push valve lever forward beyond normal travel and release slowly. Valve lever will return to maximum cold position. Clamp control wire sheath.



Cadillac 1961 – No adjustment. Valve operation controlled by vacuum diaphragm on valve and vacuum modulator at air conditioner control panel.

Chevrolet 1961 – Make sure cable operates freely, then disconnect return spring. Move COLD lever on dash control to extreme right for maximum cold position. Remove bowden wire loop from lever arm, then move lever arm toward front of car to end of its free travel. Loosen clamp holding bowden wire sheath and move

CONTINUED ON NEXT PAGE

BUICK (EXC. SPECIAL) AIR CONDITIONING CONTROL WIRING DIAGRAM

CADILLAC AIR CONDITIONING CONTROL WIRING DIAGRAM

GENERAL MOTORS CARS (Continued)

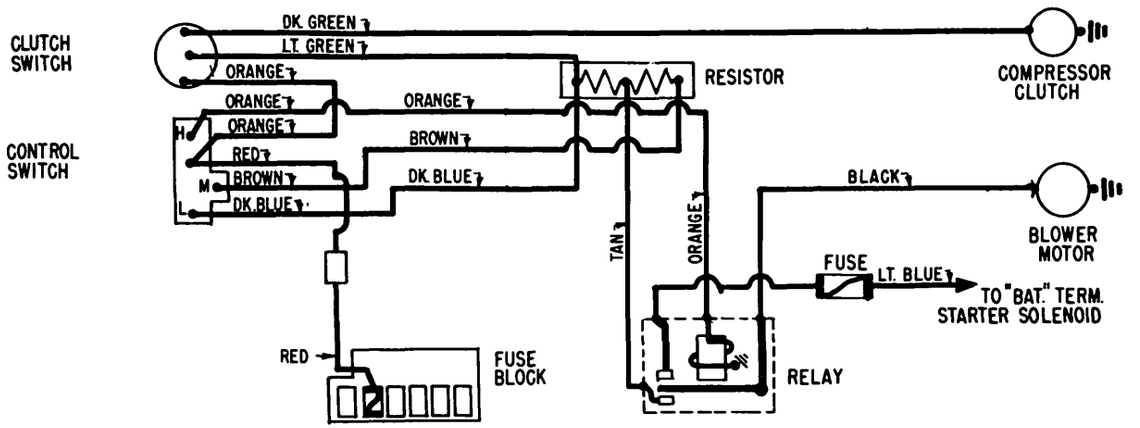
sheath until wire loop matches position of lever arm pin when pin is held ¼" to rear of maximum cooling position. Tighten clamp and reinstall wire on lever.

Oldsmobile & Oldsmobile F-85 1961 – Make sure cable is not kinked, then disconnect return spring. Place control lever in extreme right position. Disconnect control cable from lever and loosen cable clamp on bypass valve bracket. Loosen lockscrew on lever assembly. With lever against stop, position cam so that it just touches nylon plunger, then tighten lockscrew. With bypass lever held against its stop, install control wire coil over lever pin, tighten cable clamp and install return spring. Move control lever to extreme left and back to extreme right position. There should now be 1/16" spring-back of lever. Check to make sure cam is just touching nylon plunger.

Pontiac (Except Tempest) 1961 – Disconnect bowden cable loop from valve cam lever and disconnect spring, then pull loop as far forward (toward front of car) as possible. Move lever on valve forward and return it slowly until lever just contacts nylon plunger. Hold lever in this position. *NOTE – If cable loop does not extend 1/8" ahead of valve lever pin, loosen bowden cable clamp at valve and slide cable housing as required.* Tighten cable housing locknuts. Install bowden cable loop on valve lever and connect spring.

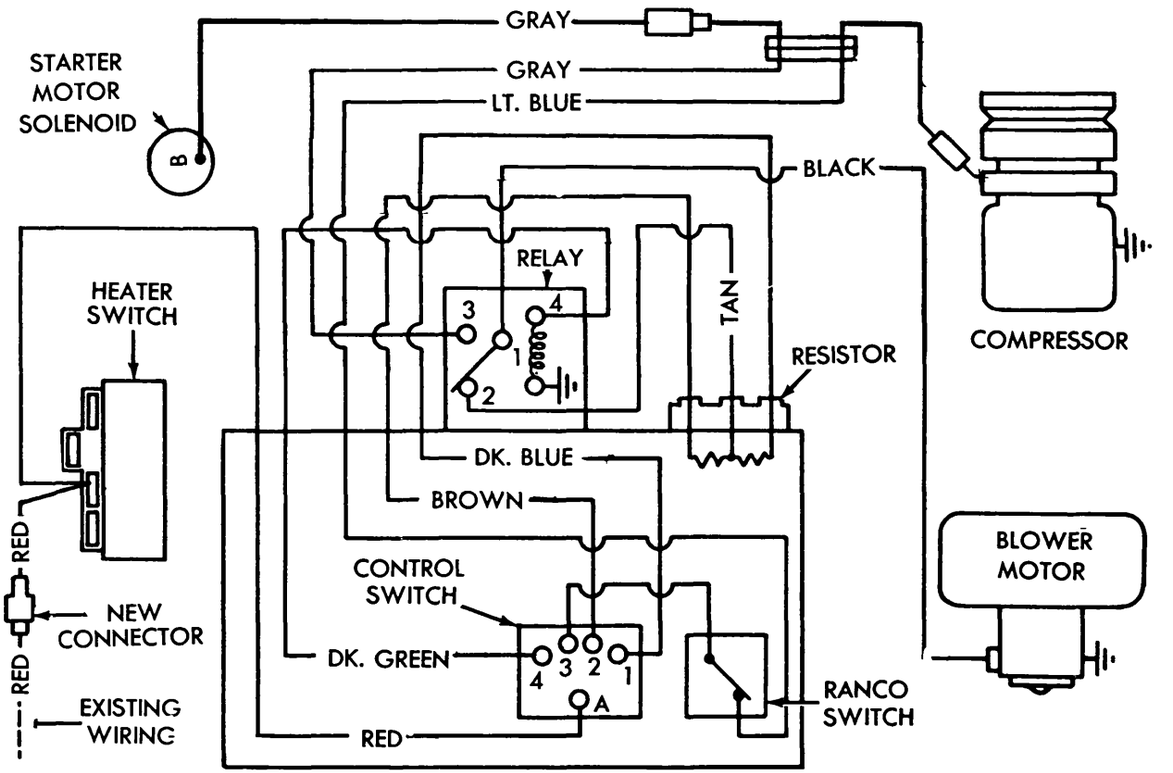
THERMOSTATIC SWITCH: Adjust switch for each model as follows:

Buick Special 1961: Pull evaporator face plate out of evaporator case, and remove cardboard cover from right end of thermostatic switch. Attach gauge set to compressor and evaporator. Set engine speed at 1600 RPM, open doors and hood, set "Cool" lever for maximum cooling (extreme right), turn blower on high speed, and make sure heater levers are off. Turn switch adjusting screw clockwise to increase pressure, counterclockwise to decrease pressure to obtain a low pressure reading of 20–31 lbs. at 90°F ambient temperature with compressor head pressure not to exceed 245 lbs.



Chevrolet & Corvair 1961: Connect gauge set to compressor, then turn compressor hand shut-off valves partially clockwise. Purge gauge lines by opening gauge set valves for a few seconds, then start engine and operate at 1500 RPM. Set controls for full inside air, maximum cooling, and high blower speed. Stabilize system by operating for about 10 minutes. When compressor head pressure reaches 130–140 lbs. at 70°F ambient temperature, reading on low pressure gauge should be 14 lbs. If pressure reading incorrect, expose switch by removing evaporator face plate and cardboard switch cover, and turn switch adjusting screw clockwise to increase pressure, counterclockwise to decrease pressure in one-turn increments until proper pressure is reached.

Pontiac & Tempest 1961: 1) Remove switch from evaporator and turn knob fully clockwise (full cold position). Determine local barometric pressure (call airport or radio station). Refer to tables below for "make" and "break" temperatures for barometric pressure just obtained.



2) Cool some water to 1°F below minimum temperature on chart and immerse capillary part of switch in the water. *NOTE – Do not let any ice in the water touch capillary as a false reading will result.* If switch contacts do not open, adjust as indicated below. If switch contacts do open, raise water temperature about 1°F and immerse capillary. Repeat until contacts do not open. Highest temperature at which contacts open is "break" temperature and should be within limits in table. If not within limits, adjust switch.

3) Reimmerse capillary in water, open points by rotating switch knob to warmer position, then return knob immediately to maximum cold position. Gradually add warm water until contacts close. This "make" temperature should not be higher than 3–4°F than "break" temperature.

CONTINUED ON NEXT PAGE

CHEVROLET "ALL WEATHER" AIR CONDITIONING CONTROL WIRING DIAGRAM

CHEVROLET "COOL PACK" AIR CONDITIONING CONTROL WIRING DIAGRAM

GENERAL MOTORS CARS (Continued)

Adjustment – Remove switch fiber cover and turn adjusting screw counterclockwise to lower "break" temperature, and clockwise to raise "break" temperature. One turn of screw will change "break" temperature about 4°F.

Pontiac & Tempest Thermostatic Switch Specifications

Barometric Pressure	Pontiac ①Break Limits	Tempest ①Break Limits
25	32–35°F	33–37°F
26	33–36°F	33½–37½°F
27	33–37°F	34½–38½°F
28	34–37°F	35–39°F
29	34–38°F	36–40°F
30	35–39°F	36–41°F

① – Highest temperature at which contact points open.

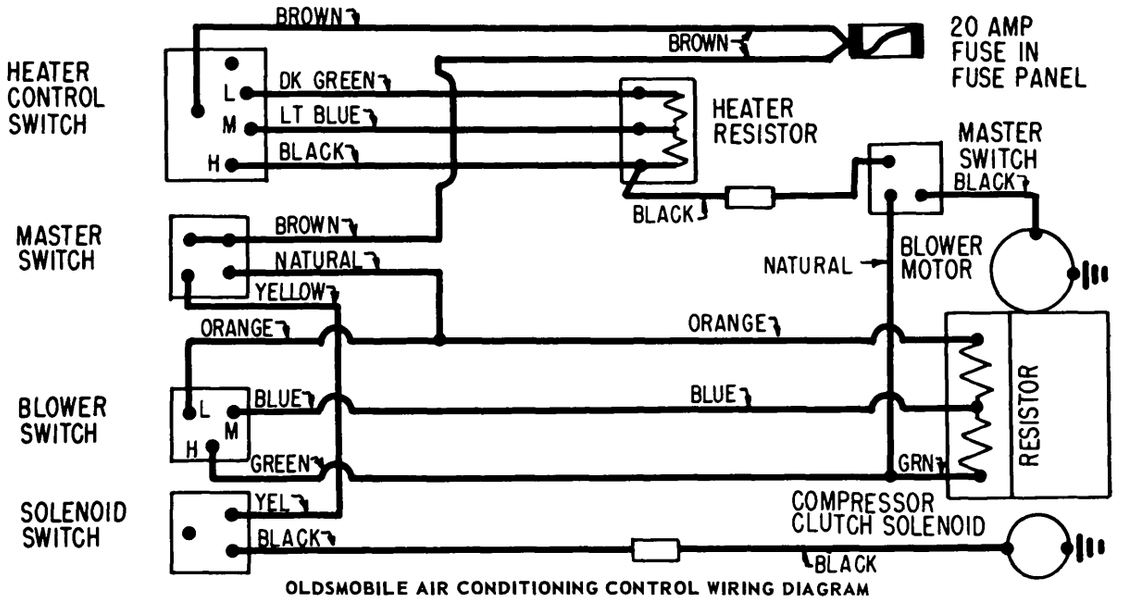
Make Limits – Minimum temperature at which contact points close should be 3–4°F higher than break limits temperature.

COMPRESSOR CLUTCH SWITCH: Buick (Except Special) 1961 – Bend switch operating tab on lever to which "Cool" control wire is attached so switch is in extreme off position when "Cool" lever is in the off position.

Chevrolet 1961: With "Outlet" knob fully out, secure cable to door control rod with rod placed at end of travel furthest from driver's side of car.

Oldsmobile (Except F–85) 1961: Bend switch bracket as necessary so switch will close when sliding lever in control assembly is moved ¼" from extreme left position.

Pontiac (Except Tempest) 1961: Adjust switch position so switch closes when control lever is moved downward ¼" from full up position.



FAST IDLE ADJUSTMENT: Chevrolet – Adjust hand throttle wire guide stop to limit engine speed to 900 RPM with control lever pulled out and transmission in neutral. Check to see that fast idle control linkage does not interfere with normal operation of carburetor linkage when fast idle is not operating.

SERVICING

GAUGE SET INSTALLATION: Connect gauge set into system (see illustration and "System Gauge Connection Note" below). *NOTE – For purging or adding oil to system, Freon tank and Vacuum Pump are not connected to center connection on manifold.* Make sure that shut–off valves on gauge set are fully closed and that shut–off valves on compressor head (cars with this type valve) are turned fully COUNTERCLOCKWISE (back seated).

► *SYSTEM GAUGE CONNECTION NOTE* Usual location for gauge set connections is at the compressor. However, the low pressure line valve may be located at the hot gas bypass valve. On some cars, high pressure valve is located at the compressor muffler on the left wheelhouse panel with the low pressure valve at the air intake pipe near the dash panel, also on left wheelhouse panel. Some cars have an additional low pressure line valve at the evaporator case inside passenger compartment. *This valve must be used for low pressur gauge connection when adjusting hot gas bypass valve. See individual hot gas bypass valve adjustment procedures above for particular car application.*

► *SCHRADER TYPE VALVE CONNECTION CAUTION: On cars using this type valve in place of hand operated shut–off valves in refrigerant lines at compressor head, it is necessary to connect Adapters J–5420 to gauge connecting lines and to make sure that both valves on gauge set are completely closed before connecting adapters to Schrader type valves as the adapters will automatically open these valves.*

OLDSMOBILE AIR CONDITIONING CONTROL WIRING DIAGRAM

► *HAND OPERATED SHUT–OFF VALVE NOTE.* These are two–way valves. When turned COUNTERCLOCKWISE (back seated), compressor is connected to refrigerant lines and line to gauge fitting is closed. This is the normal operating position. When turned CLOCKWISE (front seated), compressor is closed off from refrigerant lines and open to gauge fitting. When valves are turned to middle position, compressor is open to both refrigerant lines and to gauge fitting. In this position, gauge readings can be taken with system in operation.

► *HIGH PRESSURE GAUGE CAUTION· Due to high operating capacity of compressor, a 600 lb. gauge must be used.*

ALL MODELS (EXCEPT CADILLAC, CHEVROLET & CORVAIR)

PURGING SYSTEM: Connect gauge set (see above), and turn hand shut–off valves (where equipped) partially clockwise. Open high pressure gauge valve so refrigerant escapes through gauge set and out the center fitting and hose. *CAUTION – DO NOT open gauge valve too much as oil and liquid refrigerant will escape. Refrigerant should escape in vapor form only.* When hissing ceases, all refrigerant has been discharged from system. Close gauge high pressure valve. Leave gauge set connected in preparation for evacuating and charging.

CADILLAC

PURGING SYSTEM: Install Adapters J–5420 on high and low pressure valve fittings. Tighten adapters to depress valve cores until a **slight** hissing sound is heard. When hissing stops, system is discharged. *CAUTION – DO NOT overtighten adapters or oil and liquid refrigerant will escape. Refrig rant should escape in vapor form only.* Remove adapters as soon as system is purged.

CHEVROLET & CORVAIR

PURGING SYSTEM: Connect gauge set (see above).Open both compressor hand shut–off valves ¼–turn clockwise from fully counterclockwise position. *NOTE – Corvair has Schrader type valves and this step is unnecessary.* Remove cap from gauge center connection and open high pressure gauge valve, being careful not to open it too far, and slowly discharge **vap r** through center connection. *CAUTION – Opening valve too far will cause compressor oil to be discharged with the refrigerant.* When pressure is reduced below 100 lbs. on high pressure gauge, open low pressure gauge valve and continue discharging until all refrigerant has been released or pressure does not exceed 5 lbs. Close both gauge valves, and compressor hand shut–off valves. Leave gauge set connected in preparation for evacuating and charging.

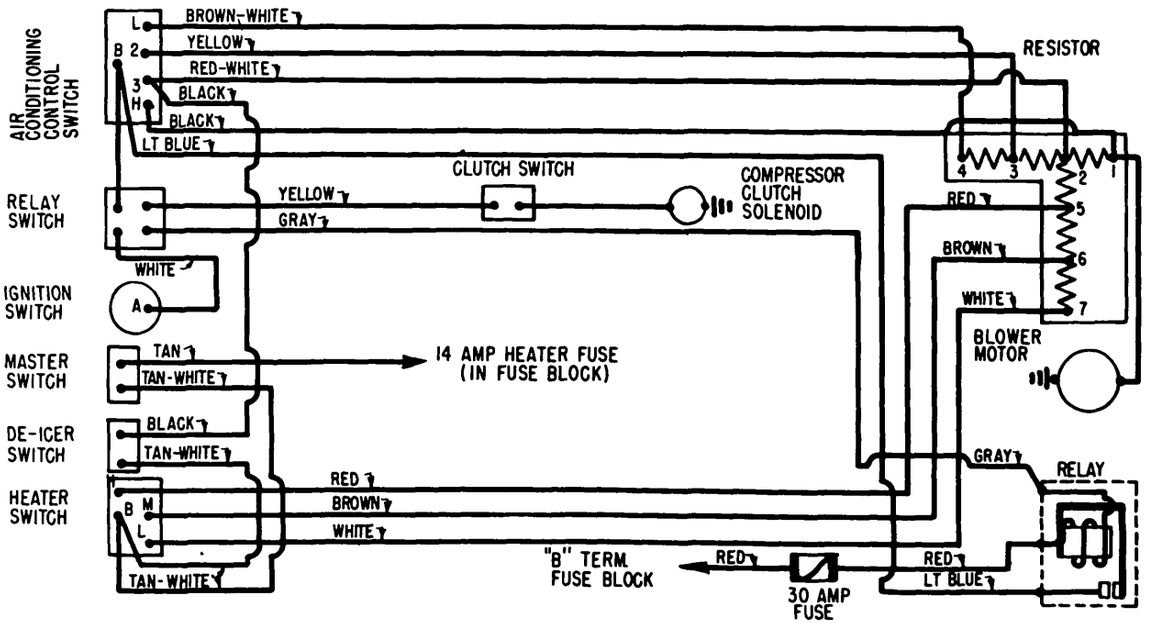
ALL MODELS

EVACUATING SYSTEM (WITHOUT VACUUM PUMP): Connect gauges as indicated in illustration, but substitute a bottle or other suitable container in place of vacuum pump (container will catch the evacuated oil so it may be measured and a like amount of clean oil replaced). *CAUTION – Be sure the fitting on discharge valve is open to compressor with no restriction from valve closure, caps, or plugs in attached line before starting engine.* Turn both high and low pressure valves on compressor clockwise to gauge position. Leave low pressure gauge valve tightly closed, carefully open high pressure gauge valve and hand shut–off valve (vacuum line valve), being careful to avoid any accidental discharge of liquid refrigerant. Discharge refrigerant, air, and any oil into bottle.

CONTINUED ON NEXT PAGE

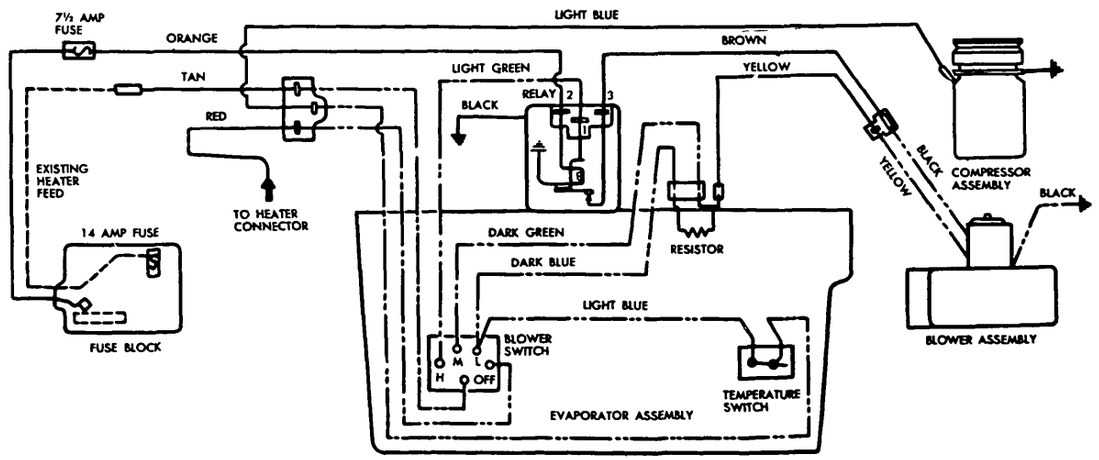
GENERAL MOTORS CARS (Continued)

Start engine and set at low idle speed and turn air conditioner to maximum cooling position. *Maintain engine speed at slow idle at all times during evacuation.* Turn high pressure service valve to shut–off position. Operate system at low idle for five minutes, then turn off engine and air conditioner and close hand shut–off valve immediately. If system holds 26–28" of vacuum *(see "Vacuum Note" below)* for 10 minutes, system is not leaking. If not, locate and correct leak. Close high pressure gauge valve, open low pressure gauge valve and charge system with refrigerant at cylinder pressure, then repeat evacuation as indicated above. Again close high pressure gauge valve and open low pressure gauge valve and then complete charging with correct amount of refrigerant *(see "Charging System" below).*



EVACUATING SYSTEM (WITH VACUUM PUMP): Connect gauge set, vacuum pump, and container of refrigerant as shown in illustration. Check fluid level in vacuum pump and add correct oil if necessary. Make sure dust cap on discharge side of vacuum pump has been removed. Open high and low pressure valves on gauge set. *CAUTION – Shut–off valve on vacuum pump must be closed.* Start vacuum pump and SLOWLY open shut–off valve at pump. *NOTE – If oil is blown from pump, oil must be replaced.* Operate pump to obtain approximately 28" of vacuum *(see "Vacuum Note" below)* for 10 minutes. If vacuum of 28" cannot be obtained, close valve at pump and note low pressure gauge to see if vacuum in system holds. If vacuum holds, pump or gauge may be at fault. If vacuum will not hold, charge system with refrigerant, check for leaks, and repair as necessary, then purge system. Repeat evacuation procedure and when vacuum of 28" has been obtained for 10 minutes, close valve at pump, stop pump and check vacuum to see that it will hold. If vacuum holds and no leaks are apparent, open refrigerant container valve to charge system to cylinder pressure, then close valve. Evacuate system again and close gauge valves. The system is now ready for a complete charge.

►*VACUUM NOTE:* Vacuum specification of 28" is for sea level. For each additional 1000 feet of elevation above sea level, lower vacuum specification by 1".



ALL MODELS

CHARGING SYSTEM: With system completely evacuated (gauge set and refrigerant tank connected), place refrigerant cylinder in a bucket of hot water (not to exceed 125°F). *CAUTION – Do not heat refrigerant cylinder above 125°F because fusible plug in cylinder valve melts at 157°F and softens at a slightly lower temperature.* Place cylinder and bucket on a suitable scale and record total weight. Open low pressure valve on gauge set (high pressure valve on gauge set closed). Set both high and low pressure service valves on compressor in gauge position. Wearing goggles to protect eyes, fully open refrigerant cylinder valve and allow refrigerant vapor to flow into system. Operate engine at slow idle speed until the correct amount of refrigerant has been charged into the system (see "Refrigerant Capacity Table" below). *NOTE – It may be necessary to refresh water in bucket to maintain required pressure.* Close both valves on gauge set, close valve on cylinder and remove cylinder from bucket. Operate compressor with engine running at 1600 R.P.M. and check removal performance of air conditioner. If performance satisfactory, stop engine, then firmly backseat both high and low pressure service valves on compressor. Remove gauge lines and replace protective caps over gauge connections and shut–off valves. Check oil level in compressor (see below).

PONTIAC "CIRC-L-AIRE" AIR CONDITIONING CONTROL WIRING DIAGRAM

PONTIAC "COOL PACK" AIR CONDITIONING CONTROL DIAGRAM (TYPICAL OF TEMPEST)

GENERAL MOTORS CARS (C ntinued)

Refrigerant Capacity Table

Car Model	Capacity
Buick (Except Special)	4½ lbs.
Buick Special	2½ lbs.
Cadillac (Except Series 75)	4½ lbs.
Cadillac, Series 75	6 lbs.
Chevrolet Cars (All Weather System)	3 lbs., 12 ozs.
Chevrolet Cars (Cool Pack System)	3 lbs.
Corvair	5 lbs.
Oldsmobile (Except F–85)	5 lbs., 3 ozs.
Oldsmobile F–85	2 lbs., 8 ozs.
Pontiac (Circ–L–Aire System)	5 lbs.
Pontiac (Cool Pack System)	3.25 lbs.
Pontiac Tempest	3 lbs.

ALL MODELS (EXCEPT CADILLAC)

CHECKING & ADDING OIL TO COMPRESSOR: Checking – Operate engine at slow idle for 5 to 7 minutes with system operating, then stop engine. Loosen screw in oil test fitting on side or bottom of compressor and allow a slight seepage of oil. Retighten screw for a moment and then "crack" open slightly again. If a steady flow of oil is evident, the oil level is either at a safe minimum level of 4 ounces or above it. When oil test screw is cracked open a second time and no oil escapes, or there is a hissing sound, the oil is below a safe minimum and oil should be added.

Adding Oil (Buick & Buick Special): Purge system and remove compressor. Drain oil from compressor. If oil is dirty, flush compressor and condenser with liquid refrigerant. Pour 13 ozs. of new 1000 viscosity oil to compressor through oil check fitting. Install compressor, evacuate and charge the system.

Adding Oil (Chevrolet & Corvair – Off Car): Purge system and remove compressor. Drain and measure oil from compressor. If oil is dirty, flush system with liquid refrigerant. If system was flushed, add 13 ozs. of new 1000 viscosity oil to compressor. If system was not flushed, add new oil in the amount drained from compressor. Install compressor, evacuate and charge the system.

Adding Oil (Chevrolet & Corvair – On Car): *NOTE – Manufacturer recommends following method as the only method for adding a partial charge of oil.* Attach gauge set to compressor, fill Oil Injector Tool J–7605 with 2 ozs. of 1000 viscosity oil and install tool on low pressure side of gauge set with valve at bottom of tool turned fully clockwise. Turn compressor hand shut–off valves fully counterclockwise and purge air and moisture from gauge lines. Operate engine at fast idle and set air conditioner controls for maximum output. Open both gauge valves fully and compressor hand shut–off valves 2 turns clockwise. Open valve on oil injector tool slowly and allow engine to run until all oil is drained from tool. Close gauge valves and recheck oil level. Repeat process if necessary. *CAUTION – Do not add mor than 4 ozs. of oil b for r ch cking oil l vel.*

Adding Oil (Oldsm bil & Oldsm bile F–85 – Off Car): Turn compressor hand shut–off valves fully clockwise and remove shut–off valves (Oldsmobile), pipe adapter plate (F–85) from compressor. Remove compressor, drain and measure oil from compressor. Flush compressor and condenser with liquid refrigerant if oil dirty or contaminated. Pour 9 ozs. (Oldsmobile), 13 ozs. (F–85) new 1000 viscosity oil into compressor and tighten oil drain screw. Install compressor, evacuate and charge the system.

Adding Oil (Oldsmobile & Oldsmobile F–85 – On Car): *NOTE – For procedure for F–85 with low pressure hand shut–off valve at right angle to evaporator low pressure pipe, see special Oldsmobile F–85 note below.* Install gauge set and purge high and low pressure lines. High pressure hand shut–off valve on compressor should be turned 2 turns clockwise. Compressor low pressure hand shut–off valve should be fully clockwise. Install oil charging line to center connection on gauge set and purge line. While vapor is escaping from oil line, insert oil line to the bottom of a 1000 viscosity oil bottle and allow vapor to bubble through the oil. Close high pressure valve on gauge set. With temperature control set for maximum cooling and "Normal" button pushed in, let engine run at slow idle to obtain about 10" of vacuum. If vacuum on low pressure gauge holds, open gauge set low pressure valve and allow 2 ozs. of oil to be drawn into system. Close gauge set low pressure valve, remove oil line from bottle, and cap gauge set center connection. Open gauge set high pressure valve, then open gauge set low pressure valve slowly so high pressure forces remaining oil into compressor. Close gauge set valves and turn compressor low pressure valve fully counterclockwise. Operate engine at 1600 RPM for 5 minutes and stop engine. Check oil level and add 2 more ozs. of oil if necessary.

►*OLDSMOBILE F–85 ADDING OIL NOTE (Units With Low Pressure Hand Shut–Off Valve At Right Angle To Evaporator Low Pressure Pipe):* Turn compressor hand shut–off valve fully clockwise (closed position), then purge compressor through high pressure valve. Disconnect low pressure hose and valve and pour 2 ozs. of 1000 viscosity oil into hose. Install a new "O" ring on hose and connect to hand shut–off valve. Remove cap from gauge outlet on high pressure hand shut–off valve, start engine and run at slow idle for about 5 minutes with air conditioning "On" to evacuate compressor and hoses, then install cap and stop engine. Open low pressure hand shut–off valve fully (loosen high pressure protective cap and allow a small amount of refrigerant to escape to remove any air in hose). Tighten cap and open high pressure valve fully. Operate engine at 1600 RPM for 5 minutes with air conditioner at maximum cooling and "Low" button depressed. Check oil level and repeat process as necessary.

Adding Oil (Pontiac & Pontiac Tempest): *See "Adding Oil (Chevrolet & Corvair – On Car)" above.*

Compressor Oil Capacity

Car Model	①Capacity
All (Except Pontiac & Tempest Cool Pack)	13 ozs.
Pontiac & Tempest Cool Pack System	11 ozs.

① – Fluid measure.

CADILLAC

CHECKING & ADDING OIL TO COMPRESSOR: Checking – Operate engine at 1000 RPM for about 5 minutes with air conditioner set for maximum output. Turn off engine and disconnect generator cooling tube at generator, then adjust compressor to center of its swing on mounting bracket. Wait a few minutes and open oil test screw slightly (screw is at bottom of compressor at forward end). If no oil escapes or if only hissing or vapor is evident, oil should be added (see below). If oil escapes, allow oil to drain until hissing or vapor is evident, then close test screw. Repeat the procedure, then add 2 ozs. of oil (see below).

Adding Oil (On Bench): Remove compressor, then remove oil test screw. Drain and measure oil from the compressor. Flush compressor if oil dirty. Add same amount of 1000 viscosity oil to the compressor as was removed. *NOTE – Do not add less than 6 ozs. of oil even if less than 6 ozs. was drained. Do not add oil at relief valv opening.* Install test screw, then install compressor.

Adding Oil (On Car): *Add oil, 2 ozs. at a time, using gauge set and Oil Injector Tool J–7605 as described under "Adding Oil (Chevrolet & Corvair–On Car)" abov .*

►*CADILLAC OIL CAPACITY NOTE·* When replacing any air conditioning component, add oil to component to insure correct amount of oil in the system. It is unnecessary to add oil when replacing valves or hoses.

Component	Added Oil
Evaporator	3 ozs.
Condenser	1 oz.
Receiver	2 ozs.
Receiver & Condenser	3 ozs.

COMPRESSOR REMOVAL & INSTALLATION

►*CAUTION: To prevent dirt and moisture nt ring air conditioning system, it is very important to cap all openings and to complete work on syst m as soon as possible.*

BUICK (Except Special): Purge system, then remove valve retaining plate from rear of compressor. Cover openings in lines and compressor. Disconnect clutch coil wire, loosen belts, and remove compressor from mounting bracket. To install, reverse removal procedure.

BUICK SPECIAL: Purge system and disconnect high and low pressure hoses at Schrader valves. Pull clutch coil wire from connector at wheelhouse. Remove front stabilizer bar assembly. Remove compressor front brace and front bracket attaching bolts. Loosen bolt holding rear brace to engine mount, then remove bolt and nut holding rear brace and adapter to cylinder block. Loosen front brace–to–timing chain cover bolt and push brace as far out as possible. Remove belt, then lower compressor out from under car. *NOTE – It may be necessary to remov ngin left side fill r plate for sufficient clearanc .* To install, reverse removal procedure.

CADILLAC: Purge system, remove high and low pressure line fitting from compressor. Disconnect clutch coil wires and drive belt. Remove compressor mounting screws and remove compressor. To install, reverse removal procedure.

CONTINUED ON NEXT PAGE

GENERAL MOTORS CARS (Continued)

CHEVROLET (Except Corvair): Remove air cleaner, purge system, remove connectors, and disconnect clutch coil wire. Loosen brace and bracket pivot bolts and remove belt. Remove compressor attaching screws and remove compressor. To install, reverse removal procedure.

CORVAIR: Removal – Purge system, remove fittings block, and cap openings. Remove nut from compressor mounting bracket pivot bolt and remove compressor–to–adjusting bracket attaching parts. Remove belt. Disconnect electrical wires from compressor. Remove bolts attaching triangular bracket to front of compressor. Work long pivot bolt forward until threaded end is moved out of compressor rear mounting boss. Remove compressor.

Installation – Support compressor on mounting bracket and work mounting bracket pivot bolt rearward through compressor rear mounting boss. Loosely install pivot bolt nut and washer. Attach triangular bracket to compressor. Connect wiring, install drive belt, and compressor–to–adjusting bracket attaching parts. Adjust belt tension (see above), then tighten pivot bolt nut to apply light pressure on rubber mounting.

OLDSMOBILE & OLDSMOBILE F–85: Remove power steering pump on F–85. Purge system, then remove valve manifold from compressor and cap lines and openings. Disconnect clutch coil wire. Energize clutch coil from a 12–volt source so pulley nut can be loosened, then remove pulley nut and locking washer. Rebelts. Remove compressor attaching bolts and remove compressor. To install, reverse removal procedure.

PONTIAC & PONTIAC TEMPEST: *NOTE – Compressor can be positioned on fender for access to engine without disconnecting refrigerant lines or purging system.* Purge system. Disconnect clutch coil wire. Slowly remove manifold fittings assembly from compressor and cap lines and openings. Remove compressor attaching bolts, then remove compressor belt. Remove compressor.

►*OVERHAUL NOTE: Compressor clutch, clutch coil, shaft seal, and compressor oil pump are the only parts that are recommended for service replacement. The compressor main body assembly should be replaced as a unit if faulty.*

COMPRESSOR OVERHAUL

COMPRESSOR CLUTCH ASSEMBLY: Removal – With compressor on bench, bend tangs on shaft lockwasher so pulley nut can be removed. Remove capscrews holding pulley hub and armature assembly to pulley. *CAUTION – These screws must be removed to prevent damage to rotor plate during pulley hub and arma-assembly removal.* Use Puller J–8433 and remove pulley hub and armature plate assembly. Remove rotor plate with Remover J–6322. *NOTE – Scoring of these parts is normal and they should not be replaced for this reason.* Remove woodruff key, shims, and spacers from shaft. Remove coil retaining groove pins or screws, remove wire clamp from compressor, then remove coil retainer, outer gasket, coil, and inner seal. Remove pulley bearing retaining ring with Truarc pliers, then press bearing out of pulley.

Installation – Reverse removal procedure and note the following: When installing pulley bearing, press on outer race of bearing only, and be sure that beveled side of snap ring is away from bearing. After rotor installed, check clutch air gap as described under "Adjustments" above. Tighten pulley hug–to–pulley capscrews to 4 ft. lbs. torque; and compressor shaft nut to 6 ft. lbs. torque.

COMPRESSOR SHAFT SEAL & OIL PUMP: Removal – With clutch assembly removed (see above), drain oil from compressor on units having an oil pump (Cadillac, Oldsmobile & F–85). Remove coil housing attaching screws and remove coil housing and wave washer. Remove snap ring, seal seat and "O" rings, then remove shaft seal assembly. Remove shaft seal drive pin and retainer ring; remove oil pump cover and oil pump gears.

Installation – *NOTE – Oil pump gears must be replaced as a matched set.* Install parts in reverse order of removal and note the following: **1)** DO NOT score polished surfaces of shaft seal and seal seat. **2)** Use lint–free tissues (furnished in seal kit) for cleaning parts, and coat all parts with clean 1000 viscosity refrigeration oil. **3)** Seal pin must be properly installed in shaft (seal will not go on pin unless pin is correctly aligned with groove in seal). **4)** Use Seal Protector J–6320 with tapered end to front of shaft to prevent damage to "O" ring inside of seal. **5)** Torque coil seal housing screws to 15 ft. lbs. **6)** After seal housing installed, leak test seal with liquid refrigerant.

STUDEBAKER

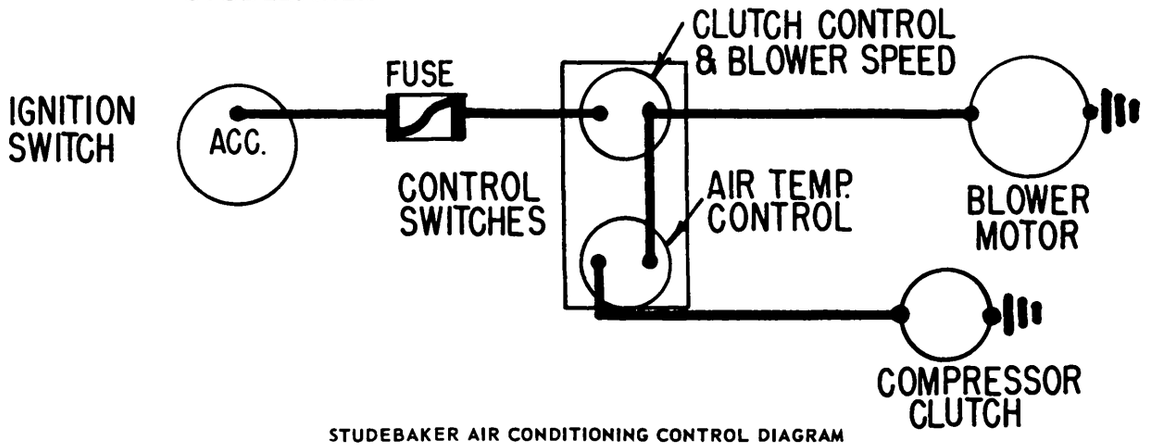
Studebaker (1961)

►CHANGES & CORRECTIONS

►*1961 LARK WATER SPLASH FROM EVAPORATOR DRAIN PAN CORRECTION:* Condition may occur on extreme right or left turns. To correct, install Auxiliary Drain Pan Kit, Part No. 1555524.

►*1959-61 LARK COMPRESSOR SUCTION VALVE INTERFERENCE WITH HOOD CORRECTION:* If interference not corrected by shifting valve downward, install new valve, Part No. 1546049 (1961), No. 1546054 (1959-60).

DESCRIPTION: Air conditioning system design is the same as used on previous models.



►*SERVICE CAUTION: Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

ADJUSTMENT

COMPRESSOR DRIVE BELT: Loosen idler pulley retaining nut and move pulley as required to tighten belt so a pull of 20 lbs. will deflect belt ½" with spring scale located midway between compressor pulley and idler pulley (6 cyl. models), between compressor pulley and fan pulley (V8 models).

SERVICING

AIR CONDITIONER SERVICE NOTE: All service operations except for removal and installation of compressor for engine repairs should be performed by a competent refrigerant service man.

STUDEBAKER AIR CONDITIONING CONTROL DIAGRAM

►*COMPRESSOR REMOVAL NOTE:* For access to engine on Silver Hawk models, the compressor hoses can be released from clamps on body and fender and the compressor can be moved out of the way. On other models, if necessary to remove compressor from its mounting, see *"Compressor Removal"* below.

COMPRESSOR REMOVAL (When Necessary to Disconnect Hoses): Remove caps and close the upper and lower service valves on compressor, then remove capscrews securing the two valves to compressor. Place tape over openings in compressor and valves. Remove compressor from engine compartment *CAUTION* - Keep compressor in its horizontal position.

Installation: Reverse removal procedure and install new valve-to-compressor gasket. Secure both valves in positions before opening valves. *NOTE -Before installing compressor belt, turn compressor over a few times by hand to discharge any oil that may have collected on top of piston.*

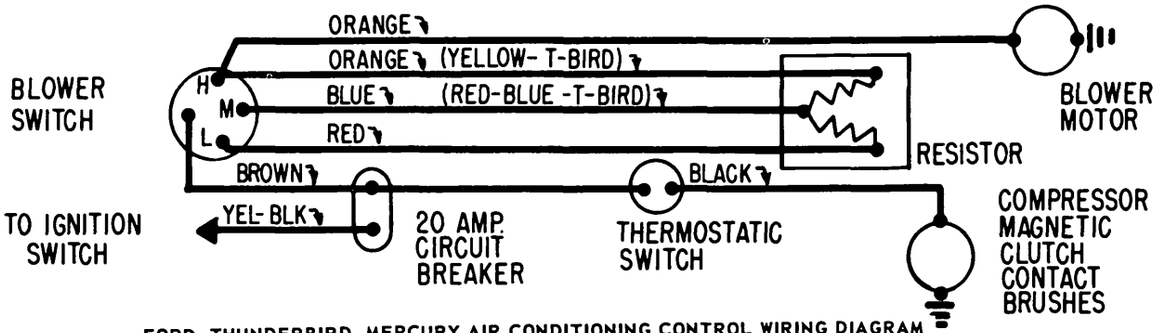
FORD MOTOR CO. CARS

Ford Pass. Cars (1961)
Lincoln Continental (1961)
Mercury (1961)
Thunderbird (1961)

►CHANGES, CAUTIONS, CORRECTIONS

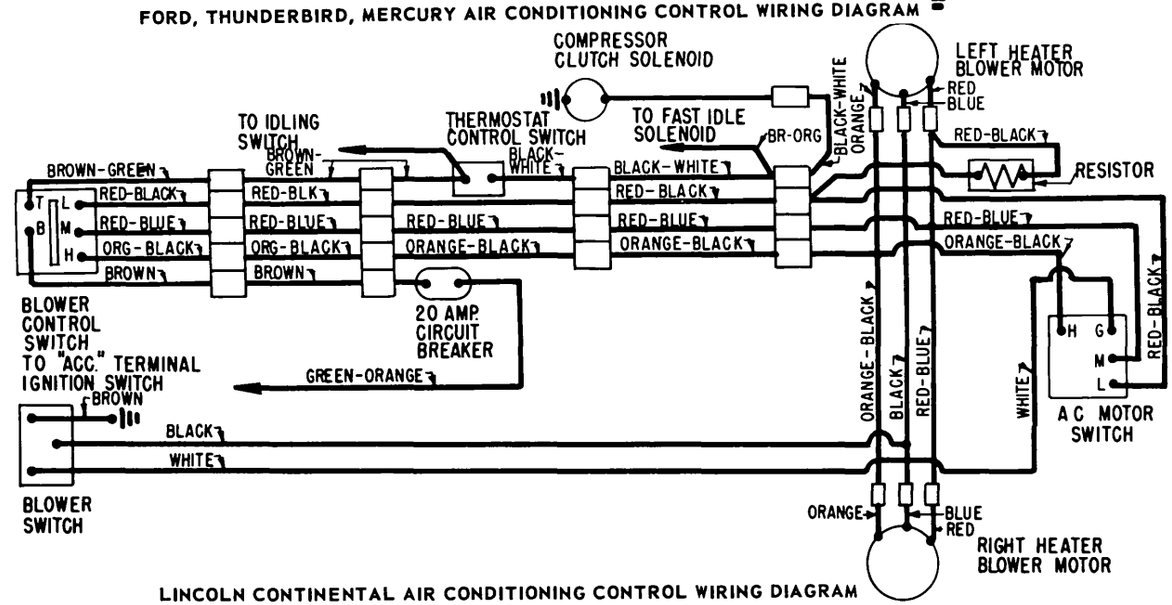
►*1961 LINCOLN CONTINENTAL AIR CONDITIONER BLOWER INTERMITTENT OR NO OPERATION CORRECTION:* May be caused by water entry into vacuum operated blower lock-out switch and corrosion of switch contacts. To correct, wrap replacement switch in a plastic bag and install switch with plastic between mounting bracket and switch bracket.

DESCRIPTION: Similar in design and operation to previous models. Both Eaton and Warner magnetic clutches used.



ADJUSTMENT

Compressor Belt: Ford - ½" deflection midway hetween compressor and water pump pulleys.
Lincoln, Mercury, T-Bird - Use Tension Gauge BT33-73F. Tension should be 120-150 lbs. (new belt), 90-120 lbs. (used belt).



SERVICING

MAGNETIC CLUTCH (Warner): Two-piece design with field coils attached to front seal plate of compressor.
Removal - Same as previous (Eaton) type.
Disassembly - Field coils can be removed by removing three attaching bolts after compressor service valves have been front seated and refrigerant charge relieved.
Installation - To install field coils, first insert centering pilot over compressor shaft and insert three attaching bolts. Torque bolts to 10-13 ft. lbs.
Clutch Bearing Removal & Installation - Remove clutch from compressor and snap ring retaining clutch hub in bearing. Press clutch hub out of pulley bearing (support pulley in belt sheave). Remove snap ring retaining bearing in pulley and press pulley bearing from pulley. *NOTE* - Press from front of clutch towards rear. To reassemble, reverse removal procedure.

►*OTHER DATA: See "Edsel, Ford, Lincoln, Mercury Air Conditioning" in 1958 Final Data or later Manual edition and note the following:*
Freon Capacity - 2½ lbs. (Ford, Lincoln, Mercury), 2¾ lbs. (Thunderbird).
Compressor Oil Level - *NOTE - Height on dip rod inserted in oil filler hole.* ¾" (Ford, Mercury,, Thunderbird); 1¼-1½" (Lincoln).

FORD, THUNDERBIRD, MERCURY AIR CONDITIONING CONTROL WIRING DIAGRAM

LINCOLN CONTINENTAL AIR CONDITIONING CONTROL WIRING DIAGRAM

RAMBLER

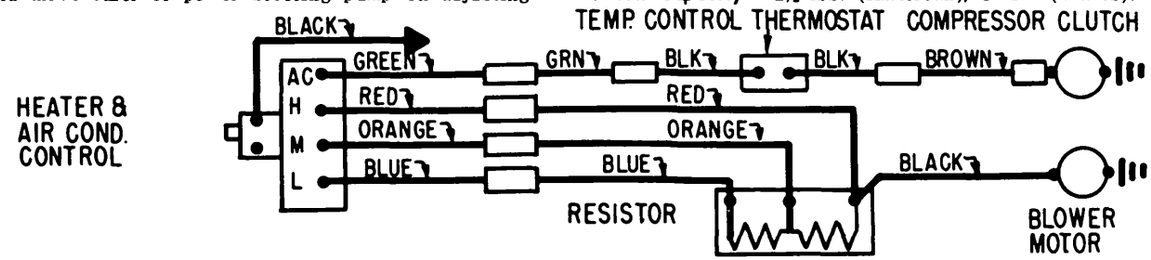
Rambler, All Series (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*SERVICE CAUTIONS: Before disconnecting any part of the air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

►*1961 AMERICAN (L-HEAD ENGINE) VIBRATION DURING OPERATION CORRECTION:* Install an Idler Pulley Assembly, Kit No. 3203205. Pulley will also remove slack in belt and prevent belt vibration.

►*1961 CLASSIC SIX (ALUMINUM ENGINE) IDLER PULLEY MISALIGNMENT, NOISE, AND BELT SQUEAL CORRECTION:* Install Idler Pulley Assembly Kit, No. 3203277.



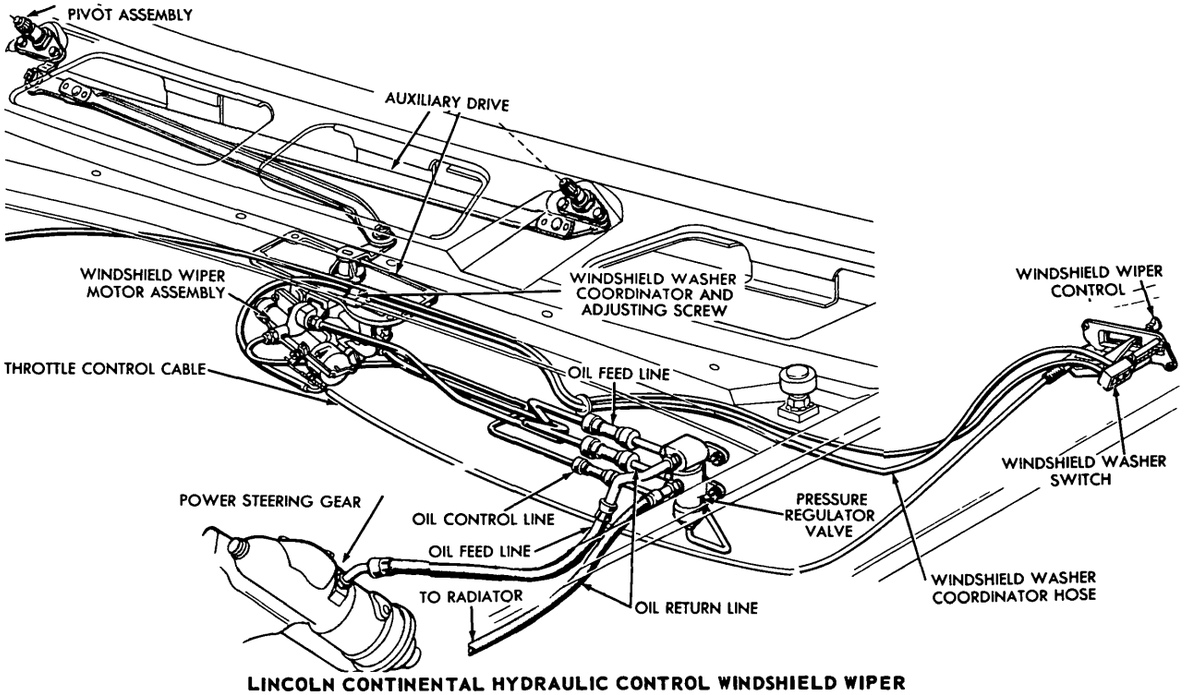
DESCRIPTION: Similar in design and operation to previous models.

LEAK TESTING & TROUBLE SHOOTING: *See "Leak Testing & Troubl Shooting" at beginning of Air Conditioning Section.*

SERVICING

COMPRESSOR BELT: Use fan belt strand tension gauge. Place gauge between longest span between pulleys and move idler or power steering pump on adjusting bracket to obtain a reading of 70-80 lbs. (used belt), 110-120 lbs. (new belt).

►*OTHER DATA: See "Rambler Air Conditioning" in 1960 Final Data or later Manual edition and note the following:*
Freon Capacity - 2½ lbs. (American), 3 lbs. (Others).



RAMBLER AIR CONDITIONER CONTROL WIRING DIAGRAM

LINCOLN HYDRAULIC WINDSHIELD WIPER

Lincoln Continental (1961)

DESCRIPTION: Wipers - Windshield wiper motor hydraulically operated by power steering return line fluid. A pressure regulator valve connects wiper motor and power steering in series during windshield wiper operation. Wiper arms are link driven in tandem from an auxiliary drive assembly above wiper motor through a pivot assembly for each wiper arm and blade assembly. **Washer** - An electric pump with a reservoir is mounted on right fender apron and controlled by washer switch mounted on windshield wiper control on instrument panel.

OPERATION: Wipers - When not in operation some hydraulic fluid is directed to wiper motor to be available to operate hydrostatic coupler in regulator valve when wipers turned on. Rest of fluid bypasses wiper motor and returns to power steering pump reservoir through cooling coils in radiator. When wipers turned on, control cable from instrument panel control opens throttle valve in wiper motor allowing control fluid to operate hydrostatic coupler in pressure regulator valve. Coupler decreases bypass port opening in regulator valve and allows greater fluid pressure to flow to wiper motor. Wiper motor then drives wiper arms. The construction of the regulator valve allows throttle valve to control wiper motor speed. **Washers** - When washer button is pressed, electric pump is energized and pumps fluid from reservoir through the pump to the washer nozzles and against windshield. At the same time washer button is pressed, engine vacuum through washer switch actuates wiper motor throttle valve to start wiper operation. Pump will continue to pump fluid against windshield until washer button released. After washer button released, windshield wipers will continue to operate at medium speed for eight cycles until vacuum is bled from wiper vacuum control line at washer control valve. An adjusting screw at washer control valve regulates number of cycles wiper will operate after washer button released.

LINCOLN CONTINENTAL HYDRAULIC CONTROL WINDSHIELD WIPER

REMOVAL & INSTALLATION: Pivot Shaft & Housing - Remove wiper arms and blades and cowl top ventilation grille and screen. On right side, disconnect drive arm from pivot shaft. On left side, disconnect drive arm from pivot shaft and from auxiliary drive. Remove pivot shaft retaining screws and nuts and remove pivot shaft and housing. To install, reverse removal procedure.

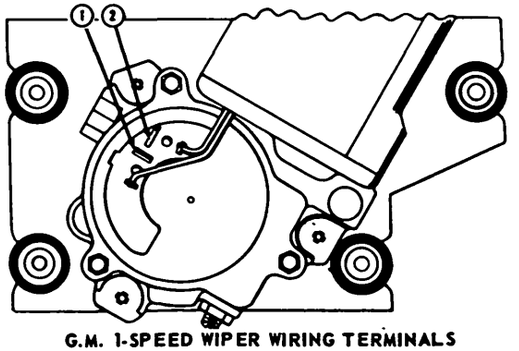
Wiper Motor: Remove washer coordinator hose, and oil return, feed, and control lines from motor. Disconnect and control cable at motor. Disconnect motor from auxiliary drive and remove motor. To install reverse removal procedure *and bleed power steering lines.*

Auxiliary Drive: Remove wiper arms and blades, ventilation grille and screen, and both washer nozzles. Disconnect pivot shaft drive arm from auxiliary drive. Remove attaching screws and remove auxiliary drive assembly. To install, reverse removal procedure.

Pressure Regulator Valve: Disconnect fluid lines at valve and remove valve attaching screws. Remove valve. To install reverse removal procedure *and bleed power steering lines.*

G.M. ONE-SPEED ELECTRIC WINDSHIELD WIPER & WASHER

Buick & Buick Special (1961)
Chevrolet Pass. Cars (1961)
Chevrolet Trucks (1961)
Corvair (1961)
Oldsmobile & Oldsmobile F-85 (1961)
Pontiac & Pontiac Tempest (1961)



►*NOTE:* 2-Speed type also used.

DESCRIPTION: Single speed rectangular shaped shunt type 12-volt motor similar in design to previous models. Washer (optional) mounts on gear housing section of wiper and is driven by wiper motor.

ADJUSTMENTS, TROUBLE SHOOTING & OVERHAUL:
Washer - *See "G.M. Two-Speed Electric Windshield Wiper & Washer" in 1960 Final Data or later Manual edition.*

Wiper - *See "G.M. One-Speed Electric Windshield Wiper" in 1959 Final Data or later Manual edition and note the following:*

Gearbox Disassembly & Reassembly - Remove crank arm retaining nut, crank arm, steel cap, retaining ring and endplay washers. Remove gear box cover or washer pump and pull gear and shaft out of gear box. Remove terminal board assembly and unsolder motor leads as required.

►IMP RTANT FACT RY PRODUCTION & RECOMMENDED CHANGES (Se N xt Pag)

IMPORTANT FACTORY PRODUCTION & RECOMMENDED CHANGES

FOR PREVIOUS MODELS & 1962 MODELS

AMERICAN MOTORS

►*1962 RAMBLER V8 ENGINE HYDRAULIC VALVE LIFTER STICKING CORRECTION (EARLY CARS):* .0005" undersize hydraulic valve lifters, Part No. 3240106, are available for installation in place of a standard lifter to correct a sticking condition. *See "Valve Syst m" in Rambl r Special Data.* Later engines, after Code No. 40123 should not require the undersize lifter.

►*RAMBLER VOLTAGE REGULATOR ADJUSTMENT NOTE:* For adjustment and specifications of "Rambler Brand" voltage regulators, *see "Rambler Replacem nt R gulators" in El ctrical Section.*

►*1961-62 AMERICAN (L-HEAD ENGINE) WITH AIR CONDITIONING VIBRATION CORRECTION:* On cars without power steering, an engine vibration, during air conditioning operation, can be corrected by installing a Belt Idler Pulley Assembly, Kit Part No. 3203205, to relieve a slack condition on drive side of compressor pulley.

CHRYSLER CORPORATION

►*1960-62 170" & 225" ENGINE CHAMPION SPARK PLUG INSTALLATION CAUTION:* Whenever a Champion spark plug is installed on these engines, always include a gasket with each plug to prevent oil leakage into spark plug tubes.

►*1960-62 TORQUEFLITE SIX TRANSMISSION FRONT PUMP HOUSING BUSHING REPLACEMENT NOTE: S "Torqu Flit Six Automatic Transmission" in Transmission Section.*

►*1960-62 LANCER, DODGE, PLYMOUTH & VALIANT 6 CYL. ENGINE OIL PRESSURE INDICATOR LIGHT NOTE:* If the time required for oil pressure indicator light to go out, after starting a cold engine, exceeds approximately five seconds, install Oil Filter Stand Pipe, Part No. 2402607. If an excessive amount of time is still required after installation of stand pipe, install Mopar Filter, Part No . 1851658. If the above condition occurs on a car with replaceable element type filter, install Mopar Oil Filter Assembly, Part No. 2128548.

►*1962 TORQUEFLITE EIGHT HIGH FREQUENCY "CLICK" CORRECTION:* This condition which occurs at 2-3 upshift and is most noticeable in direct gear around 24-40 MPH may be caused by kickdown band rattling against its anchor. Check kickdown band adjustment and reset to **tw turns** if necessary. If noise is not corrected, remove transmission oil pan and valve body and back off adjusting screw to completely unload kickdown band. If free gap is less than 11/16" between band ends, replace band with one that has and end gap of at least 11/16". In addition, replace original band anchor with Part No. 1942120 (copper plated). If band gap is more than 11/16", remove band anchor only and replace with Part No. 1942120.

►*1960-62 CHRYSLER CORP. CARS (WITH ALTERNATOR) NOTE:* During cold weather operation the ammeter or charge indicator may not show a charging condition for a few seconds after engine is started, or until voltage regulator warms up. This condition is normal and no harm to regulator or alternator occurs. Even at sub-zero temperatures, this condition should not last for more than one mile of driving.

►*1962 & EARLIER CHRYSLER CORP. CARS (WITH POWER STEERING) PUMP FITTING LEAKAGE CORRECTION:* If proper tightening of high pressure hose tube nut to 24 ft. lbs. does not correct the leakage, replace the Outlet Ball Seat Fitting in the pump as follows: With pump assembly removed from car, clamp pump in a vise so that discharge opening is in a downward position. Use a No. 4 E-Z Out and remove ferrule, being careful not to damage threads on housing. Clean bore in housing, then install a new ferrule, Part No. 1738683, centering it in bore with tapered end of ferrule upward. Press ferrule into position by reinstalling high pressure hose and tightening flare nut to 24 ft. lbs.

►*1961 LANCER & 1960-61 VALIANT DIFFERENTIAL SIDE BEARING PRELOAD SPECIFICATION CHANGE:* The method for checking and determining spacer thickness for proper side bearing preload remains the same. However, the .003" to .006" addition to zero endplay spacer pack should be changed to .010". *See "Lancer & Valiant Hypoid" in Rear Axle Section.*

►*1961 LANCER & 1960-61 VALIANT REAR AXLE SHAFT BEARING REPLACEMENT:* Use procedures for 1962 models. *See "Lancer & Valiant Hypoid" in Rear Axle Section.*

FORD MOTOR CO.

►*1960-62 COMET, FALCON, FAIRLANE & METEOR (144" & 170" ENGINES) IMPROVED PERFORMANCE & FUEL ECONOMY CORRECTION (CARS WITHOUT HEATER):* Connect water-heated carburetor spacer (spacer is installed on engine during production) to engine cooling system. To connect spacer, drain cooling system and remove air cleaner. Remove pipe plugs from water pump and cylinder head. Install inlet and outlet nipples, then install hoses. Fasten hoses securely with clamps. Check for leaks. *CAUTION - Do not allow hose to rest on exhaust manifold.*

►*1961-62 LINCOLN ENGINE FAILURE TO OPERATE AT HIGH SPEED CORRECTION:* This condition which is similar to those resulting from vapor lock, may be caused by wear at end of fuel pump pushrod. To correct, replace pushrod.

►*1960-62 COMET, FALCON, FAIRLANE & METEOR (144" & 170" ENGINES) THERMOSTAT REPLACEMENT NOTE:* Use Thermostat, Part No. C2DZ-8575-A (190°F Thermostat) on cars using permanent type anti-freeze.

►*1961-62 AUTOMATIC TRANSMISSION (ALL MODELS EXC. LINCOLN) LOW LINE PRESSURE CORRECTION:* Inspect throttle control valve rod for wear at throttle valve end if transmission shifts are early and soft. If control valve rod is worn, replace rod.

►*1961-62 FORD & MERCURY (EXC. COMET, FALCON, FAIRLANE & METEOR) SYNCHRO-MESH HIGH SHIFT EFFORT & GEAR CLASH IN 2ND GEAR CORRECTION:* Install a new heavier synchronizer retainer spring, Part No. C2AZ-7109-A (yellow color).

►*1960-61 IGNITION TIMING RECOMMENDED CHANGE (ALL MODELS):* Initial ignition timing should be set to specifications indicated for comparable 1962 models. *S e individual 1962 car mod l pages.*

►*1961-62 MERCURY & FORD 292" ENGINE RUNAWAY DURING 1-2 UPSHIFT CORRECTION: See "Ford M tor 2-Speed Automatic Transmission" in Transmissi n Section.* If the procedures indicated under "Changes, Cautions, Corrections" do not correct engine "runaway", it is recommended that a softer front servo spring, Part No. C1DP-7A003-A be installed in front servo. This spring has a free length of 3.17", 9¾ coils, and a wire diameter of .207".

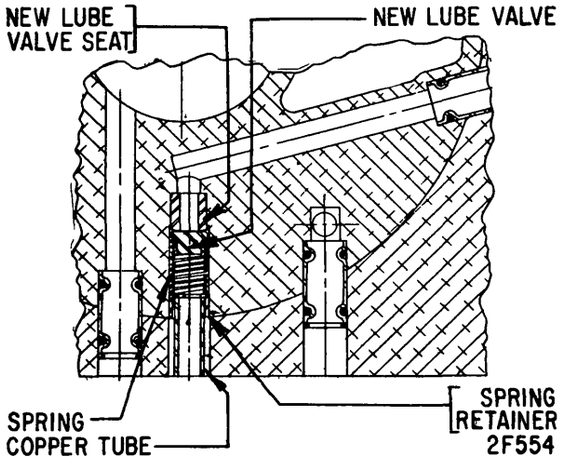
►*1962 FORD FAIRLANE & MERCURY METEOR (221" & 260" ENGS.) AUTOMATIC TRANSMISSION 1-2 UPSHIFT SLIPPAGE CORRECTION: See "Ford M t r 2-Speed Automatic Transmission" in Transmissi n Section and check transmission for proper fluid level, line pressure and vacuum.* Make sure that all air has been bled from front servo. If the condition continues to exist after the above checks and tests have been found to be within specifications, replace front servo return spring with Spring, Part No. B9AZ-7A003-A. If replacement of servo spring does not correct the condition, disassemble transmission and check for worn, damaged, or incorrect parts. Pay particular attention to items which may cause leakage in clutch circuit.

►*1960-EARLY 1962 COMET & FALCON FRONT BRAKE SQUEAL CORRECTION:* A new "O" ring type front wheel brake cylinder piston, Part No. C2DZ-2196-A can be installed on these models to reduce brake squeal. The new piston, which has an "O" ring installed in an annular groove, is used in production beginning March 7, 1962.

►*1962 MERCURY METEOR WITH 221" ENGINE & SYNCHRO-MESH TRANSMISSION SUB-STANDARD PERFORMANCE NOTE:* Replace original 1¾" diameter exhaust system with the 2" diameter exhaust system used on cars with automatic transmission.

GENERAL MOTORS CORP.

►*1961 BUICK SPECIAL CLUTCH PEDAL LASH NOTE & RATTLE CORRECTION:* Install spring, Part No. 1352190 (Clutch Equalizer Spring used on 1962 models) as follows: Drill a ¼" hole 1 5/16" from bottom of equalizer lower arm, then remove former coil spring from clutch release fork and install the new spring between hole in equalizer lower arm and clutch release fork.



►*1961 BUICK SPECIAL (WITH 4-BARREL CARB.) HESITATION CORRECTION:* If carburetor accelerating pump system is not defective, trouble may be due to incorrect pump stroke setting which depends on average daytime temperature. *See "Rochester 4G & 4GC 4-Barrel Carburetors" in Carburetion Section.*

►*1959 & EARLIER BUICK TRIPLE TURBINE AUTOMATIC TRANSMISSION "BUZZ" CORRECTION:* Install Lube Valve Kit, Part No. 1389297 as follows: Remove oil pan and valve body, then drill out lube exhaust hole in transmission case to a depth of 5/8"

CONTINUED ON NEXT PAGE

GENERAL MOTORS CORP. (Cont.)

using a 7/16" drill. Remove lube valve spring retainer from hole (spring and ball will fall out). Tap center hole of valve seat with a ¼"-20 tap to secure two or three effective threads. Remove tap and install a ¼"-20 X 2¼" bolt into tapped hole of valve seat, placing a suitable wood spacer between head of bolt and transmission case. Withdraw valve seat by turning bolt into threads (shimming between head of bolt and wood block as necessary). Disconnect cooler line and flush passage with kerosene and blow dry with air. Install a new valve seat with lead chamfer upward. *NOTE - Use a brass rod to tap valve seat into position, then install a new valve and spring and spring retainer.* Make up a piece of 5/16" copper tubing 53/64" long and install in hole so end of tube is seated in lower end of spring retainer. Install valve body and check all adjustments. Install oil pan and refill transmission.

BUICK TRIPLE TURBINE LUBE VALVE

►*1962 BUICK SPECIAL AUTOMATIC TRANSMISSION COAST CLUTCH PRODUCTION CHANGE TO PREVENT STICKING OF PISTON IN CYLINDER:* Beginning with transmission code number E145, a new coast clutch piston, Part No. 1356770, incorporating a counterbore on its inner diameter is being used in production to prevent sticking if piston should be tilted slightly. It is recommended that the new piston be installed in earlier transmissions whenever transmission is disassembled for any reason.

►*1961 BUICK (EXC. SPECIAL) CONSTANT VELOCITY UNIVERSAL JOINT LUBRICATION NOTE:* If a frame contact hoist is used when lubricating the center universal joint, it will be necessary to either raise the rear axle assembly to its correct running position or disconnect propeller shaft at rear companion flange and raise propeller shaft for access to grease fitting. Make sure rear companion flange and propeller shaft are reassembled in the original position.

►*1961 BUICK (EXC. SPECIAL) REAR AXLE "CLICKING" NOISE CORRECTION:* This noise which occurs when shifting from Drive to Reverse can be corrected as follows: Disconnect propeller shaft and remove pinion nut and flat washer, then install copper washer, Part No. 1353954 over pinion shaft until it contacts companion flange (lubricate washer with rear axle lubricant before installation). Use a flat end punch and gently tap outer diameter of washer so it starts into splines, then reinstall flat washer on pinion shaft. Install nut and tighten to 350 ft. lbs. Reinstall propeller shaft.

►*1962 & EARLIER BUICK TWIN TURBINE AUTOMATIC TRANSMISSION "WHINE" CORRECTION & REACTION SHAFT BUSHING CLEARANCE CHECK:* With reaction shaft and input shaft assembled in transmission, mount a dial indicator on input shaft so movement of shaft can be measured. Move input shaft up and down, then rotate shaft and move side to side. If total indicator reading is more than .006" in each direction, replace reaction shaft bushing. Excessive wear on this bushing has some effect on turbine gear whine.

►*1959-61 BUICK LESABRE HARD STARTING (HOT) CORRECTION:* This condition is caused by dry starter bearings and can be corrected by installing a later type starter armature, Part No. 1958023 which has a grease groove at each end of starter shaft. Make sure bearings are in good condition and are properly lubricated with Buick 4X (silicone lubricant) Compound.

►*1961-EARLY 1962 CADILLAC HYDRA-MATIC TRANSMISSION GEAR WHINE CORRECTION:* The whine, which is heard when decelerating from approximately 15 MPH to stop may be caused by governor drive gear snap ring. *See "Dual-Coupling (4-Speed) Hydra-Matic Transmission" in Transmission Section.*

►*1961 CADILLAC FRONT SUSPENSION UPPER CONTROL ARM REMOVAL PROCEDURE CHANGE: See "1962 Cadillac Front Suspension" in Suspension & Wheel Alignment Section.*

►*1959 & LATER CADILLAC HYDRA-MATIC GOVERNOR DRIVE GEAR REPLACEMENT CAUTION:* Governor drive gear and locating snap rings should always be installed with governor and driven gear removed. Then install governor, carefully meshing the gears. This procedure assures proper gear alignment and prevents gear damage.

►*1961 CHEVROLET 409" ENGINE NOTE: This engine which was released in mid-1961 is the same as the 1962 409" engine. See "1962 Chevrolet V8 & Corvette" car pages.*

►*1955-62 CHEVROLET PASS. CARS & 1961-62 CORVAIR "95" TRUCKS UPPER BALL JOINT STUD REPLACEMENT NOTE:* If upper control arm ball stud replacement unit, Part No. 3813205 has ¼" attaching holes in flange, drill holes to 5/16" diameter. Special 5/16" diameter bolts furnished in unit **must** be used to attach ball stud assembly.

►*1958 CHEVROLET V8 (CARB. NO. 7012452) STUMBLE DURING ENGINE WARM-UP CORRECTION:* Install Pump Modification Kit, Part No. 7019742. Carburetors having the brass identification tag stamped "D" or later have the above changes made in production.

►*1960-62 SERIES 10-40 TRUCK LOSS OF FRONT SUSPENSION CASTER-CAMBER SHIMS CORRECTION:* To prevent loss of shims after front end alignment, pivot shaft attaching bolts must be tightened properly and aligned in frame bracket hole as follows: Raise front of truck so wheels hang free, then tighten nut on pivot bolts to 30-40 ft. lbs. Rap front and rear flange of upper control arm, near pivot shaft, using a one pound hammer. When bolts are properly seated, increase torque on nut to proper specification.

►*1961 OLDSMOBILE F-85 SYNCHRO-MESH TRANSMISSION LONG SHIFT LEVER TRAVEL FROM FIRST TO SECOND GEAR CORRECTION:* Install a 1962 Shift Equalizer Lever, Part No. 1350390. Adjust linkage as outlined in 1961 Final Data, Page 395.

►*1961-62 OLDSMOBILE (EXC. F-85) PROCEDURE FOR REPLACING LOWER CONTROL ARM BUSHINGS:* Replacement bushing kits are now available for installation. *For procedure, see "Oldsmobile Front Suspension" in Suspension & Wheel Alignment Section.*

►*1961-62 PONTIAC TEMPEST (SINGLE BARREL CARBURETOR) THROTTLE RETURN CHECK (ANTI-STALL DIAPHRAGM) NOTE:* This unit is eliminated from production on automatic transmission cars (except with air conditioning).

►*1961 PONTIAC TEMPEST UPPER & LOWER FRONT SUSPENSION BALL JOINT REPLACEMENT: For new procedures, see "1962 Pontiac Tempest Front Suspension" in Suspension & Wheel Alignment Section.*

STUDEBAKER CORP.

►*1962 STUDEBAKER 6 CYL. ENGINE MAIN BEARING REPLACEMENT CAUTION:* Engines equipped with "Full-Flow" oil filter system require different main bearings (except rear main bearing) than those used on engines without "Full-Flow" oil filter. *DO NOT USE bearings designed for engines with out "Full-Flow" oil filter on engines with "Full-Flow" filter.*

►*1961-62 STUDEBAKER 4-SPEED SYNCHRO-MESH TRANSMISSION PARTS REPLACEMENT CAUTION:* Two different drive pinions are used. To assure installation of correct drive pinion and matching cluster gear, count the number of teeth in pinion (either 25 or 27). This can be done by removing side cover of main case.

WILLYS MOTORS

►*1962 & EARLIER WILLYS L6-226 ENGINE CRANKSHAFT REAR OIL SEAL LEAKAGE CORRECTION:* Install Crankshaft Rear Oil Seal Kit, Part No. 925958 which contains a new molded victoprene crankshaft oil seal to replace the previous rope type. Installation instructions are provided with each kit.

Oil Pump Mounting	28-32

ALUMINUM ENGINE SERVICE CAUTIONS

SERVICE PRECAUTIONS: *NOTE* - Extreme caution must be observed when working on aluminum engines to prevent damage by scratching, nicking, or scoring. Note the following

1) Do not drop or slide machined surfaces on bench or floor.

2) Do not use gasket cement (Except as indicated under Cylinder Head Installation)

3) Lubricate all bolts or screws entering an aluminum part See "Bolt Thread Lubrication Note" below.

4) Tighten bolts and nuts to the specified torque. DO NOT overtighten. Torque valves are for clean lubricated threads.

►*BOLT THREAD LUBRICATION NOTE:* Use engine oil or special thread lubricant on all threads entering an aluminum part.

DAMAGED OR WORN THREAD REPAIR (ALUMINUM BLOCK): "Heli-Coils" are available locally for repairing damaged or worn threads in aluminum The repair consists of drilling out worn or damaged threads, tapping hole with special "Heli-Coil" tap, and installing a "Heli-Coil" insert in tapped hole. This brings hole back to original thread size See following table for inserts and tools required.

"Heli-Coil" Thread Inserts

Thread Size	Insert Part No.	Drill Size	Special Tap Part No.	Inserting Tool No.
1/4"-20	1185-4	266"	4 CPB	528-4N
5/16"-18	1185-5	332"	5 CPB	528-5N
3/8-16	1185-6	397"	6 CPB	528-6N
7/16"-14	1185-7	453"	7 CPB	528-7N
1/2"-13	1185-8	516"	8 CPB	528-8N
Spark Plug				
14 MM Short	512		137-11	542
14 MM Long	513		137-11	542

ENGINE

6 CYL. ENGINE

ENGINE REMOVAL: **1)** Remove hood assembly, drain cooling system and engine oil Remove air cleaner, starter and radiator core Disconnect exhaust pipe at manifold and remove flywheel housing screws and flywheel mud pan

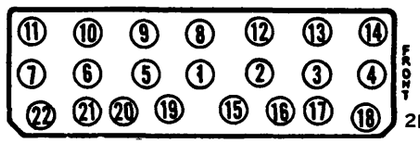
2) Disconnect thrust rod assembly from bracket on lower left side of block (Classic 6 Auto. Trans.). Then drain torque converter and transmission and remove flywheel drive plate-to-converter assembly screws on Auto. Trans. Cars (All models).

3) Remove front engine support upper nuts. Disconnect all wiring, lines, and hoses from engine and power steering assembly Remove Air Conditioning compressor and bracket assembly *NOTE* - DO NOT DISCHARGE system

4) Attach lifting hook, lift engine upward and forward to clear clutch shaft pilot bushing

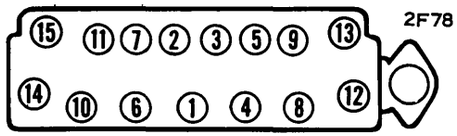
V8 ENGINE

ENGINE REMOVAL: **1)** Remove battery and hood assembly Drain oil and cooling system On Auto Trans Cars, drain transmission and disconnect cooler lines at radiator and straps on engine oil pan. On Air Conditioned Cars, remove air compressor and mounting bracket from engine and move compressor and hoses to one side



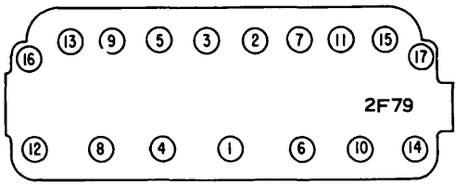
2) Remove water pump upper and lower hoses and hoses at fuel pump, heater control valve and cylinder head Remove radiator core and loosen exhaust pipes at mufflers. Remove exhaust manifolds from cylinder heads and push them outward towards wheelhouse panels.

3) Disconnect all wiring and hose connections from engine, coil primary, heat sending unit, oil sending unit, vacuum safety switch, generator, etc

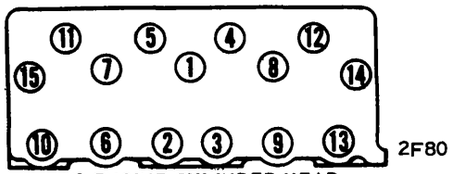


4) Remove starter Loosen flywheel housing and remove flywheel mud pan

5) On Auto. Trans. Cars, drain torque converter and loosen flywheel drive plate from converter.



6) Attach lifting fixture to engine, loosen rear engine support cushions at rear crossmember Support transmission and torque tube and remove rear crossmember. Loosen front engine support cushions, raise engine upward and forward through hood opening.



6 CYL. "L-HEAD" CYLINDER HEAD

6 CYL. (CAST IRON) CYLINDER HEAD

6 CYL. (ALUMINUM) CYLINDER HEAD

V8 ENGINE CYLINDER HEAD

CYLINDER HEAD & MANIFOLD

6 CYL. ENGINE (CAST IRON)

CYLINDER HEAT INSTALLATION: Use torque indicating wrench to tighten cylinder head studs in sequence shown in cylinder head diagram. Torque specifications are for engine operating temperature.

Cylinder Head Gasket - Always use new gasket. Coat gasket with non-hardening gasket paste to insure tight seal between cylinder head and block.

6 CYL. ENGINE (ALUMINUM)

CYLINDER HEAD INSTALLATION: Hollow guide pins are located at right front and rear corners of block. Guide pin at right front corner also serves as oil delivery tube to rocker arm shaft assembly. *Two neoprene "O" rings form a seal between guide pin, cylind r block and cylinder head. R plac "O" rings ach tim cylinder r m ved. See R plac m nt Proc dure b low.* After "O" rings replaced, apply "Perfect Seal" or equivalent to both sides of cylinder head gasket. Place

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

head on block and tighten capscrews in approximately 20 lb. increments to 50-53 ft. lbs., following sequence in diagram. Retorque cylinder head bolts after engine reaches normal operating temperature.

Neoprene "O" Rings Replacement Procedure: Remove delivery tube carefully by grasping with pliers and turning in each direction while pulling upward. Install "O" rings on tube and apply engine oil to assembly. Tap tube lightly into cylinder block bore half its own length. Then install cylinder head as outlined above.

V8 ENGINE

CYLINDER HEAD INSTALLATION: Cylinder block has two sleeve locating dowels to assist in lining up cylinder head and gasket during installation. Coat gasket with non-hardening gasket paste, install gasket with marks AM and TOP upward. Install cylinder head, pushrods, and rocker arm assembly *(CAUTION - Special drilled capscrew must be installed in rear rocker arm support bracket to provide lubrication for rocker arms).* Tighten head bolts in sequence shown in diagram to correct torque.

PISTON PINS

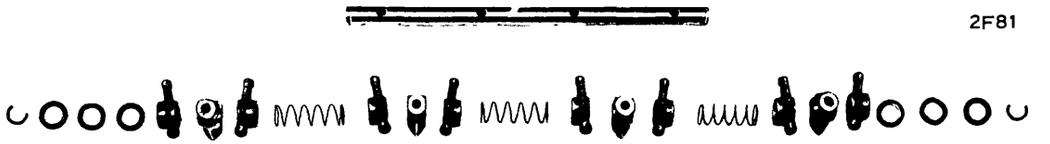
ALL ENGINES

PISTON PIN: Pin is press fit in connecting rod and no clamp bolt or locking rings are used to retain pin. Piston pin must be removed and installed as detailed below to prevent distortion or damage to piston.

Removal - Remove pins with special Piston Pin Remover J-6360 and an arbor press. Place piston in remover support so pin will enter support when pressed out with piloted driver.

Installation - Place piston pin pilot in support, insert piston and connecting rod. This aligns piston and connecting rod piston pin bores. Press piston pin into connecting rod and piston assembly until lower pilot bottoms in support which will properly center rod on pin.

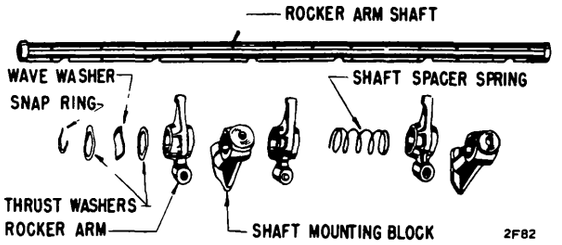
►*CAUTION:* Pin must be tight press fit in connecting rod.



CRANKSHAFT & MAIN BEARINGS

6 CYL. ENGINE

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Packing in groove in block and cap behind oil slinger on crankshaft. Cap sealed with rubber plugs in groove on each side where cap fitted in recess in block. Use Tool J-1610 to install packing in groove in block and cap. Place packing in groove (with bearing shell removed), place small diameter of tool over packing, hit end of tool with lead hammer to seat packing, cut ends of packing flush with bearing cap seat, remove tool. Repeat operation for groove in block. Install rubber seal plugs on each side of bearing cap (where angle seal used, make certain that seal also seated in horizontal groove in block). *NOTE* - Side seals may leak for short duration during engine warm-up. However, they will swell as they absorb engine oil.



V8 ENGINE

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Install hemp packing in block and in bearing cap using tool J-3048-A to seat packing in groove. Trim excess packing off flush with face of cap. Rubber type seals are installed in side grooves of bearing cap. *NOTE* - Side seals may leak for short while during initial engine warm-up. They will swell as they absorb engine oil.

2F81

V8 ENGINE ROCKER ARM ASSEMBLY

6 CYL. ROCKER ARM ASSEMBLY

ENGINE FRONT COVER

V8 ENGINE

REMOVAL: Remove water pump, fuel pump assembly and vibration damper. Remove cover-to-cylinder block screws and remove cover.

INSTALLATION: Locate dowels in cylinder block and leave cover screws loose until vibration damper is partially installed. This prevents damage to oil seal and aligns cover properly. Tighten cover screws and install fuel and water pumps.

CAMSHAFT & BEARINGS

V8 ENGINE

CAMSHAFT REMOVAL: Remove rocker arm covers, spark plug wires, rocker arm assemblies, intake manifold and carburetor. Remove upper oil breather and lifter assembly cover. Remove spring and lower oil baffle and pushrods. Keep pushrods in order for correct reinstallation. Remove hydraulic lifters, keeping in order for reinstallation. Remove fuel pump, vibration damper, and engine front cover. Remove water pump and cylinder head water distributing manifold. Crank engine to bring timing marks adjacent and in line across shaft centers and remove fuel pump eccentric, crankshaft and camshaft sprockets and timing chain assembly. Remove camshaft thrust retainer plate and withdraw camshaft.

6 CYL. "L" HEAD ENGINE

CAMSHAFT LOBE LIFT: With cylinder head removed and all valve lash adjusted to zero, rotate engine until cam lobe to be checked has the basic circle (opposite nose of cam) under valve tappet. Install a dial indicator so arm rests on head of valve, and adjust dial indicator to zero. Rotate engine to point where maximum upward movement of valve occurs. This reading should be .340' ±.006" for all cam lobes (Intake & Exhaust).

OHV 6 & V8 ENGINES

CAMSHAFT LOBE LIFT: Drain radiator and remove rocker arm assembly. Install dial indicator on end of pushrod (rubber tubing may be installed to secure indicator plunger to pushrod). Rotate engine until cam lobe basic circle (opposite nose of cam) is under the valve tappet. Set dial indicator to zero, then rotate engine to a point where maximum upward movement of pushrod occurs. See table below for correct dial reading (±.006").

Cam Lob Lift	
6 Cyl. (Cast Iron) Intake	.262"
6 Cyl. (Cast Iron) Exhaust	.263"
6 Cyl. (Aluminum) All Valves	.254"
V8 (All Valves)	.254"

VALVE SYSTEM

ROCKER ARMS

6 CYLINDER ENGINES

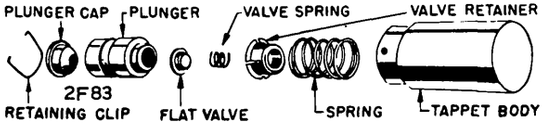
ROCKER ARM ASSEMBLY: Rocker arm shaft is one piece type and entire rocker arm assembly can be removed after taking out mounting bolts in shaft brackets.

Disassembly & Inspection: Remove snap ring on end of shaft. Slide thrust washers, wave washer, rocker arms, mounting brackets and springs off shaft. Inspect all parts for wear. See that plugs are tight in shaft.

Reassembly & Installation: Install all parts in same relative positions. *CAUTION* - Rocker arms are "Right" and "Left" and must not be interchanged. On aluminum engines the support blocks must be installed with "Front" facing forward. Install assembly with rocker arm lubricating holes in shaft down or toward cylinder head. Oil is supplied through front rocker arm shaft support block.

V8 ENGINE

ROCKER ARM ASSEMBLY: Complete assembly mounted on cylinder head by four long cylinder head retaining capscrews *(CAUTION* - Rear bolt is special hollow type for rocker arm lubrication). Assembly can be removed by taking out the retaining screws.



Disassembly & Inspection: Remove snap ring on end of shaft and slide all parts off shaft. Keep all parts in order for correct reassembly. Clean and inspect all parts for wear. Inspect rocker arm radius at valve stem end for wear and replace worn rocker arms. Plugs must be tight in ends of shaft.

HYDRAULIC LIFTERS

V8 ENGINE

►*V8 ENGINE VALVE LIFTER CLEARANCE CAUTION:* Clearance must be .0005-.002". Tight fit of lifter in bore may cause damage to valve train and engine parts, excessive clearance will cause low oil pressure at low engine speeds. If lifter is tight, check lifter

CONTINUED ON NEXT PAGE

V8 HYDRAULIC VALVE LIFTERS

CONTINUED FROM PRECEDING PAGE

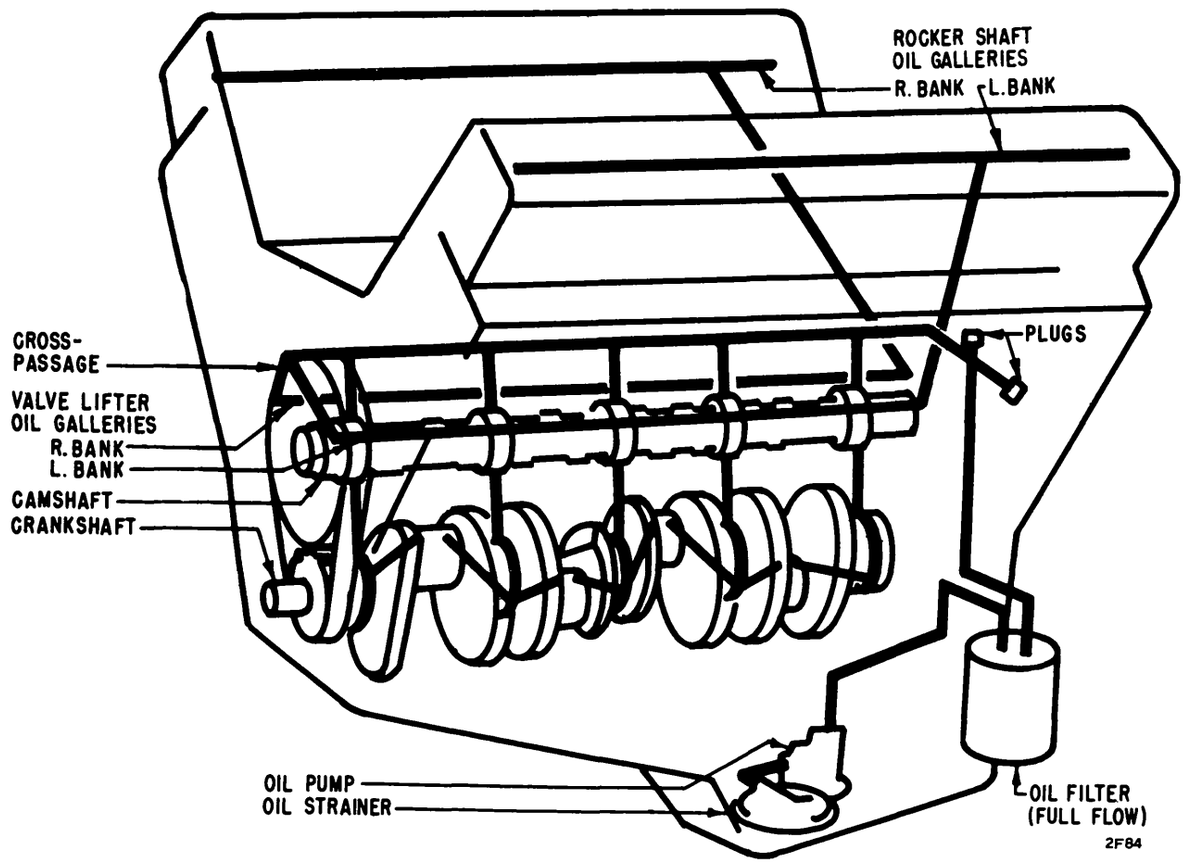
bore for burrs and lifter for scuffing or galling. Check clearance as directed below. If correct clearance cannot be secured with standard lifter, undersize lifter may be installed as listed below. Use of undersize lifters should not be necessary on engines after No. 40123.

Ch cking Lift r Clearanc - Insert lifter approximately one-half of total length in lifter bore. Lifter should fall into position of its own weight. Do not force lifters into place.

R placement Lift rs - Standard (Part No. 3160304), .0005" Undersize (Part No. 3204106). Undersize lifter is identified by small "V" groove on top of lifter body.

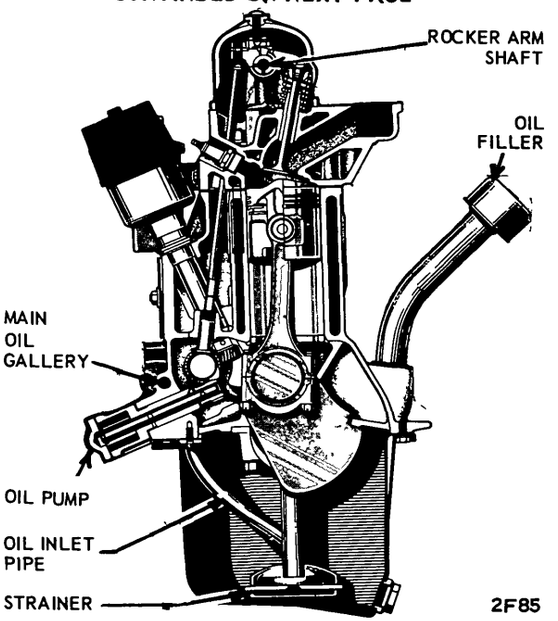
HYDRAULIC VALVE LIFTERS: Removal - Remove rocker arm covers, spark plug wires, rocker arm assemblies, intake manifold and carburetor. Remove upper oil breather and lifter assembly cover. Remove spring and lower baffle and pushrods. Keep pushrods in order for installation in original positions. Remove hydraulic lifters, keeping them in order for reinstallation.

Disassembly: Press down on valve pushrod socket and use needle nose pliers to remove the lock ring. Remove pushrod socket, plunger, and plunger spring. Remove check valve assembly from plunger, being careful not to lose the small flat valve and coil spring. *CAUTION - Disassemble one lifter at a time to prevent mixing plungers and bodies. These parts are selectively fit and must not be interchanged.* Wash all parts in clean solvent, removing all varnish and gum deposits.



Inspection: Inspect the plunger and wall of body for scratches (if either scratched, replace entire unit). Try plunger for fit in body. If check valve removed from plunger inspect flat disc valve, spring and seat.

Reassembly: Reverse disassembly procedure. *See illustration for correct sequence.*



Testing: Fill body with kerosene and install plunger return spring, plunger assembly, and pushrod socket (do not install snap ring). Place lifter between jaws of Checking Tool J-5790 and check leakdown by depressing tool. A decided resistance should be felt. If lifter leaks down rapidly, or collapses immediately, recheck and replace lifter assembly if necessary. Normal lifter should require 10-45 seconds to leak down when filled with kerosene (.125" travel with 50 lb. load).

Installati n: Lifters should be prelubricated and installed in engine WITHOUT being filled with oil. They will normally charge themselves in 3-8 minutes of engine operation.

RAMBLER V8 ENGINE OILING SYSTEM

6 CYL. CAST IRON ENGINE OILING SYSTEM

6 CYL. ALUMINUM ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING PAGE

OILING SYSTEM
ENGINE LUBRICATION
6 CYLINDER ENGINES (CAST IRON)

►*OVERHEAD VALVE & "L" HEAD ENGINE NOTE:* Oiling systems for both engines are similar except for cylinder head rocker arm and valve lubrication used on Overhead Valve Engines only.

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and valve mechanism on cylinder head (Overhead Valve Engines only). All other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted externally on right side of crankcase. Pump draws oil through fixed strainer and intake pipe in oil pan (intake passage in crankcase registers with intake port in mounting face of pump body) and delivers oil through passage around pump body hub to main oil gallery which extends along right side of crankcase. Oil pressure regulator valve (under plug on right side of crankcase) regulates pressure by bypassing oil from main oil gallery back into oil pan. Oil is distributed through main oil gallery as follows:

Crankshaft & Camshaft Bearings - Oil passages in crankcase webs supply oil from main oil gallery to each camshaft and crankshaft bearing (passage intersects lower part of camshaft bearing bore and extends past this point to main bearing bore).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from oil hole in each side of connecting rod when these holes register with oil hole in connecting rod journal (these squirt holes are located 24° and 29° from rod center line).

Timing Chain & Sprockets - Lubricated by oil metered by front camshaft bearing.

Valve Lifters, Cam Lobes, Distributor & Oil Pump Drive Gears - Lubricated by spray and oil mist thrown off by connecting rod and crankshaft bearings.

Rocker Arms, Pushrods & Valve Stems (Overhead Valve Engine) - Oil tube connected to main oil gallery (at front of engine) and to fitting on side of cylinder head (at forward end directly above No. 1 spark plug) supplies oil to passage in cylinder head and through front rocker arm shaft support block to hollow rocker shaft. Rocker shafts have drilled oil holes at each rocker arm. Rocker arms are drilled (upper hole in arm allows oil to run down flat machined surface to each end of arm for pushrod and valve stem lubrication).

OIL FILTER: Partial flow type mounted on bracket on engine. Intake pipe is connected to main oil gallery and return pipe is connected to fitting on crankcase.

6 CYL. ENGINES (ALUMINUM)

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, valve lifters, and valve mechanism on cylinder head. All other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted externally on right side of crankcase. Pump draws oil through fixed strainer and intake pipe in oil pan (intake passage in crankcase registers with intake port in mounting face of pump body) and delivers oil through passage in pump body to main oil gallery which extends along right side of crankcase. Oil pressure regulator valve in pump cover regulates pressure by bypassing oil back into oil intake passage. Oil is distributed through main oil gallery as follows:

Crankshaft & Camshaft Bearings - Oil passages in crankcase webs supply oil from main oil gallery to each camshaft and crankshaft bearing (passage intersects upper part of camshaft bearing bore and extends past this point to main bearing bore).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from oil hole in each side of connecting rod when these holes register with oil hole in connecting rod journal (these squirt holes are located 24° and 29° from rod center line).

Timing Chain & Sprockets - Lubricated by oil metered by front camshaft bearing.

Cam Lobes, Distributor & Oil Pump Drive Gears - Lubricated by spray and oil mist thrown off by connecting rod and crankshaft bearings.

Rocker Arms, Pushrods, & Valve Stems - An oil gallery (vertical) located in right front corner of cylinder block distributes oil from main longitudinal oil gallery, through the hollow locator pin into the cylinder head where a pair of drilled passages connect into the front valve rocker arm support block and into the hollow rocker arm shaft. Each rocker arm is drilled to direct oil to flat machined surface of top, then to each pushrod, valve stem and spring. Holes on top of cylinder head drain oil back into oil pan.

Valve Lifters - Ports in main oil gallery supply lubrication to valve lifters.

OIL FILTER: Externally mounted, full flow type located on adapter on oil pump body.

V8 ENGINE

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, hydraulic valve lifters, and rocker arm and valve mechanism on cylinder head. All other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted on rear main bearing cap in crankcase draws oil through fixed strainer and intake pipe assembly mounted on pump cover. Oil pressure regulator is located in pump body with oil pipe through which oil is bypassed back into oil pan. Pump delivers oil through passage in bearing cap and block to full flow type oil filter mounted externally on left side of engine block. From the filter, oil flows through transverse and vertical passages in block to main oil gallery extending full length of block directly above camshaft. Main gallery feeds two lifter galleries (on either side of main gallery and extending full length of block) through grooved channel in rear face of camshaft thrust plate which serves as a cover for the galleries on front face of engine block. Oil is distributed through these galleries as follows:

Crankshaft & Camshaft Bearings - Oil passage in each crankcase web connects main oil gallery with camshaft bearing and corresponding main bearing.

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod is lubricated through passage from adjacent main bearing.

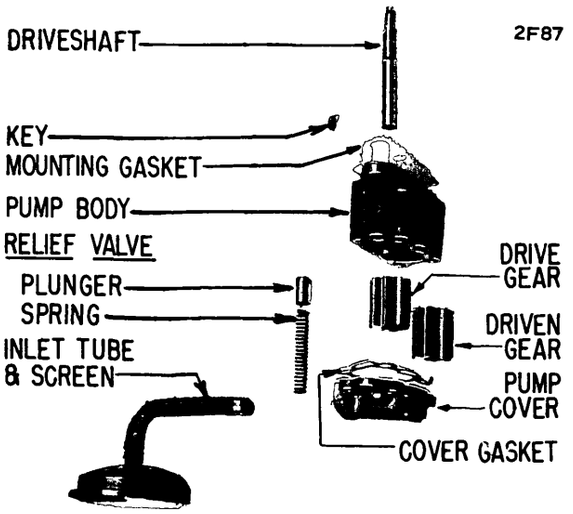
Pistons & Pins - Lubricated by oil spray thrown on cylinder wall from grooved passage in bearing cap of rod for opposite bank of cylinders (groove in rod must be upward or toward center of engine for this cross-lubrication).

Timing Chain & Sprockets - Lubricated through drilled passage in camshaft front bearing journal. This oil is metered by camshaft bearing.

Valve Lifters - Lifter oil galleries intersect lifter bores for direct oil supply to the hydraulic lifters.

Rocker Arms, Pushrods & Valve Stems - Oil passage in block at rear end of each lifter oil gallery connects with rear cylinder head and rocker shaft bracket bolt hole in block. Special drilled bolts used in these holes which permit oil to flow upward, through and around undercut bolt stem, and through bracket to hollow rocker arm shaft. Shaft is drilled at each rocker arm. Rocker arms have drilled oil hole on upper side which permits oil to flow over top of arm for pushrod and valve stem lubrication. Drain holes in lower corners of cylinder head provide a return passage to oil pan.

OIL FILTER: Full flow type mounted on pad on left side of engine block. Bypass valve located in filter adapter mounted on filter pad (bypass valve allows oil to flow directly to outlet passage).



OIL PUMP
V8 ENGINE

OIL PUMP: Removal - Remove oil pan and screws retaining oil pump to rear main bearing cap, remove oil pump. *NOTE* - Oil pump is driven by distributor drive shaft so removal of oil pump does not affect ignition timing.

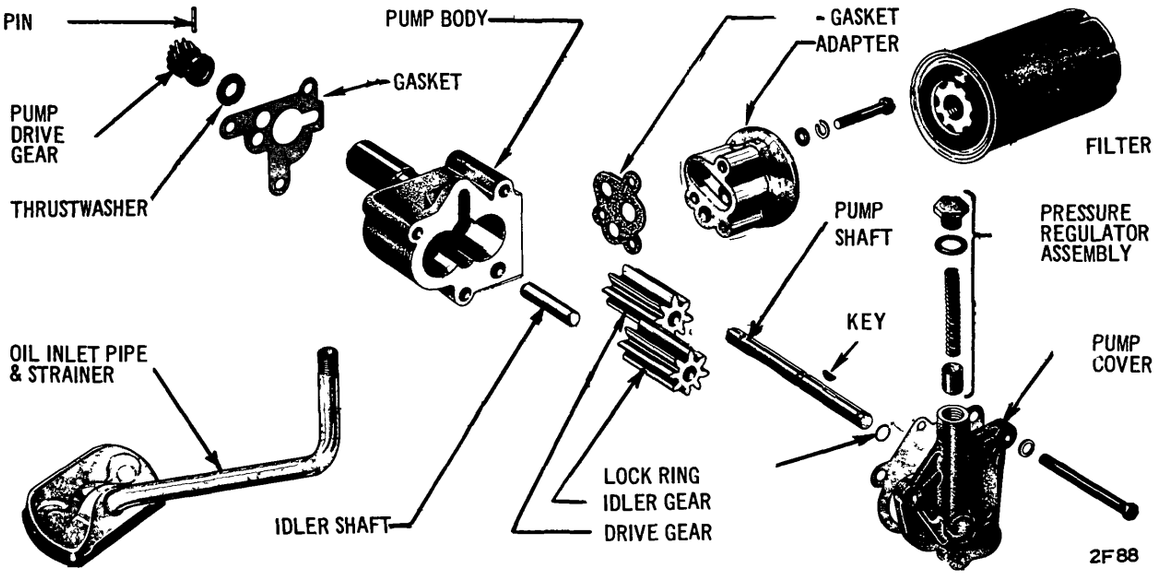
Disassembly: Remove inlet tube and screen assembly from pump cover. Remove cover retaining screws, cover, pump gears, relief valve spring and plunger.

Inspection: Check gear to cover clearance by placing straight edge across pump body with gears in operational cavity. Clearance should not exceed .004". A clearance of .008" maximum should exist between gears and

CONTINUED ON NEXT PAGE

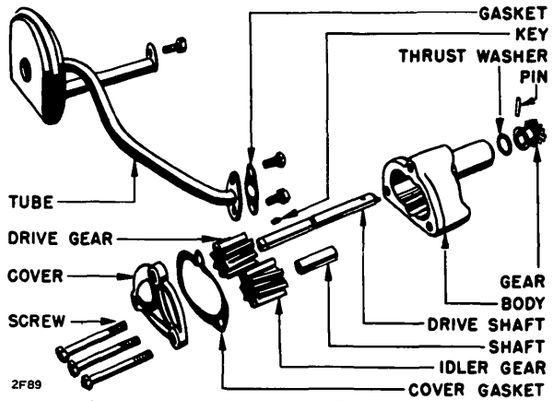
V8 ENGINE OIL PUMP

CONTINUED FROM PRECEDING PAGE



walls of gear cavity opposite point of gear mesh.

Reassembly & Installation: Reverse disassembly procedure. Install cover with pump out of engine, and check pump for free operation before installation.



6 CYLINDER ENGINE

OIL PUMP: Removal - Pump mounted externally on right side of engine. Remove pump by taking out three capscrews in pump cover.

►*OIL PUMP REMOVAL (CARS EQUIPPED WITH "E-STICK" AUTO. CLUTCH) NOTE:* If wheelhouse inner panel interferes with valve body (oil pump cover) removal, proceed as follows: Remove both lower capscrews and loosen top capscrew. Pull valve body (oil pump cover) away from engine about ¼" and rotate clockwise (to front of car) until capscrew and valve body can be removed. Then remove pump. When installing valve body, torque capscrews to 13-15 ft. lbs. DO NOT OVERTIGHTEN.

6 CYL. ALUMINUM ENGINE OIL PUMP

6 CYL. CAST IRON ENGINE OIL PUMP

►*"E-STICK" AUTO. CLUTCH VALVE BODY SERVICE NOTE: See "E-Stick Automatic Clutch" in Clutch Section.*

Oil Pump Overhaul: Remove pump cover and gasket. Lift out pump drive gear, idler gear, and idler gear shaft. Remove key from keyway in shaft. Remove shaft and driving gear assembly through upper end of pump body. *NOTE - Driving pin is held on shaft by a pin.* Remove thrust washer from shaft. Reassemble pump by reversing removal procedure.

MODEL IDENTIFICATION

Model	Model Identification Deluxe	Custom
2-Door Club Sedan	6206	6206-2
2-Door Coupe Ⓒ	6202	
2-Door Sta. Wgn.	6204	6204-2
4-Door Sedan	6205	6205-2
4-Door Sta. Wgn.	6208	6208-2

Ⓒ - Fleet sales only.

►*MODEL IDENTIFICATION NOTE: See "Car Code Number" below.*

SERIAL NUMBER: Stamped to plate attached to right hand wheelhouse panel under hood.

Car Code Number: Number plate located on left front door hinge pillar post. Number includes model, body, trim, paint code and car built sequence numbers. Not used for licensing.

Engine Code Number: Located at upper front corner on left side of cylinder block. Indicates date of manufacture, not used for licensing.

ENGINE NUMBER LETTERS: Located below engine code number (see above). First letter is size of bore, second letter is size of main bearings, and third letter is size of connecting rod bearings. "A" - Standard. "B" - .010" Undersize. "C" - .010" Oversize.

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. minimum at cranking speed with throttle wide open. Maximum variation between cylinders 10 lbs.

VALVE TAPPET CLEARANCE: .016" Intake, .018" Exhaust. Set cold.

MANIFOLD HEAT CONTROL: None used.

CRANKCASE VENTILATION VALVE: Check at regular intervals (at least every 10,000 miles) and check operation before performing a "Tune-Up" for ignition and and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .033-.037".

Spark Plugs - Champion H10 or H18Y. 14mm. Torque to 30 ft. lbs.

COIL: Prestolite (Autolite) 200562 or 200613.

Ignition Current - 3 amperes (stopped).

Resistor - None used.

DISTRIBUTOR: Prestolite (Autolite) IAT-4407. Pivoted breaker plate type.

Condenser - Autolite No. IBB-2042SS-1.

Capacity - .18-.23 mfd.

Contact Point Set - Autolite No. IBP-2040L.

Breaker Gap - .018-.022". *NOTE* - Set gap with engine stopped and use a feeler gauge. DO NOT BEND breaker arm. To adjust, bend stationary contact support.

Cam Angle - 36-42°.

Breaker Arm Spring Tension - 17-22 ozs.

Rotation - Counterclockwise at commutator end.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	420	0	840
1	540	2	1080
2.5	700	5	1400
6	1700	12	3400
7	2000	14	4000

Vacuum Spark Control: Autolite No. IAT-2023LL. Integral type.

Vacuum Advanc

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5
1	2	5 7/8
2	4	6 3/4
4	8	9
5.5	11	11

IGNITION TIMING

Setting - 3° BTDC (Reg. fuel), 6° BTDC (Prem. fuel).

Timing Mark - Vibration damper pulley has five notches (TDC,3°,5°,8°,10° BTDC). Align correct notch with pointer on timing chain cover.

CARBURETOR

►*CARBURETOR APPLICATION: Carter YF single barrel used on all models.*

THROTTLE LINKAGE ADJUSTMENT (FLASH-O-MATIC CARS): Throttle valve pressure controlled by cable connected to carburetor throttle lever on carburetor throttle shaft. To adjust, perform following: **1)** With carburetor throttle valve in hot idle position (off fast idle cam) and engine not running, disconnect throttle cable at lever on carburetor throttle control shaft. **2)** Pull throttle cable toward carburetor and adjust clevis to obtain "free" pin in throttle shaft lever hole. *NOTE - If, after this adjustment, transmission does not shift properly, see "Rambler Six Automatic Transmission" in Transmission Section.*

THROTTLE LINKAGE ANTI-STALL DASHPOT ADJUSTMENT ("E-STICK" AUTO. CLUTCH): Turn idle speed screw out to allow throttle valve to close tightly in bore. Depress dashpot diaphragm stem fully. Adjust by turning dashpot in or out to obtain 1/8" clearance between dashpot stem and throttle lever. Tighten locknut, then reset idle speed.

CARTER YF CARBURETOR

Carter YF, No. 2014S (Without "E" Stick), 3331S (With "E" Stick Clutch).

Idle Setting - ½-1½ turns out. Turn screw out for richer mixture.

Idle Speed - 550 RPM (Synchro-mesh & O.D.), 500 RPM (Flash-O-Matic in "N"), 500 RPM (Air Cond. Cars "ON").

Float Level - ½" (Gauge T109-83 or J-818-1) from top of float at free end to bowl cover (gasket removed) with air horn and float assembly inverted so that float hangs freely. Adjust by bending lip that contacts needle valve (do not bend float arm). *CAUTION - On carburetors with resilient type needle valve seat, DO NOT allow float arm to contact inlet needle when bending lip to adjust float level as seat can be compressed enough to cause a false setting.*

Accelerating Pump - No seasonal adjustment.

Fast Idle: .054" throttle valve opening (Gauge J-5660) with choke valve tightly closed. Adjust by bending fast idle connector link at lower angle.

Automatic Choke Setting: One notch lean.

►*OTHER DATA: See "Carter YF Carburetors" in Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter MODF-3184SA. Fuel & Vacuum, diaphragm type.

Pressur - 4-5½ lbs. maximum, measured 16" above pump outlet with engine running at 1800 RPM.

Gas lin Gauge: King-Seeley Electric Contact Voltage ("CV") type with Gauge Voltage Regulator, King-Seeley No. 57603.

Dash Unit - King-Seeley No. 57592.

Tank Unit - King-Seeley No. 59230.

Radio Suppression Chok Filt r - Located on feed terminal of Gauge Voltage Regulator.

Air Cleaner: Dry filter element (Std.) or Oil Bath (Optl.) types used. Dry filter element should be removed and cleaned every 4000 miles and replaced every 25,000 miles. Check oil bath type every 4000 miles, drain and refill sump every 12,000 miles and wash filter in kerosene (drain dry).

►*AIR CLEANER PAPER ELEMENT CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. DO NOT wash in any liquid or use compressed air. DO NOT LUBRICATE.

BATTERY

Globe-Union or Prestolite (Aut lit). As follows:

Car Use	ⓒGlobe-Union N .	Plat s	②Hr. Capacity
All(less A.C.)	2SM-40	42	40 Amp.
All(with A.C.)	2SMH-60	66	60 Amp.
Heavy Duty	2SH-70	66	70 Amp.

ⓒ - Autolite No. 11HS70 (70 Amp. hr. capacity at 20 hr. rate) used only as heavy duty.

② - 20 hour rate.

Battery Ground - Negative to cylinder head.

Engine Ground - Transmission case to rear engine crossmember.

STARTER

Prestolite (Autolite) MEC-6002. Armatur N . 16-77.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 42-53 ozs.

Shunt Field Current Draw - 4.4-5.1 amps. at 10 volts.

Performanc Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	5300	10.0	48
6.5 ft. lbs.	Lock	4.0	285

Neutral Safety Switch ("E-Stick" Automatic Clutch): Engine can be started in neutral only. *For all data see Rambler "E-Stick" Aut matic Clutch in Clutch Section.*

GENERATOR

Prestolite (Autolite) GJO-7402A (Std. & Air C nd.).

►*GENERATOR NOTE: "A" Circuit typ us d on all models.*

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 18-36 ozs.

Field Current - 1.6-1.7 amperes at 10 volts.

Performance Data - C ld (70°F)

Amperes	Volts	RPM
13.0	15.0	1750
25.0	15.0	2300
30.0	15.0	2700

Belt Adjustment: 110-120 lbs. (new belt), 70-80 lbs. (used belt) strand tension using belt tension gauge. Move generator in its mounting bracket to adjust. *NOTE* - When using gauge on notched belt, finger of gauge should be in notch.

GENERATOR REGULATOR

Prestolite (Autolite) VBO-4223H-1 (With ut Air C nd.), VBO-4223G-1 (With Air C nd.).

►*REGULATOR NOTE: "A" Circuit typ used on all mod ls.*

CONTINUED FROM PRECEDING PAGE

18 Ampere - Headlight, Headlight Beam Indicator. Located in headlight switch.
12 Ampere - Parking Light, Tail Light, Instrument Light, License Plate Light, Trunk or Cargo Light. Located in headlight switch.

FUSES: 3AG 7½ Ampere - Dome Light, Clock Light, Glove Compartment Light, Instrument Panel Courtesy Lights. Located on light switch assembly.
AGA-5 Ampere - Radio. Located in line.
AGC-15 Ampere - Overdrive Relay. Located in relay.

ENGINE

ENGINE SPECIFICATIONS: Own. Cast Iron, 6 Cylinder "L" head.

Bore	Stroke	Displacement
3 1/8"	4 1/4"	195.6 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
8.0-1	23.4	90 at 3800 RPM

OIL PAN REMOVAL: Remove steering linkage cross tie rod before removing oil pan.

ENGINE REMOVAL: *See "ENGINE" in Rambler Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Rambler Special Data.*

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Rambler Special Data.*

PISTONS

Aluminum alloy, solid skirt, tin plated type with flat top.
Original Bore & Piston Sizes - *See "ENGINE NUMBER LETTERS" under Model Identification, above.*
Clearance - .0006"-.0012" at bottom of skirt.
Removal - Pistons and rods removed from above.
Fitting New Pistons: Piston to bore clearance .0006-.0017" (Skirt Top), .0006-.0012" (Skirt Bottom). Piston properly fitted should support its own weight with piston and bore dry.
Replacement Pistons: Std., .002", .005", .010", and .020" Oversize. Furnished with fitted pins.
Installing Pistons: Notch in perimeter must be to front of engine.

PISTON PIN

Press fit in connecting rod. No locking device.
Diameter - .8595-.8598". **Length** - 2.75".
Clearance in Piston - Palm press fit in piston at room temperature.
Pin Removal & Installation - *See "Piston Pins" in Rambler Special Data.*
Replacement Pins: Furnished Std. and .001", .003", .005" Oversize.

PISTON RINGS

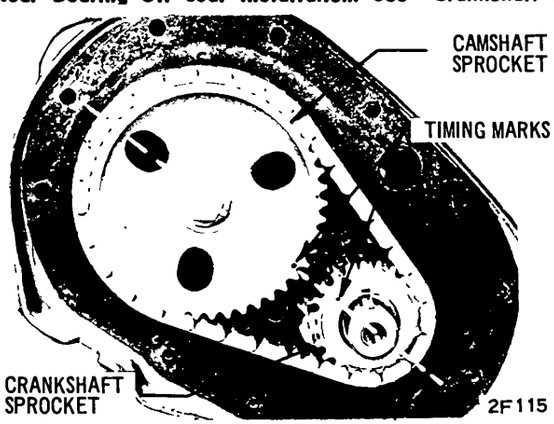
Two compression rings and one oil ring used.

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0930-.0935"	.010-.020"	.003-.005"
Compr.(2)	.0925-.0935"	.010-.020"	.003-.005"
Oil (3)①	.0245"	.015-.055"	.0008-.004".

① - Three-piece steel rail.

Replacement Rings: Sets of Standard and .020" Oversize.

CONNECTING ROD



►*CONNECTING ROD & BEARING PRODUCTION CHANGE:* Connecting rod on later cars has one oil squirt hole only on camshaft side of engine (second squirt hole on opposite side of rod eliminated). Bearing upper half also has only one oil hole (indexing with squirt hole in rod). Both types of bearing inserts can be used with later type rod (second oil hole will be blanked off by rod) or, if desired, second oil hole in rod (opposite camshaft side) can be closed by light peening. *CAUTION - Oil squirt hole on camshaft side of rod must be open and bearing insert must have oil hole indexing with oil hole in rod.*

Length - 6.625" center-to-center. **Weight** - 23 ozs.
Crankpin Journal Diameter - 2.0948-2.0955".
Original Bearing Sizes - *See "ENGINE NUMBER LETTERS" under Model Identification above.*
Bearings - Steel-backed babbitt. No shims.
Clearance - .001-.0015". **Side Play** - .005-.015".

Replacement Bearings: Furnished Std. and .001", .002", .010", .012" Undersize.
Installing Rods: Identification marks (raised surface on center of rod and cap) and notch in top of piston toward front of engine. On rods with single squirt hole *(see Production Change Note above)*, oil squirt hole must be on camshaft side of engine.

CRANKSHAFT

Journal Diameter - 2.4793-2.4798". Four Bearings.
Original Bearing Sizes - *See ENGINE NUMBER LETTERS under Model Identification above.*
Bearings - Steel-backed babbitt. No shims.
Clearance - .001-.0015".
Replacement Bearings: Std. & .001", .002", .010", .012" Undersize.
End Thrust: Taken by flanged front main bearing.
Endplay - .003-.008".
Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Rambler Special Data.*

VALVE TIMING MARKS

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Rambler Special Data.*

CAMSHAFT

►*CAMSHAFT LOBE LIFT NOTE:* When improper valve operation is indicated, check lift of each cam. *See "Camshaft & Bearings" in Rambler Special Data.*

Bearings - Steel-backed babbitt bushings.
Clearance - .001-.003".

End Thrust: Thrust plate on front face of engine between No. 1 bearing and camshaft sprocket.
Endplay - .004-.008".

Timing Chain: Morse non-adjustable type. **Width** 1", **Pitch** 3/8", **Length** 22½" or 60 links.

Camshaft Setting: Install chain with punch mark on camshaft sprocket and mark on crankshaft sprocket adjacent and in line with each other across centerline of sprockets.

Engine Front Cover Oil Seal (Crankshaft Front Seal): Cover oil seal can be replaced without removing cover by using Remover Tool J-9256 and Installer J-9163.

VALVES

Tappet Clearance: .016" Intake, .018" Exhaust.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.469"	.3407-.3412"	4.781"
Exhaust	1.281"	.3407-.3412"	4.7835"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°①	.340"	.002-.0035"
Exhaust	45°①	.340"	.002-.0035"

① - Valve Face angle 44°.

Valve Seat Width - 5/64-3/32".
Valve Stem Oil Seal - None used.

Valve Springs: Single spring used on each valve. Specifications as follows:

Valve	Lbs. Pressur	Length
Open	75-82	1 7/16"
Closed	37-41	1 3/4"

Valve Guides: Use Tool J-1429-1 to remove and replace guides. Guides should be flush with guide bore opening in block. Finish ream all guides after installation.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves - Open 10° BTDC, Close 58° ALDC.
Exhaust Valves - Open 49° BLDC, Close 19° ATDC.
Valve Timing Check - Set valves on No. 1 cylinder at .003" lash. With No. 6 piston at TDC in firing position, timing will be correct if exhaust valve opens the same amount before DC on vibration dampener as intake valve opens after DC as engine is rocked back and forth over DC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Rambler Special Data.*

Crankcase Capacity: 4 qts. refill. Add 1 qt. for filter change.

Normal Oil Pressure: 12 lbs. minimum at 600 RPM, 50 lbs. at 3000 RPM.

Pressure Regulator Valve - Non-adjustable spring loaded valve located in cylinder block just ahead of oil pump.

Oil Pressure Indicator: Light on instrument panel comes on when ignition switch turned on, goes out after engine starts and oil pressure reaches 4±1 lbs. Oil pressure indicator switch located on right side of block to rear of fuel pump.

Oil Pump: Gear type. Mounted on right side of engine. *See OILING SYSTEM in Rambler Special Data.*

►*OIL PUMP REMOVAL CAUTION FOR CARS EQUIPPED WITH "E-STICK" AUTO. CLUTCH: See ENGINE OILING SYSTEM in Rambler Special Data.*

Oil Filter: Partial flow type. Replace element every 4000 miles or sooner if needed.

Replacement Filter Element - Rambler No. 8990508.

Crankcase Ventilation: Standard Cars - Filter in crankcase filler cap and breather tube in valve chamber front side plate.

Positive Crankcase Ventilation Cars - Usual breather tube in valve chamber front side plate replaced by vacuum line to manifold, with valve in line to vary the air flow through crankcase to meet changing conditions at all engine speeds and loads. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 11 qts. Add 1 qt. for heater.

Pressure Valve: 12-15 lb. radiator filler cap, Rambler No. 3165718.

Thermostat: Rambler No. 3203274 (Dole - 192-197°).

Water Pump: Centrifugal, double row ball bearing type. Requires no lubrication. Service as an assembly.

Temperature Gauge: King-Seeley "CV" electric type with Gauge Voltage Regulator, King-Seeley No. 57603.

Dash Unit - King-Seeley No. 57596.

Engine Unit - King-Seeley No. 44275.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*MODEL IDENTIFICATION NOTE: See "Car Code Number" below.*

SERIAL NUMBER: Stamped on plate attached to right hand wheelhouse panel under hood.

Car Code Number: Number plate located on left front door hinge pillar post. Number includes model, body, trim, paint code and car built sequence numbers. Not used for licensing.

Engine Code Number: Located at upper front corner of left side of cylinder block. "C" prefix on Cast Iron Engines, and "B" prefix on Aluminum Engines. Indicates date of manufacture. Not used for licensing.

ENGINE NUMBER LETTERS: Located below engine code number on Cast Iron Engines, and at left rear corner of cylinder block on Aluminum Engines. First letter is size of bore, second letter is size of main bearings, third letter is size of connecting rod bearings. "A" - Standard. "B" - .010" Undersize. "C" - .010" Oversize.

TUNE-UP

COMPRESSION PRESSURE: 145 lbs. minimum at cranking speed with throttle wide open.

VALVE TAPPET CLEARANCE: Cast Iron Block - .012" Intake, .016" Exhaust, Hot.

Aluminum Block - "O" lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: None used.

CRANKCASE VENTILATION VALVE: Check at regular intervals (at least every 10,000 miles) and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .033-.037".

Spark Plugs - Champion H-10 or H18Y. 14 mm. Torque to 30 ft. lbs.

COIL: Delco-Remy No. 1115066.

Ignition Current - 1.7 amps. idling, 3.75 amps. stopped.

Resistor - None used.

DISTRIBUTOR: Delco-Remy No. 1112435.

Condenser - Delco-Remy No. 1928111.

Capacity - .18-.23 mfd.

Contact Point Set - Delco-Remy No. 1924571 or 1944375 (pre-assembled).

Breaker Gap - .016".

Cam Angle - 28-35°.

Breaker Arm Spring Tension - 17-21 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
.5-2.5	600	1-5	1200
5-7	900	10-14	1800
7.5-9.5	1500	15-19	3000
10-12	2100	20-24	4200

Vacuum Spark Control: Delco-Remy No. 1116174.

Vacuum Advance

Distr. Degrees	Engine Degrees	Vacuum ("of Hg)
1	2	5-7
11	22	16-17

IGNITION TIMING

Model	Ignition Setting Regular - Fuel - Premium
American (S.M. Trans.)	8° BTDC — 12° BTDC
American (Auto. Trans.)	10° BTDC — 14° BTDC
Classic (S.M. Trans.)	TDC — 3° BTDC
Classic (Auto. Trans.)	5° BTDC — 8° BTDC

Timing Mark - Vibration damper pulley has five notches (TDC, 3°, 5°, 8°, 10° BTDC). Align correct notch with pointer on timing chain cover.

CARBURETOR

►*CARBURETOR APPLICATION: Carter & Holley Single & Dual Carburetors used as follows:*

Car Model	Carburetor
American (exc. "E-Stick")	Holley 1908FC(2381-1)
American ("E-Stick")	Holley 1908FC(2446)
Classic (S.M. & O.D. Trans.)	Holley 1908FC(2138-1)
Classic (Auto. Trans.)	Carter AS 3206S
Classic (Opt. All Trans.)	Carter WCD 3322S

THROTTLE LINKAGE ADJUSTMENT (FLASH-O-MATIC CARS): Throttle valve pressure controlled by cable connected to carburetor throttle lever on carburetor throttle shaft. To adjust, perform following: 1) With carburetor throttle valve in hot idle position (off fast idle cam) and engine not running, disconnect throttle cable at lever on carburetor throttle control shaft. 2) Pull throttle cable toward carburetor and adjust clevis to obtain "free" pin in throttle shaft lever hole. Unscrew clevis ONE FULL TURN, then install clevis pin and retain with cotter pin. *NOTE - If, after this adjustment, transmission does not shift properly, see Rambler Six Flash-O-Matic Transmission in Transmission Section.*

THROTTLE LINKAGE ANTI-STALL DASHPOT ADJUSTMENT ("E-STICK" AUTO. CLUTCH): 1) Turn idle speed screw out to allow throttle valve to close tightly in bore. 2) Depress dashpot diaphragm stem fully. 3) Adjust by turning dashpot in or out to obtain 9/64" clearance between dashpot stem and throttle lever. Tighten locknut, then reset idle.

CARTER AS

Carter AS 3206S. Single barrel downdraft type.

Idle Setting - ¼-1¼ turns open. Turn screw out for richer mixture.

Idle Speed - 500 RPM. If equipped, Air Conditioning unit "ON". Flash-O-Matic transmission in neutral.

Float Level - 3/32" (Gauge T109-50) for carburetors with resilient inlet needle seat (5/32" - Gauge T109-148 for carburetors with solid inlet needle seat), Check and adjust float level exactly as follows: Remove gasket and invert bowl assembly while holding float pin retainer in place so that float hangs freely with float weight only on inlet needle. Use gauge to check distance from top of float at free end to gasket surface on bowl. To adjust, remove float lever pin retainer, install float holding tool, T109-389, and bend float lip as necessary *(CAUTION - Holding tool prevents float and needle pressing against resilient needle valve seat which might be compressed and cause false setting).* After adjustment, remove tool, install lever pin retainer, recheck float setting.

Accelerating Pump - No seasonal adjustment.

Fast Idle: .033-.037" (Gauge J-5496) opening between edge of throttle plate and carburetor bore (side opposite idle port). Adjust by bending connector link at lower angle

Automatic Choke Setting: Center on index.

►*OTHER DATA: See "Carter AS Carburetors" in Carburetion Section.*

HOLLEY SINGLE BARREL

Holley Model 1908FC. Single barrel downdraft type similar in design to Holley Visiflo. Used as follows:

Car Model	Holley Carb. No.
American (Without "E" Stick)	R-2381-1
American (With "E" Stick Clutch)	R-2446
Classic 6	R-2138-1

Idle Setting - 1 turn open approximately. Turn screw out for richer mixture.

Idle Speed - 550 RPM in neutral. 500 RPM on cars equipped with Air Conditioning and unit turned "ON".

Fuel Level - With engine running, measure through economizer diaphragm hole. With depth gauge placed on machined surface of opening, distance should be 3/4" (R-2446 & R-2381-1), 11/16" (R-2138-1).

Accelerating Pump - No seasonal adjustment.

Fast Idle: Integral type operated by choke valve. No adjustment required.

Automatic Choke Setting: Center on index.

►*OTHER DATA: See "Holley Visi-Flo Carburetors" in Carburetion Section.*

CARTER WCD

Carter WCD 3322S. 2-Barrel, downdraft type.

Idle Setting - ½-1½ turns open. Turn screws out for richer mixture.

Idle Speed - 550 RPM (S.M. & O.D. Trans. in neutral), 500 RPM (Auto. Trans. in neutral, Air Cond. Cars with unit "ON").

Float Level - Two separate adjustments must be made, lateral & vertical. For LATERAL adjustment, invert bowl cover assembly (gasket removed), then place float gauge J-4773 directly under floats with notches of gauge fitted over edges of casting. Sides of floats should just touch vertical uprights of gauge. To adjust, bend float arms. For VERTICAL adjustment, with float gauge in same position, floats should just clear horizontal portion of gauge. Vertical distance between top of float and machined casting surface must be 5/32" (Gauge T109-196) for carburetors with solid inlet needle seat, 1/8" (Gauge T109-36) for carburetors with resilient inlet needle seat. *CAUTION - On carburetors with resilient inlet needle seat, check float level with float hanging freely so that only weight of float is on inlet needle and be careful not to allow float lever to press on inlet needle when adjusting float level (seat can be compressed enough to cause false setting).*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Acc l rating Pump - No seasonal adjustment.

Fast Idl : .010" (Gauge J-5640) clearance between lip of fast idle cam and boss on body with choke valve closed (loosen clampscrew and adjust lever on choke shaft, then hold in place and tighten clampscrew). Then check for .020" clearance (Gauge J-1388) between throttle valve and bore of carburetor (side opposite idle port), with idle adjusting screw on high step of fast idle cam. Adjust by turning fast idle screw.

Automatic Ch k Setting: Centered on index.

►*OTHER DATA: S "Carter WCD Carburetors" in Carburetion S ction.*

CARB. EQUIPMENT

Fuel Pump: American - Carter MDOF-3184SA. Fuel & Vacuum, diaphragm type.

Classic - Carter No. MPF-3025SA. Fuel & Vacuum, with piston type vacuum pump.

Pr ssur - 4-5½ lbs. minimum at 16" above inlet at 1800 RPM (American), 4-5½ lbs. maximum, using 6" hose and "T" fitting 6" above carb. inlet (Classic).

Gasoline Gaug : King-Seeley Electric Constant Voltage ("CV") type with Voltage Regulator, King-Seeley No. 57603.

Dash Unit - King-Seeley No. 57592 (American), No. 58852 (Classic).

Tank Unit - King-Seeley No. 59230 (American), No. 59225 (Classic).

Radi Suppr ssi n Ch k Filter - Located on feed terminal of Gauge Voltage Regulator.

Air Cl an r: Dry filter element type Std. Filter element should be cleaned every 4000 miles and replace every 25,000 miles.

►*AIR CLEANER PAPER ELEMENT CLEANING CAUTION:* Clean paper filter element by tapping and shaking to remove dirt particles. DO NOT wash in any liquid or use compressed air. DO NOT LUBRICATE.

BATTERY

Gl be-Uni n r Pr st lit (Autolite). As follows:

Car Us	①Glob -Uni n No.	Plates	②Hr. Capacity
All (Less A.C.)	2SM-45	42	45 Amp.
All (With A.C.)	2SMH-60	66	60 Amp.
Heavy Duty	2SH-70	66	70 Amp.

① - Also Autolite No. 11HS-70 (70 Amp. hour capacity - 20 hr. rate) used only for heavy duty.

② - 20 hr. rate.

Batt ry Gr und - Negative to cylinder head.

Engin Ground - Transmission case to rear engine crossmember.

STARTER

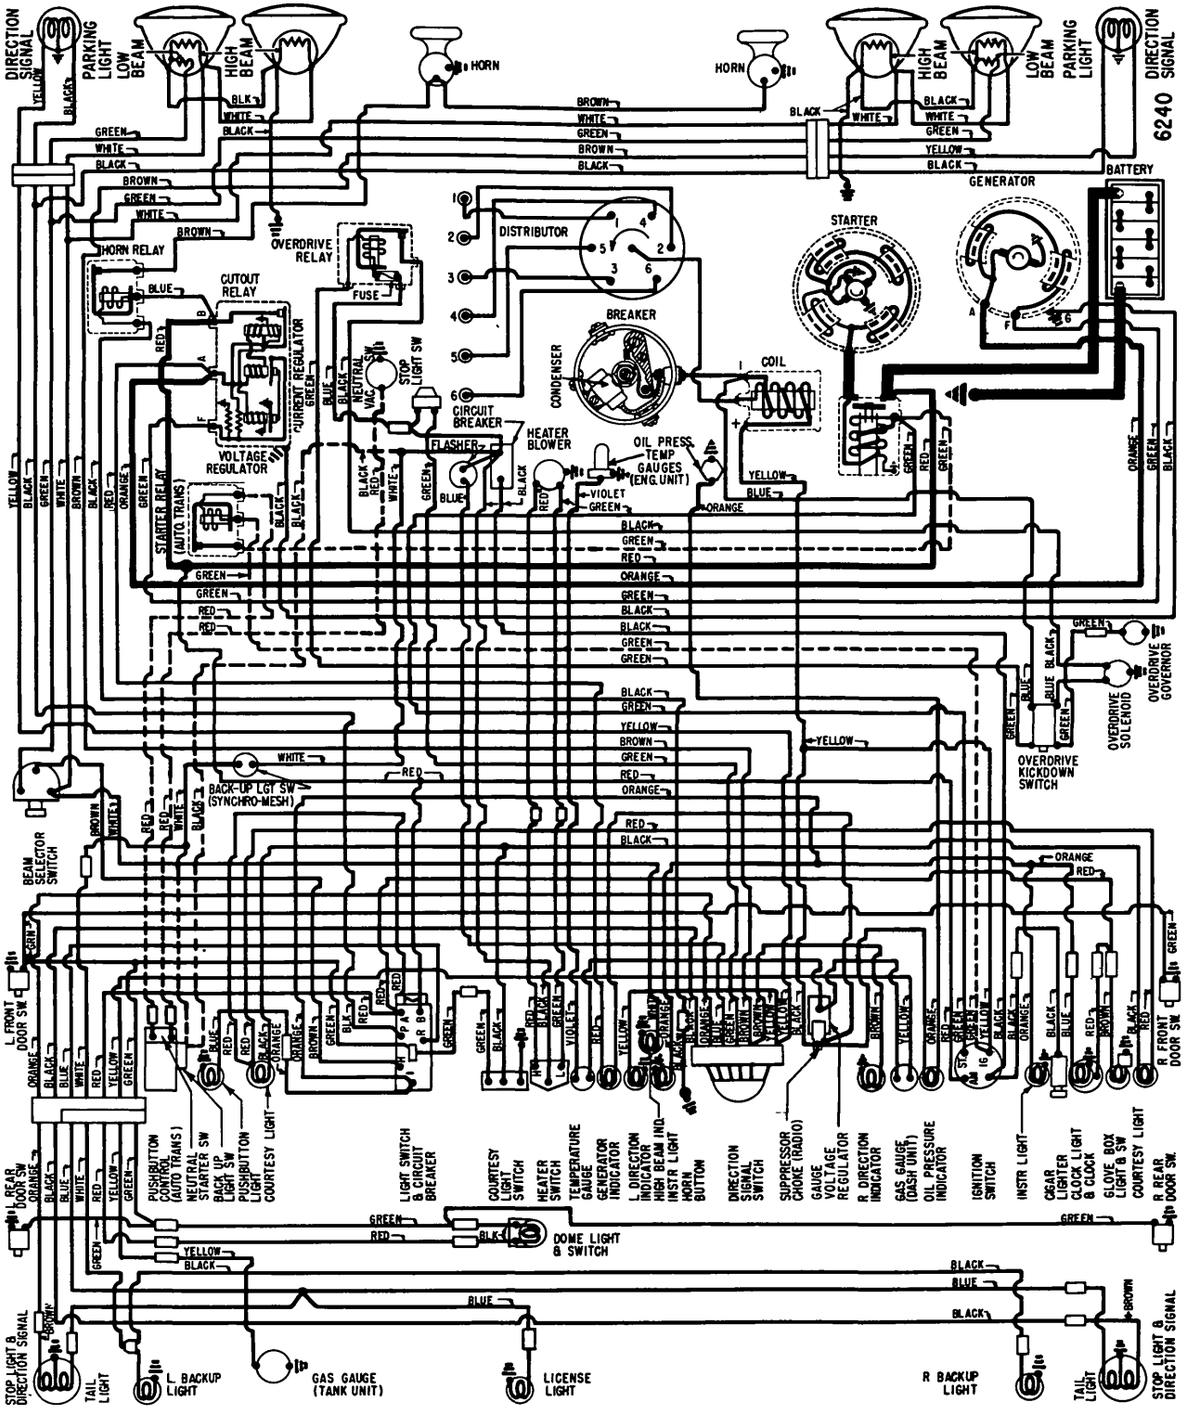
D lc -Remy N . 1107201.

Driv - Overrunning clutch (solenoid pinion shift).

R tation - Counterclockwise at commutator end.

Brush Spring T nsi n - 35 ozs. minimum.

Performance Data



Torque	RPM	Volts	①Amperes
0 ft. lbs.	6200-9400	10.6	49-76
	Lock	4.3	270-310

① - Includes solenoid.

Start r Switch: Delco-Remy Solenoid No. 1119798 mounted on starter and controlled by Ignition & Starter Switch Rambler No. 3158414 for key starting (synchro-mesh). Automatic Transmission Cars controlled as follows:

American - Same as synchro-mesh above with Neutral

CONTINUED ON NEXT PAGE

CONTINUED ON NEXT PAGE

Safety & Back-Up Light Switch Rambler No. 3203293. *S NOTE b l w.*

Classic - Neutral Safety Switch Rambler No. 3157963 and Relay No. 3156115 with Push Button Control Switch mounted on gearshift control and operated by pushing in "Neutral" button with ignition switch turned ON. Vacuum switch prevents starter operation with engine running.

►*"E-STICK" AUTO. CLUTCH EQUIPPED CARS STARTER RELAY NOTE:* Two types used. Rambler No. 3156115 (Relay has 3 screw type terminals), No. 3165763 (Relay has 2 screw type terminals and 1 male arcless type).

►*VACUUM NEUTRAL STARTER SWITCH CAUTION:* DO NOT apply a hot lead direct to switch for test purpose as it will overheat loading spring and/or burn contacts. Disconnect lead to switch and ground lead to engine. If engine will start, switch is defective. Switch opens at 11-14" of vacuum. Starter gear clash that occurs when engine started cold and on low fast idle setting with choke fully closed is the result of low engine vacuum and is normal.

Neutral Safety Switch Adjustment (American) - *See "Rambler Automatic Transmission" in Transmission Section.*

GENERATOR

Delco-Remy. Used as follows.

Model	Generator No.
All Without Air Conditioning	1100416
All With Air Conditioning	1102299
Heavy Duty	1102123

►*AUTOLITE HEAVY DUTY GENERATOR NOTE: See Rambler Ambassador Car Model Pages.*

Performance Data

Generator	Amperes	Volts	RPM
1100416	25	14.0	2710
1102299	30	14.0	2240
1102123	45	14.0	2520

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.5-1.62 amps. (1100416), 1.69-1.79 amps. (1102299), 2.66-2.86 amps. (1102123), at 12 volts and 80°F.

Belt Adjustment: 110-120 lbs. (New), 70-80 lbs. (Used) tension, using a belt tension gauge at center of longest span between pulleys. Move generator in its mounting bracket to adjust. *NOTE* - When using gauge on notched belt, finger of gauge should be in notch.

GENERATOR REGULATOR

Delco-Remy. Used as follows:

Model	Regulator	Generator
Standard	1119122, E	1100416
Air Cond.	1119003, E	1102299
Heavy Duty	1119600	1102123

►*REGULATOR NOTE: All regulators are "A" Circuit.*

►*AUTOLITE HEAVY DUTY REGULATOR NOTE: See Rambler Ambassador Car Model Pages.*

►*DOUBLE CONTACT REGULATOR NOTE:* Regulator 1119600 has double contacts for voltage regulation. *NOTE - Sp cificati ns below ar "N rmal" settings.*

Cutout Relay

Cuts In - 11.8-13.5 volts (1119003, 122), 11.8-13.0 volts (1119600).

C ntact Gap - .020".

Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting (1119003, 122) - 13.8-14.7 volts at 125°F.

Setting (1119600) - 13.8-14.6 volts operating on upper contacts, .1-.3 volt lower on lower contacts. At ambient temperature of 125°F.

Contact Gap - (1119600) .016" (upper contacts) with lower contacts just touching.

Air Gap - .075" (1119122 & 1119003), .060" (1119122E & 1119003E), .067" (1119600) with armature pressed down to point where contacts just touch.

Current Regulator

Setting (1119122) - 23-27 amperes (hot).

Setting (1119003) - 27-33 amperes (hot).

Setting (1119600) - 38-45 amperes (hot).

Air Gap - .075" with armature pressed down to point where contacts just touch.

Replacement Regulator (30 Ampere): Rambler No.3203659.

►*OTHER DATA: See "Rambler Replacement Regulator" under GENERATOR REGULATOR in Rambler American (L-Head Engine) Car Model Pages.*

ALTERNATOR & REGULATOR

►*See RAMBLER AMBASSADOR Car Model Pages.*

MISC. ELECTRICAL

►*ERRATIC DIRECTION SIGNAL OR TAIL LAMP OPERATION CORRECTION:* May be caused by poor ground between tail lamp socket and base. To insure a good ground at this point, remove tail lamp lens and bulbs. Centerpunch the flange of the lamp socket to the base in about six places.

Light Switch Removal: Disconnect battery, place switch in full OFF position and press button (top of switch) to release shaft and knob assembly, then remove french nut. Remove switch and disconnect wires.

Stop Light Switch: Located on fitting at front end of master cylinder (American), in fitting on front face of firewall (classic). Use thread sealer when installing new switch.

CIRCUIT BREAKERS: 30 Ampere - Back-up Light, Direction Indicator, Stop Light, Power Windows. Located on cowl ceiling under dash.

18 Ampere - Headlights, Headlight Beam Indicator. Located in headlight switch.

15 Ampere - Protects Power Windows. Mounted near each motor.

12 Ampere - Parking, Tail, Instrument, License Plate, Instrument Panel Courtesy Lights. Located on light switch assembly.

FUSES: 3AG 7½ Ampere - Dome, Clock, Glove Compartment, and Instrument Panel Courtesy Lights. Locate on light switch assembly.

AGC - 15 Ampere - Overdrive Relay. Located in relay.

AGA-5 Ampere - Radio. Located in line.

ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl. valve-in-head.

8.7-1	23.44	Ⓒ127 at 4200 RPM

Ⓒ - 1-Bbl. Carb. 138 at 4500 RPM with 2-Bbl. Carb.

►*ENGINE THRUST ROD ASSEMBLY (Seri s 6210 with Auto. Trans.):* Limits forward movement of engine. Attached by bracket to lower left side of block and to front suspension crossmember at rear.

►*ALUMINUM ENGINE SERVICE NOTE: See Rambler Special Data for special precautions in handling parts.*

ENGINE REMOVAL: *See "ENGINE" in Rambler Special Data.*

TIGHTENING TORQUES: *See "Tight ning Sp cifications" in Rambler Special Data.*

CYLINDER HEAD & MANIFOLD: *See "Cylind r Head & Manifold" in Rambler Special Data.*

PISTONS

Aluminum alloy, solid skirt, steel strut, tin plated type with contoured top.

Original Bore & Pistons - *S "ENGINE NUMBER LETTER" under Model Id ntificati n above.*

Clearance - .0006-.0012" at bottom of skirt.

Weight (Piston only) - 14.7 ozs.

Removal - Pistons and rods removed from above.

Fitting New Pistons: Piston to bore clearance .0006-.0017" (Skirt Top)..0006-.0012" (Skirt Bottom). Piston properly fitted should support its own weight with piston and bore dry

Replacement Pistons: Std., .002", .005", .010" and .020" Oversize. Furnished with fitted pins.

Installing Pistons: Notch in perimeter must be to front of engine.

PISTON PIN

Press fit in connecting rod. No locking device.

Diameter - .8595-.8598". **Length** - 2.75".

Clearance in Piston - Palm press fit in piston at room temperature.

Pin Removal & Installati n - *See "Pist n Pins" in Rambler Special Data.*

Replacement Pins: Furnished Std. and .001", .003", .005" Oversize.

PISTON RINGS

Two compression rings and one oil ring per piston.

Ring	Width	End Gap	Sid Cl aranc
Compr. (1)	.0930-.0935"	.010-.020"	.003-.005"
Compr. (2)	.0925-.0935"	.010-.020"	.003-.005"
Oil (3)①	.0245"	.015-.055"	.0001-.0084".

① - Three-piece steel rail.

Installing Rings: *NOTE* - Top compression ring outer edges beveled. Install both compression rings with inner notched edge up.

Replacement Rings: Sets of Standard and .020" Oversize.

CONNECTING ROD

►*CONNECTING ROD & BEARING PRODUCTION CHANGE:* Connecting rod on later cars has one oil squirt hole only on camshaft side of engine (second

CONTINUED ON NEXT PAGE

S INDEXES on Pgs. 4 to 9 for complet CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

squirt hole on opposite side of rod eliminated). Bearing upper half also has only one oil hole (indexing with squirt hole in rod). Both types of bearing inserts can be used with later type rod (second oil hole will be blanked off by rod) or, if desired, second oil hole in rod (opposite camshaft side) can be closed by light peening. *CAUTION - Oil squirt hole on camshaft side of rod must be open and bearing insert must have oil hole indexing with oil hole in rod.*

Length - 6.625" center-to-center. Weight - 23 ozs.

Crankpin Journal Diam ter - 2.0948-2.0955".

Original Bearing Sizes - See *"ENGINE NUMBER LETTERS" under Model Identification above.*

Bearings - Steel-Backed "Micro-Babbitt" (Cast Iron Eng.), "Sintered Copper-Lead" (Aluminum Eng.). No shims.

Clearance - .001-.0015". Sideplay - .005-.015".

Replacement Bearings: Furnished Std. and .001", .002", .010", .012" Undersize.

Installing Rods: Install rods in respective cylinders with cylinder numbers on rods and caps toward camshaft side of engine and notch in top of piston to front of engine. On rods with single oil squirt hole *(see Production Changes above)*, oil squirt hole must be on camshaft side of engine.

CRANKSHAFT

Journal Diameter - 2.4793-2.4798". Four bearings.

Original Bearing Size - See *"ENGINE NUMBER LETTERS" under Model Identification above.*

Bearings - Steel-Backed "Micro-Babbitt" (Cast Iron Eng.). "Sintered Copper-Lead" (Aluminum Eng.). No shims.

Clearance - .001-.0015".

End Thrust: Taken by flanged front main bearing.

Endplay - .003-.008".

Replacement Bearings: Furnished Std. and .001", .002", .010", .012" Undersize.

Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Rambler Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Rambler Special Data.*

CAMSHAFT

►*CAMSHAFT LOBE LIFT NOTE:* **When improper valve operation is indicated, check lift of each cam. *See "Camshaft & Bearings" in Rambler Special Data.***

Bearings - Steel-backed babbitt bushings.

Clearance - .001-.003".

End Thrust: Thrust plate on front face of engine between No. 1 bearing and camshaft sprocket.

Endplay - .004-.008".

Timing Chain: Morse non-adjustable type. Width 1", Pitch 3/8", Length 22½" or 60 links.

Camshaft Setting: Install chain with punch mark on camshaft sprocket and mark on crankshaft sprocket adjacent and in line with each other across centerline of sprockets.

Engine Front Cover Removal: *See "Engine Front Cover" in Rambler Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): Cover oil seal can be replaced without removing cover by using Remover J-9256 and Installer J-9163.

VALVES

Tappet Clearance: (Cast Iron Engine) - .012" Intake, .016" Exhaust, with engine hot and running.
(Aluminum Engine) - "0" lash, hydraulic lifters.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.594"	.341-.342"	4.791"
Exhaust	③	④ .3405-.3415"	②

Valve	Seat Angle	Lift	Stem Clearance
Intake	① 45°	⑤	.0015-.0035"
Exhaust	⑥ 45°	⑦	.0025-.004"

① - Valve face angle 44°.
② - 4.791" (Cast Iron Eng.), 4.808" (Aluminum Eng.).
③ - 1.343" (Cast Iron Eng.), 1.250" (Aluminum Eng.).
④ - .3407-.3412" (Cast Iron Engine).
⑤ - .371" (Cast Iron Eng.), .406" (Aluminum Eng.).
⑥ - 44½° face angle (Aluminum Eng.), 44° face angle (Cast Iron Eng.).
⑦ - .369" (Cast Iron Eng.), .406" (Aluminum Eng.)..

Valve Seat Width - .078-.093".

Valve Stem Oil Seals - Rubber deflectors mounted on all valve stems at upper end of guide.

Valve Springs: Single spring used on each valve. Specifications as follows:

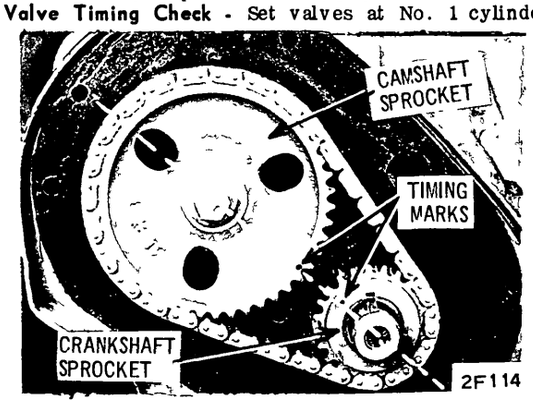
Cast Iron Engine

Valve	Lbs. Pressure	Length
Open	115-125	1 7/16"
Closed	65-70	1 13/16"

Aluminum Engine

Valve	Lbs. Pressure	Length
Open	155-165	1 7/16"
Closed	75-85	1 13/16"

Valve Guides: Use Tool J-1429-B to remove and install all guides. Install guide so it extends 23/32" above surface of cylinder head. Finish ream all guides after installation.



Rocker Arm Assembly: *See VALVE SYSTEM in Rambler Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 12°30' BTDC. Close 51°30'ALDC.
Exhaust Valves - Open 53°30' BLDC. Close 10°30'ATDC.
Valve Timing Check - Set valves at No. 1 cylinder at .003" lash. With No. 6 piston at TDC in firing position, timing will be correct if exhaust valve opens the same amount before DC on vibration damper as intake valve opens after DC as engine is rocked back and forth over DC.

VALVE TIMING MARKS

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Rambler Special Data.*

Crankcase Capacity: 4 qts. refill. Add 1 qt. for filter change.
Normal Oil Pressure (Cast Iron Engine) - 12 lbs. at 600 RPM, 50 lbs. at 3000 RPM.
Normal Oil Pressure (Aluminum Engine) - 15 lbs. at 600 RPM, 55 lbs. at 3000 RPM.
Pressure Regulator Valve - Non-adjustable spring loaded valve located in cylinder block (Cast Iron Engine), in oil pump cover (Aluminum Engine).

Oil Pressure Indicator: Light on instrument panel comes on when ignition switch turned on, goes out after engine starts and oil pressure reaches 4-6 lbs. Oil pressure indicator switch located on right side of engine block.

Oil Pump: Gear type, mounted on right side of engine. *See "Oiling System" in Rambler Special Data.*

►*OIL PUMP REMOVAL CAUTION (CARS EQUIPPED WITH "E-STICK" AUTO. CLUTCH): See ENGINE OILING SYSTEM in Rambler Special Data.*

Oil Filter: Partial flow type Std. (Cast Iron Engine), full flow type Std. (Aluminum Engine). Replace element and gasket at 4000 mile intervals.

►*OIL FILTER INSTALLATION CAUTION:* Apply thin coat of oil to new gasket. Install filter by hand until gasket contacts mounting bracket seat. Then tighten ½ additional turn. DO NOT OVERTIGHTEN.

Replacement Filter Element - Rambler No. 8990508 (Cast Iron Eng.), No. 8991072 (Aluminum Eng.).

Crankcase Ventilation: Standard Cars - Filter in crankcase filler cap and breather tube in valve tappet cover.
Positive Crankcase Ventilation Cars - Usual breather tube in valve chamber front side plate replaced by vacuum line to manifold with valve in line to vary the air flow through crankcase to meet changing conditions at all engine speeds and loads. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 10 qts. Add 1 qt. for heater.
Pressure Valve: 12-15 lb. radiator filler cap, Rambler No. 3165718.
Thermostat: 192-197°F Dole. Rambler No. 3203274 (American), No. 3203275 (Classic).
Water Pump: Centrifugal, double row ball bearing type. Requires no lubrication. Service as an assembly.
Temperature Gauge: King-Seeley.
Dash Unit - King-Seeley No. 57596 (American), No. 58855 (Classic).
Tank Unit - King-Seeley No. 44275 (All).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

MODEL IDENTIFICATION

Model	Model Identification Deluxe	Custom	400
4-Door Sedan	6285 Ⓒ	6285-2	6285-5
Station Wagon (2 Seat)		6288-2	6288-5
Station Wagon (3 Seat)			6288-6

Ⓒ - Fleet Sales only.

SERIAL NUMBER: Stamped on plate attached to right hand wheelhouse panel under hood.

Car Code Number: Stamped on bottom of body and number plate located on left front door hinge pillar. Number is not used for licensing.

Engine Code Number: Stamped on tag attached to generator mounting bracket. Number is not used for licensing.

►*ENGINE NUMBER LETTERS (Adjacent To Engine Code Number):* First letter is size of bore, second letter is size of main bearings, and third letter is size of connecting rod bearings. Engines not marked are standard in all respects. "A" - Standard. "B" - .010" Undersize. "C" - .010" Oversize.

TUNE-UP

COMPRESSION PRESSURE: 145 lbs. minimum at cranking speed. Cylinders must be equal within 10 lbs.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located between right bank exhaust manifold and exhaust crossover pipe (exhaust gases diverted through heat passages in manifold when valve closed).

CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033-.037".

Spark Plugs - Champion H-10 or H-18Y. 14 mm. Torque to 25-30 ft. lbs.

COIL: Prestolite (Autolite) No. 200571.

Ignition Current - 3 amps. at 12.5 volts with resistor in circuit.

Resistor - Autolite No. PU-5003 connected in circuit between positive terminal of coil and ignition switch. *Resistor must be in circuit when testing coil output.*

DISTRIBUTOR: Prestolite (Autolite) IBP-4109.

Condenser - Autolite No. IBB-2042SS-1.

Capacity - .18-.23 mfd.

Contact Point Set - Autolite No. IBP-2040L.

Breaker Gap - .018-.022". **Cam Angle** - 28-32°.

Breaker Arm Spring Tension - 17-22 ozs.

Rotation - Counterclockwise at commutator end.

Automatic Advance - IBP-4109

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	250-350	0	500-700
7.5-9.4	750	15-18.8	1500
17-19	1900	34-38	3800

Vacuum Spark Control: Autolite No. IBP-2023LC. Integral type.

Vacuum Advance - IBP-2023LC

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5-7
8.2-11	16.4-22	15

IGNITION TIMING

Carb. & Trans.	Ignition Setting Regular - Fuel - Premium
2-Bbl. Carb. Synchro-mesh & O.D.	TDC ..... 3° BTDC
2-Bbl. Carb. Auto. Trans.	5° BTDC ..... 8° BTDC
4-Bbl. Carb. Auto. Trans.	5° BTDC

►*TIMING SETTING NOTE:* Set timing with vacuum line disconnected and distributor opening taped closed, and with engine at idle speed.

Timing Mark - Timing pointer on engine front cover and milled notches on vibration damper. Notches indicate TDC, 3° BTDC, 5° BTDC, and 8° BTDC. Align correct notch with pointer.

CARBURETOR

►*CARBURETOR APPLICATION: Holley 2-Barrel carburetor Standard; Holley 4-Barrel carburetor Optional.*

THROTTLE LINKAGE ADJUSTMENT (AUTO. TRANS. CARS): None required. Transmission shift points controlled by vacuum & solenoid unit at rear of transmission.

Anti-Stall Dashpot Adjustment: With dashpot plunger fully depressed, turn dashpot in or out to obtain 3/32" (2-Bbl.), 7/64" (4-Bbl.) between dashpot plunger and throttle lever.

HOLLEY 2 & 4-BARREL

2-BARREL CARBURETOR	Holley No.
Synchro-mesh & O.D.	Model 2300, No. 2442
Auto. Trans.	Model 2300, No. 2463
4-BARREL CARBURETOR	
Synchro-mesh & O.D.	Model 4150, No. 1957-1
Auto. Trans.	Model 4150, No. 2464

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting - Initial setting 1 turn open. Turn screws out for richer mixture.

Idle Speed - 550 RPM (Synchro-mesh & O.D.), 475 RPM (Auto. Trans. in "N"), 500 RPM (Air Conditioning "ON").

►*OTHER DATA: See "Holley 2 & 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. MPF-3158-S. Fuel & Vacuum, with piston type vacuum pump.

Pressure - 4-5½ lbs. maximum using 6" hose and "T".

Gasoline Gauge: King-Seeley Electric Constant Voltage ("CV") type with Gauge Voltage Regulator King-Seeley No. 57603.

Dash Unit - King-Seeley No. 58852.

Tank Unit - King-Seeley No. 59225 (Exc. 9-Pass. Sta. Wgn.), No. 59230 (9-Pass. Sta. Wgn.).

Radio Suppression Choke Filter - Located on feed terminal of Gauge Voltage Regulator.

Air Cleaner: Replaceable element (dry type) used for all models. Clean element every 4000 miles, replace every 25,000 miles.

►*AIR CLEANER CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. DO NOT WASH in any liquid or use compressed air. DO NOT OIL.

BATTERY

Globe-Union 2SMH-60 & 2SH70, Prestolite (Autolite) 11HS70. 12 volt, 11 plate, 60 ampere hour capacity (2SMH-60), 70 ampere hour capacity (2SH70 & 11HS70) at 20 hour rate.

Battery Ground - Negative to cylinder block.

Engine Ground - Transmission to rear crossmember.

STARTER

Prestolite (Autolite) MDY-6009. Armature No. 16-77.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 42-53 ozs.

Performance Data - MDY-6009

Torque	RPM	Volts	Amperes
0 ft. lbs.	4200	10.0	60
9 ft. lbs.	Lock	4.0	405

Starter Switch: Autolite Solenoid No. SAJ-4004 mounted on starter and controlled by Ignition & Starter Switch Rambler No. 3158414 (Synchro-mesh). On Auto. Trans. Cars, solenoid controlled by Ignition Switch Rambler No. 3158613, a Neutral Safety Switch No. 3157963, and a Relay No. 3156115 with Push Button Control. Neutral Safety Switch is mounted on gear shift control and operated by pushing in Neutral Button with ignition switch ON. Vacuum Switch prevents starter operation with engine running.

►*VACUUM NEUTRAL STARTER SWITCH CAUTION:* DO NOT apply a hot lead direct to switch for test purpose as it will overheat loading spring and/or burn contacts. Disconnect lead to switch and ground lead to engine. If engine will start, switch is defective. Switch opens at 11-14" of vacuum. Starter gear clash that occurs when engine started Cold and on low fast idle setting with choke fully closed is the result of low engine vacuum and is normal.

GENERATOR

Prestolite (Autolite) GJP-7405A & S (Std.), GJP-7104A (Heavy Duty).

Armature - Autolite No. 10-53 (GJP-7104A Gen.).

►*CHARGING CIRCUIT CAUTION:* Generator GJP-7405A is "A" circuit type with generator field grounded in generator regulator. Generator GJP-7104A is "B" circuit type with generator field grounded in the generator.

►*OPTIONAL DELCO-REMY "HEAVY-DUTY" GENERATOR NOTE: See Rambler American & Classic 6 data pages.*

Performance Data - GJP (Cold - 70°F)

Amperes	Volts	RPM
16 min	15.0	1750
30	15.0	2390
35	15.0	2600

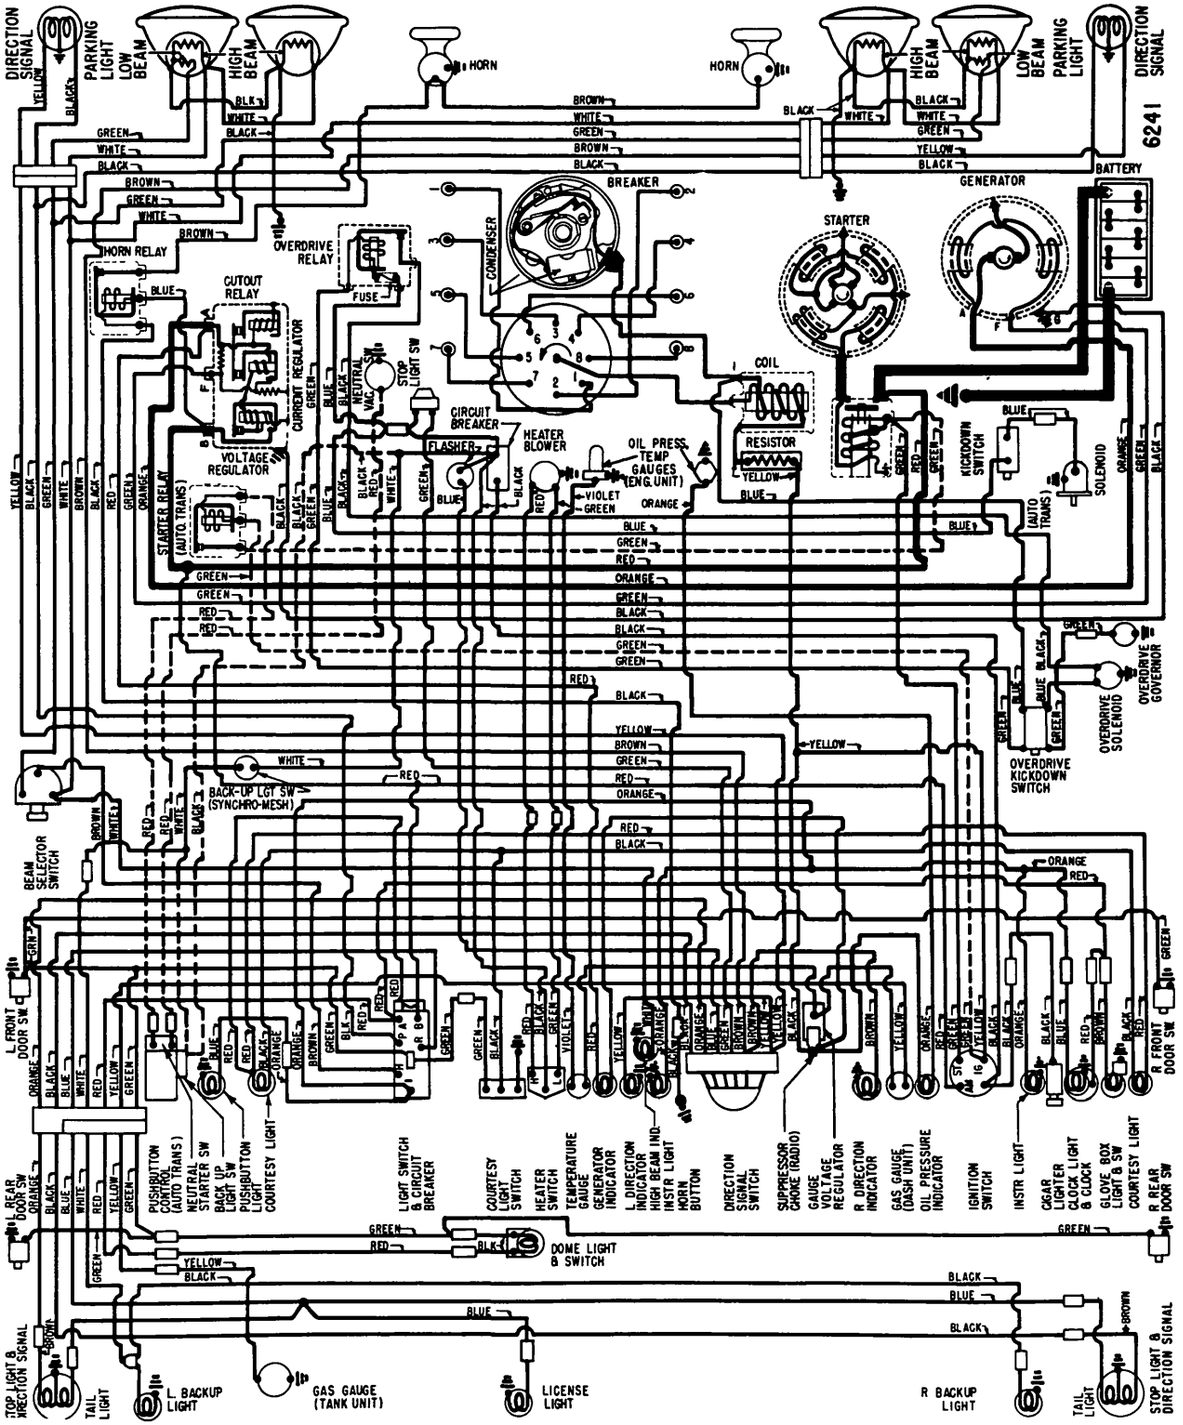
Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 18-36 ozs.

Field Current - 1.6-1.7 amperes at 10.0 volts.

Motoring Current - 3.1-3.5 amperes at 10.0 volts.

Belt Adjustment: Use a Belt Tension Gauge on longest accessible belt span. Gauge should read 70-80 lbs. (Used Belt), 110-120 lbs. (New Belt). Adjust by moving generator on its mounting bracket. *NOTE* - When using gauge on a notched belt, finger of gauge should be in belt notch.



GENERATOR REGULATOR

Prestolite (Autolite) VBO-4223F-1 ("A" Circuit), VBO-6201A ("B" Circuit). Used as follows:

►*OPTIONAL DELCO-REMY "HEAVY DUTY" GENERATOR REGULATOR NOTE: See Rambler American & Classic 6 data pages.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Cutout Relay

Cuts In - 12.5-13.5 volts.
Cuts Out - 3-5 amps. discharge current after a charge of 7 amperes.
Contact Gap - .015". **Air Gap** - .025-.027".

Voltage Regulator

Setting - 14.2-14.8 volts at 80°F charging at 7 amperes or with a .25 ohm resistor in series with regulator and battery.
Air Gap - .048-.052" (check at brass armature stop pin).

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A - Operating Amperes -	Test B
44 max.	35 (33-37)

Test A - After 15 minutes operation charging at 7 amperes.
Test B - After additional 15 minutes operation with current regulator operating and load applied to hold voltage down to 13.6-13.8 volts.
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
►*OTHER DATA: See "Prestolite (Autolite) "A" Circuit Regulators" and "Prestolite (Autolite) "B" Circuit Regulators" in Electrical Section.*

ALTERNATOR

LEECE-NEVILLE: A00122116-AA or A0012074AB. Three phase type with internal rectifiers.

A00122116-AA Specifications

Rated Output - 50 amperes at 12.0 volts and 1950 RPM.
Field Coil Resistance - 3.8-4.2 ohms at 12.0 volts.
►*OTHER DATA: See "Leece-Neville Alternator & Regulator" in Electrical Section.*

PRESTOLITE (AUTOLITE): No. ALD-5005. Three-phase type with internal rectifiers.

Rotation - Clockwise at drive end.
Rated Output - 38 amps. minimum at 14.2 volts and 4200 alternator RPM (1750 engine RPM).
Field Current - 2.34-2.42 amps. at 10.0 volts and 70°F.
►*OTHER DATA: See "Prestolite (Autolite) Alternator & Regulator" in Electrical Section.*

DELCO-REMY: No. 1117070. Three-phase type with internal rectifiers.

Rotation - Clockwise at drive end.
Brush Spring Tension - 10 ozs.
Field Current Draw - 6-6.6 amps. at 12 volts and 80°F.
►*OTHER DATA: See "Delco-Remy Delcotron Alternators (Internal Rectifier)" in Electrical Section.*

ALTERNATOR REGULATOR

LEECE-NEVILLE: No. R-0013533-RA. Consists of a Voltage Regulator and a Load (Field) Relay. Voltage Regulator is "Double Contact" type.

Load Relay

Closing Voltage - 6.0-6.4 volts.
Contact Gap - .018-.020" with contacts open.
Air Gap - .018-.020" with contacts closed.
Hinge Gap - .005-.007" with contacts closed.

Voltage Regulator

Voltag Setting - 13.6-13.8 volts (upper contacts); 13.7-13.9 volts (lower contacts); 14.0-14.2 volts (transfer voltage).
C ntact Gap - .018-.020" with lower contacts closed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Air Gap - .035-.043" with lower contacts closed.
Hing Gap - .018-.020" with lower contacts closed.
►*OTHER DATA: See "Leece-Neville Alternator & Regulator" in Electrical Section.*

PRESTOLITE (AUTOLITE): No. VBS-6201A-1 (Early), VBV-6221A-1 (Later). Consists of a "Double Contact" type Voltage Regulator and an Indicator Light Relay (VBS), Circuit Breaker (VBV). *NOTE* - VBV type has no 'L" terminal and Indicator Light lead connected to Regulator "A" terminal.

Indicator Light Relay (VBS)

C ntacts Close - 1.5 amperes maximum.
C ntacts Open - 2.0-2.5 amperes.

Circuit Breaker (VBV)

C ntacts Close - 8.0-9.0 volts.
C ntacts Open - 13.0-13.5 volts.
C ntact Gap - .017-.022".
Air Gap - .025-.027".

Voltage Regulator

Setting (VBS-6201A) - 13.9-14.3 volts at 80°F operating on upper contacts. Voltage spread between upper and lower contacts .1-.3 volts.
S tting (VBV-6221A-1) - 14.0-14.4 volts at 70°F operating on upper contacts. Voltage spread between upper and lower contacts .2-.5 volts.
C ntact Gap - .010-.012" (lower contacts with upper contacts closed).
Air Gap - .034-.038" (VBS-6201A), .034-.037" (VBV-6221A-1), with lower contacts just touching.
►*OTHER DATA: See "Prestolite (Autolite) Alternator & Regulator" in Electrical Section.*

DELCO-REMY: No. 9000552. Consists of a Voltage Regulator and a Field Relay (integral).

Field Relay

Cl sing Voltage - 5.0-9.5 volts.
Air Gap - .014" with points just touching.
Contact Gap - .027".

Voltage Regulator

S tting - 13.0-13.6 volts (adjust to 13.4 volts).
Air Gap - .075".
►*OTHER DATA: See "Delco-Remy Delcotron Alternator (Internal Rectifier) & Transistorized Regulator" in El ctrical Section.*

MISC. ELECTRICAL

►*ERRATIC DIRECTION SIGNAL OR TAIL LIGHT OPERATION CORRECTION:* May be caused by poor ground between tail light socket and base. To insure a good ground at this point, remove tail lamp lens and bulbs. Centerpunch the flange of lamp socket.

Light Switch Removal: Disconnect battery, place switch in full OFF position and press button (top of switch) to release switch shaft and knob assembly, then remove French nut. Remove switch and disconnect wires.

Stop Light Switch: Located in fitting on front face of firewall. Use thread sealer when installing new switch.

CIRCUIT BREAKERS: 18 Ampere - Headlights and High Beam Indicator. In light switch.
12 Ampere - Parking, Tail, License, Instrument, & Trunk lights. In light switch.
30 Ampere - Stop lights, Direction Signals, Back-up lights. On ceiling of cowl beneath dash panel.

FUSES: AGC 15 Amper - Overdrive circuit. Clipped to "B" terminal of overdrive relay.
3AG 7½ Ampere - Courtesy, Dome, & Glove Box lights.
AGA 5 Amper - Radio. In feed wire.

ENGINE

ENGINE SPECIFI CATIONS: Own. V8, valve-in-head of same design used previously.

Bore	Stroke	Displacement	Rated HP
4"	3¼"	327 cu. ins.	51.2

Model	Compr. Ratio	Developed HP
Std. 2-Bbl.Carb.	8.7-1	250 at 4700 RPM
Optl. 4-Bbl. Carb.	9.7-1	270 at 4700 RPM

Compression Reading - *See TUNE-UP.*

►*CRANKSHAFT OIL SHEDDER AND ENGINE FRONT COVER PRODUCTION CHANGE:* Oil Shedder, No. 3165660, installed on crankshaft beginning Engine Code No. 30920. Revised Engine Front Cover, No. 3203682, also installed to accommodate oil shedder. Oil shedder can be used only with new type cover.

OIL PAN REMOVAL: Remove right shock absorber upper retaining nut and remove right front coil spring. Loosen strut rod nuts at right front lower control arm ball joint. Remove stabilizer bar. Disconnect engine support tubes from crossmember. Remove power steering cylinder piston rod nut and grommet or idler arm. Disconnect right side of crossmember, pull crossmember down, and install a 6¼" wood block between crossmember and underbody to hold crossmember down. Remove flywheel dust cover. Drain crankcase, then remove oil pan by tilting forward, down, and to the right to clear crossmember.

CYLINDER HEAD INSTALLATION: *See "Cylinder Head & Manifolds" in Rambler Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Rambler Special Data.*

ENGINE REMOVAL: *See "ENGINE" in Rambler Special Data.*

PISTONS

Aluminum alloy, slipper type, tapered skirt, cam ground with steel reinforcement. Piston pin offset to thrust side of piston.
Original Bore & Piston Sizes - *See "ENGINE NUMBER LETTER" under Model Identification, above.*

►*LOW COMPRESSION (8.7-1) PISTON IDENTIFICATION:* This piston has two notches in piston head.
Weight - 23.45 ozs.
Removal - Pistons & rods removed from above.
Clearance - .0009-.0015" (bottom of skirt).

Installing Pistons: Install with "F" cast in piston strut and notches (or notch) in piston head toward front of engine. *See Rod Installation.*

Replacement Pistons: Std. & .002", .005", .010", .020", .030" oversize. Use .030" oversize on 4-Bbl. cars only.

PISTON PIN

Press fit in connecting rod. No locking device.
Diameter - .9307". **Length** 3.1870".
Pin Fit in Piston - Palm press fit at room temperature.
Pin Fit in Connecting Rod - Tight press fit, no locking device used.
Pist n Pin Rem val & Installati n - Tool Set 6360 should be used to prevent damage to piston. *S "Piston Pins" in Rambler Sp cial Data.*
Replac ment Pins: Std. and .003", .005" Oversize.

PISTON RINGS

Two compression rings and one oil ring used.

Ring	Width	End Gap	Side Cl aranc
Compr.(1&2)	.0775-.0780"	.010-.020"	.002-.006"
Oil (3)	.0245"	℄ .015-.055"	.0001-.0079"

℄ - Each rail.
Installing Rings - Install upper compression ring (both outside edges beveled), and lower compression ring (outside edges not beveled) with beveled inner edges on inside diameter up.
Replacement Rings: Sets of Std. & .020", .030" Oversize.

CONNECTING ROD

Length - 6.3750" center-to-center. **Weight** - 27.6 ozs.
Crankpin Journal Diameter - 2.2483-2.2490".
Original Bearing Sizes - *See "ENGINE NUMBER LETTERS" under Model Identificati n ab v .*
Lower Bearing - Steel-backed, sintered copper lead alloy precision type.
Clearance - .0007-.0028". **Side Cl aranc** - .004-.012"
Replacement Bearings: Std. and .001", .002", .010", .012" Undersize.
Installing Rods: Assemble connecting rod to piston with notch in piston to front of engine. Cylinder numbers on connecting rod and cap should be toward outside bank in which they are installed.

CRANKSHAFT

Journal Diameter - 2.4983-2.4995".
Original Bearing Sizes - *Se ENGINE NUMBER LETTERS under Model Identificati n ab v .*
Bearings - Steel-backed, micro-babbitt alloy, precision type.
Clearance - .0006-.003".
Replacement Bearings: Std. & .001", .002", .010" Undersize.
End Thrust: Taken by No. 1 flanged bearing.
Endplay - .003-.007".
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Rambler Sp cial Data.*
Crankshaft Front Oil Seal: *See "Engin Fr nt Cov r" in Rambler Special Data.*

CAMSHAFT

►*CAMSHAFT LOBE LIFT NOTE:* When improper valve operation is indicated, check lift of each cam. *Se "Camshaft & Bearings" in Rambl r Special Data.*
Bearings - Steel-backed babbitt lined bushings.
Clearance - .001-.003".
End Thrust: Taken by thrust plate behind camshaft sprocket.
Endplay - .003-.006".
Timing Chain: Non-adjustable side guide type. **Width** .875". **Pitch** .375". **Length** 23¼" or 62 links.
Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers. To check assembly, rotate crankshaft until timing mark on camshaft sprocket is on horizontal line at either 3 or 9 o'clock position. There should be 10 links or 20 pins between timing marks.
Camshaft Removal & Installati n: *Se "Camshaft & Bearings" in Rambler Special Data.*
Engine Front Cover Removal: *S "Engin Front Cover" in Rambler Special Data.*
Engine Front Cover Oil Seal (Crankshaft Fr nt Seal): Cover oil seal can be replaced without removing cover by using Remover J-9256 and Installer J-9163.

CONTINUED ON NEXT PAGE

S INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

VALVES

Tapp t Cl arance: Zero lash, hydraulic lifters.

Valv	H ad Diam.	Stem Diam.	Length
Intake	1.787"	.3715-.3725"	4.859"
Exhaust	1.406"	.3715-.3725"	4.859"

Valv	Seat Angl	Lift	Stem Clearance
Intake	30°①	.375"	.0015-.0025"
Exhaust	45°②	.375"	.0015-.0025"

① - Valve face angle 29°. ② - Valve face angle 44°.

Valv S at Width - .078-.093" (Int.), .093-.140" (Exh.).

Valv St m Seals - Rubber deflector installed on valve stem and over top of valve guide on all valves.

Valv Springs: Install springs with closed coil end against cylinder head. **Fr e Length** - 2.20".

Valve Spring Specifications

Valves	Spring Pressure	Spring Length
Closed	85-91 lbs.	1 13/16"
Open	150-160 lbs.	1 7/16"

Valv Guides: Drive old guides out, drive new guides in to a height of 3/4"±1/64" above cylinder head (measured from top of guide to flat machined surface for lower spring retainer on head). Finish ream all guides after installation.

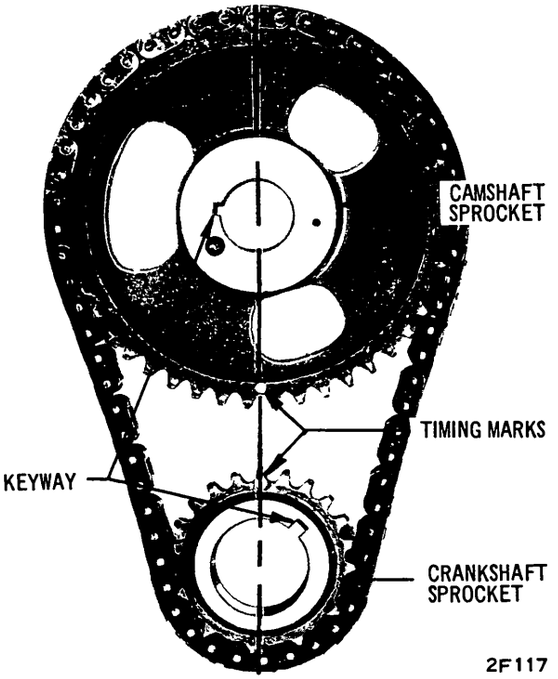
Valv Lift rs: Hydraulic Type.

Clearanc - .0005-.002".

►*LIFTER CLEARANCE CAUTION:* Tight fit may cause damage to valve and engine parts, loose fit will cause reduced engine oil pressure at low speed. *For selective fit of und rsiz lift rs to control clearance, see "Valve Syst m" in Rambl r Sp cial Data.*

Lift r R m val. Ov rhaul & Testing - *See "Valve Syst m" in Rambler Sp cial Data.*

R ck r Arm Assembly: *S "Valve System" in Rambler Sp cial Data.*



VALVE TIMING

S "Camshaft S tting" under CAMSHAFT above.

Intak Valve - Open 12°30'BTDC. Close 51°30' ALDC.

Exhaust Valves - Open 53°30'BLDC. Close 10°30'ATDC.

Valv Timing Ch ck: Remove rocker arm cover and spark plugs. Turn crankshaft to bring No. 6 piston to TDC of compression stroke (No. 1 will be on exhaust stroke in overlap position). Rotate crankshaft 90° **counter-clockwise.** Install dial indicator on No. 1 intake rocker arm pushrod end. Crank engine in a **clockwise** direction until dial indicator indicates pushrod movement (hydraulic lifter should be fully charged for this check). At time indicator moves, ignition timing pointer on front cover should align with a point approximately 25/32" before TDC position on vibration damper. *NOTE* - **If more than ½" variation in either direction, remove timing chain cover and inspect timing chain for stretch. Chain deflection should not exceed ½". Replace as necessary.**

VALVE TIMING MARKS

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engin Lubrication" und r OILING SYSTEM in Rambl r Sp cial Data.*

Crankcas Capacity: 4 qts. refill. Add 1 qt. with filter change.

Normal Oil Pressure - 10 lbs. at 600 RPM, 55 lbs. at 3000 RPM.

Pressure Regulator - In oil pump. Opens at 55-60 lbs.

Oil Pressure Indicator: Light on instrument panel comes on when ignition switch turned on, goes out after engine starts and oil pressure reaches 4-6 lbs. Oil pressure indicator switch located on engine block.

Oil Pump: Gear type. Mounted on rear main bearing cap and driven by distributor drive shaft.

Oil Pump Removal, Overhaul & Installation: *See "Oiling System" in Rambler Special Data.*

Oil Filter: Full-flow, disposable type

►*FULL-FLOW OIL FILTER BYPASS VALVE NOTE & FILTER CHANGE CAUTION:* When making filter change, check to be sure that bypass valve is properly secured in retainer.

Replacement Filter - Rambler No. 8991072.

Crankcase Ventilation: Standard Cars - Filter element in oil filler cap and breather pipe attached to valve lifter cover.

Positive Crankcase Ventilation Cars - Usual breather tube normally at rear of engine is replaced by vacuum line to carburetor base insulator with valve in line to vary air flow through crankcase to meet changing conditions at all engine speeds and loads. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 18 qts., add 1 qt. for heater.

Pressure Valve: 13 lb. radiator filler cap.

Water Pump: Centrifugal, double row ball bearing type. Requires no lubrication. Service as an assembly.

Temperature Gauge: King-Seeley "CV" electric type with Gauge Voltage Regulator No. 57603.

Dash Unit - King-Seeley No. 58855.

Engine Unit - King-Seeley No. 44275.

"Power-Saver" Fan (Air Cond. Cars): Fan operates normally up to 2600 RPM±100 RPM and then the viscous fluid clutch will slip to maintain speed of 2600 RPM. Service as an assembly.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

ALUMINUM ENGINE SERVICE CAUTIONS

SERVICE PRECAUTIONS: *NOTE* - Extreme caution must be observed when working on aluminum engines to prevent damage by scratching, nicking, or scoring. Note the following:

1) Do not drop or slide machined surfaces on bench or floor.
2) Do not use gasket cement (Except as indicated under Cylinder Head Installation).
3) Lubricate all bolts or screws entering an aluminum part. See "Bolt-Thread Lubrication Note" below.
4) Tighten bolts and nuts to the specified torque. DO NOT overtighten. Torque valves are for clean lubricated threads.

BOLT THREAD LUBRICATION NOTE: Use engine oil or special thread lubricant on all threads entering an aluminum part.

DAMAGED OR WORN THREAD REPAIR (ALUMINUM BLOCK): "Heli-Coils" are available locally for repairing damaged or worn threads in aluminum. The repair consists of drilling out worn or damaged threads, tapping hole with special "Heli-Coil" tap, and installing a "Heli-Coil" insert in tapped hole. This brings hole back to original thread size. See following table for inserts and tools required.

"Heli-Coil" Thread Inserts

Thread Size	Insert Part No.	Drill Size	Special Tap Part No.	Inserting Tool No.

ENGINE

6 CYLINDER ENGINE

REMOVAL: Remove hood, drain cooling system, remove battery and air cleaner. Remove radiator (plug transmission oil cooler lines). Remove crankcase vent pipe and disconnect all lines, wires, cables and linkage from engine. Disconnect exhaust pipe from manifold. Remove clutch torque shaft, brake cables and rods, speedometer cable, gear shift rods, transmission oil cooler lines and filler tube (drain transmission and torque converter), and push button cable. Support rear of engine (Support Tool C-3806). Remove transmission. Attach Lifting Fixture C-3804 to cylinder head and disconnect engine front mounts. Remove engine.

V8 ENGINES

REMOVAL: Remove hood, drain cooling system, remove battery, fan shroud, and radiator (plug transmission oil cooler lines). Disconnect all lines, wires, cables and linkage from engine. Remove carburetor. Attach Lifting Fixture C-3466 to carburetor flange studs and disconnect engine front mounts. Remove No. 6 spark plug. Disconnect exhaust pipes from manifolds. Support rear of engine with Tool C-3487 and remove engine rear crossmember. Remove transmission. Remove engine.

CYLINDER HEAD & MANIFOLD

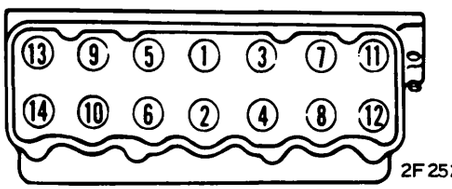
6 CYLINDER ENGINE

CYLINDER HEAD: Removal - Drain cooling system, disconnect all lines and wires on cylinder head *(CAUTION - Disconnect spark plug cables by pulling straight out in line with plug).* Remove carburetor air cleaner, disconnect exhaust pipe at exhaust manifold flange, remove carburetor as a unit with intake and exhaust manifolds. Remove rocker arm cover. Remove rocker arm assembly by taking out bolts in rocker shaft support pedestals. Remove pushrods *(CAUTION - Keep pushrods in order and reinstall in same positions).* Take out bolts and remove cylinder head.

Installation: Coat new head gasket with suitable sealer, install gasket and head over dowels in block *(CAUTION - Rocker arm oil feed hole at right rear corner of head must register with oil hole in block).* Tighten all cylinder head bolts in sequence shown in diagram to 65 ft. lbs., then retighten all bolts in same sequence to 65 ft. lbs. *NOTE* - Use Sealing Compound Part No. 1057794 on both sides and place copper side of gasket toward cylinder block.

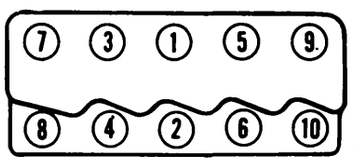
MANIFOLD ASSEMBLY: Installation - *CAUTION Loosen 3 intake manifold-to-exhaust manifold bolts before installing assembly (necessary to maintain correct alignment) and also note "Manifold Stud Replacement" note below.* Install manifold and carburetor assembly on cylinder head with cup side of conical bolt washers against manifold. Tighten nuts to 15 ft. lbs., then tighten intake manifold-to-exhaust manifold bolts to 15 ft. lbs.

318" ENGINE



CYLINDER HEAD INSTALLATION: Coat new gasket with sealer and install on block. Assemble rocker arm shaft assembly in cylinder head struts *(see "Valve System" below).* Install cylinder head on block and tighten attaching bolts to specified torque in sequence shown in diagram. **Retighten in same sequence to same torque.** Install pushrods with small ends in lifters (use Valve Spring Compressor Tool C-3695 to position large end of pushrod under rocker arm and make sure low point of camshaft lobe is under lifter). Complete reassembly procedure.

361", 383" & 413" ENGINES



CYLINDER HEAD: *REMOVAL NOTE* - On air conditioned cars, No. 8 cylinder exhaust valve must be open to provide removal clearance between rocker arm cover and heater housing.

Installation: Coat new head gasket with Mopar Sealer No. 1122893. Install cylinder head and tighten bolts to correct torque in sequence shown in diagram. **Retighten in same sequence to same torque.** Complete reassembly procedure.

6 CYL. CYLINDER HEAD

V8 318" ENGINE CYLINDER HEAD

CONTINUED FROM PRECEDING PAGE

V8 361", 383", & 413" ENGINE CYLINDER HEAD

PISTON PINS

6 CYL. ENGINES & V8 361", 383" & 413" ENGINES

PISTON PIN REMOVAL: Use Tool C-3724 (6 Cyl.), C-3684 (V8) as shown in illustration to remove pin from piston and rod. *CAUTION* - When pin falls freeof rod, stop press to prevent damage to anvil of tool.

PISTON PIN INSTALLATION: *CAUTION - DO NOT ream pistons or connecting rods.* Lubricate pin bores in piston and rod and use Tool C-3724 (6 Cyl.), C-3684 (V8) as shown in illustration. Notch or "front" on piston must face upwards when assembled in tool and with connecting rod properly positioned (see below), press piston pin in until pin bottoms on pilot.

►*CONNECTING ROD POSITION:* **6 Cyl.** - With notch on piston to front of engine, oil hole in rod must be to left side of engine. **V8** - For right bank cylinders, large chamfer on lower end of connecting rod must be opposite to notch in piston head (rod facing downward in tool). For left bank cylinders, large chamfer on rod must be on same side as piston head notch (rod facing upward in tool).

Testing For Proper Fit - Assemble piston and rod with tool in same manner as for pin removal (see illustration). Clamp screw shaft end of tool in a vise. With torque wrench at nut (anvil end of tool), apply 15 ft. lbs. torque. If pin does not move, fit is correct. If pin moves in rod, fit is incorrect and rod should be replaced.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

►*TOOL NOTE:* Use Seal Installer C-3743 for 6 Cyl., C-3511 for 318" engine, C-3625 for 361", 383" & 413" engines. *NOTE* - On 6 Cyl., 361", 383" & 413" engines, use bridge of tool over seal retainer when installing seal, but do not use bridge when installing seal into block.

REAR MAIN BEARING OIL SEAL: Install new seal in block and cut off ends of seal flush with block. Install new seal in cap or seal retainer in same manner and cut off ends of seal flush with cap or retainer. Install side seals in cap or retainer. *NOTE - On 318" engine, short cap seal must be on doweled side of cap.*

ENGINE FRONT COVER

6 CYLINDER ENGINE

ENGINE FRONT COVER: Removal - Drain cooling system and remove radiator and fan. Remove vibration damper (Puller Tool C-3732). Loosen oil pan attaching bolts to provide clearance. Remove engine front cover.

Installation: Reverse removal procedure and make sure mating surfaces of cover and block are free of burrs.

FRONT OIL SEAL: Removal - Use Tool C-3506. With inside of cover up, put puller screw through seal and position puller blocks directly opposite each other under flange of seal retainer. With washer and nut on puller screw tighten nut so puller blocks distort seal retainer lip. Place sleeve over retainer and place removing and installing plate into sleeve. Place flat washer and nut on puller screw, hold center screw and tighten nut to remove seal.

Installation: Insert puller screw through removing and installing plate so thin shoulder faces up. Insert assembly through seal opening in front cover (inside of cover up), and place seal in opening with neoprene part of seal down. Place seal installing plate into seal with protective recess toward lip of seal retainer. With flat washer and nut on puller screw, hold screw and tighten nut until neoprene is tight against face of front cover. If a .0015" feeler gauge **cannot** be inserted between neoprene and cover, seal is installed correctly.

V8 ENGINES

ENGINE FRONT COVER: Removal - Drain cooling system and remove radiator and water pump assembly. Remove crankshaft damper bolt, then remove two of the pulley bolts and install Tool C-3688 to pull damper off end of crankshaft. Remove cover-to-cylinder block bolts and remove cover.

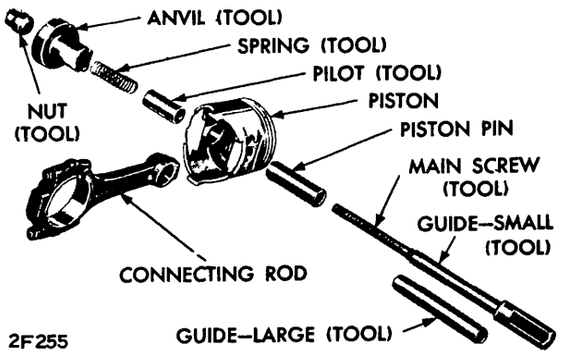
Installation: Reverse removal procedure and tighten bolts to specified torque. Use extreme care not to damage oil pan gasket.

FRONT OIL SEAL: Removal - *See 6 Cyl. above.*

Installation: *See 6 Cyl. above.*

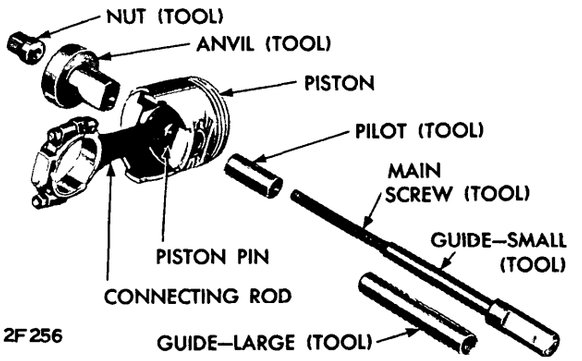
CAMSHAFT & BEARINGS

6 CYLINDER ENGINE



►*ALUMINUM ENGINE CAMSHAFT REAR PLUG REMOVAL NOTE:* To prevent damage to aluminum block, punch a hole in center of plug with 1/8" sharp punch (do not drill hole), then tap hole for threads with 10-24 tap. Use a steel bar 1/4"x1"x6" with 1/4" hole drilled in center, across supports to plug pull with a 10-24 x 1 1/8" long screw placed in hole in bar. Remove all foreign material from block before inserting new plug.

CAMSHAFT REMOVAL: Remove engine. Remove valve lifters with Lifter Removing Tool C-3661 (after removing rocker arm shaft assembly and pushrods). Remove engine front cover, timing sprockets, distributor, oil pump, and fuel pump. Remove camshaft carefully.



Bearing Installation: Use Tool C-3132A to install bearings. No. 1 bearing must be installed 3/32" in from front face of cylinder block. Make sure oil holes in bearings index with oil holes in block. Use Tool C-897 to install rear welch plug.

318" ENGINE

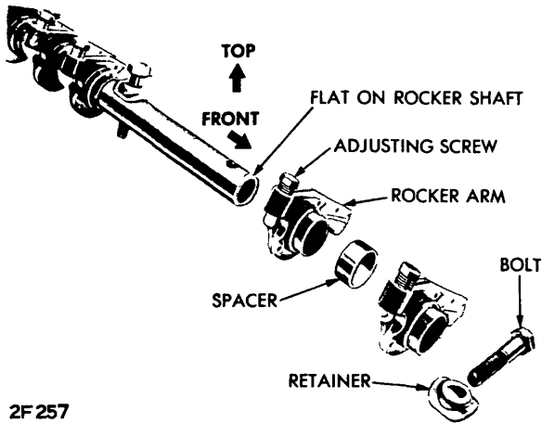
CAMSHAFT: Removal - Remove engine. Back off valve lash adjusting screws, slide rocker arms to one side and remove pushrods. Remove valve lifters (accessible after intake manifold removed). Remove timing sprockets, distributor, and distributor-oil pump drive gear. Remove camshaft.

PISTON PIN INSTALLATION

PISTON PIN REMOVAL

Installation: Lubricate cam lobes and bearing journals and install camshaft. When shaft within 1¾-1½" of final position, install Camshaft Holding Tool C-3509 to prevent disturbing welch plug at rear of block and causing oil leak as follows: Install tool in place of distributor drive gear and against rear side of cam gear, and attach with distributor retainer plate bolt. Now push camshaft in to final position and leave tool in place until sprockets and timing chain are installed.

361", 383" & 413" ENGINES



CAMSHAFT: Removal - Remove engine. Remove lifters (see below). Remove timing sprockets, distributor, oil pump-distributor drive shaft, and fuel pump. Remove camshaft.

Installation: Modify Tool C-3509 by grinding off index lug holding upper arm on tool and rotate arm 180°. Sliding bar will now extend outward in direction opposite to fixed tongue. Proceed as for 318" engine above.

►*BEARING INSTALLATION NOTE:* No. 1 bearing must be 1/32" in from front face of cylinder block.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6 CYL. ROCKER ARM ASSEMBLY

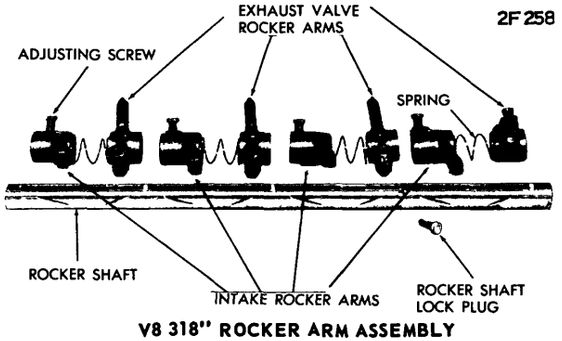
VALVE SYSTEM

318" ENGINE

►*VALVE SERVICE NOTE:* For access to valve assemblies or for pushrod removal without removing rocker arm shaft assembly or cylinder head, back off valve lash adjusting screw and slide rocker arm to one side.

VALVE TAPPET ADJUSTMENT
413" SUPER HI-PERF. ENGINE

VALVE TAPPET ADJUSTMENT: Adjustment must be made with lifter on lowest point of cam base circle. Use indicator light in ignition primary circuit to determine crankshaft position and made adjustments as detailed below. Set tappet clearance at .028" Intake, .032" Exhaust as follows:

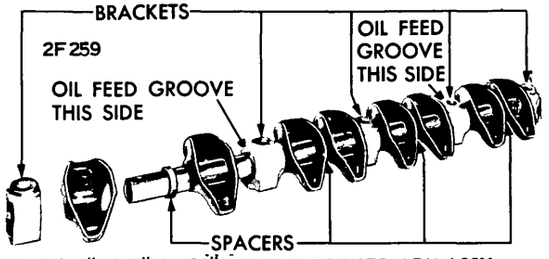


1) Adjust ignition timing to TDC.
2) Chalk mark TDC and 180° opposite TDC on crankshaft damper.
3) With crankshaft at TDC on No. 1 Cylinder (Compression stroke, Points opening), adjust No. 2 & 7 Int.; 4 & 8 Exh.
4) Rotate crankshaft 180° (until points open on No. 4 Cylinder) and adjust No. 1 & 8 Int.; 3 & 6 Exh.
5) Rotate crankshaft an additional 180° (until points open No. 6 Cylinder) and adjust No. 3 & 4 Int.; No. 5 & 7 Exh.
6) Rotate crankshaft an additional 180° (until points open on No. 7 Cylinder) then adjust No. 5 & 6 Int.; No. 1 & 2 Exh.
7) Reset ignition timing to operating specifications.

ROCKER ARMS
6 CYLINDER ENGINE

ROCKER ARM SHAFT ASSEMBLY: Installation - Install assembly with flat on end of rocker shaft upward and toward front of engine. *CAUTION - This is necessary to provide correct lubrication of rocker arms.* Make certain that shaft retainers are seated on shaft between extended bushings of adjacent rocker arms. Long rocker shaft retainer goes in center position and long rocker shaft bolt goes at *rear of engine. Tighten bolts to* specifications.

318" ENGINE

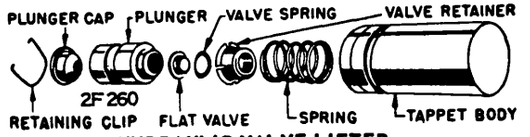


ROCKER ARM SHAFT ASSEMBLY: Installation - Slide rocker arm shaft into bore of strut, engage intake rocker arm. Install spring and engage exhaust rocker arm. Repeat this procedure until all intake and exhaust rocker arms are installed. Make sure that rocker shaft bolt grooves align with head bolt holes in rocker shaft struts. *NOTE* - The plug hole in strut must align with hole in rocker shaft. Install new rocker shaft plug.

V8 318" ROCKER ARM ASSEMBLY

361", 383" & 413" ENGINES

ROCKER ARM SHAFT ASSEMBLY: Installation - Install rocker shafts so that the 3/16" lubrication holes point downward into rocker arms and 15° angle of holes points outward toward valve end of rocker arm. Disregard arrows stamped on shafts when determining shaft position. This procedure supersedes all previous data on installation.



V8 361", 383" & 413" ENGINE ROCKER ARM ASSY.

HYDRAULIC LIFTERS
361", 383" & 413" ENGINES

Removal: *NOTE - Unnecessary to remove cylinder heads or intake manifold if following procedure observed:* Remove rocker arm shaft assembly and pushrods. Slide Puller C-3661 through pushrod hole in cylinder head and seat firmly in lifter. Remove lifter with a twisting motion. *Keep lifters and pushrods together and reinstall in bores from which removed.*

Disassembly: *CAUTION - Disassemble one lifter at a time to avoid intermixing parts (parts not interchangeable between lifters).* Pry out plunger retainer spring clip. Invert body and remove plunger cap, plunger, check valve, check valve spring, check valve retainer, and plunger spring. Separate plunger, check valve retainer, and check valve spring.

Inspection: Clean all parts in solvent and check for any nicks, scratches or wear. Replace entire lifter if any parts damaged.

HYDRAULIC VALVE LIFTER

Reassembly: Reverse disassembly procedure making sure lifter is assembled as shown in illustration.

Testing: With cap removed from plunger, submerge upright lifter completely in a pan of clean kerosene and allow to fill. Replace cap. Place lifter upright in Lifter Testing Pliers C-3160 and check leakdown. If lifter collapses immediately, disassemble, clean and test again. If leakdown persists, replace lifter.

Installation: Lubricate lifters and reverse removal procedure.

OILING SYSTEM
ENGINE LUBRICATION
6 CYLINDER ENGINE

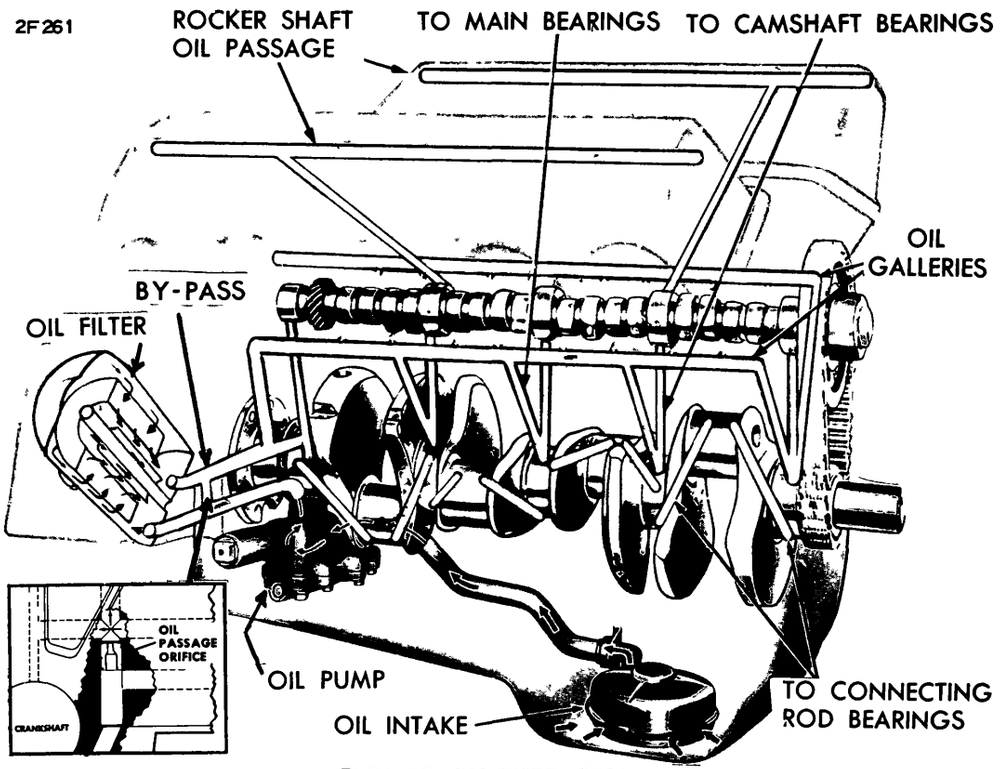
ENGINE LUBRICATION: Force feed type with oil supplied to all crankshaft, connecting rod, and camshaft bearings, and to valve mechanism on cylinder head (metered by rear camshaft bearing). All other points are lubricated by spray or oil mist in crankcase.

OPERATION: Rotor type oil pump mounted externally on right side of crankcase (assembly consists of oil pump, oil filter, and oil pressure regulator). Pump draws oil from oil pan through fixed strainer and intake pipe screwed into crankcase wall at pump mounting pad. Pump delivers oil directly into main oil gallery extending along right side of crankcase (slot in gallery registers with pump outlet port when pump installed). Oil is distributed through main oil gallery as follows:

Crankshaft & Camshaft Bearings - Oil channel in each crankcase web furnishes oil from main oil gallery to each crankshaft and camshaft bearing.

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing. Oil groove in main bearings provides continuous flow of oil to crankshaft passages.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from oil hole on left (upper) side of connecting rod when this hole registers with oil passage in connecting rod journal.



Timing Chain & Sprockets - Lubricated by oil from front main bearing (bearing is chamfered to provide this oil spray).

Rocker Arms, Pushrods & Valve Stems - Oil from rear camshaft bearing flows up through vertical channel in block and head, and through rear rocker shaft bracket to hollow rocker shaft. Rocker arms are lubricated through oil hole in shaft and each rocker arm has trough on upper surface (for adjusting screw and pushrod lubrication) and oil hole (for valve tip lubrication). Excess oil drains down through pushrod chamber to valve lifters and returns to crankcase.

Valve Lifters - Lubricated by connecting rod oil spray and oil drainage from rocker arm chamber on head.

OIL FILTER: Full flow type mounted on oil pump body. Integral relief valve permits oil to bypass filter if element is clogged.

CONTINUED ON NEXT PAGE

ENGINE OILING SYSTEM (318" ENGINE)

CONTINUED FROM PRECEDING PAGE

V8 ENGINE (318")

ENGINE LUBRICATION: Force feed type with oil supplied under pressure to all crankshaft, connecting rod, and camshaft bearings, and to hydraulic lifters. Oil metered by camshaft bearing supplies other valve parts (rocker arms, pushrods, valve stems). All other parts are lubricated by oil spray.

OPERATION: Rotor type oil pump mounted on rear main bearing cap, draws oil through floating oil strainer and intake pipe mounted on pump cover and delivers oil through a channel in pump body and rear main bearing cap to oil filter intake port (filter is mounted on pad at right rear corner of crankcase). From the filter outlet port on the pad, a horizontal cross channel and vertical channel connect with the right main oil gallery extending the full length of the engine just below the right bank valve lifters. At the forward end of this gallery, a "V" channel connects to the front main bearing and the forward end of the left main oil gallery which extends back the full length of the engine. Oil is distributed from these main oil galleries as follows:

Crankshaft & Camshaft Bearings - Rear crankshaft and camshaft bearings are lubricated by a vertical channel connecting to an extension of the horizontal cross channel leading from the oil filter outlet port (see above). Other crankshaft and camshaft bearings are lubricated by a "V" shaped oil channel in each crankcase web leading down from the right main oil gallery to the crankshaft bearing and then up to the camshaft bearing (an additional channel at the front crankshaft bearing supplies oil to the left main oil gallery).

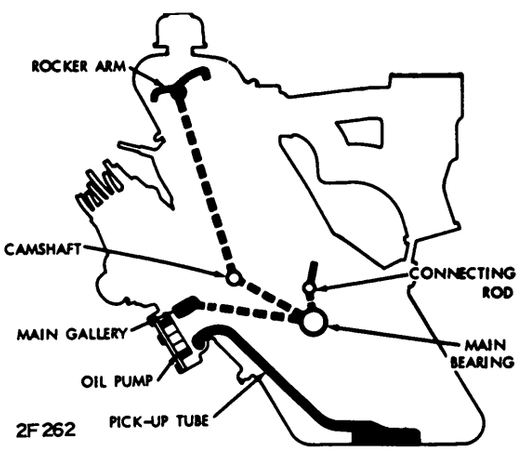
Connecting Rod Bearings - Crankshaft is drilled. Each connecting rod bearing is lubricated by passage from adjacent main bearing (separate oil lead to each rod on each crankshaft throw).

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from slot in side of rod bearing cap of the rod for opposite bank of cylinders (slot in rod must be upward or toward center of engine to provide this cross-lubrication)

Valve Lifters - Right and left main oil galleries intersect lifter bores so that separate oil passage to each lifter is not required.

Rocker Arms, Pushrods, & Valves - On these engines oil channel from No. 4 camshaft bearing (for left bank), No. 2 camshaft bearing (for right bank) connect with cylinder head bolt holes in block (Nos. 3 & 5 bolts as shown in Cylinder Head Diagram). These bolt holes in block and head are oversize so that oil passes up around bolts to angle passage in shaft bracket and through this drilled hole into the hollow rocker arm shaft *(NOTE - A screw in the shaft bracket positions shaft and aligns these oil holes).* All rocker arms have drilled passage to pushrod socket end. Intake arms have drilled passage terminating at end of arm directly above valve stem contact point. Exhaust arms have drilled hole from rocker arm bushing to upper surface of arm and valve stems are lubricated by gravity flow of oil from this oil hole.

OIL FILTER: Shunt type used. Filter mounted on pad at right rear corner of engine crankcase. Bypass passage in block has restriction or metering orifice which controls oil flow directly into engine or through oil filter.



V8 ENGINES (361", 383" & 413")

►*ENGINE IDENTIFICATION:* These engines may be identified by distributor mounting (at front of engine) and oil pump and filter assembly mounted externally at left front corner of engine block.

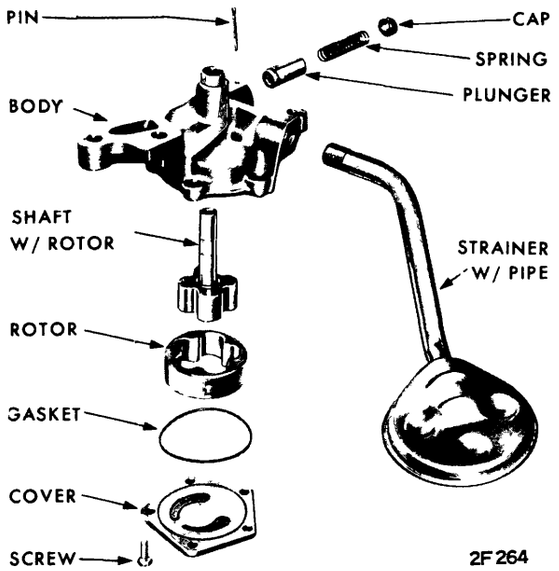
ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and to hydraulic lifters. Oil metered by camshaft bearing supplies other valve parts (rocker arms, pushrods, valve stems). All other parts are lubricated by oil spray.

OPERATION: Rotor type oil pump mounted externally on left front corner of block draws oil through fixed oil strainer and intake pipe in crankcase. From the pump, oil flows through filter (Filter, bypass valve, and oil pressure regulator valve are located in pump body) and then through transverse channels in front end of block to the right main oil gallery extending the full length of engine block just below right bank valve lifters. At rear end of right main oil gallery, two angled transverse channels connect the right and left main oil galleries. Left main oil gallery extends full length of engine block just below left bank valve lifters. Oil is distributed from these main oil galleries as follows:

CONTINUED ON NEXT PAGE

ENGINE OILING SYSTEM (6 CYLINDER ENGINE)

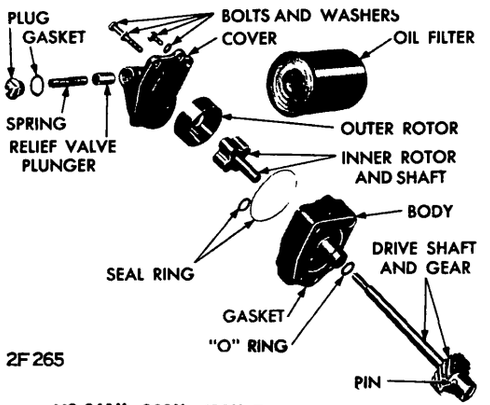
CONTINUED FROM PRECEDING PAGE



Crankshaft & Camshaft Bearings - Fr nt crankshaft and camshaft bearings are lubricated by a vertical channel intersecting the transverse channel in the front of the block (feed to right main oil gallery). Other crankshaft and camshaft bearings are lubricated by a "V" shaped channel in each crankcase web leading down from the right main oil gallery to the crankshaft bearing and then up to the corresponding camshaft bearing.

Connecting Rod Bearings - Crankshaft is drilled. Each connecting rod is lubricated by passage from adjacent main bearing (separate oil lead to each rod on each crankshaft throw).

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from slot in side of bearing cap for rod of opposite bank of cylinders (slot in rod must be upward or toward center of engine to provide this cross-lubrication).



Valve Lifters - Right and left main oil galleries intersect lifter bores for direct oil supply to lifters.

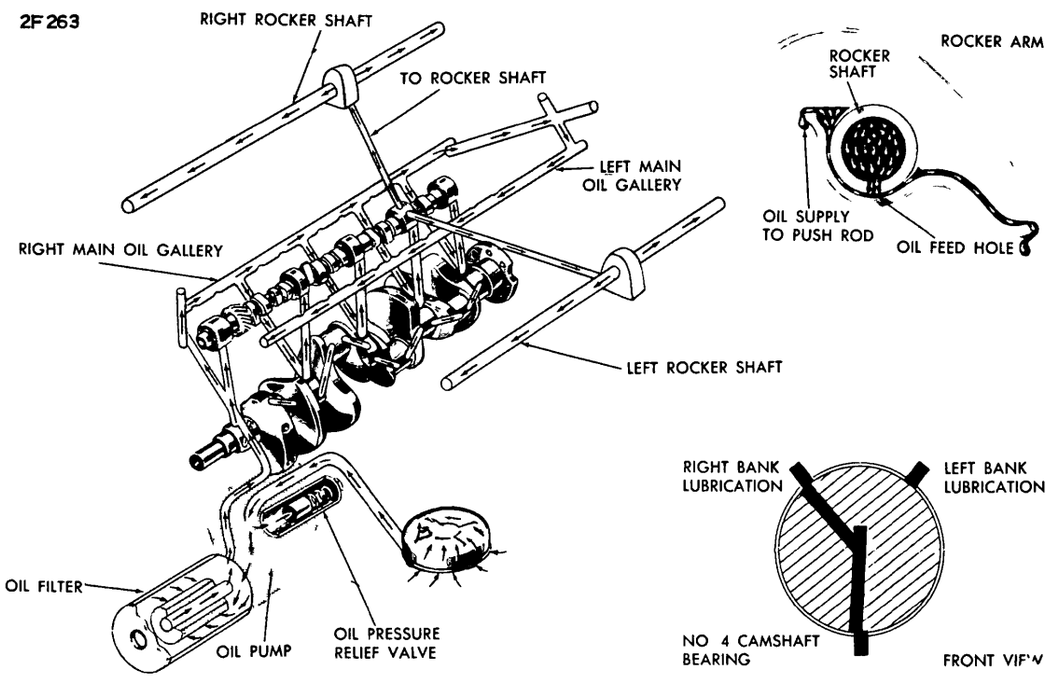
Rocker Arms, Pushrods, & Valves - Hollow rocker arm shaft on each head is supplied with oil through channel in block leading from No. 4 camshaft bearing (both banks - camshaft journal is drilled and registers with each channel in turn as camshaft rotates). Channel in block registers with drilled hole in head which terminates at rocker shaft support bracket pad on head

V8 318" ENGINE OIL PUMP

(oil holes provided at Nos. 2 and 4 brackets - one hole and oil lead in head will register with channel in block when head installed). Nos. 2 and 4 (wider) rocker shaft support brackets have oil passage connecting oil lead in head with rocker arm shaft (*CAUTION* - These brackets must be installed with oil passage toward center of engine to align with oil hole in head). Rocker arms are stamped steel with channel section which forms oil reservoir. Oil flows from valve tip end of arm to lubricate valve stem and through hole at pushrod end of arm to lubricate pushrod seat.

V8 361", 383", 413" ENGINE OIL PUMP

OIL FILTER: Full flow and shunt types used. Filter has bypass valve (full flow type), bypass passage (shunt type), which ensures engine lubrication if filter element is clogged.



OIL PUMP

OIL PUMP: Removal (6 Cyl. Eng.) - Disconnect battery cable and remove air cleaner and horns with brackets. Attach lifting plate Tool C-3804 and fixture Tool C-3809 and raise car on hoist (Two post) and remove lower engine mount insulator to frame stud nut (right & left side) then lower car. Raise engine by tightening fixture nut until mount insulator stud clears pad and remove left mount and bracket from block. Raise car again and remove right mount and bracket from block. Disconnect front shock absorbers from lower arms and place stands under frame crossmember or "K" member. Lower front post of hoist until suspension is in full rebound under no load. Loosen torsion bar tension adjusting bolts. Use Tool C-3728 to remove torsion bars then raise front post of hoist. Remove "K" member bolts allowing "K" member to drip when hoist is lowered. Remove oil filter assembly and disconnect sending unit wire. Remove oil pump attaching bolts and remove pump.

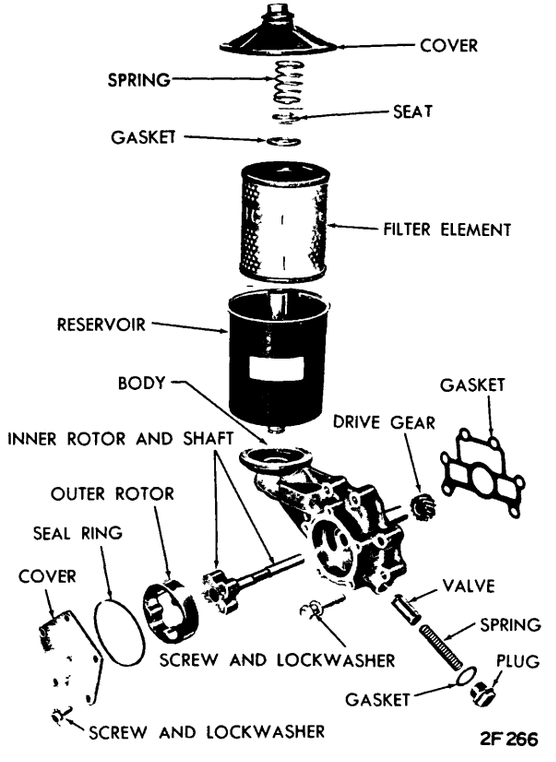
Removal (318" Eng.) - Remove oil pan, (see car Model Pages), and remove pump from rear main bearing cap.

Removal (361", 383", 413" Eng.) - Remove attaching bolts and remove oil pump and filter assembly from bottom side of engine.

Disassembly (All Engines): Remove cover. On 6 Cyl., press off drive gear (support gear to keep load off aluminum housing). Remove inner rotor and shaft and outer rotor. Remove pressure relief valve plug and and valve assembly.

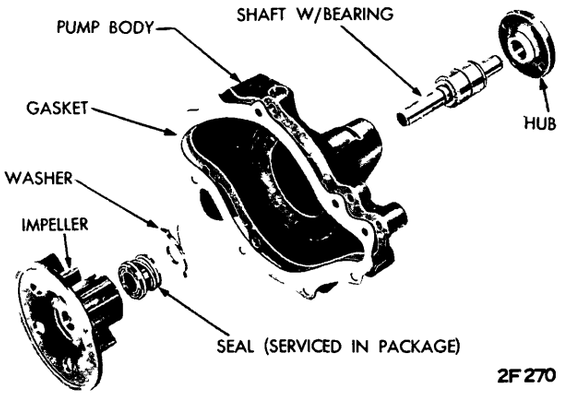
ENGINE OILING SYSTEM (361", 383", 413" ENGINES)

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

Inspection (All Engines): Clean all parts. Replace cover if mating surface scratched or grooved. Lay a straightedge across cover. If .0015" feeler gauge can be inserted between cover and straightedge, replace cover. Measure thickness of inner and outer rotors, and diameter of outer rotor. *NOTE - Minimum dimensions listed in table below. Replace rotors if measurements below these specifications.* With inner and outer rotors assembled in pump body, place a straightedge across surface of body and rotors. If a .004" feeler gauge can be inserted under straightedge, replace pump body. Remove inner rotor and press outer rotor against pump body. If clearance between outer rotor and body is more than .012", replace body. If clearance between inner and outer rotors is more than .010", replace both rotors. Test pressure relief valve spring (see below), and replace spring (if necessary) with same type previously used.



Oil Pump Rotor Specifications

Engine	Rotor Thickness	Outer Rotor Diameter
6 Cyl.	.649"	2.469"
318"	.998"	2.244"
361", 383" & 413"	.943"	2.469"

Reassembly (All Engines): Reverse disassembly procedure. On 6 Cyl., press drive gear on shaft until it is flush with end of shaft. Tighten cover screws to 130 inch-lbs. (6 Cyl.), 10 ft. lbs. (V8).

6 CYL. OIL PUMP

V8 318" ENGINE WATER PUMP

Installation (All Engines): Reverse removal procedure.

ALL ENGINES

OIL PRESSURE RELIEF VALVE: Three types of springs are available. Replace with correct type as follows:

Relief Valve Spring Specifications
(6 Cyl., 361", 383" & 413" Engines)

Color	Free Length	Load Length
Gray (Light)	2 3/16"	1 39/64" at 11.85-12.85 lbs.
Red (Std.)	2 19/64"	1 39/64" at 14.85-15.85 lbs.
Brown (Heavy)	2 25/64"	1 39/64" at 17.90-18.90 lbs.

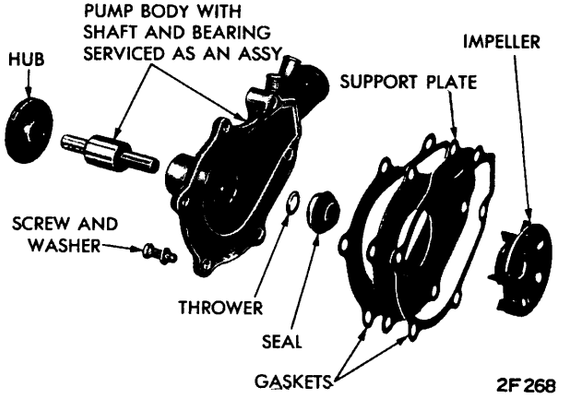
(318" Engine)

Color	Free Length	Load Length
Gray (Light)	3 1/32"	2 1/16" at 16.1-17.1 lbs.
Red (Std.)	2 27/32"	2 1/16" at 19.5-20.5 lbs.
Brown (Heavy)	2 31/32"	2 1/16" at 22.9-23.9 lbs.

COOLING SYSTEM
WATER PUMP

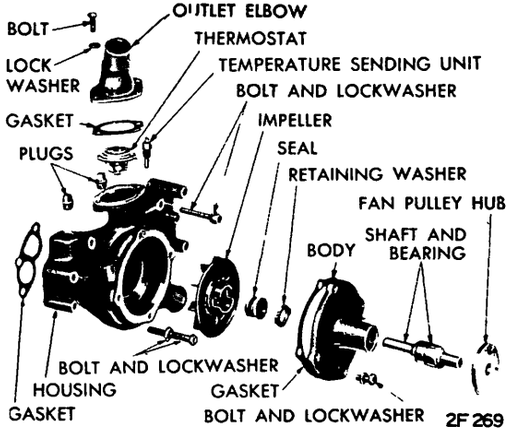
6 CYLINDER ENGINE

Disassembly: Support pump on hub end of shaft and Break plastic impeller from metal insert then remove support plate and gaskets. Place a ¼" ball bearing against a groove on outer diameter of insert, then place insert and ball bearing in vise to split insert. Remove rubber portion of seal with spring. *NOTE* - DO NOT pry retainer portion out of pump body. Use Tool C-3753 to remove retainer portion of seal then remove thrower from shaft. Use Tool C-412 to remove hub. Support pump body on front face (fan hub end) and press on rear end of shaft to remove shaft and bearing assembly out front of pump. *CAUTION* - Always use a new shaft and bearing assembly.



Reassembly: Support pump housing at hub end and use a 1¼" (12 point) socket against outer lip of seal retainer to press seal assembly into pump body, until lip is against body. Place thrower ring in position on long end of shaft (1/8" from bearing assembly), then start shaft and bearing assembly into pump body bore. Use same socket and support body at seal end and use Tool C-3468 (against outer bearing race only) to press shaft and bearing in flush with body hub end. Support pump on propeller end of shaft and press hub (flat surface out) onto shaft so shaft extends 13/32" beyond fan hub. Place new gaskets on each side of separator plate and place plate on pump body. Clean seal face and impeller hub seal surface. Support pump on hub end of shaft and press impeller on shaft (blade portion down) until it is flush with end of shaft. *NOTE* - Pump bearing outer case must be flush with front end of pump body and impeller flush with shaft end to provide correct clearance between impeller blades and separator plate.

V8 ENGINES

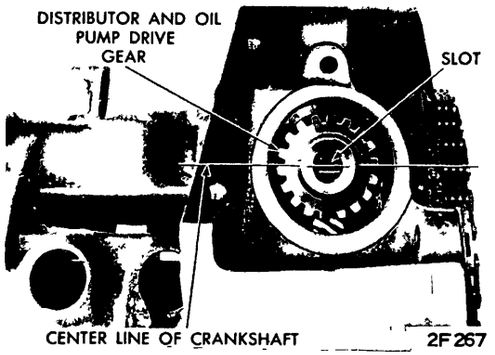


Disassembly: Remove fan hub with Puller C-412. Support hub end of pump and remove impeller by breaking it away from metal insert. Remove seal by sliding over shaft and insert. With Splitter C-3476, split metal insert and remove from shaft. Support hub end of pump body and press shaft and bearing through front of pump.

Reassembly: With pump body supported as close to center bore of pump as possible, press shaft and bearing assembly into body with Sleeve C-3468 and a press. Distance from shoulder of seal retainer to front face f

CONTINUED ON NEXT PAGE

6 CYL. WATER PUMP



361", 383", 413" ENGINE WATER PUMP

CONTINUED FROM PRECEDING PAGE

pump body must be .090". Reface pump seal seat of housing (see below). Install new seal into impeller with ears on retaining washer engaged in slots in impeller. Support shaft at hub end and press impeller on shaft until it is flush with end of shaft. Support impeller end of shaft and press hub on shaft until shaft projects .330" beyond front face of hub.

Refacing Seal Seat - Place Tool C-551 over pump shaft. Turn tool in an even continuous clockwise motion until smooth surface is obtained. Remove tool and install abrasive disc SP-1527 over end of tool and down against cutters. Polish seat surface to a high polish. **Turn by hand in a clockwise direction. Do not use motor.** Blow out with compressed air.

Installation· Reverse removal procedure.

V8 ENGINE DISTRIBUTOR DRIVE SHAFT

IGNITION NOTES

V8 ENGINES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING:
Removal - Thread Tool C-3052 into bushing, hold puller screw and tighten puller nut to remove bushing.
Installation: Slide new bushing over burnishing end of Tool C-3053. Insert tool and bushing into bore of block. Drive bushing and tool down into position using a soft hammer. As the burnisheris pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size. *DO NOT REAM THE BUSHING.*

DISTRIBUTOR BASIC TIMING: Before installing distributor, time the engine as follows: Place No. 1 piston at TDC of firing stroke. Mark on vibration damper should be under DC mark on timing pointer. Coat shaft and drive gear with engine oil. Install shaft so that, after gear spirals into place indexing with oil pump shaft, slot in top of drive gear will point to first intake manifold bolt on left side of engine (318"), will be parallel to centerline of crankshaft (361", 383" & 413").

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

④ - Assembly Plant. **3** Jefferson (Detroit), **4** Imperial (Detroit), **5** Los Angeles, **6** Newark (Del.), **7** St. Louis.
⑤ - Beginning vehicle number.

ENGINE NUMBER: Stamped on boss on top right side of cylinder block just behind water pump. Number (example below) includes identification data.

① ② ③ ④ ⑤
S 38 ... 8 4

① - Year. **S** 1962.
② - Displacement. **36** 361 cu. in., **38** 383 cu. in., **41** 413 cu. ins. **42** 426 cu. ins.
③ - If this space blank, engine is standard. *For identifying marks see below.*
④ - Month Assembled. **8** August, etc.
⑤ - Day Assembled. **4** 4th day, etc.

►*ENGINE NUMBER MARKS: Identified as follows:*
"**A**" - All cylinder bores .020" oversize.
"**Malt s Cross**" - One or more bearing journals .001" undersize. *See "Connecting Rods" & "Crankshaft" below.*
"**X**" & "**Malt s Cross**" - One or more bearing journals .010" undersize. *See "Connecting Rods" & "Crankshaft" below.*
"♦" - One or more valve lifters .008" oversize.
"**H.P.**" - High Performance Engine.

TUNE-UP

COMPRESSION PRESSURE: 125-155 lbs. at 120 RPM (361" Eng.); 130-165 lbs. at 100 RPM (383" & 413" Eng.). Engine must be warm, spark plugs removed, and throttle wide open. Maximum variation between cylinders should not exceed 20 lbs. (361" Eng.), 25 lbs. (383" & 413" Eng.).
VACUUM READING: 19.5" at idle speed.

VALVE TAPPET CLEARANCE: SC1, SC2-300, SC3, SY1 - Hydraulic, Zero-lash.
SC2-300 Hi-Perf. & SC2-300H - .015" Intake, .024" Exhaust, Hot.
Hi-Perf. Engines (Optl. Camshafts) - .016" Intake, .022" Exhaust, Cold.
All Other Models. Zero lash, hydraulic lifters.
MANIFOLD HEAT CONTROL: Thermostatically controlled valve located at exhaust manifold outlet on right side of engine. Valve must operate freely (lubricate with special lubricant, Part No. 1879318). Coil spring should have approximately ¾ turn wrap with manifold heat control valve closed. Counterweight should respond by moving clockwise approximately ½" when engine accelerated and released quickly.
CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals and check operation before performing "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.
SPARK PLUG GAP: .035".

Spark Plugs - 14 mm. Torque to 30 ft. lbs.

Model	Autolite No.	Champion No.
SC1, SC3, SY1	A-42	J-12Y
SC2-300 & SC2-300 Pwr. Pack	A-42	J-12Y
SC2-300 Hi-Perf. & SC2-300H	A-32	J-9Y

COIL: Autolite No. 200567 or Essex No. 62-160-2.
Ignition Current - 1.9 amps. idling, 3.0 amps. stopped.
Resistor - Chrysler No. 2095501, 0.5-0.6 ohms. connected in lead between ignition switch and coil. Bypassed during cranking by second lead from ignition switch.

DISTRIBUTOR: Chrysler (Own) or Autolite as follows:

Model	Chrysler	Autolite
SC1, SC2-300 ①	2095969	
SC1, SC2-300 ②	2095836	IBP-4005S
SC1, SC2-300 Police	2095832	⑤ IBS-4006G
SC2-300 Pwr. Pack ③	2095987	
SC2-300 Hi-Perf. & SC2-300H ④	⑥	⑤ IBS-4011A
SC3, SY1 ③	2095987	

① - One 2-Bbl. Carburetor. ② - Partial Production.
③ - One 4-Bbl. Carburetor. ④ - Two 4-Bbl. Carbs.
⑤ - Double breaker type distributor.
⑥ - 2095841 (No Tach.), 2098313 (With Tachometer).

Condenser - Autolite 2-32. **Capacity** .25-.285 mfd.
Contact Point Set - Chrysler No. 2098244 (2095836, 2095987).
Breaker Gap - .014-.019".
Cam Angle (Single Breaker) - 27-32° with vacuum line disconnected.
Cam Angle (Double Breaker) - 27-32° (Single set of points), 38-40° (both sets operating together).
Breaker Arm Spring Tension - 17-21.5 ozs.
Rotation - Counterclockwise viewed from above.

Automatic Advance - 2095832 & IBS-4006G

Degrees	Distr. RPM	Degrees	Eng. RPM

Distributor Basic Timing & Drive Shaft Bushing Replacement: *See "Ignition Notes" in Chrysler Corp. Special Data.*

IGNITION TIMING

Setting - 10° BTDC at 475-500 RPM with vacuum line disconnected.
Timing Mark - Mark on vibration damper and indicator on chain case cover. Align vibration damper mark with correct mark on indicator.

CONTINUED ON NEXT PAGE

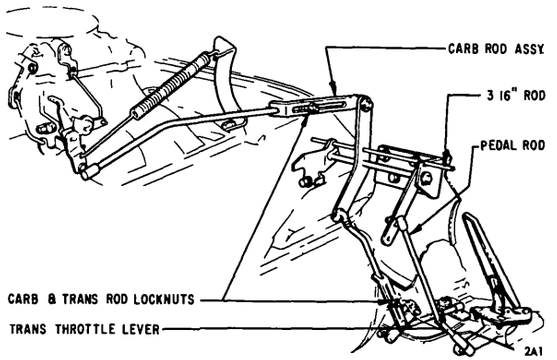
See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CARBURETOR

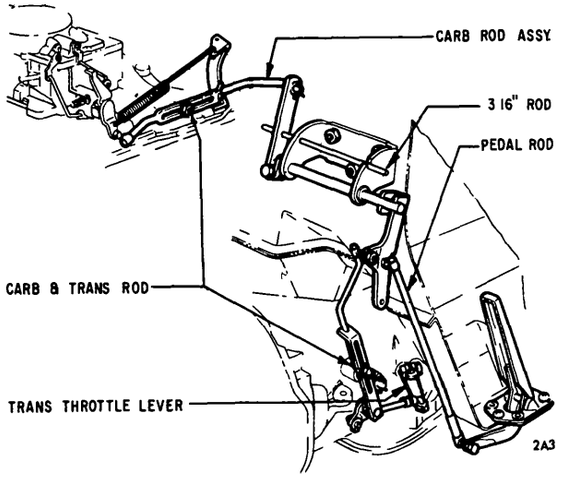
►*CARBURETOR APPLICATION:* As follows:

Engine	Carburetor
361" SC1 (Std.)	One Carter or Stromberg 2-Bbl.
383" SC1 (Police)	One Carter 4-Bbl.
383" SC2 (Std.)	One Carter 2-Bbl.
413" SC2 Pwr. Pack	One Carter 4-Bbl.
413" SC2 Hi-Perf. & 300H	Two Carter 4-Bbl.
413" SC3, SY1	One Carter 4-Bbl.
413" & 426" Hi-Perf.	Two Carter 4-Bbl. (Ram)



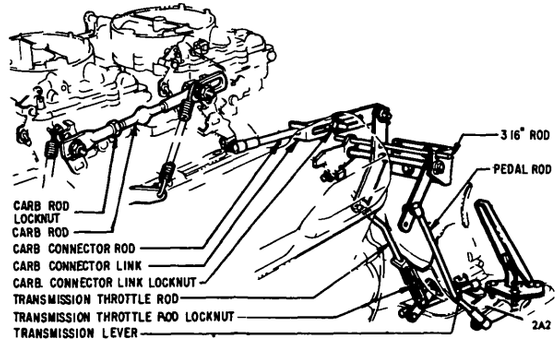
►*IDLING SETTING CAUTIONS:* When making Idle Speed and Mixture adjustments, observe the following: **1)** Turn headlights on to High Beam to compensate for alternator load (alternator charges battery at idle speed). **2)** On automatic transmission cars (exc. High Perf. & 300H), loosen nut on sliding link of carburetor-to-bellcrank rod so transmission internal stop will not interfere with carburetor lever. When adjustments completed, move carburetor throttle rod to rear against its stop and tighten locknut.

THROTTLE LINKAGE ADJUSTMENT (Chrysler & Imperial): **1)** With throttle linkage in place, disconnect or block choke valve in wide open position and place throttle at slow idle.
2) Loosen nuts on carburetor and transmission rods and insert a 3/16" rod (10" long) through holes in bellcrank bracket and lever assembly.
3) Hold transmission lever forward against stop and tighten transmission rod locknut.
4) Disconnect one end of accelerator pedal rod (at transmission and dash bracket levers) and adjust rod length to obtain a pedal angle of 113-115° from horizontal and reinstall rod.
5) Remove the 3/16" rod and move link of carburetor rod assembly rearward until transmission lever is against stop. Tighten carburetor rod locknut and remove choke block.



THROTTLE LINKAGE ADJUSTMENT (Hi-Perf. & C-300H): **1)** With throttle linkage in place, block choke in open position and place rear throttle at slow idle.
2) Loosen nuts on carburetor and transmission connector rods and insert a 3/16" (10" long) rod through bellcrank bracket and lever assembly.
3) Move transmission lever forward against its stop and tighten transmission rod locknut.
4) Disconnect end of accelerator rod and adjust length to give pedal angle of 113-115° from horizontal, then remove the 3/16" rod.
5) Move carburetor rod assembly rearward against transmission stop and tighten carburetor rod locknut.
6) Hold rear carburetor at wide open position and adjust length of connector rod so that front carburetor is also at wide open throttle position, then tighten locknut and remove choke block.

STROMBERG WWC 2-BARREL
361" Engine (Less C.C.V.)



Stromberg WWC, Code 3201 (All Trans.). Downdraft type with automatic choke. *NOTE* - Cars with Closed Crankcase Ventilation use Carter BBD, see below.

CHRYSLER AUTO. TRANS. THROTTLE LINKAGE

IMPERIAL AUTO. TRANS. THROTTLE LINKAGE

CHRYSLER AUTO. TRANS. TWO CARB. THROTTLE LINKAGE

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*
Idle Setting - 1-1½ turns open. Adjust both screws alike. Turn screws out for richer mixture.
Idle Speed - 500 RPM (500 RPM on Air Cond. cars with Air Cond. "ON"), with automatic transmission in "N", headlights on High Beam, and carburetor throttle rod locknut loosened. See *"Cautions"* above.

Float Level - With body inverted and float hanging free (Off car), or with sufficient fuel in bowl so only pressure of buoyant float holds lip firmly against inlet needle (On Car), distance from bowl surface (gasket removed) to top of float at center should be 1/8" or use Gauge 73725. To adjust, hold floats on bottom of bowl and bend lip. *CAUTION* - DO NOT compress rubber tip of fuel inlet needle as incorrect float level setting will result.
Accelerating Pump - Pump connector rod in center hole in pump lever (normal setting).

Fast Idle Speed: 1400 RPM with fast idle adjusting screw centered on index mark on top step of fast idle cam. To adjust screw position, bend tang on choke shaft lever with Tool T109-22.
Automatic Choke: "Cross-Over" type. Set 1 notch rich.
Throttle Linkage Adjustment: See *CARBURETOR* above.
►*OTHER DATA: See "Stromberg WWC Carburetors" in Carburetion Section.*

CARTER BBD 2-BARREL
361" & 383" Engines

Carter BBD No. 3244S (383" Std.), 3245S (361" & 383" with Closed Crankcase Ventilation).
►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

Idle Setting - 500 RPM (500 RPM on Air Cond. cars with Air Cond. "ON"), with automatic transmission in "N", headlights on High Beam, and carburetor throttle rod locknut loosened. See *"Cautions"* above.

Float Level - With main body inverted and float hanging free (Off car), or with sufficient fuel in bowl so only pressure of buoyant float holds float lip firmly against fuel inlet (On Car) distance from bowl surface to top of float at center should be 9/32" measured with Gauge T109-239. To adjust, hold floats on bottom of bowl and bend float lip. *CAUTION* - DO NOT compress rubber tip of fuel inlet needle as incorrect float level setting will result.

Accelerating Pump - Install connector rod in center hole (medium stroke) of throttle lever.
Fast Idle Speed: 1400 RPM with fast idle adjusting screw centered on index mark on top step of fast idle cam. To adjust screw position, bend tang on choke shaft lever with Tool T109-22.

Automatic Choke: "Cross-Over" type. Set at index.

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA: See "Carter BBD Carburetors" in Carburetion Section.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CARTER AFB 4-BARREL

383", 413" & 426" Engin (1-Carb.)

Applicati n	Carter Carb. No.
383" Engine (Police)	3375S(CCV), 3374S
413" Engine (Std.)	3256S(CCV), 3251S
413", 426" Eng. (Hi-Perf. - Large Bore)	3387S

CCV - Closed Crankcase Ventilation.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barr ls feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

Idl Spe d - 500 RPM (with Air Cond. "On" on Air Cond. Cars), 700-800 RPM (Hi-Perf. Engines). *Headlights must be on High Beam and carburetor throttle rod locknut lo sen d. See CAUTIONS above.*

Throttle Linkage Adjustm nt: *See CARBURETOR above.*

►*OTHER DATA: S "Carter AFB 4-Barrel Carburetors" in Carbur tion Section.*

CARTER AFB 4-BARREL

413" & 426" Engine

Hi-Perf. With Ram Manifold

Cart r AFB-3084S. Two carburetors, one for each bank.

►*MANIFOLD FUEL DISTRIBUTION: RIGHT carburetor fe ds l ft bank cylinders, LEFT carburetor feeds right bank cylinders.*

Idl Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (Idle Air) screw settings. *S "Carter AFB 4-Barrel Carburetors" in Carbureti n Secti n.*

Throttle Linkage & Interconnecting Linkage Adjustments: *S e CARBURETOR above.*

►*OTHER DATA: See "Carter AFB 4-Barrel Carburetors" in Carbur ti n Section.*

CARTER AFB 4-BARREL

413" Engin (2-Carbs. - Runner)

Carter AFB-3258S (Front), 3259S (Rear) Hi-Perf. & 300H.

Idl Speed & Mixture Adjustment - Turn idle mixture screws 1-2 turns open. Set idle air bypass screws (between mixture screws) 1 turn open and adjust idle speed to 650 RPM by opening or closing bypass screws (keep them equal). Adjust idle mixture screws on front carburetor for maximum RPM. Repeat on rear carburetor and readjust front carburetor if necessary. *NOTE* - If mixture adjustment increases idle speed to more than 675 RPM, readjust idle bypass screw to obtain 650 RPM.

Interconn cting Linkag Adjustment - Both front and rear carburetor levers sh uld operate freely and in same plane. Correct either bent or damaged levers. *NOTE* - Install interconnecting rod with slotted end connected to l wer h l in fr nt carburetor throttle lever, and end connected at top h le of rear carburetor throttle lever. Hold rear carburetor throttle wide open (choke in full open position) and adjust slotted end of rod so fr nt carburetor throttle valves will also be in wide open position. Tighten locknut and check operation. Interconnecting rod must rotate slightly on pivots without bind in any position.

►*IDLE SPEED ADJUSTMENT NOTE: Idl Air Bypass screw n throttl body used to adjust idle speed. Throttl valv s are normally closed on sl w idl .*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. M2769S.
Fuel Pump Pressure - 3½-5 lbs.

Fuel Filter: Disposable type located in carburetor inlet line. Replace every 16,000 miles or if clogged. DO NOT attempt to clean.

Gasoline Gauge: Constant Voltage type with voltage regulator inside oil pressure gauge (Chrysler), inside temperature gauge (Imperial).
Dash Unit - Part No. 2258137 (Chrysler), No. 2197225 (Imperial).
Tank Unit - Chrysler No. 2240547.

Air Cleaner: Paper element type. Clean every 8,000 miles, replace element every 32,000 miles or sooner if needed.

►*CLEANING CAUTION:* Clean filter element by blowing out with compressed air from inside surface of element. Hold air nozzle 2" from element to avoid damage. DO NOT oil, lubricate or wash element.

BATTERY

SC1 & SC2 300. Autolite 11-HS-59B, Willard MB-24-59 or Gould 11B-OE-59. 12 volt, 11 plate, 59 ampere hour capacity (20 hr. rate).
SC2-300H, SC3, SY1. Autolite 12-HB-70B or Willard MB-27-70. 12 volt, 13 plate, 70 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Left front engine.

STARTER

Chrysler Own No. 1889200 Manual Trans. Std. Eng. Autolite MDT-6002 Manual Trans. Hi Perf. Eng.; Chrysler Own No. 2095150 (gear reduction type) Auto. Trans.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 32-48 ozs.

Performance Data - 1889200

Torque	RPM	Volts	Amperes
0 ft. lbs.	3800 Min.	11.0	78 Max.
8.5 ft. lbs.	Lock	4.0	350

Performance Data - 2095150

Torque	RPM	Volts	Amperes
0 ft. lbs.	1980	11.0	85 Max.
24.0	Lock	4.0	475

Performance Data - MDT-6002

Torque	RPM	Volts	Amperes
0 ft. lbs.	3600	10.0	56 Max.
8.5 ft. lbs.	Lock	4.0	350

Starter Switch: Solenoid, Chrysler No. 1889146 (S.M. Trans.), No. 2275554 (Auto. Trans.) on starter and controlled by Ignition & Starter Switch Chrysler No. 2097628. Neutral Safety Switch Chrysler No. 1704283, mounted on transmission on automatic transmission cars.
Neutral Safety Switch Adjustment - *S "Torqu Flit V8" in Transmission Section.*

ALTERNATOR

Chrysler Own. Three-phase A.C. unit with full-wave rectifier. Used as follows:

Model	Chrysler N .
Standard	2098265
Air Cond. & H.D.	2098320

Rotation - Clockwise at drive end.
Rated Output - 35 amperes (2098265), 40 amperes (2098320).
Field Coil Draw - 2.30-2.70 amps. at 12 volts (alternator turned by hand); 3.00-3.50 amps. at 15 volts, 70°F and 750 Alternator RPM.

►*OTHER DATA: See "Chrysler Alternator & Regulator" in Electrical Section.*

Belt Adjustment: Use Torque or Deflection method as follows:

Belt Torque Specifications - Ft. Lbs.

Model	New	Used
Alternator (No Air Cond.) SC1, SC2	60 ©	40 ©
Alternator (No Air Cond.) SC3, SY1	40 ©	30 ©
Alternator (With Air Cond.) All	60	40
Fan Idler	50	35

© - Torque wrench assumes a different position according to model, when adjusting belt tension.

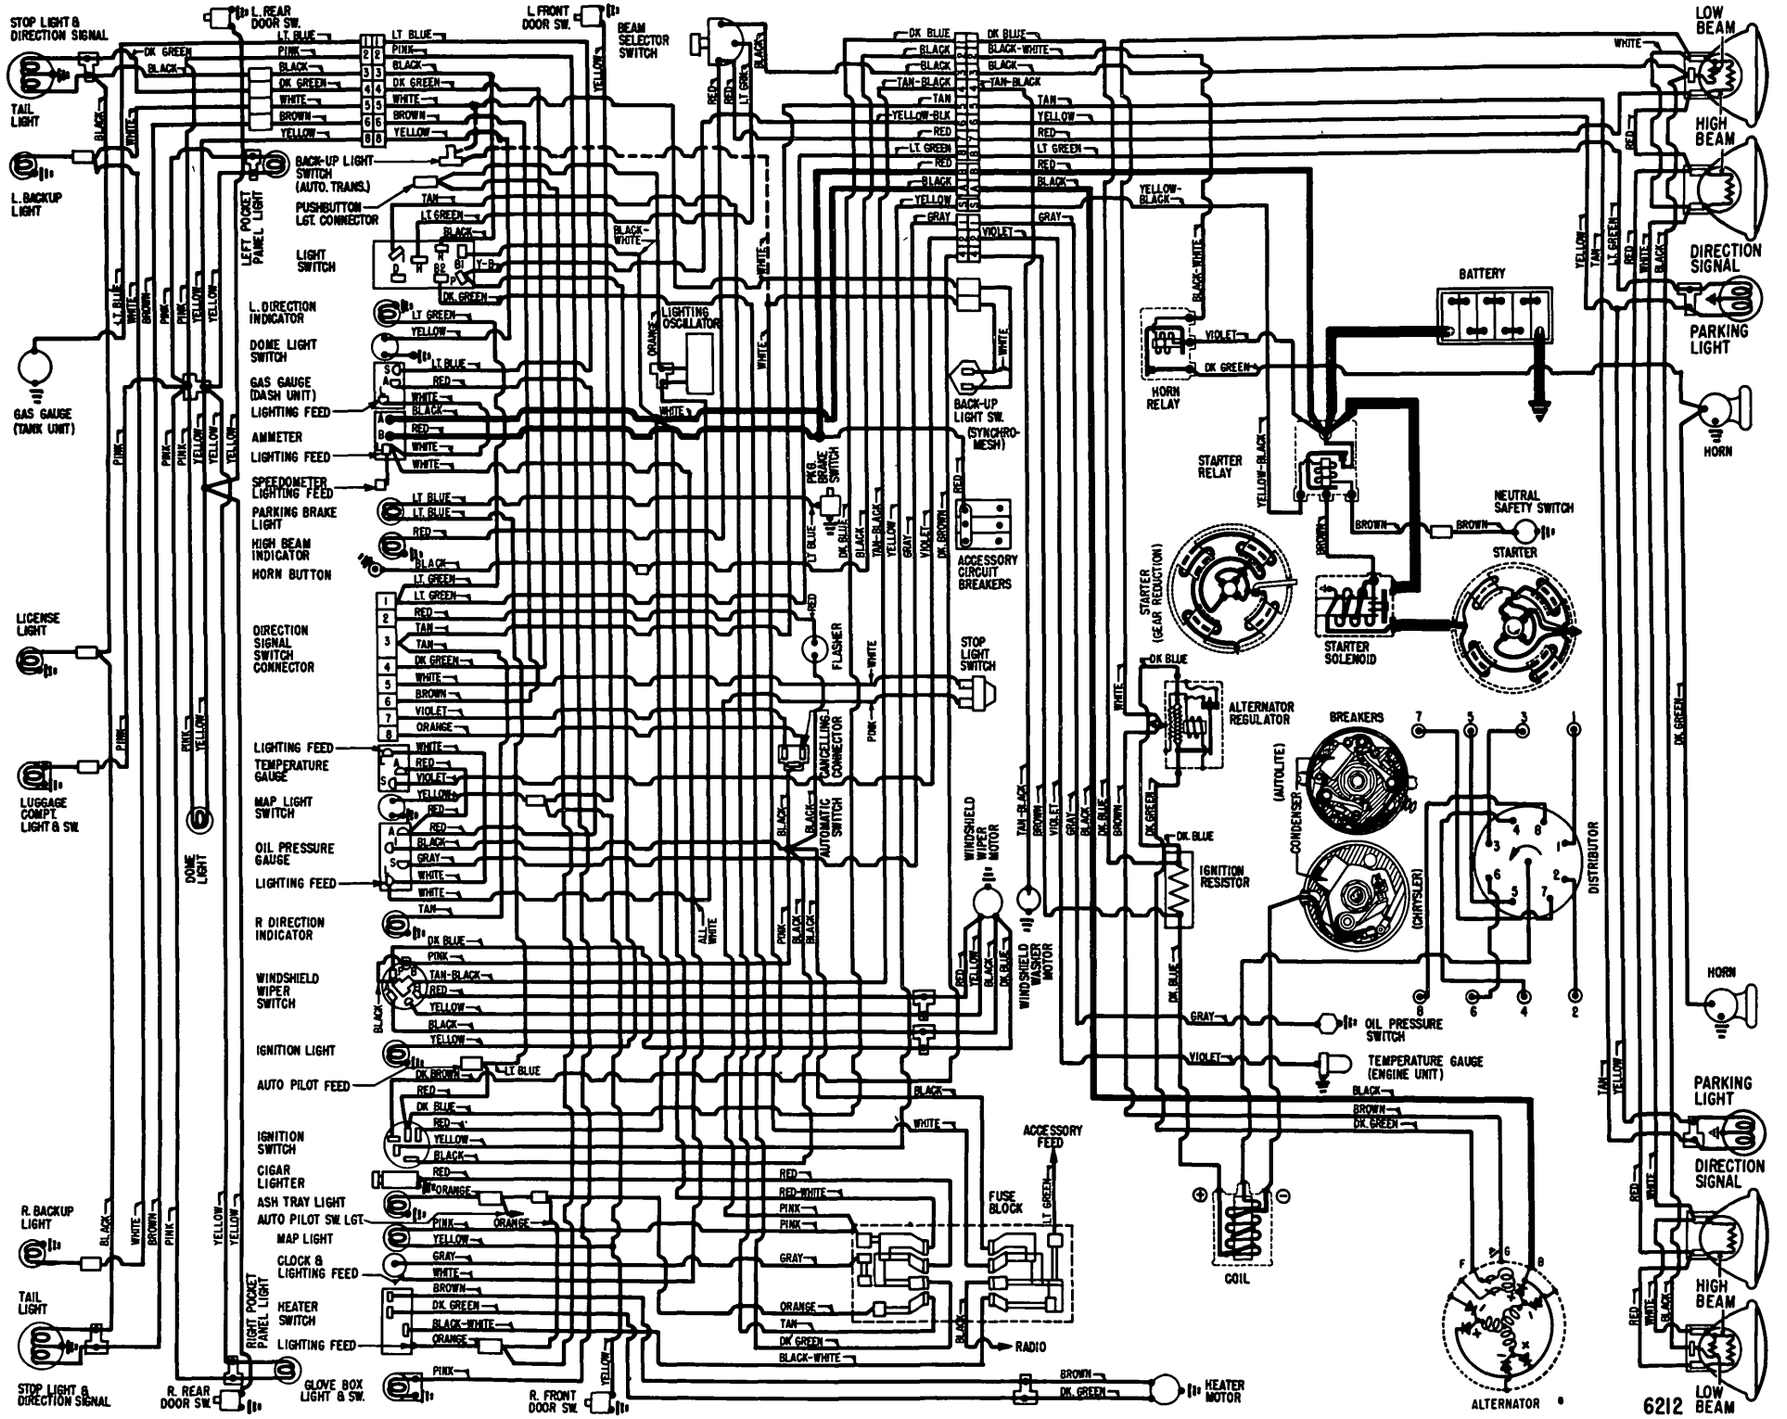
Belt Deflection Method

Model	New	Used
Alternator (No Air Cond.)	1/8"	1/4"
Alternator (With Air Cond.)	1/4"	3/8"
Fan Idler	1/16"	1/8"

REGULATOR

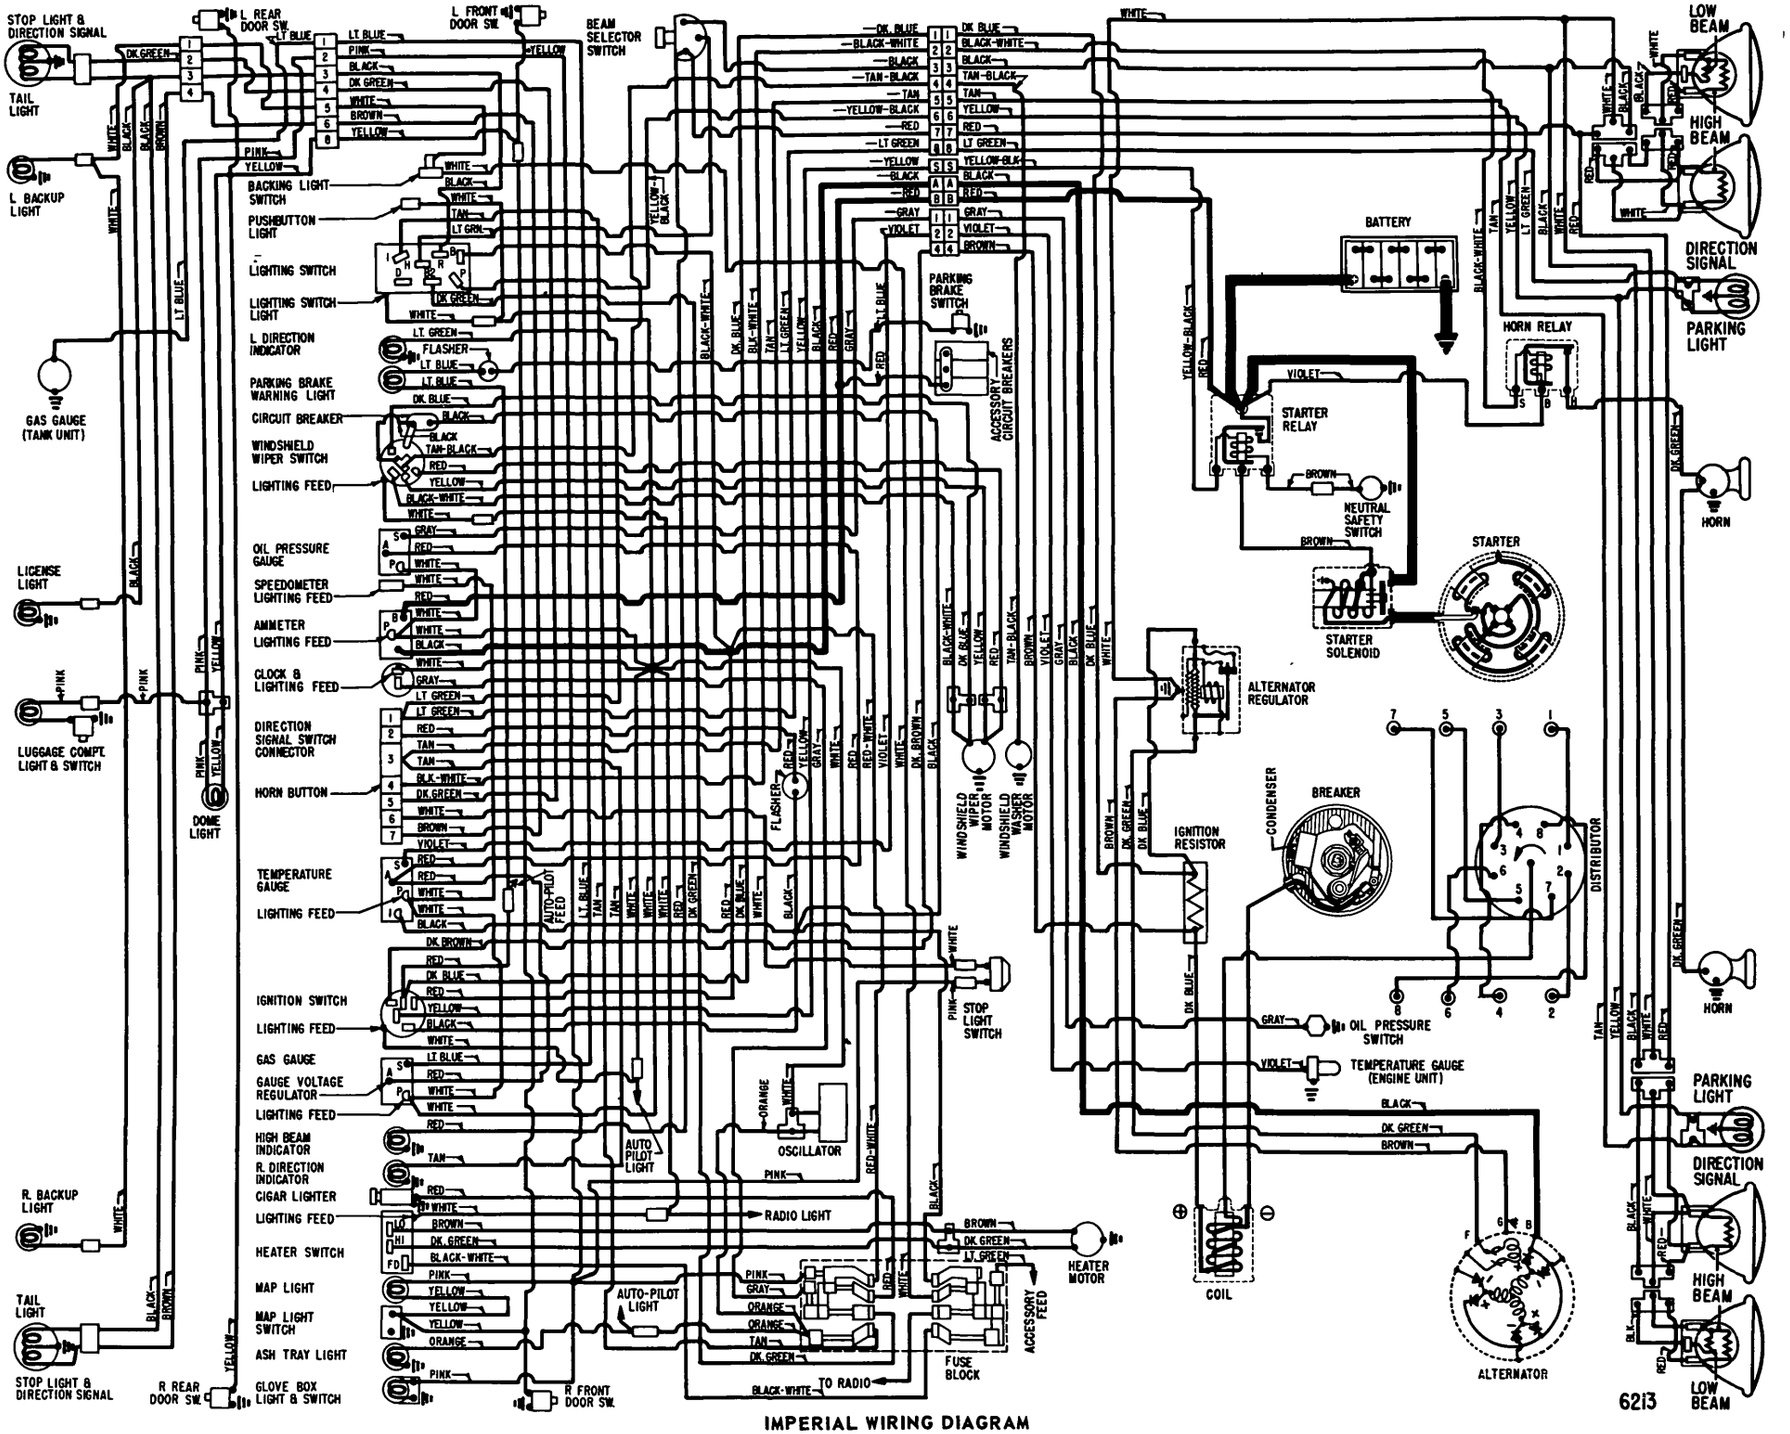
Chrysler Own. No. 2098300 (All Models). Field control type. No Cutout Relay or Current Regulator.
Air Gap - .048-.052". Point Gap - .014-.016".
Voltage Setting - 13.7-14.3 volts at 70°F.

►*OTHER DATA: See "Chrysler Alternator & Regulator" in Electrical Section.*



MISC. ELECTRICAL

Automatic Beam Changer: *See Electrical Section.*
Electronic Rear View Mirror: *See Electrical Section.*
Instrument Panel Lighting: *See "Chrysler & Imperial Panelescent Lighting" in Electrical Section.*
Stop Light Switch Location: Mechanical type on brake pedal lever bracket.
Adjustment - Adjust position of switch so stoplight pedal goes ON in the first 1/8" of pedal pushrod travel.



Instrument Cluster & Speedometer (Chrysler): Removal - 1) Disconnect battery ground cable. Remove steering wheel and steering jacket tube cover and disconnect all wires at terminals and the instrument ground wire. 2) Remove instrument cluster bezel and disconnect speedometer cable. Remove steering tube collar and remove two screws and spacers that attach dome and cluster assembly to support. 3) Remove plastic dome to instrument panel screws and carefully release base of dome from supports (use pointed instrument), and move dome away from panel opening. Tip cluster outward to reach parking brake warning lamp socket. *NOTE* - If dome fits tightly into support it may be necessary to remove cluster-to-dome screws and push cluster up into dome so dome can be

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CHRYSLER (EXC. IMPERIAL) WIRING DIAGRAM

IMPERIAL WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

compressed to clear supports.
4) Snap out lamp socket and bulb and remove dome and cluster assembly.
5) Remove speedometer head assembly.
Installation - Reverse removal procedure.

Instrument Cluster & Speedometer (Imperial): Removal - 1) Disconnect battery ground cable. *NOTE - When equipped with Heater and/or Air Cond., remove defroster and spot cooler hoses.*
2) Disconnect speedometer cable at head and odometer reset cable at instrument panel cluster. *NOTE - Mask steering jacket tube.*
3) Remove instrument cluster-to-panel screws and remove cluster by tilting lower end outward.
4) Disconnect all electrical connections and disengage wire harness loom from clips and remove cluster. *NOTE* - For speedometer service do not remove head from cluster.
Installation - Reverse removal procedure.

CIRCUIT BREAKERS: 22.5 Ampere - Headlights, High Beam Indicator, Ignition switch.
6 Ampere - Windshield wiper. Between switch & motor.
8 Ampere - Rear Cigar Lighter & Power Antenna.
5 Ampere - Windshield Wiper. Wiper switch.

FUSES: Located in fuse block behind instrument panel to left of steering column.
9 Ampere - Parking, Tail, License Plate, Lights.
9 Ampere - Stop, Dome, Glove Compartment, Map, Trunk and Spot lights.
2 Ampere - Instrument, Ignition, Clock Lights & Clock.
10 Ampere - Rear Defroster & Air Cond. Blower.
6 Ampere - Back-Up Lamp.
14 Ampere - Front Cigar Lighter.

ENGINE

ENGINE SPECIFICATIONS: Own. 90°V8, valve-in-head. Different engines used as follows:

Engine	Bore	Stroke	Displacement
361"	4.125"	2.375"	361 cu. in.
383"	4.250"	3.375"	383 cu. in.
413"	4.190"	3.750"	413 cu. in.
426"	4.250"	3.750"	426 cu. in.

Engine	Compr. Ratio	Rated HP	Developed HP
361"	9.1-1	54.3	265 at 4000 RPM
383"	10.1-1	57.8	305 at 4600 RPM
413" ①	10.1-1	55.9	340 at 4600 RPM
413" ②	10.1-1	55.9	365 at 4800 RPM
413" ③	10.1-1	55.9	380 at 5200 RPM
413" ④	11.0-1	55.9	405 at 5400 RPM
426" ②	11.0-1	57.8	373 at 4800 RPM
426" ②	12.0-1	57.8	385 at 4800 RPM
426" ④	11.0-1	57.8	413 at 5400 RPM
426" ④	12.0-1	57.8	421 at 5400 RPM

① - SC3 New Yorker; SY1 Imperial.
② - SC2-300 Hi-Perf. Large Bore Carb.
③ - SC2-300H & SC2-300 HI Perf. with 2 4-Bbl. Carbs.
④ - SC2-300 & 300H Hi-Perf. with 2 4-Bbl. Ram Induction.

Compression & Vacuum Reading: *See TUNE-UP.*
ENGINE REMOVAL: *See "Engine" in Chrysler Corp. Special Data.*
CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifolds" in Chrysler Corp. Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Chrysler Corp. Special Data.*

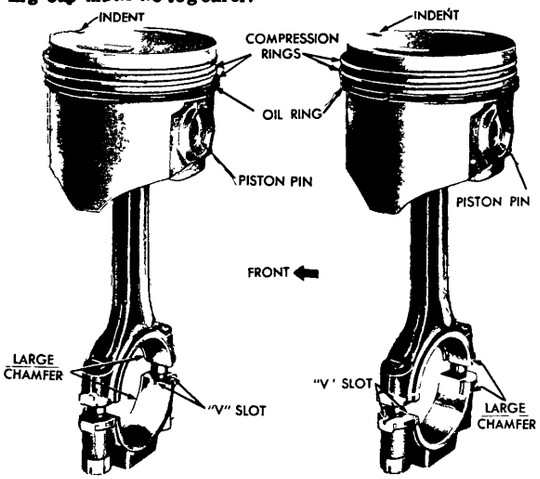
OIL PAN REMOVAL: 1) Disconnect battery, raise car on hoist and disconnect steering linkage from idler and pitman arms.
2) Remove outlet vent pipe and disconnect exhaust pipe branches from right and left manifolds. Remove exhaust pipe.
3) Drain oil and remove converter dust shield. Remove oil pan bolts. Turn flywheel until counterweight and connecting rods at front of crankshaft are at highest position to provide clearance and lower oil pan. *NOTE* - Turn oil pan counterclockwise to clear oil screen and suction pipe as it is lowered.

PISTONS

Cast Aluminum alloy, eliptically turned, tin-plated thermally controlled by steel strut (Std.) Forged Aluminum alloy, domed, trunk-type, eliptically turned (Optl. on Hi-Perf. Engines).
Removal - Pistons and rods removed from above.
Fitting New Pistons: Clearance should be .0003-.0013" between piston and cylinder wall, measured at top of skirt on piston, and halfway down cylinder wall crosswise to engine.
►*CYLINDER BORE OVERSIZE CAUTION:* Letter "A" within engine number indicates that cylinder bores are .020" Oversize.
Installing Pistons: Notch in piston head must be toward front of engine. Assemble piston to rod with notch on same side as large chamfer on lower end of connecting rod (left bank cylinders 1-3-5-7), with notch on side opposite to large chamfer at lower end of connecting rod (right bank cylinders 2-4-6-8), *see Rod Installation.*
Replacement Pistons: Furnished Std., .005", .020", & .040" Oversize with fitted pins.

PISTON PIN

Pin is press fit in connecting rod and special removal and installation procedures required.
Diameter - 1.0935-1.0937". **Length** - 3.555-3.575".
Clearance in Piston: .00045-.00075".
Clearance in Rod: .0007-.0012".
Piston Pin Removal & Installation: *See "Piston Pins" in Chrysler Corp. Special Data.*
Replacement Pins: Furnished standard size only with new pistons.



PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.0775-.0780"	.013-.025"	.0015-.003"
Oil (3)	.1860-.1865"	.013-.025"	.001-.009"

Installing Rings: Install compression rings with "Top" mark toward top of piston.
Replacement Rings: Furnished for oversize ranges of Std. to .009", .020" to .029", .040" to .049".

CONNECTING ROD

Length (Center-to-Center) - 6.36" (361" & 383"), 6.77" (413" & 426").
Crankpin Journal Diameter: 2.374-2.375".
►*JOURNAL DIAMETER CAUTION (ONE OR MORE JOURNALS MACHINED UNDERSIZE):* See CRANKSHAFT below.
Clearance - .0005-.0015". Wear limit .0025".
Sideplay - .009-.017". Total both rods.
Installing Rods: With piston correctly installed on connecting rod (see PISTONS above), larger chamfer on lower end of rod should be installed toward nearest crankshaft journal fillet. Oil grooves in rod and bearing cap must be together.

PISTON & ROD ASSEMBLY

CRANKSHAFT

Journal Diameter: (361" & 383") 2.6245-2.6255". (413") 2.7495-2.7505".
►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:* **.001" UNDERSIZE** - Indicated by "Maltese Cross" within engine number. **.010" UNDERSIZE** - Indicated by "X" and "Maltese Cross" within engine number. Position of undersize Main Journals is stamped on No. 2 counterweight, and position of undersize Connecting Rod Journals is stamped on No. 3 counterweight. Connecting rod journals will be identified by letter "R" and main journals by letter "M". The number following letter "R" or "M" indicates journal number.
Clearance - .0005-.0015". Wear limit .0025".
Endplay - .002-.007".
End Thrust - Taken by No. 3 (Center) main bearing.
Replacement Bearings: Std. & .001", .002", .003", .010" & .012" oversize.

CAMSHAFT

►*HI-PERF. OPTIONAL CAMSHAFTS NOTE: For identification, these camshafts will be designated as camshaft Option 284°, 292°, & 308°. See Valve Lift, Valve Springs & Valve Timing, below.*

Journal Diameter: (1) 1.998-1.999". (2) 1.982-1.983". (3) 1.967-1.968". (4) 1.951-1.952". (5) 1.748-1.749".

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Bearing Diameter: (1) 2.000-2.001". (2) 1.984-1.985". (3) 1.969-1.970". (4) 1.953-1.954". (5) 1.750-1.751".
Bearings - Removable, lead base babbitt on steel.
Clearance - .001-.003". Wear limit .005".
End Thrust: Controlled by camshaft sprocket hub riding against front face of cylinder block.
Timing Chain: Width .88". **Pitch** .50". **Length** 50 links.
Camshaft Setting: Marks on both sprockets adjacent and in line with straightedge across shaft centers.
Camshaft Removal: *See "Camshaft & Bearings" in Chrysler Special Data.*
Engine Front Cover Removal: *See "Engine Front Cover" in Chrysler Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chrysler Special Data.*

VALVES

Tappet Clearance: SC2-300 & 300H Hi-Perf. - Intake .015", Exhaust .024". Hot. **Hi-Perf. Optional Camshafts** - Intake .016", Exhaust .022". Cold.

►*OVERSIZE VALVE STEM NOTE:* Engines with .005" oversize valve stems will be marked with an "E" (Exh.) or an "I" (Int.) on end of cylinder head on untapped boss.

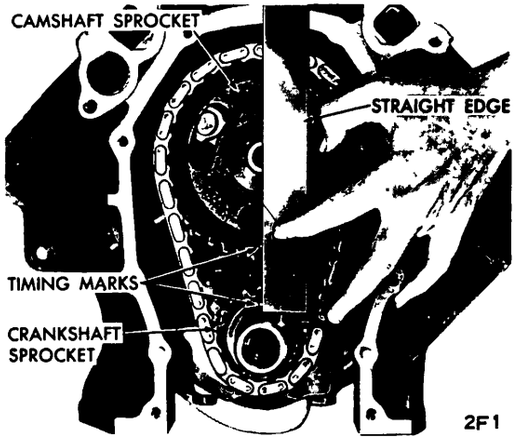
Valve	Head Diam.	Stem Diam.	Length
Intake	2.08"	.372-.373"	4.87"
Exhaust	1.60" ①	.371-.372"	4.87"

Valve	Seat Angl	Lift	Stem Clearance
Intake	45°	②	③.001-.003"
Exhaust	45°	②	④.002-.004"

① - Hi-Perf. Optl. 1.74".
② - **SC1, SC2 300, SC2 300 Pwr. Pack, SC3, SY1** - Int. & Exh. .390".
SC2-300 Hi-Perf., SC2-300H - Int. .444". Exh. .456".
SC2 Hi-Perf. Optl. Camshafts - 284° Int. .449", Exh. .454"; 292° All .490"; 308° All .520".
③ - Wear limit .004". ④ - Wear limit .006".

Valve Seat Width - 1/16-3/32" Intake, 3/64-1/16" Exhaust.
Valve Stem Oil Seal - Cup type seals used on all valve stems.

►*VALVE GRINDING CAUTION:* Check valve height in head after grinding valves using Tool C-3648. If valve tip exceeds maximum (end of cylinder gauge), grind tip down to approach, but do not go below minimum height (slotted area on gauge).



Valve Springs: Damper springs used on SC2-300 Hi-Perf., SC2-300H, SY1, & 284° & 292° Optl. SC2 Hi-Perf. camshaft engines. Inner springs used with 308" SC2 Hi-Perf. camshaft engine.

Spring Specifications
(SC1, SC2-300, SC2-300 Pwr. Pack, SC3, SY1)

Valve	Pressure	Length
Closed	100 lbs.	1.86"
Open	195 lbs.	1.47"

(SC2-300H, SC2-300 Hi-Perf. & SC2 Hi-Perf. 284° Optl. Camshaft)

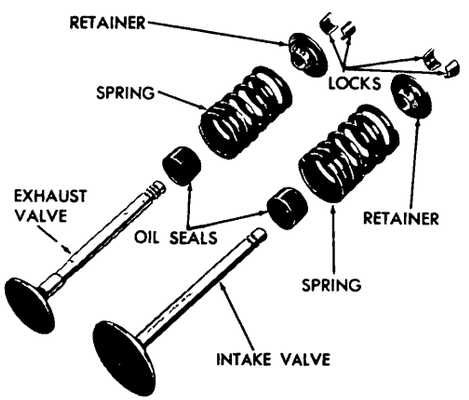
Valve	Pressure	Length
Closed	90 lbs.	1.86"
Open	226 lbs.	1.43"

CHRYSLER & IMPERIAL VALVE TIMING MARKS

(SC2 Hi-Perf. Optl. 292° Camshaft)

Valve	Pressure	Length
Closed	122 lbs.	1.86"
Open	284 lbs.	1.47"

(SC2 Hi-Perf. Optl. 308° Camshaft) ①



Valve	Pressure-Inner-Length	Pressure-Outer-Length
Closed	30 lbs. 1.562"	95 lbs. 1.86"
Open	77 lbs. 1.132"	261" lbs. 1.36"

① - Includes damper.

Free Length - 2.38" SC2-300H; 2.34" SC1, SC2-300, SC2 Pwr. Pack, SC2 Hi-Perf. (Std. Camshaft), SC2 Police, SC3, & SY1.

►*VALVE SPRING HEIGHT CAUTION:* If valves or seats are ground, check installed height of spring (from counterbore in head to lower surface of spring retainer). If height exceeds 1 57/64", install a 1.16" spacer under spring to bring height within limits of 1 53/64-1 57/64".

►*CAUTION:* Spring ends must be square within 1/16".

CHRYSLER & IMPERIAL VALVE ASSEMBLY

Valve Guides: Guides are cast integral with cylinder head. When clearance is excessive, ream guides and install valves with oversize stems. Valves furnished with .005", .015" & .030" oversize stems. Use Tool C-3433 (.005"), C-3430 (.015"), and C-3427 (.030") to ream guides in progressive steps of .005", .015" & .030".

►*PUSHROD INSTALLATION CAUTION:* Small diameter end of pushrod must seat in lifter. Large diameter end must contact rocker arm. Improper installation will cause valves to be held open partially.

VALVE LIFTERS

Mechanical lifters used in SC2-300 Hi-Perf., SC2-300H and SC2 Hi-Perf. Optl. camshafts. Hydraulic lifters used in all other models.

►*OVERSIZE LIFTER NOTE.* A "♦" on engine serial number pad indicates that lifters are .008" oversize. If only certain lifters are oversize, the diamond will be placed on lifter boss facing engine centerline. These oversize lifters will also have notches on top top surface of body.

Diameter - .9040-.9045". **Clearance** - .0005-.0018".
Replacement Lifters: Furnished Std. & .001", .008", .030" oversize.
Hydraulic Lifter Overhaul & Testing: *See "Valve System" in Chrysler Corp. Special Data.*
Rocker Arm Assembly: *See "Valve System" in Chrysler Corp. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

①Valve Timing Specifications
(SC1, SC2-300, SC2-300 Pwr. Pack, SC3, SY1)
Intake Valves - Open 13°BTDC. Close 59°ALDC.
Exhaust Valves - Open 59°BLDC. Close 13°ATDC.
(SC2-300 Hi-Perf., SC2-300H)
Intake Valves - Open 22°BTDC. Close 66°ALDC.
Exhaust Valves - Open 62°BLDC. Close 28°ATDC.
(SC2 Optl. 284° Camshaft)
Intake Valves - Open 25°BTDC. Close 79°ALDC.
Exhaust Valves - Open 74°BLDC. Close 30°ATDC.
(SC2 Optl. 292° Camshaft)
Intake Valves - Open 31°BTDC. Close 81°ALDC.
Exhaust Valves - Open 76°BLDC. Close 36°ATDC.
(SC2 Optl. 308° Camshaft)
Intake Valves - Open 43°BTDC. Close 85°ALDC.
Exhaust Valves - Open 83°BLDC. Close 45°ATDC.
① - With valve train solid (Hydraulic Lifters).

VALVE TIMING CHECK (Exc. SC2 Hi-Perf. & 300H): Rotate crankshaft until No. 6 exhaust valve closes (No. 6 intake opens). Insert a ¼" spacer between rocker arm pad and stem tip of No. 1 intake valve (second valve on left bank). Install dial indicator so plunger contacts valve spring retainer as nearly perpendicular as possible. Allow spring load to bleed lifter down to provide a solid lifter. Zero indicator. Turn crankshaft in normal running direction until valve has lifted .017". Timing indicator should read 10° BTDC to 2° ATDC.

CONTINUED ON NEXT PAGE

INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CAUTION - Remove spacer before turning crankshaft any further in normal direction.

VALVE TIMING CHECK (SC2 Hi-Perf. & 300H): With No. 6 exhaust valve is closing and the No. 6 intake is opening. Turn rocker arm adjusting screw down to zero clearance plus 1/2 turn. Install dial indicator so that indicator plunger contacts retainer as near to 90° angle as possible. Adjust dial indicator to zero. Turn crankshaft clockwise (Normal running direction) until valve has lifted .069". The timing pointer should read 5° BTDC to 7° ATDC. Remove dial indicator, back off adjusting screw; with engine running at hot idle, adjust valve clearance to specifications.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under "OILING SYSTEM" in Chrysler Corp. Special Data.*

Crankcase Capacity: 5 qts. refill. Add 1 qt. with filter change.

Normal Oil Pressure: 45-65 lbs. at 2000 RPM.

Oil Pressure Relief Valve - Mounted in oil pump. For various springs used, see *"Oiling System" in Chrysler Corp. Special Data.*

Oil Pressure Gauge: Constant Voltage type with voltage regulator inside oil pressure gauge (Chrysler), inside temperature gauge (Imperial).

Dash Unit - Chrysler No. 2291302 (Chrysler), No. 2197222 (Imperial).

Engine Unit - Chrysler No. 1972241.

Oil Pump: Rotor type mounted on cylinder block at lower left front side of engine.

Pump Overhaul - *See "Oiling System" in Chrysler Corp. Special Data.*

Oil Filter: Full-flow disposable type. Replace filter every 4000 miles to coincide with engine oil change.

►*OIL FILTER INSTALLATION CAUTION:* Before installing, make sure that drain-back valve is free by unseating valve with blunt instrument inserted in four holes in oil filter base. Screw new filter on base until gasket contacts base. **Tighten ½ turn additional by hand.** DO NOT overtighten.

Crankcase Ventilation: Standard Cars - Filter element in crankcase filler cap and breather tube in right valve rocker cover. Clean filter in filler cap at every oil change or sooner under heavy dust conditions.

Positive Crankcase Ventilation Cars - A vacuum tube is connected to air outlet vent cap on right valve rocker and to lower part of carburetor throttle body. A ventilation valve is installed in outlet cap to regulate crankcase ventilation. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 16 qts. Add 1 qt. for heater.

►*AIR CONDITIONING OPERATION CAUTION:* Engine cooling system must be protected to a temperature of 15°F for summer operation.

Pressure Valve: 14 lb. (Std.), 16 lb. (Air Cond.) radiator filler cap used on all models.

Thermostat: Pellet type. Located in water outlet housing. Chrysler No. 1735011 (180°F).

Water Pump: Sealed ball bearing type. No. lubrication.

Water Pump Removal - Drain cooling system. On Air Cond. cars remove upper half of fan shroud. Loosen all belts. Remove fan, spacer and pulley (Exc. Air Cond. Cars), remove pulley from fan hub and then remove fan drive (Air Cond. Cars). Remove pump.

Water Pump Overhaul - *See "Cooling System" in Chrysler Corp. Special Data.*

Fluid Fan Drive: Used on Air Cond. cars and Std. on all SC2-300 Hi-Perf. & 300H.

Temperature Gauge: Constant Voltage Type with voltage regulator inside oil pressure gauge (Chrysler), inside temperature gauge (Imperial).

Dash Unit - Chrysler No. 2257660 (Chrysler), 2291553 (Imperial).

Engine Unit - Chrysler No. 2240744 (King-Seeley or Autolite), No. 2256302 (Stewart Warner).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

DODGE DART

Model Identification

Model	Std. Series	330 Series	440 Series
2-Door Sedan	SD1-L-21	SD1-M-21	
2-Door Hardtop		SD1-M-23	SD1-H-23
4-Door Sedan	SD1-L-41	SD1-M-41	SD1-H-41
Station Wagon	SD1-L-45	SD1-M-45	

PLYMOUTH

Model	Savoy	Belvedere	Fury
2-Door Sedan	SP1-L-21	SP1-M-21	
2-Door Hardtop		SP1-M-23	SP1-H-23
4-Door Sedan	SP1-L-41	SP1-M-41	SP1-H-41
Station Wagon	SP1-L-45	SP1-M-45	

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post. Number (example below) includes identification data.

① ② ③ ④ ⑤
2 1 2 1 100001

① - Car make. 2 Plymouth. 4 Dart.
② - Model series. 1 2 & 4-Door Sedan (Std. & Savoy), 2 2 & 4-Door Sedan and Hardtop (330 & Belvedere), 3 2-Door Hardtop & 4-Door Sedan (440 & Fury), 5 Station Wagon (Std. & Savoy), 6 Station Wagon (330 & Belvedere), 8 Taxi, 9 Special.
③ - Model year. 2 1962.
④ - Assembly plant. 1 or 2 Detroit (Plymouth). 2 or 3 Detroit (Dodge). 5 Los Angeles. 6 Newark. 7 St. Louis (Dodge), Valley Park (Plymouth).
⑤ - Beginning vehicle number at each assembly plant.

ENGINE NUMBER: Stamped on right side of cylinder block below cylinder head opposite No. 1 cylinder. Number (example below) includes identification data.

① ② ③ ④
S 17 8 4

① - Year. S 1962. AS denotes aluminum engine.
② - Displacement. 17 170 cu. ins. 22 225 cu. ins.
③ - Month assembled. 8 August, etc.
④ - Day assembled. 4 4th day, etc.

►*ENGINE NUMBER MARKS:* Identified as follows: "A" on Model Pad indicates .020" oversize cylinder bore.
"♦" on Model Pad indicates .008" oversize tappets.
"Main Cross" on Model Pad indicates .001" undersize bearing shells. Location of undersize journals identified by letter "M" (Main Journal), letter, "R" (Connecting Rod Journal) on crankshaft counterweight. *NOTE* - Number following letters, indicate which journals are undersize.
"X" on Model Pad indicates .010" undersize crankshaft. Crankshaft counterweight will be stamped "M-10" or "R-10" to indicate all main and/or connecting rod journals are .010" undersize.

TUNE-UP

►*CARTER BBS CARB. EQUIPPED CARS HARD COLD START (NECESSITATES PUMPING ACCELERATOR) & SLOW WARM-UP CORRECTION:* Condition may be caused by incorrect "R" Series (1961) choke rod which is shorter than the correct "S" Series (1962) choke rod. Be sure "S" Series choke assembly is on vehicle. Shorter choke rod prevents choke valve from closing when starting engine.

COMPRESSION PRESSURE: 110-140 lbs. at 130 RPM (plugs removed). Maximum variation between cylinders 20 lbs.

VACUUM READING: 19.5" at idle speed.

VALVE TAPPET CLEARANCE: .010" Intake, .020" Exhaust, Hot.

►*ALUMINUM ENGINE NOTE:* When setting tappet clearance, after engine reaches normal operating temperature, remove cylinder head cover and operate engine for additional 5 minutes at 550 RPM. Make adjustments.

MANIFOLD HEAT CONTROL: Thermostatic coil spring type. Valve must operate freely. When installing, coil spring should be installed so that about one full turn (355° wrap) is required to hook outer end around stop stud.

CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals and check operation before performing a "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .035".

Spark Plugs - Champion N12Y or Autolite AG52. "Long Reach" type. 14mm. Torque to 30 ft. lbs..

►*CARBON AND/OR OIL FOULED SPARK PLUGS CORRECTION:* If carburetor and automatic choke operate properly, replace ONLY affected plug with MoPar Spark Plug No. 2098374 (Champion UN12Y auxiliary gap type). *CAUTION - DO NOT use any other type spark plug.*

►*SPARK PLUG GASKET NOTE:* A gasket must be used along with aluminum sleeve on each plug to insure against oil leakage into spark plug sleeves.

COIL: Chrysler Nos. 1688212 or 2095223. Autolite No. 200567. Essex No. 62-160-2.

Ignition Current - 1.9 amps. idling, 3.0 amps. stopped.

Resistor - Chrysler No. 2095501 (0.5-0.6 ohms) connected in lead between ignition switch and coil. Bypassed during cranking by second lead from ignition switch.

DISTRIBUTOR: Chrysler No. 2095974 (170" Eng.), No. 2095976 (225" Eng.).

Condenser - Chrysler 2098058. **Capacity** .25-.285 mfd.
Contact Point Set - Chrysler No. 2098244.
Breaker Gap - .017-.023".
Cam Angle - 40-45°.
Breaker Arm Spring Tension - 17-21.5 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance - 2095974

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	325-475	0	650-950
0-2.5	475	0-5	950
8-10	925	16-20	1850
12.5-14.5	2200	25-29	4400

Automatic Advance - 2095976

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	325-475	0	650-950
0-2	475	0-4	950
7-9	1000	14-18	2000
10.5-12.5	2300	21-25	4600

Vacuum Spark Control: Integral type.

Vacuum Advance - 2095974

Distr. Degrees	Eng. Degrees	Vacuum ("of Hg)
Start	0	5.0-7.1
5	10	8-9.5
9.5-12.5	19	12.5

Vacuum Advance - 2095976

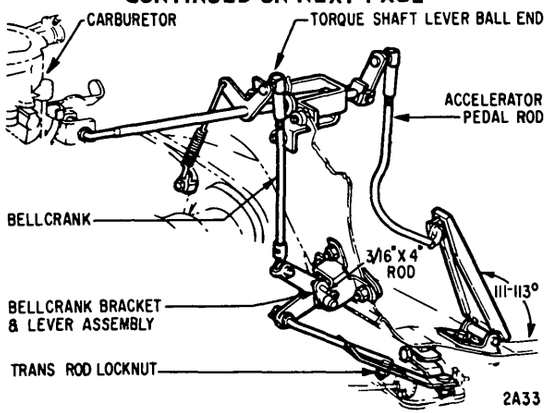
Distr. Degrees	Eng. Degrees	Vacuum ("of Hg)
Start	0	4.9-7.1
3-5	6-10	10.5
5.25-7.5	10.5-15.0	13

IGNITION TIMING

Setting - 2½° BTDC (range 2½° ATDC to 7½° BTDC). *NOTE* - Set timing with distributor vacuum line disconnected and engine idling at 500 RPM in Neutral.

Timing Mark - Timing tab on chain case cover marked "0" and "10" with 5° marks before and after "10". Align timing mark on vibration damper with correct mark on tab.

CARBURETOR



►*THROTTLE LINKAGE STICKING CORRECTION:* Check accelerator shaft and bracket assembly for proper (.030-.070") endplay. Pry accelerator end of shaft with screwdriver to relieve shaft binding.

►*CARBURETOR APPLICATION: One Carter BBS single barrel carburetor used on all cars with Closed Crankcase Ventilation. One Holley Model 1920 single barrel carburetor optional for all transmissions.*

►*IDLE SETTING CAUTION:* When making Idle Speed & Mixture adjustments, observe the following: 1) Turn headlights on to high beam to compensate for alternator load (alternator charges battery at idle speed). 2) On automatic transmission cars, unsnap ball joint connection at accelerator shaft bellcrank so transmission interval stop will not interfere with carburetor throttle lever. When adjustments completed, screw ball joint up or down until ball on bellcrank will mate exactly with socket.

THROTTLE LINKAGE ADJUSTMENT: 1) Disconnect upper end of bellcrank-to-torque shaft rod ball joint. 2) Disconnect choke at carburetor or block choke in full open position. Open throttle slightly to release

CONTINUED ON NEXT PAGE

AUTO. TRANS. THROTTLE LINKAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

fast idle cam, then return throttle to curb idle. 3) With locknut loose in transmission rod, insert a 3/16" rod (4" long) through holes in bellcrank bracket and lever assembly. 4) Move transmission lever forward against stop and tighten transmission locknut. 5) Disconnect top end of pedal rod, then adjust to provide 111-113° pedal angle (see illustration). Reinstall top end of pedal rod. 6) Remove 3/16" rod from bellcrank bracket and lever assembly. Adjust length of transmission bellcrank-to-torque shaft rod by means of adjustment screw. The correct rod length allows the ball socket to line up with the ball end when rod is held upward against transmission stop. 7) Install ball socket on torque shaft lever ball end, connect choke rod.

CARTER BBS

Carter BBS-3231S (Synchro-mesh), BBS-3232S (Auto. Trans.), BBS-3233S (All Taxi), BBS-3235S (All Closed Crankcase Ventilation Cars).

Idle Setting - ½-1½ turns open. With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn screw in until speed starts to drop. Turn screw out just enough to recover lost engine speed. Readjust idle speed screw for correct engine idle speed.

Idle Speed - 550 RPM with headlights on high beam and accelerator shaft rod ball joint unsnapped. See *"Idle Setting Caution" above.*

Float Level - With main body inverted and float hanging free (off car), or with sufficient fuel in bowl so only pressure of buoyant float holds float lip firmly against fuel inlet needle (on car), float fulcrum pin seated against fulcrum pin retainer, distance from bowl surface (gasket removed) to crown of floats at center should be 7/32" measured with Gauge T109-239. To adjust, bend float lip. *CAUTION - DO NOT compress rubber tip of fuel inlet needle as incorrect float level setting will result.*

Accelerating Pump - Install throttle connector rod in center hole of throttle lever.

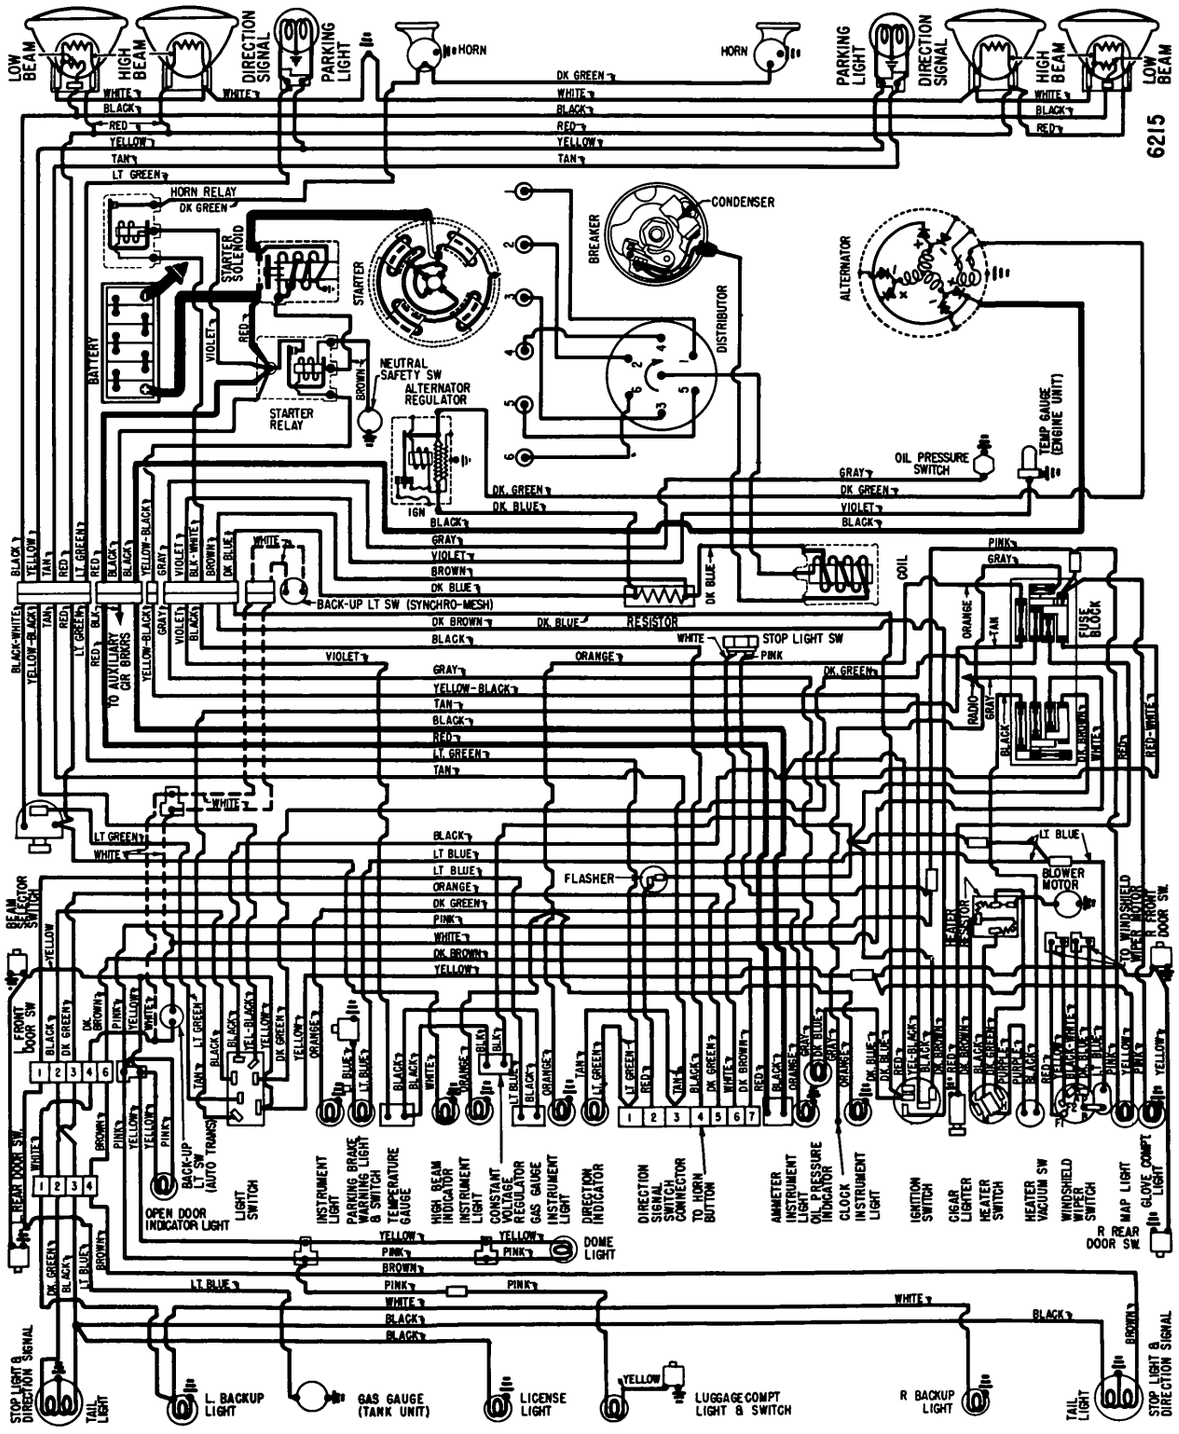
Fast Idle: 170" Engine - 1300 RPM (Auto. Trans. without Closed Crankcase Ventilation), 1400 RPM (Others). **225" Engine** - 1300 RPM (Synchro-mesh Trans.), 1400 RPM (Auto. Trans.).

Automatic Choke: "Cross-Over" type. 2 notches rich.

Throttle Linkage Adjustment: See *CARBURETOR above.*

►*OTHER DATA: See "Carter BBS Carburetors" in Carburetion Section.*

HOLLEY MODEL 1920



Holley No. 1920 R-2418A (Synchro-mesh), R-2419A (Auto. Trans.).

Idle Setting - ½-1½ turns open. With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn screw in until speed starts to drop. Turn screw out just enough to recover lost engine speed. Readjust idle speed screw for correct engine idle.

Idle Speed - 550 RPM with headlights on high beam and accelerator shaft rod ball joint unsnapped. See *"Idle Setting Caution" above.*

Fuel Level: 11/16" below machined mounting surface of power valve (economizer) with engine running and car on level floor. Remove power valve assembly and use scale to measure fuel level. *See "Holley Single Barrel Model 1920 Carburetor" in Carburetion Section for adjustment procedure.*

CONTINUED ON NEXT PAGE

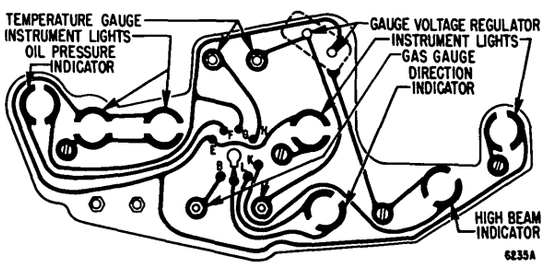
DODGE DART 6 CYL. WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Accelerating Pump - Install throttle connector rod in center hole of throttle lever.
Fast Idle: 170" Engine - 1500 RPM (Synchro-mesh), 1800 RPM (Auto. Trans.).
225" Engine - 1500 RPM (Synchro-mesh), 1700 RPM (Auto. Trans.).
Automatic Choke: "Cross-Over" type. Set at Index.
Throttle Linkage Adjustment: See *CARBURETOR* above.
►*OTHER DATA:* See *"Holley Model 1920 Carburetors"* in Carburetion Section.

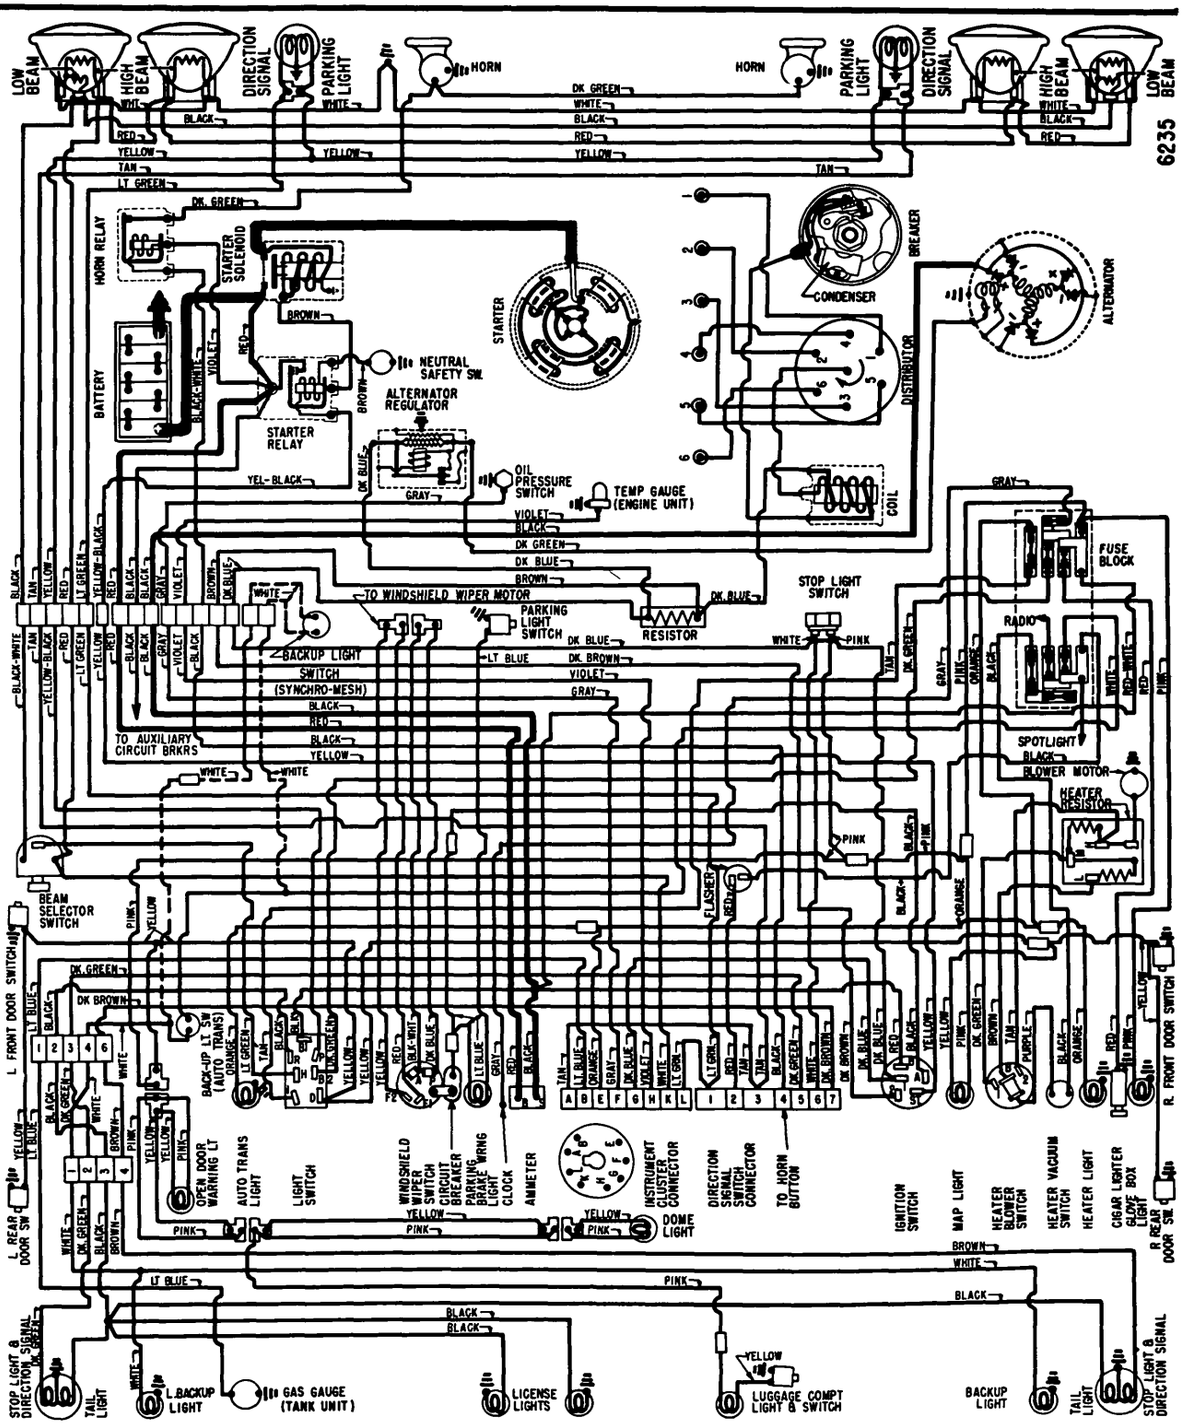
CARB. EQUIPMENT

Fuel Pump: Carter M2996S. Mechanical type.
Pressure - 3½-5 lbs. at 500 RPM.
Fuel Filter: Disposable paper type, located in fuel line between pump and carburetor. Replace element every 16,000 miles.
Gasoline Gauge: Constant voltage type with separate voltage regulator Chrysler Corp. No. 2209216 (Dodge), No. 2258413 (Plymouth) mounted on back of instrument panel.
Dash Unit - Chrysler Corp. No. 2258240 (Dodge), 2257205 (Plymouth).
Tank Unit - Chrysler Corp. No. 2275589 (Exc. Sub.), No. 2275588 (Suburban).
Air Cleaner: Paper element type. Clean every 8,000 miles or more often as required. Replace every 32,000 miles.
►*CLEANING CAUTION:* Remove cleaner from carburetor and remove cover and element. Clean inside cover with compressed air and gently clean element by holding air nozzle at least two inches from inside screen. Discard element if it has been punctured. Check soft plastic sealer on both sides of element for smoothness.



BATTERY

170" Engines - Autolite 9-HS-38, Willard HB-42-38, Gould-National 9B-OE-38. 12 volt, 7 plate, 38 ampere hour capacity (20 hr. rate).
225" Engines - Autolite 11-HS-48B, Willard MB-24-48, Gould-National 11B-OE-50. 12 volt, 9 plate, 48 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.



STARTER

Chrysler No. 2095150. Armature - Chrysler 2095094.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 32-48 ozs.

CONTINUED ON NEXT PAGE

PLYMOUTH 6 CYL. PRINTED CIRCUIT

PLYMOUTH 6 CYL. WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	1950	11.0	85
24.0	Lock	4.0	475

Starting Switch: Solenoid Switch No. 1889146 on starter and controlled by combination Starter & Ignition Switch No. 2097628 and Neutral Safety Switch No. 1704283 mounted on automatic transmission.

Neutral Safety Switch Adjustment - *See "TorqueFlite Six" in Transmission Section.*

ALTERNATOR

Chrysler No. 2098275 (Lancer & Valiant), No. 2098265 (Dart & Plymouth), No. 2098320 (Heavy Duty).

Rotation - Clockwise at drive end.

Rated Output - 26 amperes (2098275), 34.5 amperes (2098265), 39 amperes (2098320).

Field Coil Draw - 2.3-2.7 amperes at 12 volts (alternator turned by hand), 3.00-3.50 amperes at 15 volts and 70°F & 750 alternator RPM.

►*OTHER DATA: See "Chrysler Alternator & Regulator" in Electrical Section.*

Belt Adjustment: Use Torque or Deflection methods as follows:

Eng.	Belt Torque (Ft. Lbs.) New	Belt Torque (Ft. Lbs.) ©Used	Belt Deflection New	Belt Deflection ©Used
170"	20	15	5/32"	1/4"
225"	20	15	1/8"	1/4"

© - Belt used ½ hour or more.

REGULATOR

Chrysler No. 2098300. Field control type. No cutout relay or current regulator.

Air Gap - .048-.052". **Point Gap** - .014-.016".

Voltage Setting - 13.7-14.3 volts at 75°F.

►*OTHER DATA: See "Chrysler Alternator & Regulator" in Electrical Section.*

MISC. ELECTRICAL

Lighting Switch Removal (Dodge): Part of Instrument Cluster. *See "Instrument Cluster Removal" below.*

Lighting Switch Removal (Plymouth): Disconnect battery. Pull switch knob out and rotate it until flat on shaft is down. Push knob in all the way. Disconnect wires, press spring loaded release button on top center of switch, and pull shaft and knob out of switch. Remove switch mounting bezel on instrument panel and remove switch.

Stop Light Switch Location: Mechanical type, mounted on brake pedal lever bracket.

Adjustment - Adjust position of switch so stoplight goes on in first 1/8" of pedal pushrod travel.

Cluster Removal (Dodge): *NOTE - Removal of cluster is necessary to service instruments.* 1) Disconnect negative battery terminal at battery and remove steering wheel. Mask steering jacket tube area and disconnect speedometer cable at speedometer.

2) Slide wiper switch knob off stem and remove headlight switch control knob by pressing knob stem release button on under side of instrument panel (pull button must be in full ON position). Release spring and pull out knob and stem.

3) Remove heater control knob and remove sleeve on heater control lever and four clutch trip plate-to-clutch base screws and remove trip plate.

4) Remove four cluster panel to instrument cluster mounting panel screws and pull cluster forward out of mounting panel, then tilt top of panel downward and roll it over to expose harness, sockets and connectors.

5) Disconnect wire connectors, snap out light sockets and remove cluster assembly.

Installation: Reverse removal procedure.

Cluster Removal (Plymouth): *NOTE - Removal of cluster necessary to service instruments.* 1) Remove negative battery cable at battery. Mask steering jacket tube area and remove heater switch and temperature control knob.

2) Disconnect speedometer cable at speedometer and remove four cluster bezel screws. Pull cluster forward and tilt it downward to expose harness connectors and printed circuit.

3) Disconnect wire connectors, snap out lamp sockets and lead wires to clock and ammeter and remove cluster. Instruments are secured to cluster base by nuts and screws.

Installation: Reverse removal procedure.

CIRCUIT BREAKERS: 30 Ampere - Tailgate Lift, located behind left front kick panel.

22½ Ampere - Headlights, integral with lighting switch.

20 Ampere - Window Lifts, located behind left front kick panel.

6 Ampere - Variable Speed Windshield Wiper, back of wiper switch.

5 Ampere - Single Speed Windshield Wiper, back of wiper switch.

FUSES: 20 Ampere - Heater.

14 Ampere - Cigar Lighter.

9 Ampere - Tail Lights, Parking Lights, Glove Compartment & Trunk Lights, Dome Light & Stop Lights.

7½ Ampere - Radio.

6 Ampere - Back-Up Lights & Rear Window Defroster.

2 Ampere - Instrument Panel Lights & Clock.

NOTE - Fuse block located at bottom edge of instrument panel.

ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl., valve-in-head, inclined 30° to right, of same design used previously.

►*PLYMOUTH TAXI NOTE:* 170" Engine optional on this model. Specifications below apply to both engines (225" & 170").

Engine	Bore	Stroke	Displacement
225"	3.41"	4.125"	225 cu. ins.
170"	3.41"	3.125"	170 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
225"	8.2-1	27.7	145 at 4000 RPM
170"	8.2-1	27.7	101 at 4400 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Using tie rod end puller Tool J-3742, remove steering and idler ball joints from steering linkage center link. Remove dust shield. Remove oil pan attaching bolts, then rotate engine crankshaft to clear the counterweights, then remove oil pan.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Chrysler Corp. Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chrysler Corp. Special Data.*

ENGINE REMOVAL: *See "Engine" in Chrysler Corp. Special Data.*

PISTONS

Aluminum alloy, cam ground, tin plated, slipper type skirt. Thermally controlled by steel strut.

Weight - 16 ozs.

►*OVERSIZE CYLINDER BORE CAUTION:* Letter "A" incorporated in engine number indicates .020" oversize bore.

Removal - Pistons and rods removed from above.

Clearance - .0005-.0015" at top of skirt.

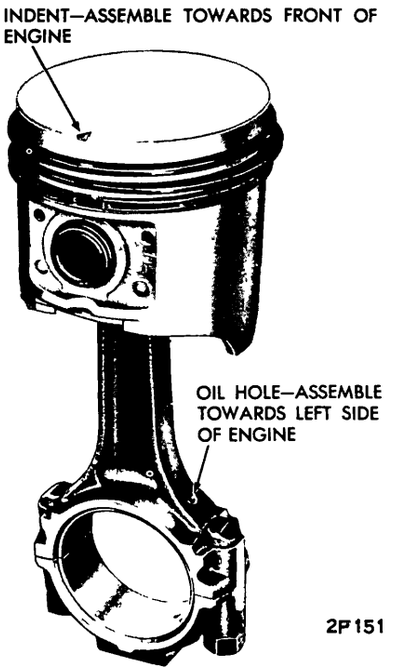
Fitting New Pistons - Use micrometers with piston and cylinder bore clean and dry and at 70°F. Measure piston at top of skirt at right angles to pin hole, measure cylinder bore halfway down and at right angles to crankshaft.

Installing Pistons - Notch in piston head must be toward front of engine. *See Rod Installation.*

Replacement Pistons: Furnished with pins in Std. size and .005", .020", .040" Oversize. *NOTE* - All pistons are machined to same weight.

PISTON PIN

Press fit in connecting rod.



Diameter - .9007-.9009". **Length** - 2.955-2.975".

Pin Fit in Piston - .00045-.00075" clearance. Pin should be sliding fit in piston at 70°F.

Pin Fit in Rod - .0007-.0012" Interference fit. Special procedure and tools used for removal & installation. *See "Piston Pins" in Chrysler Corp. Special Data.*

Replacement Pins: Std. size only. Furnished as an assembly with new pistons.

CONTINUED ON NEXT PAGE

PISTON ASSEMBLY

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

PISTON RINGS

Compression rings are cast iron. No. 1 is taper twist, tin plated, No. 2 is reverse twist, taper face, lubrite coated, Oil ring is Cast Iron single piece (170"), 3-piece, two chrome plated rails with stainless steel expander-spacer (225").

Ring	Width	End Gap	Side Clearance
Compr.(1&2)..	.0775-.0780"..	.010-.020"....	.0005-.0040"
Oil (3).....	.1860-.1865"..	.015-.062"....	.0090" Max.

Installing Rings - Mark "Top" on compression rings must be toward top of engine.

Replacement Rings: Furnished in sets for oversize ranges as follows: Std. to .009", .020-.029", .040-.049".

CONNECTING ROD

Length (Center-to-Center) - 5.707" (170"), 6.699" (225").

Weight - 25.7 ozs. (170"), 27.3 ozs. (225").

►*JOURNAL DIAMETER CAUTION (ONE OR MORE Journals Machined UNDERSIZE): See CRANKSHAFT below.*

Piston Pin Bore in Rod - .8995-.9000".

Clearance - .0005-.0015". Wear limit .0025".

Side Clearance - .006-.012".

Bearing Adjustment - None, replace bearings.

Installing Rods - Notch in head of piston must be to front of engine, oil squirt hole in lower end of rod must be toward left side of engine.

Replacement Bearings: Std. and .001", .002", .010", Undersize.

CRANKSHAFT

Journal Diameter - 2.7495-2.7505". Taper and out-of-round limit .001".

Bearing Type - Removable, precision type, lead-base babbitt on steel, exc. thrust bearing which is tin-based babbitt on steel.

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize crankshaft journals identified as follows:

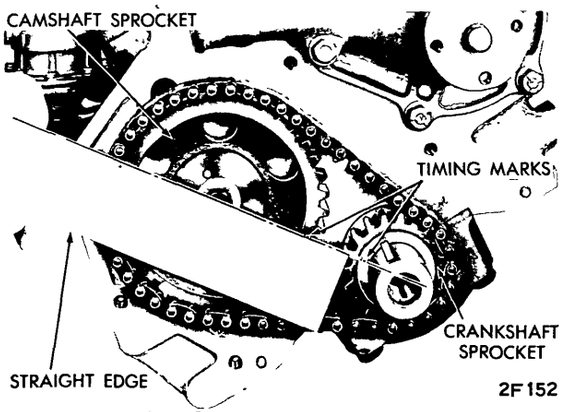
"MALTESE CROSS" - On Model pad, indicates .001" undersize journals. Location of the undersize journals is indicated by letter "M" (Main journal), or "R" (Connecting Rod Journal) on crankshaft counterweight. *NOTE* - Numbers following letter "M" or "R" indicate which journals undersize.

"X" - On Model Pad indicate .010" undersize crankshaft and crankshaft counterweight will be stamped "M-10" or "R-10" indicating all main or all connecting rod journals .010" undersize.

►*MAIN BEARINB INTERCHANGEABILITY CAUTION:* Upper halves have oil holes, are grooved and are not interchangeable with lower halves. No. 3 bearings are flanged for crankshaft end thrust control. No. 1 upper is chamfered for timing chain lubrication and is marked "Red" on edge. No. 2 & 4 uppers are interchangeable. No. 1, 2 & 4 lowers are interchangeable.

Clearance - .0005-.0015".

End Thrust - Taken by No. 3 (rear intermediate) flanged bearing.



Endplay - .002-.007".

Replacement Bearings: Std. and .001", .002", .010" undersize.

►*MAIN BEARING SERVICING NOTE:* Bearing caps are numbered and must be installed in correct position (not interchangeable).

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chrysler Corp. Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chrysler Corp. Special Data.*

ENGINE VALVE TIMING MARKS

CAMSHAFT

Journal Diameter - (1) 1.998-1.999", (2) 1.982-1.983", (3) 1.967-1.968", (4) 1.951-1.952".

Bearings - Lead based babbitt on steel.

Clearance - .001-.003". Wear Limit - .005".

End Thrust: Taken by rear face of sprocket hub on front face of block. No thrust plate used.

Timing Chain: Side guide type. **Width** - .88". **Pitch** - .50". **Length** - 50 links. Replace chain when slack exceeds 11/64". Measure slack by holding crankshaft gear stationary and rotating camshaft in both directions, (use torque wrench on camshaft sprocket bolt). Apply 30 ft. lbs. (with head installed), 15 ft. lbs. (with head removed) turning torque.

Camshaft Removal: *See "Camshaft & Bearings" in Chrysler Corp. Special Data.*

Tappet Clearance: .010" intake, .020" exhaust. Hot.

►*OVERSIZE TAPPET NOTE:* A "♦" on Model Pad indicates .008" oversize tappets.

Camshaft Setting: Marks on sprockets must be adjacent and in line across shaft centers.

Engine Front Cover Installation: *See "Engine Front Cover" in Chrysler Corp. Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chrysler Corp. Special Data.*

VALVES

Valve	Head Diam.	①Stem Diam.	Length
Intake	1.615-1.625"	.372-.373"	4.774"
Exhaust	1.355-1.365"	.371-.372"	4.797"

Valve	Seat Angle ④	Lift	Stem Clearance
Intake	45°	.375"	②.001-.003"
Exhaust	45°	.360"	③.002-.004"

① - Std. Also furnished .005", .015", .030" Oversize.
② - Wear Limit .004". ③ - Wear Limit .006".
④ - Valve face angle 45° (Int.), 47° (Exh.).

Valve Seat Width: 5/64-3/32" Int., 3/64-1/16" Exh.

Valve Stem Oil Seals: Cup type seals used on all valve stems (long seal on intake, short seal on exhaust).

Valve Guides: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance is excessive. Valves with oversize stems furnished .005", .015", .030" Oversize. Use Reamer Tool No. C-3433 (.005" O.S.), C-3430 (.015" O.S.), C-3427 (.030" O.S.) in sequence.

Valve Springs: Free Length 2".

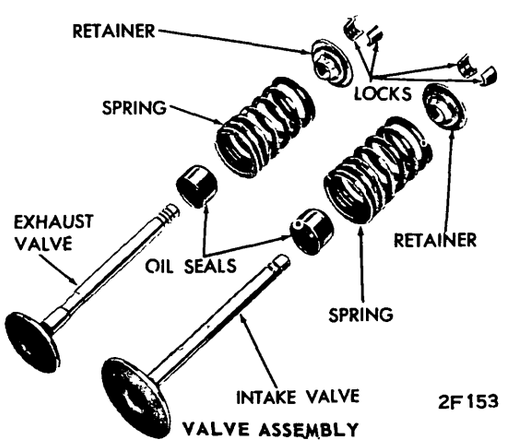
Valve Spring Specifications

Valve	Pressure	Length
Closed	83 lbs.	1 11/16"
Open	177 lbs.	1 5/16"

Valve Spring Installation - Valve spring ends must be square within 1/16". Check installed height of spring which must not exceed 1 11/16" (measure from face of spring seat in cylinder head to lower face of spring retainer). If height greater, install 1/16" spacer in head counterbore to bring spring height within limits of 1 5/8" to 1 11/16".

Valve Lifters: Barrel type, removed from above.

Rocker Arm Assembly: *See "Valve System" in Chrysler Corp. Special Data.*



VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 8° BTDC. Close 44° ALDC.
Exhaust Valves - Open 48° BLDC. Close at TDC.

CONTINUED ON NEXT PAGE

VALVE ASSEMBLY

Se INDEXES on Pgs. 4 to 9 for complet CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Valv Timing Check - Turn crankshaft until No. 6 exhaust valve is closing and No. 6 intake valve is opening. Install dial indicator so pointer contacts No. 1 intake valve spring retainer parallel to axis of valve stem. Turn No. 1 intake valve adjusting screw one full turn to remove all lash, zero dial indicator and rotate crankshaft clockwise (normal running direction) until valve has lifted .018". Timing on timing tab should read from 12° BTDC to TDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under "OILING SYSTEM" in Chrysler Corp. Special Data.*

Crankcase Capacity: 4 qts. refill. Add 1 qt. for filter change.

N rmal Oil Pressure: 45-60 lbs. at 40-50 MPH.

Oil Pressure Relief Valve - Located in pump body.

►*RELIEF VALVE SPRING NOTE:* Three types of springs available. Replace with same color spring, *see "Oiling System" in Chrysler Corp. Special Data.*

Oil Pressure Indicator: Indicator light on Instrument panel operated by Oil Pressure Switch Chrysler Corp. No. 2256800. On oil pump on right side of block.

Oil Pump: Rotor type. On right side of crankcase.

Overhaul - *See "Oiling System" in Chrysler Corp. Special Data.*

Oil Filter: Full-flow type. Replace filter element every 4,000 miles, to correspond with oil changes.

Crankcase Ventilation: (Standard Cars) - Filter in filler cap (air intake) and outlet vent tube extending from rocker arm cover to right rear of engine. Wash filler cap in kerosene and re-oil with SAE No. 30 engine oil every 8,000 miles or more often in dusty areas.

Positive Crankcase Ventilation Cars: Vacuum tube connects outlet breather cap with lower part of throttle body. A ventilation valve is located in outlet vent cap and regulates crankcase ventilation. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 11 qts. (170"), 12 qts. (225") Std. Add 1 qt. for heater.

►*AIR CONDITIONER OPERATION CAUTION:* Engine cooling system must be protected to a temperature of 15°F (above zero) both summer and winter.

Pr ssur Valv : 14 lb. Std., 16 lb. Air Cond. Cars, pressure radiator filler cap.

Thermostat: Pellet type. In water outlet connection on cylinder head (160°F) No. 2129206, (180°F) 2129205.

Water Pump: Sealed ball bearing, packless type. No lubrication required.

See "Cooling System" in Chrysler Corp. Sp cial Data.

Pump Removal - Drain cooling system and remove fan shroud if equipped with Air Cond. Loosen alternator mounting bracket (to loosen fan belt) and swing alternator in towards water pump. On Air Cond. Cars, loosen idler pulley. Remove pump.

Temperature Gauge: Constant Voltage Type with separate voltage regulator Chrysler Corp. No. 2209216 (Dodge), No. 2258413 (Plymouth) mounted on back of instrument panel.

Dash Unit - Chrysler Corp. No. 2258241 (Dodge), 2257213 (Plymouth).

Engine Unit - Chrysler Corp. No. 2240744 (King-Seeley & Autolite), No. 2256302 (Stewart Warner).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

① - Six Passenger. ② - Nine Passenger.

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post. Number (example below) includes identification data.

① ② ③ ④ ⑤
5 3 2 6 100001

① - 5 Dodge, 3 Plymouth.
② - Car Model. See below.
③ - 2 Year 1962.
④ - Assembly Plant. See below.
⑤ - Starting Serial Number each plant.

Car Model

1 - Std. Dart or Savoy. 2 - Dart 330 or Belvedere.
3 - Dart 440 or Fury. 4 - Polara or Sport Fury.
5 - 6 Pass. Sta. Wgn. Std. Dart or Savoy.
6 - All Sta. Wgn. Dart 330 or Belvedere.
7 - All Sta. Wgn. Dart 440 or Fury.
8 - Police. 9 - Special.

Assembly Plant

1 - Plymouth (Detroit). 2 - Dodge (Detroit). 3 - Jefferson (Detroit). 5 - Los Angeles. 6 - Delaware. 7 - St. Louis.

ENGINE NUMBER: (361") Stamped on right side of block below distributor. Number (example below) includes identification data.

① ② ③ ④
S 36 8 1

① - Year S 1962.
② - 36 First two numbers of cu. in. displacement
③ & ④ - Month and Year built

318" Engine. Stamped on left front of block under cylinder head. Number (example below) includes identification data.

① ② ③
S 318 1001

① - Year S 1962.
② - Displacement 318" 318 cu. in.
③ - Beginning sequence number.

►*ENGINE NUMBER MARKS:* Stamped on Engine No. pad unless specified otherwise. Identified as follows: "A" All cylinder bores .020" oversize.

"Maltese Cross" One or more bearing journals .001" undersize.

361" Engine. "Maltese Cross" & Letter "X" indicates .010" undersize bearings.

318" Engine. Letter "B" following engine number indicates .010" undersize bearings.

318" Engine. Letters "HD" under serial number indicates 10½" clutch.

318" Engine. A "♦" following serial number indicates .008" oversize lifters.

Letters "LC", "HP" or "SP" stamped on Model pad indicate Low Compression, High Performance or Special police engines.

►*OVERSIZE VALVE NOTE:* Letter "E" (Exhaust), "I" (Intake) marked on upper side of exhaust manifold (318" Eng.), on untapped boss on end of cylinder head (361" Eng.) indicates .005" oversize valves.

TUNE-UP

COMPRESSION PRESSURE: 120-125 lbs. (318"), 125-155 lbs. (361") at cranking speed (120 RPM) with engine warm, spark plugs removed and wide open throttle. Maximum variation between cylinders 20 lbs.

VACUUM READING: 19.5" at idling speed.

VALVE TAPPET CLEARANCE: As follows:

Standard Engine

318" Eng. - .013" Int. .020" Exh. Hot. ①
361" Eng. (SD2, SD3) - Hydraulic, Zero lash.

361", 383", 413" Hi-Perf. Engines (One 4-Bbl. or Two 4-Bbl. Runner Carb.)

268° Camshaft - Hydraulic, zero lash.
268° & 276° Camshaft - .016" Int., .028" Exh. Cold.

413 Hi-Perf. Engine (Two 4-Bbl. Carbs. Ram Induction)

284° Camshaft - .016" Int., .028" Exh. Cold.
292° Camshaft - .016" Int., .018" Exh. Cold.
308° Camshaft - .022" Int., .026" Exh. Cold.

413" Super Hi-Perf. Eng.

.028" Int., .032" Exh. Cold.

① - *Supersedes previous specifications.*

►*413" SUPER HI-PERF. ENGINE VALVE TAPPET ADJUSTMENT CAUTION:* Procedure for adjusting tappet clearance on Standard 413" Engine does not apply to this engine. *See 413" Super Hi-Perf. Eng. Tappet Adjustment under VALVE SYSTEM in Chrysler Corp. Special Data.*

MANIFOLD HEAT CONTROL: Thermostatically controlled valve located at exhaust manifold outlet on right side of engine. Valve must operate freely (lubricate with special lubricant Part No. 1879318). Coil spring should have approximately 3/4 turn wrap with manifold heat control in closed position.

CRANKCASE VENTILATION VALVE: Service at 10,000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035" All Normal Driving, .025" Acceleration Trials.
Spark Plugs - **(318")** Autolite A42 or Champion J-12Y. **(361")** Autolite A-42 or Champion J-9Y (Std.). Champion J-12Y (Custom 880). **(383" & 413" Hi Perf.)** Champion J-9Y (Std.), J-7Y (Optl.). **(413" Super Hi-Perf. Eng.)** J-9Y (Std. Driving), J-2Y (Acceleration Trials).

COIL: Autolite No. 200567 or Essex No. 62-160-2.
Ignition Current - 1.9 amps. idling. 3.0 amps. stopped.
Resistor - Chrysler No. 2095501. 0.6 ohms. Connected in lead between ignition switch and coil. Bypassed during cranking by second lead from ignition switch.

DISTRIBUTOR: Chrysler & Autolite. As follows:

Engine	Distributor No.
318" Synchro-mesh	Chrysler 2095983
318" Auto. Trans.	Chrysler 2095979
318" Pwr. Pack	Chrysler 2095981
361" (Dodge Cust. 880)	Chrysler 2095836
361" (Dodge Polara 500)	Autolite IBS-4006G
361" & 383" Hi Perf.	Autolite IBS-4006G
413" Hi. Perf-	Autolite IBS-4011-A
413" Super Hi-Perf. Eng.	Autolite IBB-4202

NOTE - "IBB" & "IBS" Distributors are double break type.

Condenser - Chrysler No. 2098058 (Chrysler Distr.), No. 1818757 (Autolite Distr.), **Capacity** .25-.285" mfd.
Contact Point Set - Chrysler No. 2098244 (Chrysler Distr.), No. 2299322 (Autolite Distr.).
Breaker Gap - .014-.019".
Cam Angle (Single Breaker) - 27-32° with vacuum line disconnected.
Cam Angle (Double Breaker) - 27-32° (Single set of points), 34-40° (both sets operating together).
Breaker Arm Spring Tension - 17-21.5 ozs.
Rotation - Clockwise (318"), Counterclockwise (361") viewed from above.

IGNITION TIMING

Engine	Ignition Setting
318" Synchro-mesh	① 5° BTDC (Range 0-10° BTDC)
318" Auto. Trans.	① 10° BTDC (Range 5-15° BTDC)
318" Pwr. Pack	① 10° BTDC (Range 5-15° BTDC)
361"	① 10° BTDC (Range 5-15° BTDC)
361" & 383" Hi. Perf.	① 10° BTDC
413" (IBS-4011-A Distr.)	① 10° BTDC
413" (IBB-4202 Distr.)	② 10° BTDC

① - At 500 RPM with vacuum line disconnected.
② - At 800 RPM or 34° at 3000 RPM.

Timing Mark (318") - Graduation marks on crankshaft pulley and pointer on chain case cover. Align proper mark on pulley with pointer.

Timing Mark (361", 383", 413") - Mark on vibration damper and graduations on indicator on timing chain cover. Align vibration damper mark with proper mark on indicator.

CARBURETOR

►*CARBURETOR APPLICATION: Carter & Stromberg carburetors used as follows:*

Engine	Carburetor
318" Std.	Carter BBD or Stromberg WW 2-Bbl.
318" Optl.	One Carter AFB 4-Bbl.
361" (Polara)	One Carter AFB 4-Bbl.
361" (Custom 880)	Stromberg WWC 2-Bbl.
383", 413" Hi-Perf	One Carter AFB 4-Bbl.
361", 383", 413"	① Two Carter AFB 4-Bbl.
413"	② Two Carter AFB 4-Bbl.

① - Runner. ② - Ram Induction.

►*ACCELERATOR SHAFT BIND CORRECTION:* Check accelerator shaft and bracket assembly for proper end-play of .030-.070". Correct by bending assembly using a screwdriver as a pry bar.

►*CARBURETOR SAG, STUMBLE, OR SURGE CORRECTION (318" DART or 361" DODGE CUSTOM 880):* When engine Tune-Up does not correct these conditions, *see "Carter BBD" and "Stromberg WW & WWC" Carburetors in Carburetion Section for recommended changes.*

►*ERRATIC CHOKE OPERATION (361" ENGINES WITH 4-BARREL CARBURETOR):* Poor starting, stalling, erratic fast idle speed, and richness or leanness, may be caused by choke connector rod binding in choke housing. Check by disconnecting rod from choke valve lever with engine warmed up. If resistance felt when rod tilted for removal from lever, correct as follows: Remove choke assembly from engine and allow to cool off. Note position of choke coil hooked end, number and location of washers on rod and spring coil, and position of bracket through which rod is fastened. Remove two pin springs and washers, remove thermostat spring and bracket, lift rod out. Use a square and pliers to correct bend in lower end of rod to exactly 90°. Reassemble choke and install on engine. Recheck rod for freedom from bind.

►*IDLE SETTING CAUTIONS:* When making Idle Speed & Mixture adjustments, observe the following: **1)** Turn headlights on to High Beam to compensate for alternator load (alternator charges battery at idle speed). **2)** On automatic transmission cars loosen nut on sliding link of carburetor-to-bellcrank rod so transmission internal stop will not interfere with carburetor throttle lever. When adjustments completed, move carburetor throttle rod to rear against its stop and tighten locknut.

THROTTLE LINKAGE ADJUSTMENT (All Carb.): With all throttle linkage connected except transmission rod ball socket-to-ball end at upper end of rod, disconnect choke at carburetor or block choke valve in full open position and open throttle slightly to release the fast idle cam, then return carburetor to curb idle. With transmission lever against its stop, adjust length of transmission rod (at upper end) so ball socket lines up with ball end without exerting any force on rod. *NOTE - Socket and Rod must be at sam h ight wh n ch cking rod length.* When adjustment correct, assemble ball socket to ball end. The transmission lever will be in its extreme forward position with carburetor at curb idle. When throttle opened transmission lever will also start its travel with no vertical movement of lever or vertical movement of rod in lever. Assemble remainder of throttle linkage with cable clamp loose, and insert a 3/16" rod, 4" long in holes in dash bellcrank and lever assembly. Adjust position of cable housing ferrule in clamp so that all slack is removed from cable with carburetor at curb idle. To remove slack, move cable in clamp in direction away from carburetor lever. Tighten clamp nut, remove 3/16" rod and connect choke rod or remove choke block.

CARTER BBD

Engine	Cart r Carb. N .
318" Synchro-mesh	BBD 3240S
318" Auto. Trans.	BBD 3241S
361"	BBD 3245S

►*MANIFOLD FUEL DISTRIBUTION: Carbur tor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel 1-4-6-7.*
Idle Setting - 1 turn open. Turn idle speed screw in or out to obtain 500 RPM. *NOTE - Chok valve must b wide open and fast idle screw off fast idl cam.* Turn each mixture screw to obtain highest RPM. Readjust to 500 RPM with Idle Speed Screw. Turn each mixture screw clockwise (leaner) until slight drop in RPM, then turn each mixture screw counterclockwise (richer) just enough to regain lost RPM. Readjust idle speed to

CONTINUED ON NEXT PAGE

S INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

500 RPM. Repeat above procedure if necessary. Move sliding link to rear against stop and tighten nut. **Idl Sp d** - 500 RPM Std. & Air Cond. See *"Idle Setting Cautions" above.*

Float L v l - *NOTE* - Carburetors equipped with synthetic rubber tipped fuel inlet needle and require accurate float adjustment to give best performance and fuel economy. To adjust, proceed as follows: Invert main body so weight of floats **only** is forcing needle against its seat. Fulcrum pin must be fully seated. Use Tool T109-230 or "T" scale placed across inverted bowl at center of floats. Distance from surface of fuel bowl to crown of each float at center should be 9/32". To adjust, hold floats against bottom of bowl and bend float lip toward or away from needle. *CAUTION DO NOT allow lip of float to push against needle while making adjustment. Keep float lip perpendicular to the needle or slanted not more than 10° away from needle when float is set correctly.*

Accel rating Pump - Install connector rod in inner hole of rocker arm and center hole of throttle lever. If connector rod moved to other holes, bowl vent clip must be moved correspondingly.

Fast Idl : 1400 RPM. Turn fast idle adjusting screw. *NOTE* - To align screw with index mark on fast idle cam, bend tang on choke shaft.

Automatic Choke: "Cross-Over" type. Set at Index.

Throttle Linkag Adjustment: *See CARBURETOR above.*

►*OTHER DATA: S "Carter BBD Carburetors" in Carbur tion S ction.*

STROMBERG WW & WWC 2-BARREL

Engin	Stromberg Code No.

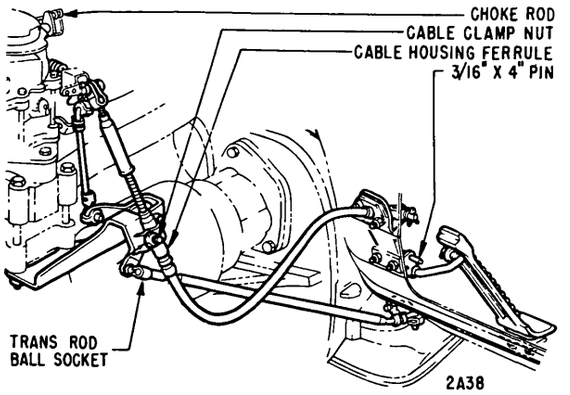
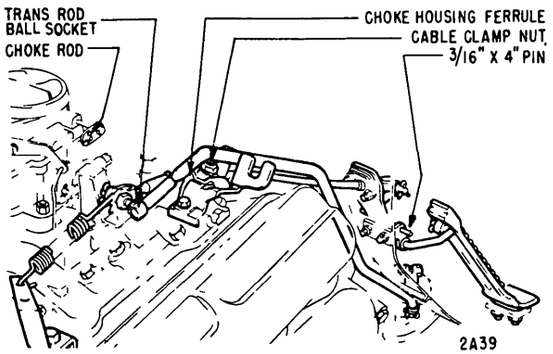
361" Dodge Custom 880	WWC 3-201

Ⓒ - Closed Crankcase Ventilation.



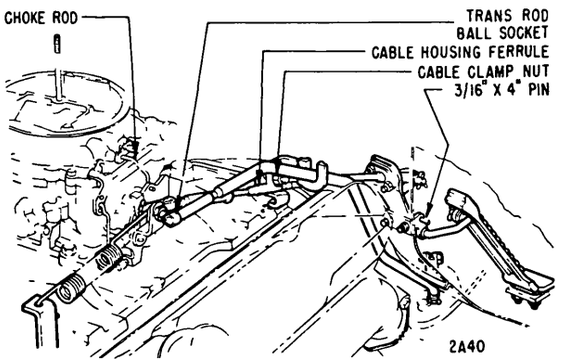
►*STUMBLE ON ACCELERATION OR ENGINE STALL DURING WARM-UP CORRECTION:* Caused by bent pump rocker arm. At normal idle speed (not Fast Idle), vent should be open 1/16" with pump vent clip in middle stroke position. Straighten arm as necessary.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*



Idl Setting - 1½ turns open. Turn idle speed screw in or out to obtain 500 RPM. *NOTE - Choke valve must be wide open and fast idle screw off fast idle cam.* Turn each mixture screw to obtain highest RPM. Readjust to 500 RPM with Idle Speed Screw. Turn each mixture screw clockwise (leaner) until slight drop in RPM, then turn each mixture screw counterclockwise (richer) just enough to regain lost RPM. Readjust idle speed to 500 RPM. Repeat above procedure if necessary. Move sliding link to rear against stop and tighten nut.

Idle Speed - 500 RPM Std. & Air Cond. *See "Idle Setting Cautions" above.*



Float Lev l - *NOTE* - Carburetors equipped with synthetic rubber tipped fuel needle and require accurate float adjustment to give best performance and fuel economy. To adjust proceed as follows: Invert main body so weight of floats **nly** is forcing needle against its seat. Fulcrum pin must be fully seated. Use Tool 73725 or "T" scale, place across inverted bowl at center of floats. Distance from surface of fuel bowl (gasket removed) and top of float at center should be 7/32" (except Custom 880), 1/8" (Dodge Custom 880). To adjust, hold the floats against bottom of bowl and bend float lip (Tool 73605) toward or away from needle. *CAUTION - DO NOT allow float to push against needl while making adjustment. K p float lip perpendicular to the needle or slanted not more than 10° away from needle when float is set correctly.*

AUTO. TRANS. THROTTLE LINKAGE ADJUSTMENT (BBD CARB.)

AUTO. TRANS. THROTTLE LINKAGE ADJUSTMENT (WW CARBS.)

AUTO. TRANS. THROTTLE LINKAGE ADJUSTMENT (AFB CARBS.)

Accelerating Pump - Install connector rod in center (medium stroke) of throttle lever. If connector rod moved to other holes, bowl vent clip must be changed correspondingly.

Fast Idle: 1250 RPM (exc. Custom 880), 1400 RPM (Custom 880) with fast idle adjusting screw on top step of fast idle cam.

Automatic Choke: "Cross-Over" type. **All (exc. Cust m 880)** - Centered on Index. **Custom 880** - 2 Points lean (supersedes previous Index setting).

Throttle Linkage Adjustment: *See CARBURETOR above.*

Belt Adjustment. Use torque or deflection methods

Belt Torque Specifications

Model	New	③Used
Alternator (318")	50	30
Idler Bracket (318")	75	55
Alternator (361") With Air Cond.	60	40
Alternator (361") Less Air Cond.	60	40
Fan Idler (361")	50	35

Deflection Method ℄

Model	New	③Used
Less Air Cond.	1/8"	1/4"
With Air Cond.	②	1/4"
Fan Idler	1/16"	1/8"

℄ - With 5 lb. load at midpoint of belt.
② - 1/8" (318"), 1/4" (361"). ③ - In use 1/2 hour.

REGULATOR

Chrysler Own. No. 2098300 (All Models). Field control type. No cutout Relay or Current Regulator.
Air Gap - .048-.052". Point Gap - .014-.016".
Voltage Setting - 13.7-14.3 volts at 70°F.

►*OTHER DATA: See "Chrysler Alternator & Regulator" in Electrical Section.*

MISC. ELECTRICAL

Lighting Switch Removal (Dodge): Part of Instrument Cluster. *See "Instrument Cluster Removal" below.*

Lighting Switch Removal (Plymouth): Disconnect battery. Pull switch knob out and rotate until flat on shaft is down. Push knob in all the way. Disconnect wires, press spring loaded release button on top center of switch, and pull shaft and knob out of switch. Remove switch mounting bezel on instrument panel and remove switch.

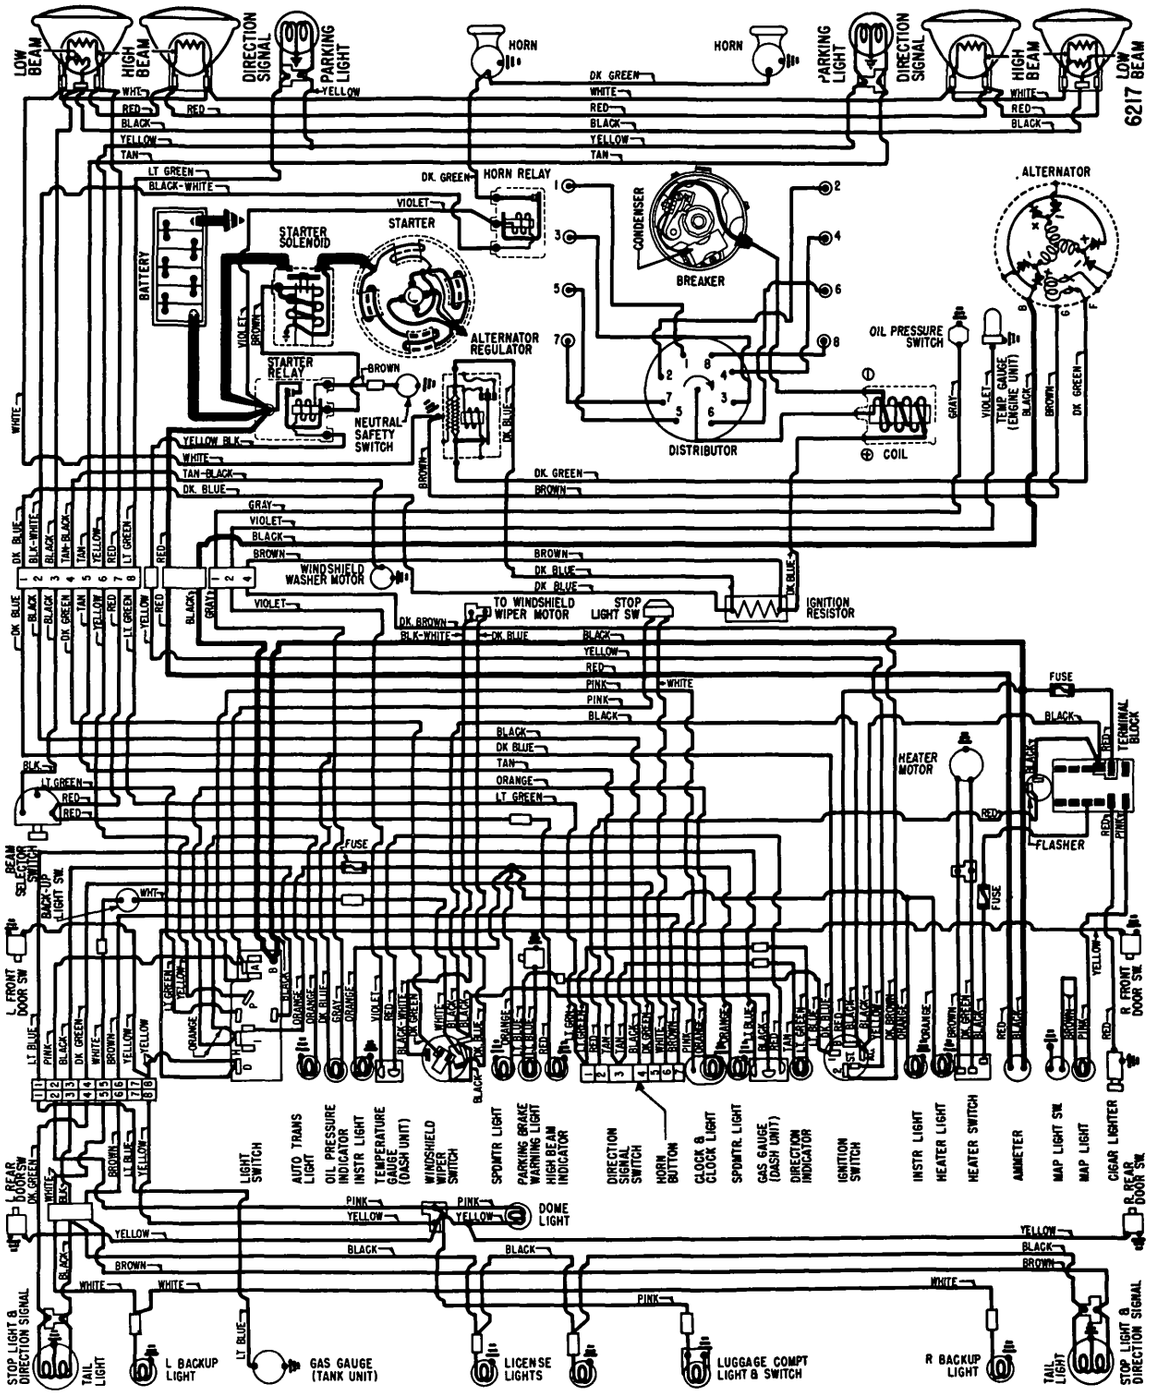
Stop Light Switch Location: Mechanical type, mounted on brake pedal lever bracket.

Adjustment - Adjust position of switch so stop light goes ON in the first 1/8" of pedal pushrod travel.

Cluster Removal (Dodge): *NOTE - Removal of cluster necessary to service instruments.* 1) Disconnect negative battery terminal at battery, and remove steering wheel. Mask steering jacket tube area and disconnect speedometer cable at speedometer.

2) Slide wiper switch knob off stem and remove headlight switch control knob by pressing knob stem release button on under side of instrument panel (pull button must be in full ON position), release spring and pull out knob and stem.

3) Remove heater control knob and remove sleeve on heater control lever and four clutch trip plate-to-clutch base screws and remove trip plate.



4) Remove four cluster panel-to-instrument cluster mounting panel screws and pull cluster forward out of mounting panel, then tilt top of panel downward and roll it over to expose harness, sockets and connectors.

5) Disconnect wire connectors, snap out light sockets and remove cluster assembly.

Installation - Reverse removal procedure.

Speedometer Removal (Dodge): See Cluster Removal above, then remove speedometer attaching screws at rear of base.

CONTINUED ON NEXT PAGE

DODGE CUSTOM 880 WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Installation - Reverse removal procedure.

Clust r R moval (Plym uth): *NOTE - R moval f clust r n c ssary t s rvic instruments.* 1) Remove negative battery cable at battery. Mask steering jacket tube area and remove heater blower switch and temperature control knobs.

2) Disconnect speedometer cable at speedometer and remove four cluster bezel screws. Pull cluster forward and tilt it downward to expose harness, connectors and printed circuit.

3) Disconnect wire connectors, snap out lamp sockets and lead wires to clock and ammeter, then remove cluster. Instruments are secured to cluster base by nuts or screws.

Installati n - Reverse removal procedure.

CIRCUIT BREAKERS: 22.5 Ampere. In headlight switch, protects headlamps & High Beam Indicator.

6 Amper . Variable Speed Windshield wiper, **5 Ampere** Single Speed Wiper. On back of wiper switch.

FUSES: *NOTE* - Fuse block located at left of Glove Compartment and secured to under side of instrument panel.

9 Amp r . Parking, Tail, License Plate, Stop, Dome & Glove Compartment lights.

2 Amp r . Instrument, Clock, Parking Brake lights and Clock.

6 Amp r . Back-Up Lights.

20 Amp r . Heater.

14 Ampere. Cigar Lighter.

⑥ - Hi-Perf. Optl. Engine (Two 4-Bbl. Carb. Runner).

⑦ - Hi-Perf. Optl. Engine (Two 4-Bbl. Carb. Ram).

⑧ - Optl. Compression Ratio 13.5-1.

C mpr ssion & Vacuum R ading - See *TUNE-UP.*

►*361" & 383" ENGINE VIBRATION CORRECTION (AIR COND. CARS):* Install a brace (fabricated from 1" x 1" angle iron or ½" x ½" bar stock) from right hand compressor head to rear of ignition coil mounting pad. It may be necessary to fabricate a triangle plate to mount ignition coil after brace installed.

►*30-35 & 55-65 MPH NOISE CORRECTION (318" Eng. with Auto. Trans.):* When noise is similar to rear axle gear, torque converter, air cleaner or wind noise at crankshaft torsional period, install parts as follows:

Item	Less Air Cond.	With Air Cond.
Damper	2402090	
Pulley	1821411	1855152
Indicator	1947236	
Bolt (5/16"x18x3/4)	Six 180077	
Lockwasher	Six 120214	
Screw	One 1821414	

►*ROUGH IDLE CORRECTION (318" Eng.):* When abnormal roughness occurs after engine tuned to specifications, perform the following service operations: 1) Tighten intake manifold bolts to 35 ft. lbs. 2) Check complete intake system for air leaks. 3) Set tappets to .013" intake, .021" exhaust (at operating temperature). 4) Adjust engine idle speed to 550 RPM in neutral with transmission rod disconnected. 5) Adjust mixture screws to obtain maximum smoothness in neutral. 6) Adjust transmission rod.

►*ENGINE OIL LEVEL CHECK (Early 318" Eng.):* When 4-quart refill (5-quart with filter), brings oil level on dipstick (engines prior to No. S318-55281) above "Full Mark", dipstick should be reworked for correct position for both "Full" and "Add Oil" marks or dipstick replaced with Part No. 2202921.

►*ENGINE OIL LEVEL CHECK (361" Eng.):* When 4-quart refill (5-quart with filter change) brings oil level on dipstick above "Full" mark, dipstick should be reworked for correct position for both "Full" and "Add Oil" marks or dipstick replaced with Part No. 2402227.

►*EXHAUST OIL SMOKE ON STARTING OR AFTER EXTENDED IDLING (1961-62 318" V8 ENGINES BEFORE NO. S318-45889):* Caused by oil entering combustion chamber through exhaust valve guides. Can be corrected by installing special flat type seals, Part No. 2402178, on exhaust valve stems above valve guide. Seals can be installed without removing cylinder head by using compressed air to hold valves up with springs removed. *NOTE* - Regular cup type seals (as used on intake valves and all valves on later engines) cannot be installed on these engines as guide bosses are not machined to take these seals. *See Cylinder Head Production Change Note following.*

►*318" V8 ENGINE CYLINDER HEAD PRODUCTION CHANGE:* Beginning with Engine No. S318-45889, a new cylinder head with machined exhaust valve guide bosses for the installation of "cupped" type valve stem seals was used in production. This cylinder head, No. 2402116, must be used with head gasket, No. 2268376, and cup type valve stem seals are used on all valve stems. Seals are Part No. 2128977. *NOTE* - Flat type exhaust valve stem seals can be used on this engine (see Exhaust Oil Smoke Correction above), but these cup type seals cannot be used on earlier engines.

►*413" SUPER HI-PERF. ENGINE INTAKE MANIFOLD BOLT IDENTIFICATION:* Length of the bolt (tip to under head) for each attaching bolt is indicated by a number located on intake manifold near each access hole to aid in proper installation.

ENGINE REMOVAL: *See "Engine" in Chrysler Corp. Special Data.*

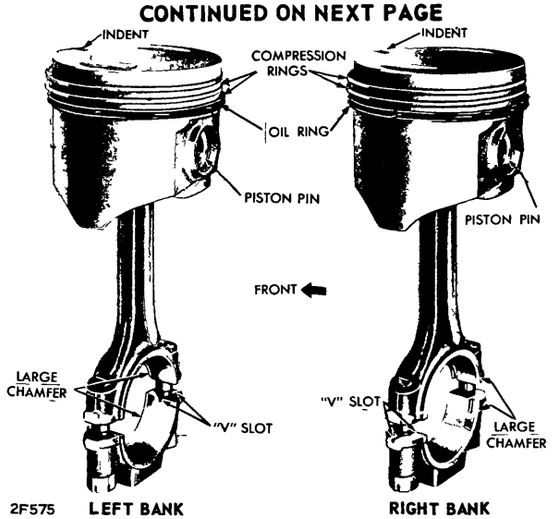
CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Chrysler Corp. Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chrysler Corp. Special Data.*

OIL PAN REMOVAL (318"): Disconnect battery ground at battery and remove dipstick. Raise car, drain oil and remove engine to torque converter housing brace. Remove exhaust cross-over pipe from exhaust manifolds and leave it hang from muffler (unnecessary with dual exhaust). Remove steering and idler arm ball joints from steering linkage center link, then remove oil pan bolts and oil pan.

OIL PAN REMOVAL (361"): Disconnect battery ground at battery and remove dipstick. Raise car on hoist and drain oil. Remove steering and idler arm ball joints from steering linkage center link, then remove oil pan bolts and oil pan.

PISTONS



Cast Aluminum alloy, elliptically turned, tin-plated thermally controlled by steel strut (Std.), Forged Aluminum alloy, domed, trunk-type, elliptically turned (Optional on 413" Hi-Perf. Engine).

►*CYLINDER BORE OVERSIZE NOTE:* Letter "A" within engine number indicates all cylinder bores are .020" oversize.

Removal - Pistons & rods removed from above.

Fitting New Pistons: (318") - Clearance should be .0005-.0015" on thrust side at top of skirt. With .0015" x ½" feeler inserted between cylinder wall and piston at

CONTINUED ON NEXT PAGE

PISTON & ROD ASSEMBLY

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

thrust face, pull required to withdraw feeler should be 5-10 lbs.

(361", 383", 413") - Clearance should be .0003-.0013" between thrust face of piston and cylinder wall, measured at top of skirt on piston and halfway down cylinder wall crosswise of engine.

Installing Pistons: Notch in piston head must be toward front of engine. Assemble piston to rod with notch on same side as large chamfer on lower end of connecting rod (left bank cylinders 1-3-5-7), with notch on side opposite to large chamfer at lower end on connecting rod (right bank cylinders 2-4-6-8). *See Rod Installation.*

PISTON PIN

318" Engine - Floating type with lock ring at each end.
361", 383", 413" Engines - Pin is press fit in connecting rod and special removal and installation procedure required.

Diameter - .9842" (318"), 1.094" (361", 383", 413").
Clearance in Piston: .0001-.0004" (318"), .00035-.00075" (361", 383", 413"). Thumb press fit at 70°F.
Clearance in Rod: .0001-.0004" (318"), thumb press fit in rod at 70°F. .0007-.0012" (361", 383", 413") interference fit.
Piston Pin Removal & Installation (361", 383", 413"): *See "Piston Pins" in Chrysler Corp. Special Data.*
Replacement Pins: Std. and .003", .008" Oversize (318"), Furnished only with new pistons (361", 383", 413").

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.078"	Ⓒ	.015-.0030"
Oil (3)	.186"	Ⓒ	.0010-.009"

Ⓒ - .010-.020" (318"), .013-.025" (361", 383", 413").

Installing Rings: Install compression rings with "Top" mark toward top of piston.
Replacement Rings: Furnished in oversize sets with ranges of Std. to .009", .020-.029", & .040-.049".

CONNECTING ROD

Length (Center-to-Center) - 6.123" (318"), 6.36" (361" & 383"), 6.77" (413").
Weight - 25.6 ozs. (318"), 28.6 ozs. (361" & 383"), 29.8 ozs. (413").
Crankpin Journal Diameter - 2.124-2.125" (318"), 2.374-2.375" (361", 383" & 413").
►*JOURNAL DIAMETER CAUTION (ONE OR MORE Journals Machined UNDERSIZE):* See CRANKSHAFT below.
Lower Bearing - Removable precision type. Bi-metal Grid (318"), Lead base babbitt on steel (361", 383" & 413").

Clearance - .0005-.0015". Wear limit .0025". All Engines.
Sideplay - .006-.014" (318"), .009-.017" (361", 383" & 413"). Total for both rods.

Installing Rods: With pistons correctly installed on connecting rod (see PISTONS above), larger chamfer on lower end of rod should be installed toward nearest crankshaft journal fillet. Oil grooves in rod and bearing cap must be together.
Replacement Bearings: Std. & .001", .002", .003", .010", .012" Undersize.

CRANKSHAFT

Journal Diameter: (318") 2.4995-2.5005". (361") 2.6245-2.6225", (413") 2.7490-2.7500.

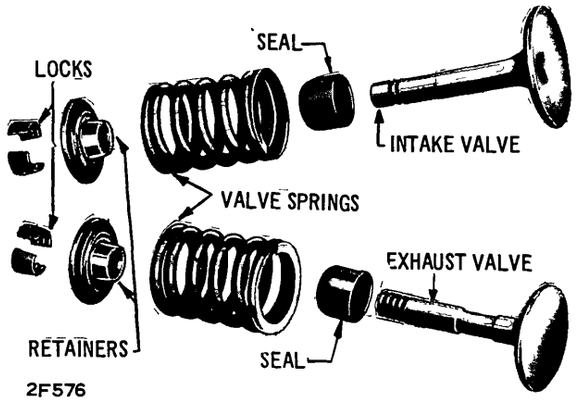
►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:*
.001" UNDERSIZE - Indicated by "Maltese Cross" on engine number pad. Position of undersize Main Journals is stamped on No. 2 counterweight, and position of undersize Connecting Rod Journals is stamped on No. 3 counterweight. Connecting rod journals will be identified by letter "R" and main journals by letter "M". The numbers following letter "R" and "M" indicate journal number.

Bearings - Removable precision type. Tin based babbitt on steel (No. 3 thrust bearing), lead based babbitt on steel (Others). *NOTE* - Copper-lead babbitt bearings optional on Hi-Perf. engines.
Clearance - .0005-.0015" Std. bearings, .010-.025" optional Hi-Perf. engine bearings.
Replacement Bearings: Std. & .001", .002", .003", .010", .012" Undersize.

►*BEARING INTERCHANGEABILITY NOTE:* Upper and lower halves of any bearing are not interchangeable. No. 3 bearing is not interchangeable with other bearings. On 318" engine, No. 5 is not interchangeable with other bearings.

End Thrust: Taken by flanged No. 3 (center) main bearing.
Endplay - .002-.007".
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chrysler Corp. Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chrysler Corp. Special Data.*

CAMSHAFT



►*CAMSHAFT USAGE NOTE:* Various camshafts used. For identification, standard camshafts will show model application, optional camshafts (Hi-Perf. Engines) will be designated as Camshaft Options 268°, 284°, 292°, 308° and qualified by carburetion used. *See Valve Lift, Valve Springs & Valve Timing below.*
►*CAMSHAFT PRODUCTION CHANGE (318" Eng.):* Camshafts Part Nos. 2268990 (Std.), 2268991 (Pwr. Pack) used in production with engine Nos. S318-83038 (Std.), S318-89994 (Pwr. Pack) have eliminated need for use of spacer No. 1618717. Use these camshafts for replacements, discarding old spacer.

Journal Diameter: (1) 1.998-1.999". (2) 1.982-1.983", (3) 1.967-1.968". (4) 1.951-1.952". (5) 1.5605-1.5615" (318"), 1.748-1.749" (361", 383", & 413").
Bearing Diameter: (1) 2.000-2.001". (2) 1.984-1.985". (3) 1.969-1.970". (4) 1.953-1.954". (5) 1.5625-1.5635" (318"), 1.750-1.751" (361", 383" & 413").
Bearings - Removable, lead base babbitt on steel.
Clearance - .001-.003". Wear limit .005".
End Thrust (318"): Taken by thrust plate behind camshaft sprocket hub. **Endplay** - .002-.006". Wear limit .010".
End Thrust (361", 383" & 413"): Controlled by camshaft sprocket hub riding against front face of cylinder block.

Timing Chain (318"): Width 1.02". Pitch .375". Length 68 links.
Timing Chain (361", 383" & 413"): Width .88". Pitch .50" Length 50 links.
Camshaft Setting: Marks on sprockets adjacent and in line with straightedge across shaft centers.
Camshaft Removal: *See "Camshaft & Bearings" in Chrysler Corp. Special Data.*
Engine Front Cover Removal: *See "Engine Front Cover" in Chrysler Corp. Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chrysler Corp. Special Data.*

VALVES

►*OVERSIZE VALVE STEM NOTE:* Letter "E" (Exhaust), "I" (Intake) marked on upper side of exhaust manifold (318" Eng.) on untapped boss on end of cylinder head (361" Eng.) indicates .005" oversize valves.

S INDEXES on Pgs. 4 to 9 for complet CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

413" Super Hi-Perf. Engine - .507" Intake & Exhaust (Zero Lash).
℄ - To center of valve face.
℃ - 1.60" Std., 1.74" or 1.88" Optl.
Valve Seat Width - 1/16"-3/32" Int., 3/64"-1/16" Exh.
Valve Stem Oil Seals - Cup type used on all valves except early production 318" Exh. *See "318" Cylinder Head Production Change" above.*

►*VALVE GRINDING CAUTION:* Check valve height in head after grinding valves using Tool C-3648. If valve tip exceeds maximum (end of cylinder gauge), grind tip down to approach, but do not go below, minimum height (slotted area on gauge).

Valve Springs: Damper used with single spring all engines
►*VALVE SPRING SPECIFICATION NOTE (318" Eng.):* Early valve spring (.192" wire) and later spring (.182" wire) are completely interchangeable in sets or intermixed.

318" Engine (Early)

Valve	Pressure	Length
Closed	83 lbs.	1.69"
Open	177 lbs.	1.31"

318" Engine (Later)

Valve	Pressure	Length
Closed	53 lbs.	1.69"
Open	143.5 lbs.	1.31"

361 Engine Std.

Valve	Pressure	Length
Closed	100 lbs.	1.86"
Open	195 lbs.	1.47"

361", 383", 413" Engines (4-Bbl. & Two 4-Bbl. Carburetors)
(Hyd. Lifters & 268° & 276° Camshafts & 413" Two 4-Bbl. Ram 284° Camshaft)

Valve	Pressure	Length
Closed	100 lbs.	1.86"
Open	195 lbs.	1.47"

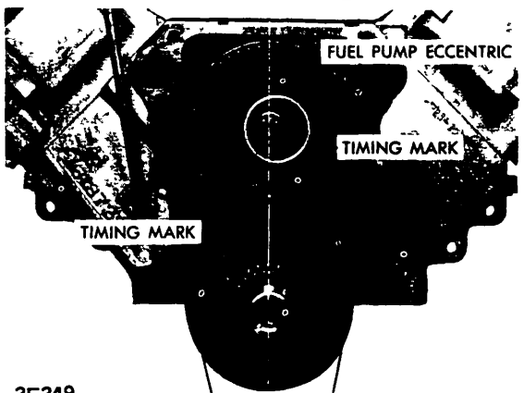
Optional

Valve	Pressure	Length
Closed	90 lbs.	1.86"
Open	226 lbs.	1.43"

413" Engine (Two 4-Bbl. Ram Manifold) (292° & 308° Camshafts)

Valve	Pressure	Length
Closed	90 lbs.	1.86"
Open	226 lbs.	1.43"

Optional No. 1



Valve	Pressure-Outer-Length	Pressure-Inner-Length
Closed	95 lbs. 1.86"	30 lbs. 1.56"
Open	261 lbs. 1.36"	77 lbs. 1.13"

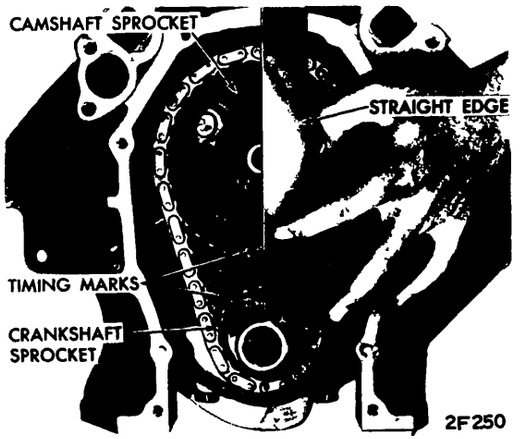
Option No. 2

Valve	Pressure	Length
Closed	120 lbs.	1.86"
Open	305 lbs.	1.39"

Spring Free Length - 2.38" (361"), 2.34" (383" & 413").
Spring Installation (361", 383", 413") - Install all springs with closed coil end toward cylinder head.

Valve Guides: Guides are cast integral with cylinder head. When clearance is excessive, ream guides and install valves with oversize stems. Valves furnished with .005", .015" & .030" oversize stems. Use Tool C-3433 (.005" OS), C-3430 (.015" OS), C-3427 (.030" OS) to ream guides in progressive steps.
►*OVERSIZE VALVE STEM IDENTIFICATION NOTE (318" Eng.):* "I" or "E" on boss above nearest appropriate valve guide indicates that valve is .005" Oversize.
►*PUSHROD INSTALLATION CAUTION:* Small diameter end of pushrod must seat in lifter. Large diameter end must contact rocker arm. Improper installation will cause valves to be held open partially.
Hydraulic Valve Lifters: Used on D-500, Polara 500, Custom 880, Golden Commando & 361", 383", 413" engines with 4-Bbl. and two 4-Bbl. Runner Carburetors. Mechanical lifters used with optional camshafts on 361", 383" & 413" engines.
►*OVERSIZE LIFTER NOTE:* A "♦" on engine serial number pad indicates that lifters are .008" oversize. If only certain lifters are oversize, the diamond will be placed on lifter boss facing engine centerline. These oversize lifters will also have notches on top surface of lifter body.
Diameter - .9040-.9045". **Clearance** - .0005-.0018".
Replacement Lifters: Furnished Std. & .001", .008", .030" oversize.
Lifter Overhaul & Testing: *See "Valve System" in Chrysler Corp. Special Data.*
Rocker Arm Assembly: *See "Valve System" in Chrysler Corp. Special Data.*

318" ENGINE VALVE TIMING MARKS



VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

℄ Valve Timing Specifications

(318" Standard)
Intake Valves - Open 19° BTDC. Close 45° ALDC.
Exhaust Valves - Open 57° BLDC. Close 1° ATDC.

(318" Pwr. Pack)
Intake Valves - Open 13° BTDC. Close 55° ALDC.
Exhaust Valves - Open 51° BLDC. Close 17° ATDC.

361", 383" & 413" ENGINES VALVE TIMING MARK

(361" Polara, Custom 880, D-500 & Golden Command)
Intake Valves - Open 13° BTDC. Close 59° ALDC.
Exhaust Valves - Open 59° BLDC. Close 13° ATDC.

361", 383", 413" Hi-Perf. Engines (4-Bbl. & Two 4-Bbl. Runner)
(Hydraulic & Mechanical Lifters 268° Camshaft)
Intake Valves - Open 22° BTDC. Close 66° ALDC.
Exhaust Valves - Open 62° BLDC. Close 26° ATDC.

(Mechanical Lifters 276° Optl. Camshaft)
Intake Valves - Open 24° BTDC. Close 72° ALDC.
Exhaust Valves - Open 62° BLDC. Close 34° ATDC.

413" Engine (Two 4-Bbl. Ram Manifold) (284° Optl. Camshaft)
Intake Valves - Open 25° BTDC. Close 79° ALDC.
Exhaust Valves - Open 74° BLDC. Close 30° ATDC.

(292° Optl. Camshaft)
Intake Valves - Open 31° BTDC. Close 81° ALDC.
Exhaust Valves - Open 76° BLDC. Close 36° ATDC.

(308° Optl. Camshaft)
Intake Valves - Open 43° BTDC. Close 85° ALDC.
Exhaust Valves - Open 83° BLDC. Close 45° ATDC.

℃ - With valve train solid (Hydraulic Lifters).

VALVE TIMING CHECK (318"): Rotate crankshaft until No. 6 exhaust valve is closing and the No. 6 intake valve is opening. Install a dial indicator on No. 1 intake valve so indicator plunger contacts spring retainer as nearly perpendicular as possible. Turn No. 1 intake valve adjusting screw in one full turn. Adjust indicator to zero. Turn crankshaft clockwise until valve has lifted as shown in table below. Timing on indicator should read from 10° BTDC to 2° ATDC.

(361") - Rotate crankshaft until No. 6 exhaust valve is closing and No. 6 intake valve is opening. Insert a 1/4" spacer between rocker arm pad and stem of No. 1 intake valve (second valve on left bank). Install dial indicator so plunger contacts valve spring retainer as nearly perpendicular as possible. Allow spring load

CONTINUED ON NEXT PAGE

S INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

to bleed down lifter to provide a solid lifter. Turn crankshaft in normal running direction until valve has lifted as shown in table below. Timing on timing indicator should read from 10° BTDC to 2° ATDC. *CAUTION* - Remove spacer before turning crankshaft any further in normal direction.

Valve Timing Check Specifications

Engine	Valve Lift
318" Standard	.033"
318" Pwr. Pack	.024"
361"	.034"

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under "OILING SYSTEM" in Chrysler Corp. Special Data.*

Crankcase Capacity: 4 qts. refill. Add 1 qt. with filter change.

Normal Oil Pressure: 45-65 lbs. at 2000 RPM.

Oil Pressure Relief Valve - Mounted in oil pump. For various springs used, *see "Oiling System" in Chrysler Corp. Special Data.*

Oil Pressure Indicator: Warning light on instrument panel operated by Oil Pressure Switch Part No. 1818830.

Oil Pump (318"): Mounted on rear main bearing cap. Rotor type with strainer mounted on pump body. Strainer must be installed parallel with bottom of cylinder block.

Oil Pump (361",383",413"): Rotor type mounted on cylinder block at lower left front side of engine. **Pump Overhaul (All Pumps):** *See "Oiling System" in Chrysler Corp. Special Data.*

Oil Filter (318"): Partial flow type. Replace filter element every 4000 miles to coincide with engine oil change.

Oil Filter (361",383",413"): Full-flow disposable type. Replace filter element every 4000 miles to coincide with engine oil change.

►*OIL FILTER REPLACEMENT CAUTION (361", 383", 413"):* Use only Filter Element Part No. 1851658 for service replacement. Before installing, make sure that drain-back valve is free by unseating valve with a blunt instrument inserted in four holes in oil filter base.

►*OIL FILTER INSTALLATION CAUTION (361", 383", 413"):* Screw new filter on base until gasket contacts base. Tighten ½-turn additional by hand. DO NOT overtighten.

Crankcase Ventilation (Standard Cars): Filter element in crankcase filler cap and breather tube in right valve rocker arm cover. Clean filter in filler cap every 5000 miles or sooner under heavy dust conditions.

Positive Crankcase Ventilation Cars - Breather tube replaced by tube connecting breather tube with lower part of carburetor throttle body. Ventilation valve located in outlet vent cap regulates crankcase ventilation. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 20 qts. (318"), 16 qts. (361", 383" & 413"). Add 1 qt. for heater.

►*AIR CONDITIONER OPERATION CAUTION:* Engine cooling system must be protected to a temperature of plus 15°F both summer and winter.

Pressure Valve: 14 lb. radiator cap (Std.), 16 lb. (Air Cond.).

Thermostat: Pellet type. In water outlet connection on cylinder head. Opens at 180°F.

Water Pump: Sealed ball bearing type. No lubrication required.
See "Cooling System" in Chrysler Corp. Special Data.

Pump Removal - Drain system, remove shroud (Air Cond. Cars), then loosen fan belt on Air Cond. Cars loosen idler pulley. Remove fan, spacer and pulley. Remove pump to housing retainer bolts and remove pump.

Fluid Fan Drive: Used on Air Conditioned Cars.

Temperature Gauge: Constant voltage type with voltage regulator Chrysler Corp. No. 2209216 (Dodge), No. 2258413 (Plymouth) mounted on back of instrument panel.

Dash Unit - Chrysler Corp. No. 2258241 (Dodge) No. 2258413 (Plymouth).

Engine Unit - Chrysler Corp. No. 2240744 (King-Seeley & Autolite), No. 2256302 (Stewart Warner).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

DODGE LANCER

Body Style	Series 170	Series 770	Series GT

2-Door Hardtop			SV1-P-23
4-Door Sedan	SV1-L-41	SV1-H-41	
4-Door Sta. Wgn.	SV1-L-45	SV1-H-45	

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post. Number (example below) includes identification data.

① ② ③ ④ ⑤
1 3 2 1 100001

① - Car Make 1 Valiant. 7 Lancer.
② - Model Series. 1 2 & 4-Door Sedan (Series 170 & V100). 2 2 & 4-Door Sedan (Series 770 & V200). 4 2-Door Hardtop (Series GT & Signet 200). 5 4-Door Sta. Wgn. (Series 170 & V100).. 7 4-Door Sta. Wgn. (Series 770 & V200).
③ - Model year. 2 1962.
④ - Assembly Plant. 1 or 2 (Valiant) Detroit. 2 or 3 (Lancer) Detroit. 5 Los Angeles. 6 Newark. 7 (Valiant) Valley Park. 7 (Lancer) St. Louis.
⑤ - Beginning serial number at each plant.

ENGINE NUMBER: Stamped on right side of cylinder block below cylinder head opposite No. 1 cylinder. Number (example below) includes identification data.

① ② ③ ④
S 17 8 4

① - Year. S 1962. AS denotes aluminum engine.
② - Displacement. 17 170 cu. ins. 22 225 cu. ins.
③ - Month assembled. 8 August, etc.
④ - Day assembled. 4 4th day, etc.

►*ENGINE NUMBER MARKS:* Identified as follows: "A" on Model Pad indicates .020" oversize cylinder bore.
"♦" on Model Pad indicates .008" oversize tappets.
"Maltese Cross" on Model Pad indicates .001" undersize bearing shells. Location of undersize journals identified by Letter "M" (Main Journal), letter "R" (Connecting Rod Journal) on crankshaft counterweight. *NOTE* - Numbers following letters indicate which journals are undersize.
"X" on Model Pad indicates .010" undersize crankshaft and crankshaft counterweight will be stamped "M-10" or "R-10" to indicate all main and/or connecting rod journals are .010" undersize.

TUNE-UP

►*CARTER CARB. CARS HARD COLD START (NECESSITATES PUMPING ACCELERATOR) & SLOW WARM-UP CORRECTION: See "Carter BBS Carburetor" below.*
►*HOLLEY CARB. CARS IMPROVED PERFORMANCE & FUEL ECONOMY SPECIFICATION CHANGE: See "Holley Carburetors" below for new fl at l v l specifications.*

COMPRESSION PRESSURE: 110-140 lbs. at 130 RPM (plugs removed). Maximum variation between cylinders 20 lbs.
VACUUM READING: 19.5" at idle speed.
VALVE TAPPET CLEARANCE: .010" Intake, .020" Exhaust. Hot.
►*ALUMINUM ENGINE NOTE:* When setting tappet clearance, after engine reaches normal operating temperature, remove cylinder head cover and operate engine for additional 5 minutes at 550 RPM. Make adjustments.
MANIFOLD HEAT CONTROL: Thermostatic coil spring type. Valve must operate freely. When installing, coil spring should be installed so that about one full turn (355° wrap) is required to hook outer end around stud.
CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals and check operation before performing a "Tune-Up" for ignition or carburetor troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAP: .035".
Spark Plugs - Champion N12Y or Autolite AG52. "Long Reach" type. 14mm. Torque to 30 ft. lbs..
►*6 CYL. ENG. SPARK PLUG CARBON AND/OR OIL FOULED CONDITION CORRECTION:* If carburetor and automatic choke operate properly, replace ONLY affected plug with MoPar Spark Plug No. 2098374 (Champion UN12Y auxiliary gap type). *CAUTION* - DO NOT install hotter heat range nor any other type spark plug.
►*SPARK PLUG GASKET NOTE:* A gasket must be used along with aluminum sleeve on each plug to insure against oil leakage into spark plug sleeves.
COIL: Chrysler Nos. 1688212 or 2095223. Autolite No. 200567. Essex No. 62-160-2.
Ignition Current - 1.9 amps. idling, 3.0 amps. stopped.
Resistor - Chrysler No. 2095501 (0,5.0.6 ohms) connected in lead between ignition switch and coil. Bypassed during cranking by second lead from ignition switch.
DISTRIBUTOR: Chrysler No. 2095976 (225" Eng.), 2095974 (170" Eng. exc. Late model with Auto. Trans.), 2098524 (Late 170" Eng. with Auto. Trans.).
►*170" ENG. (WITH AUTO. TRANS.) DISTRIBUTOR CHANGE NOTE:* New distributor No. 2098524 installed on cars in production beginning Eng. No. S-17-3-8. New distributor may be installed on early 170" Eng. with Auto. Trans. to improve low speed performance, especially at high altitudes during wide open throttle operation on steep grades.

Condenser - Chrysler 2098058. **Capacity** .25-.285 mfd.
Contact Point Set - Chrysler No. 2098244.
Breaker Gap - .017-.023".
Cam Angle - 40-45°.
Breaker Arm Spring Tension - 17-21.5 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance - 2095974

IGNITION TIMING

Setting - 2½° BTDC (range 2½° ATDC to 7½° BTDC). *NOTE* - Set timing with distributor vacuum line disconnected and engine idling at 500 RPM in Neutral.
Timing Mark - Timing tab on chain case cover marked "0" and "10" with 5° marks before and after "10". Align timing mark on vibration damper with correct mark on tab.

CARBURETOR

►*CARBURETOR APPLICATION: One Carter BBS single barrel carburetor used on all cars with Closed Crankcase Ventilation. One Holley Model 1920 single barrel carburetor optional for all transmissions.*
►*IDLE SETTING CAUTION:* When making Idle Speed & Mixture adjustments, observe the following: 1) Turn headlights on to high beam to compensate for alternator load (alternator charges battery at idle speed). 2) On automatic transmission cars, unsnap ball joint

CONTINUED ON NEXT PAGE

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

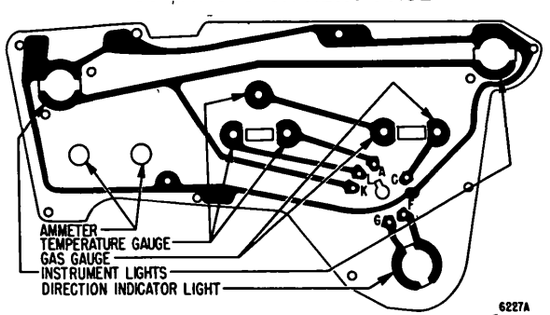
See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

connection at accelerator shaft bellcrank so transmission interval stop will not interfere with carburetor throttle lever. When adjustments completed, screw ball joint up or down until ball on bellcrank will mate exactly with socket.

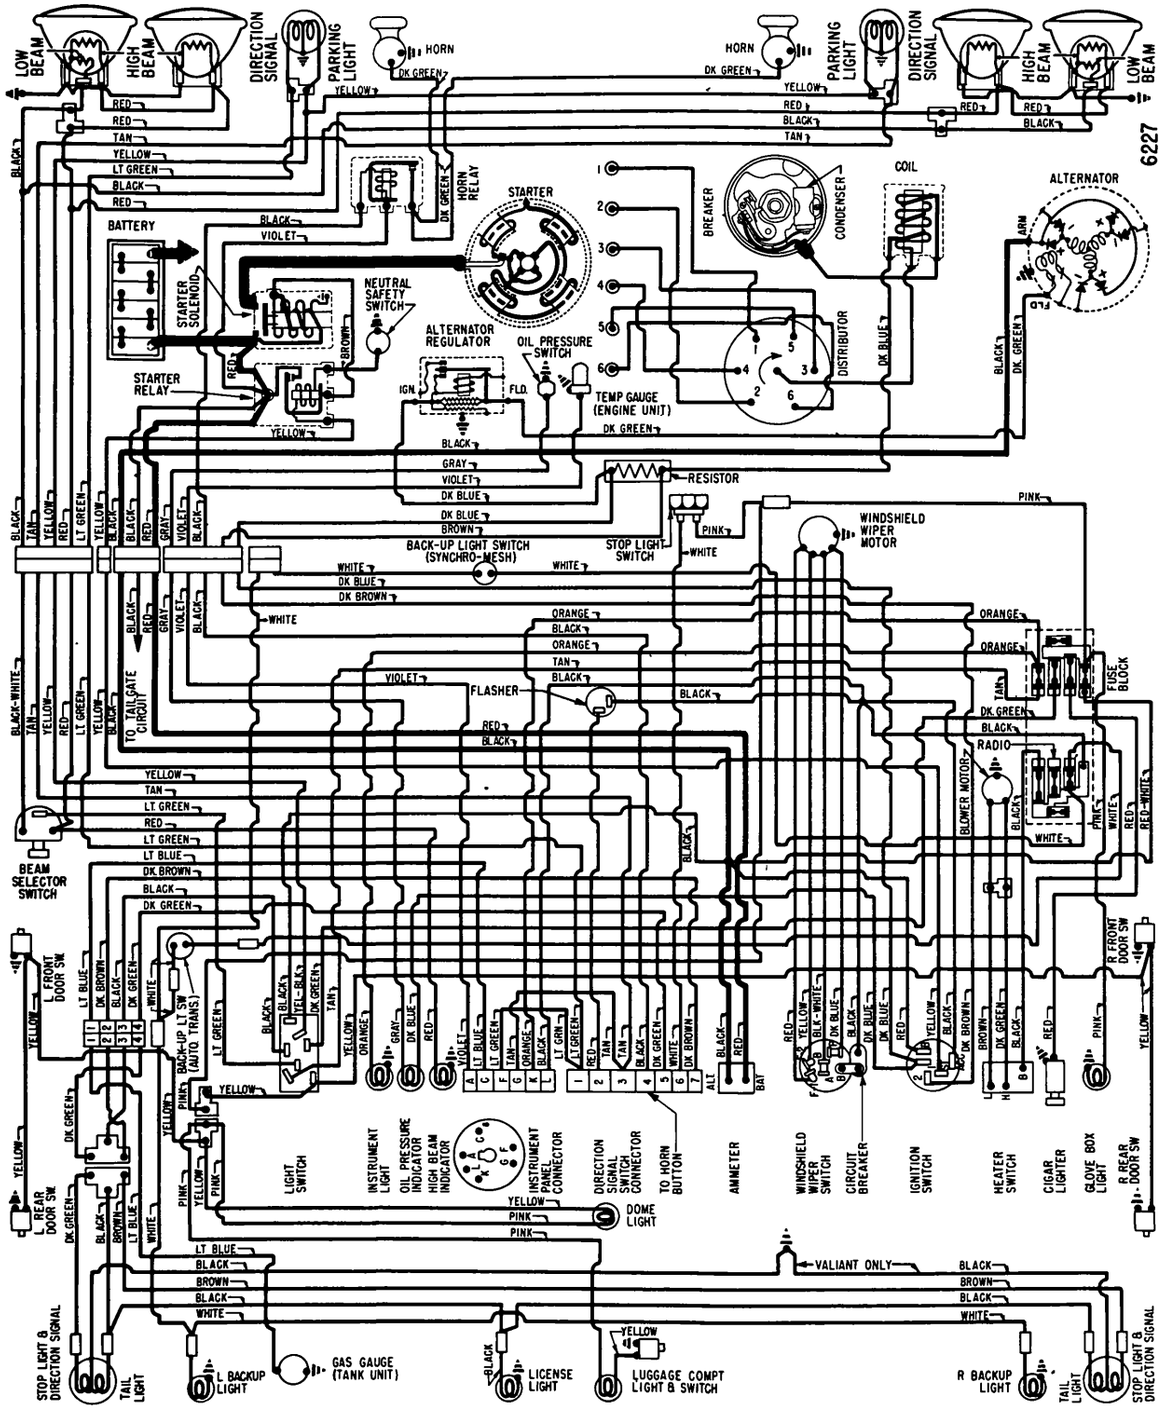
THROTTLE LINKAGE ADJUSTMENT: 1) Disconnect upper end of bellcrank-to-torque shaft rod ball joint. 2) Disconnect choke at carburetor or block choke in full open position. Open throttle slightly to release fast idle cam, then return throttle to curb idle. 3) With locknut loose in transmission rod, insert a 3/16" rod (4" long) through holes in bellcrank bracket and lever assembly. 4) Move transmission lever forward against stop and tighten transmission locknut. 5) Disconnect top end of pedal rod, then adjust to provide 111-113° pedal angle (see illustration). Reinstall top end of pedal rod. 6) Remove 3/16" rod from bellcrank bracket and lever assembly. Adjust length of transmission bellcrank-to-torque shaft rod by means of adjustment screw. The correct rod length allows the ball socket to line up with the ball end when rod is held upward against transmission stop. 7) Install ball socket on torque shaft lever ball end, connect choke rod.

CARTER BBS



►*HARD COLD START (NECESSITATES PUMPING ACCELERATOR) & SLOW WARM-UP CORRECTION:* Condition may be caused by "R" Series (1961) choke coil housing which has a shorter choke rod than the correct "S" Series (1962) model, preventing choke valve from closing enough for starting engine.

Carter BBS. Used as follows:



Model	Carburetor No.
170" Synchro-mesh Trans.	3229S
170" Auto. Trans.	3230S
170" Closed Crankcase Ventilation (All Trans.)	3234S
170" Taxi (All Trans.)	3286S
170" Taxi (With Closed Crankcase Ventilation)	3287S
225" Synchro-mesh Trans.	3237S
225" Auto. Trans.	3238S
225" With Closed Crankcase Ventilation (All)	3239S

Idle Setting - ½-1½ turns open. With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn screw in until speed starts to drop. Turn screw out just enough to recover lost engine speed. Readjust idle speed screw for correct engine idle speed.

CONTINUED ON NEXT PAGE

LANCER & VALIANT PRINTED CIRCUIT

LANCER & VALIANT WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Idle Speed - 550 RPM with headlights on high beam and accelerator shaft rod ball joint unsnapped. See *"Idle Setting Caution"* above.

Float Level - With main body inverted and float hanging free (off car), or with sufficient fuel in bowl so only pressure of buoyant float holds float lip firmly against fuel inlet needle (on car), float fulcrum pin seated against fulcrum pin retainer, distance from bowl surface (gasket removed) to crown of floats at center should be 7/32" measured with Gauge T109-239. To adjust, bend float lip. *CAUTION - DO NOT compress rubber tip of fuel inlet needle as incorrect float level setting will result.*

Accel Pump - Install throttle connector rod in center hole of throttle lever.

Fast Idle: 170" Engine - 1300 RPM (Auto. Trans. without Closed Crankcase Ventilation), 1400 RPM (Others).
225" Engine - 1300 RPM (Synchro-mesh Trans.), 1400 RPM (Auto. Trans.).

Automatic Choke: "Cross-Over" type. 2 notches rich.

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA: See "Carter BBS Carburetors" in Carburetion Section.*

HOLLEY MODEL 1920

Model	Carburetor No.
170" (Synchro-mesh Trans.)	R-2136A
170" (Auto. Trans.)	R-2416A
225" (Synchro-mesh Trans.)	R-2303A
225" (Auto. Trans.)	R-2417A

Idle Setting - ½-1½ turns open. With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn screw in until speed starts to drop. Turn screw out just enough to recover lost engine speed. Readjust idle speed screw for correct engine idle.

Idle Speed - 550 RPM with headlights on high beam and accelerator shaft rod ball joint unsnapped. See *"Idle Setting Caution"* above.

Fuel Level: 11/16" below machined mounting surface of power valve (economizer) with engine running and car on level floor. Remove power valve assembly and use scale to measure fuel level. *See "Holley Single Barrel Model 1920 Carburetor" in Carburetion Section for adjustment procedure.*

Accel Pump - Install throttle connector rod in center hole of throttle lever.

Fast Idle: 170" Engine - 1500 RPM (Synchro-mesh), 1800 RPM (Auto. Trans.).
225" Engine - 1500 RPM (Synchro-mesh), 1700 RPM (Auto. Trans.).

Automatic Choke: "Cross-Over" type. Set at Index.

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA: See "Holley Model 1920 Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter M2996S. Mechanical type.
Pressure - 3½-5 lbs. at 500 RPM.

Fuel Filter: Disposable paper type, located in fuel line between pump and carburetor. Replace element every 16,000 miles.

Gasoline Gauge: Constant voltage type with voltage regulator inside Temperature Gauge.
Dash Unit - Chrysler No. 2257926 (Lancer), No. 2256348 (Valiant).
Tank Unit - Chrysler No. 2209296.

Air Cleaner: Paper element type. Clean every 8,000 miles or more often as required. Replace every 32,000 miles.

►*CLEANING CAUTION:* Remove cleaner from carburetor and remove cover from element. Clean inside cover with compressed air and gently clean element by holding air nozzle at least two inches from inside of screen. Discard element if it has been punctured. Check soft plastic sealer on both sides of element for smoothness.

ELECTRICAL

►*ELECTRICAL NOTE: For BATTERY, STARTER, ALTERNATOR & ALTERNATOR REGULATOR, see "Dodge Dart Six & Plymouth Six" Car Model Pages.*

MISC. ELECTRICAL

Lighting Switch Removal: Remove Instrument Cluster Bezel, see below, then remove nut securing switch to cluster base and remove switch from back of base.

Stop Light Switch Location: Mechanical type, mounted on brake pedal lever bracket.
Adjustment - Adjust position of switch so stop light goes on in first 1/8" of pedal pushrod travel.

Instrument Cluster Removal: Remove battery ground cable and cover jacket tube area with masking tape. Remove headlight and wiper switch knobs by inserting screwdriver in slot of knob to depress retaining spring while pulling knob outward. Remove four cluster bezel screws and pull bezel towards driver's seat and tilt it out at top edge. Remove printed circuit and instrument assembly attaching screws (eight) and carefully lift assembly upward towards driver's seat. Remove multi-connector from printed circuit pins (pull on connector while pushing against master locator). DO NOT DAMAGE Gauge Hands and Dials. Disconnect leads to ammeter, then remove cluster.

Speedometer Removal: Remove instrument cluster bezel, see Instrument Cluster Removal above, removing speedometer cable and remove three screws securing speedometer to bezel base.

Instrument Lights: All instrument light bulbs can be replaced (except right hand printed circuit bulb) by reaching up behind panel. Right hand printed circuit bulb requires the removal of either the printed circuit or the radio speaker grille and speaker.

CIRCUIT BREAKERS & FUSES: *See "Dodge Dart Six & Plymouth Six" Car Model Pages.*

ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl., valve-in-head, inclined 30° to right, of same design used previously.

►*ALUMINUM ENGINE NOTE (225" Optl.): Specifications are the same as for Cast Iron Engine except where noted. See "Aluminum Engine Service Cautions" in Chrysler Corp. Special Data.*

Engine	Bore	Stroke	Displacement
225"	3.41"	4.125"	225 cu. ins.
170"	3.41"	3.125"	170 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
225"	8.2-1	27.7	145 at 4000 RPM
170"	8.2-1	27.7	101 at 4400 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Chrysler Corp. Special Data.*

CYLINDER HEAD: Cast Iron Engine - Either the Std. cast iron head or the "Special" cast iron head (Aluminum block) may be used.
Aluminum Engine - Cast iron head with word "Special" cast between lifting pads on left side of head. Use only this head on Aluminum block.
See "Cylinder Head & Manifold" in Chrysler Corp. Special Data.

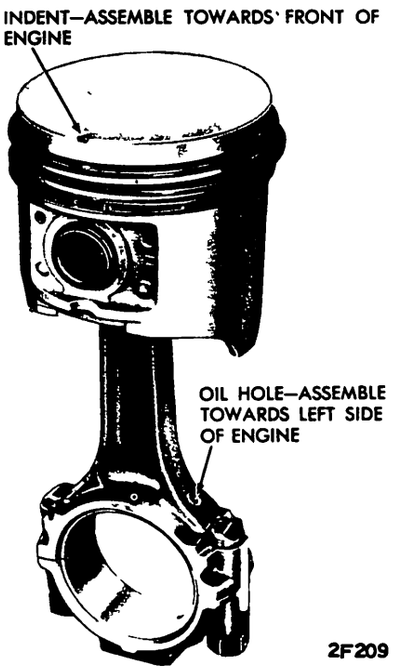
TIGHTENING TORQUES: *See "Tightening Specifications" in Chrysler Corp. Special Data.*

OIL PAN REMOVAL: Using tie rod end puller Tool C-3742, remove steering and idler arm ball joints from steering linkage center link. Remove dust shield and motor stud nuts. Remove horns and mounting brackets, then disconnect battery negative ground cable. Install engine lifter plate Tool C-3804 and Fixture C-3809. Raise engine 1½-2". Raise car on hoist, then remove oil pan.

PISTONS

Horizontal slot, steel band, elliptically turned, tin-plated.

►*CYLINDER BORE OVERSIZE CAUTION:* Letter "A" on engine number pad indicates .020" oversize cylinder bore.



Weight - 16.0 ozs.

Removal - Pistons and rods removed from above.

Clearance - .0005-.0015" at top of skirt.

Fitting New Pistons - Use micrometers with piston and cylinder bore clean and dry and at 70°F. Measure

CONTINUED ON NEXT PAGE

PISTON & ROD ASSEMBLY

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

cylinder bore halfway down and at right angles to crankshaft.

Installing Pistons - Notch in piston head must be toward front of engine.

Replacement Pistons: Furnished with pins in Std. and .005", .020", .040" Oversize. *NOTE* - All pistons are machined to same weight.

PISTON PIN

Press fit in connecting rod.

Diameter - .9007-.9008". **Length** - 2.995-2.975".

Pin Fit in Piston - .00045-.00075" clearance. Pin should be sliding fit in piston at 70°F.

Pin Fit in Rod - .0007-.0012" interference fit. Special procedure and tools used for removal and installation. *See "Piston Pins" in Chrysler Corp. Special Data.*

Replacement Pins: Std. size only. Furnished as an assembly with new pistons.

PISTON RINGS

(170" Engine) - Compression ring cast iron, low taper and twist, tin plated. Oil ring single piece cast iron.

(225" Engine) - No. 1 compression ring taper twist, tin plated, No. 2 compression ring reverse twist, taper face, Lubrite coated. Oil ring, three-piece with two chrome plated rails and stainless steelexpander (spacer).

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.0775-.0780"	.010-.020"	.0015-.0040"
Oil (3)	.1860-.1865"	.015-.062"	.0090" Max.

Installing Rings - Mark "Top" on compression rings must be toward top of engine.

Replacement Rings: Furnished in sets for oversize ranges as follows: Std. to .009", .020-.029", .040-.049".

CONNECTING ROD

Length (Center-to-Center) - **(170")** 5.707", **(225")** 6.999".

Weight - (170") 25.68 ozs. **(225")** 27.3 ozs.

Journal Diameter - 2.187". Out of round limits .001".

►*JOURNAL DIAMETER CAUTION (ONE OR MORE Journals machined UNDERSIZE): See CRANKSHAFT below.*

Clearance - .0005-.0015".

Side Clearance - .006-.012"

Bearing Adjustment - None, replace bearings.

Installing Rods: Notch in head of piston must be toward front of engine and oil squirt holes in lower end of rod must be toward left side of engine.

Replacement Bearings: Std. and .001", .002", .010" Undersize.

CRANKSHAFT

Journal Diameter - 2.7495-2.7505".

Bearing Type - Removable precision type, lead-base babbitt on steel, exc. thrust bearing which is tin-base babbitt on steel.

►*ALUMINUM ENGINE MAIN BEARING NOTE:* Same as for cast iron engine except that oil feed holes in bearings are in a different location and require special inserts. *CAUTION* - DO NOT use cast iron block original main bearing inserts in aluminum block. Upper and lower bearing caps are cast iron and are line bored in complete sets. If replacement is required, all four upper and lower main bearing caps must be replaced with a matched set for proper alignment. Identification numbers are stamped on upper caps and cast into lower caps. When upper and lower caps are installed, bearing tab slots should be on left side of engine.

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize crankshaft journals identified as follows:

"MALTESE CROSS" - On Model Pad, indicates .001" undersize journals. Location of the undersize journals is indicated by letter "M" (Main Journal), "R" (Connecting Rod Journal) on crankshaft counterweight. *NOTE* - Numbers following letter "M" or "R" indicate which journal or journals undersize.

"X" - On Model Pad indicate .010" undersize crankshaft and crankshaft counterweight will be stamped "M-10" or "R-10" indicating all main or all connecting rod journals .010" undersize.

►*MAIN BEARING INTERCHANGEABILITY CAUTION:* Upper halves have oil holes, are grooved and are not interchangeable with lower halves. No. 3 bearings are flanged for crankshaft end thrust control. No. 1 upper is chamfered for timing chain lubrication and is marked "Red" on edge. No. 2 & 4 uppers are interchangeable. No. 1, 2 & 4 lowers are interchangeable.

Clearance - .0005-.0015". Wear limit .0025".

Endplay - .0035-.0085".

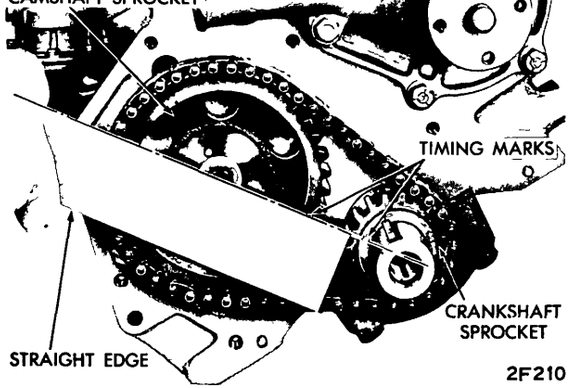
End Thrust - Taken by No. 3 (rear intermediate) main bearing.

Replacement Bearings: Std. and .001", .002", .010" Undersize.

►*MAIN BEARING SERVICING NOTE:* Bearing caps are numbered and must be installed in correct position (not interchangeable).

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chrysler Corp. Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chrysler Corp. Special Data.*



CAMSHAFT

Journal Diameter - **(1)** 1.998-1.999", **(2)** 1.982-1.983", **(3)** 1.967-1.968", **(4)** 1.951-1.952".

Bearings (Cast Iron Eng.) - Lead-based babbitt on steel.

Bearings (Aluminum Eng.) - Bearing inserts not used. Camshaft bearing journals run directly in finished bores in block.

Clearance - .001-.003". Wear limit .005".

ENGINE VALVE TIMING MARKS

End Thrust: Taken by rear face of sprocket hub on front face of block. No thrust plate used.

Timing Chain: Side guide type. **Width** .88". **Pitch** .50", **Length** 50 links. Replace chain when slack as measured on rim of camshaft sprocket exceeds 11/64" (hold crankshaft sprocket stationary, use torque wrench to turn camshaft in both directions applying 30 ft. lbs. turning torque (if cylinder head installed), 15 ft. lbs. turning torque (if head off).

Camshaft Removal: *See "Camshaft & Bearings" in Chrysler Corp. Special Data.*

Camshaft Setting: Marks on sprockets must be adjacent and in line across shaft centers.

Engine Front Cover Installation: *See "Engine Front Cover" in Chrysler Corp. Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chrysler Corp. Special Data.*

VALVES

Tappet Clearance: (Cast Iron Eng.) - .010" Intake, .020" Exhaust. Hot.

►*OVERSIZE TAPPET NOTE:* A "♦" on Model Pad indicates .008" oversize tappets.

(Aluminum Eng.) - Same as for Cast Iron Eng. *See below.*

►*ALUMINUM ENGINE NOTE:* When setting tappet clearance, after engine reaches normal temperature, remove rocker arm cover and operate engine for an additional 5 minutes at 550 RPM before making adjustments.

Valve	Head Diam.	① Stem Diam.	Length
Intake	1.615-1.625"	.372-.373"	4.774"
Exhaust	1.355-1.365"	.371-.372"	4.797"

Valve	Seat Angle ②	Lift	Stem Clearance
Intake	45°	.375"	③ .001-.003"
Exhaust	45°	.360"	④ .002-.004"

① - Std. Also furnished .005", .015", .030" Oversize.
② - Valve face angle 45° Intake, 47° Exhaust.
③ - Wear limit .004". ④ - Wear limit .006".

Valve Seat Width - .070-.090" Intake, .040-.060" Exhaust.
Valve Stem Oil Seals - Cup type seals used on all valve stems (long seal on intake, short seal on exhaust).

Valve Guides: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance is excessive. Valves with oversize stems furnished .005", .015", .030" Oversize. Use Reamer Tool No. C-3433 (.005" O.S.), C-3430 (.015" O.S.), C-3427 (.030" O.S.) in sequence.

Valve Springs: Free length 2". *NOTE* - Damper spring used inside valve spring on Hyper Pack engine.

Valve Spring Specifications

Valve	Pressure	Length
Closed	83 lbs.	1 11/16"
Open	177 lbs	1 5/16"

Valve Spring Installation - Valve spring ends must be square within 1/16". Check installed height of spring which must not exceed 1 11/16" (measure from face of

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

spring seat in cylinder head to lower face of spring retainer). If height greater, install 1/16" spacer in head counterbore to bring spring height within limits of 1 5/8" to 1 11/16".

Valve Lifters: Mechanical type on all engines.

Rocker Arm Assembly: *See "Valve System" in Chrysler Corp. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications
(All 170" & 225" Std. Engines)

Intake Valves - Open 8° BTDC. Close 44° ALDC.
Exhaust Valves - Open 48° BLDC. Close at TDC.

Valve Timing Check - Turn crankshaft until No. 6 exhaust valve is closing and No. 6 intake valve is opening. Install dial indicator so pointer contacts No. 1 intake valve spring retainer parallel to axis of valve stem. Turn No. 1 intake valve adjusting screw one full turn to remove all lash, zero dial indicator and rotate crankshaft clockwise (normal running direction) until valve has lifted .018". Timing on timing tab should read from 12° BTDC to TDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under "OILING SYSTEM" in Chrysler Corp. Special Data.*

►*ALUMINUM ENGINE OILING SYSTEM NOTE:* Same as for Cast Iron Eng. except that oil to main bearings passes through upper main bearing caps, then to bearings.

Crankcase Capacity: 4 qts. refill. Add 1 qt. for filter change.

Normal Oil Pressure: 45-60 lbs. at 40-50 MPH.

►*RELIEF VALVE SPRING NOTE:* Three types of springs available. Replace with same color spring, *see "Oiling System" in Chrysler Corp. Special Data.*

Oil Pressure Indicator: Indicator light on Instrument Panel operated by Oil Pressure Switch, Chrysler Corp. No. 2256800. On oil pump on right side of block.

Oil Pump: Rotor type. On right side of crankcase.
Overhaul - *See "Oiling System" in Chrysler Corp. Special Data.*

Oil Filter: Full-flow type. Replace filter element every 4,000 miles, to correspond with oil changes.

Crankcase Ventilation: (Standard Cars) - Filter in filler cap (air intake) and outlet vent tube extending from rocker arm cover to right rear of engine. Wash filler cap in kerosene and re-oil with SAE 30 engine oil every 8,000 miles or more often in dusty areas.

Positive Crankcase Ventilation Cars: Vacuum tube connects outlet breather cap with lower part of throttle body. A ventilation valve is located in outlet vent cap and regulates crankcase ventilation. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 11 qts. (170"), 12 qts. (225") Std. Add 1 qt. for heater.

►*AIR CONDITIONER OPERATION CAUTION:* Engine cooling system must be protected to a temperature of 15°F (above zero) both summer and winter.

Pressure Valve: 14 lb. std., 16 lb. Air Cond. Cars, pressure radiator filler cap.

Thermostat: Pellet type. In water outlet connection on cylinder head (160°F) No. 2129206 (180°F) No. 2129205.

Water Pump: Sealed ball bearing, packless type. No lubrication required.
See "Cooling System" in Chrysler Corp. Special Data.

Pump Removal - Drain cooling system and remove fan shroud if equipped with Air Cond. Loosen alternator mounting bracket (to loosen fan belt) and swing alternator in towards water pump. On Air Cond. Cars, loosen idler puller. Remove pump.

Temperature Gauge: Constant Voltage Type with voltage regulator inside gauge.
Dash Unit - Chrysler Corp. No. 2256351.
Engine Unit - Chrysler Corp. No. 2240744 (King-Seeley & Autolite), No. 2256302 (Stewart Warner).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

ENGINE

COMET & FALCON

ENGINE REMOVAL: *NOTE* - Engine only is removed Do not remove transmission Proceed as follows

1) Remove hood, drain cooling system and crankcase remove air cleaner and disconnect battery ground cable Remove radiator drive belt fan and pulley Disconnect heater hoses at water pump and at carburetor heater spacer outlet generator and starter wires at units accelerator rod and choke control cable at carburetor

2) Disconnect windshield wiper hose at vacuum pump Remove fuel pump bowl and disconnect flexible fuel line from tank line (plug tank line) Disconnect primary wire at coil and oil and temperature sending unit wires at units Remove starter and dust seal

3) Disconnect clutch retracting spring and remove equalizer shaft and arm bracket from underbody rail Remove flywheel or converter upper retaining bolts (accessible through floor pan) and disconnect exhaust pipe from manifold Disconnect engine mounts and remove flywheel or converter housing cover Remove flywheel housing lower bolts (synchro-mesh), disconnect converter from flywheel and remove converter housing lower bolts (auto trans)

4) Support transmission and flywheel or converter attach lifting hooks under exhaust manifold remove engine

FORD 6 CYLINDER CARS

ENGINE REMOVAL: *NOTE - Unnecessary to remove transmission Procedure below is for r moval of engine only* Drain cooling system and crankcase Disconnect all wires, cables, and hoses from engine units (also disconnect and plug automatic transmission oil cooler lines at radiator) Remove radiator and air cleaner Disconnect accelerator and throttle linkage (tie accelerator bracket to dash) Disconnect exhaust manifold, remove starter and automatic transmission filler tube bracket Remove engine rear plate upper right bolt and disconnect clutch linkage (remove bracket from rear of engine) Remove flywheel or converter housing cover Remove flywheel-to-converter nuts and hold converter in housing Disconnect flywheel or converter housing from engine, support transmission and remove rest of engine rear plate bolts Disconnect engine front mounts and remove engine (Lifting Hook, T52L-6000-C, may be used)

MERCURY 6 CYLINDER CARS

ENGINE REMOVAL· *NOTE - Procedure below is for removal of engine only* **1)** Remove hood Drain cooling system and crankcase Disconnect all wires, cables, and hoses from engine units (also disconnect and plug automatic transmission oil cooler lines at radiator) Remove radiator and fan guard assembly, and air cleaner Disconnect accelerator and throttle linkage from carburetor and engine Disconnect power steering pump from water pump and position out of way so oil will not drain out (unnecessary to disconnect hoses) Remove starter and dust seal and crankcase ventilation tube Disconnect exhaust pipe from exhaust manifold Disconnect engine front mounts at frame

2) Synchr -m sh Cars - Disconnect clutch linkage from flywheel housing Remove propeller shaft Disconnect shift rods, wires, and cables from transmission Support rear of engine and disconnect engine rear mount from transmission Remove flywheel housing lower cover Disconnect transmission from flywheel housing and slide transmission rearward so input shaft clears housing Disconnect engine front mount brackets from engine and remove engine *NOTE* - Lifting Bracket 6000-AB may be attached to cylinder head bolts (after valve rocker cover removed) to aid in lifting engine

3) Automatic Transmission Cars - Remove converter housing bolts Support transmission, remove converter housing lower cover, and disconnect converter from flywheel Secure converter in housing Attach Lifting Bracket 6000-AB to cylinder head bolts (remove valve rocker cover), and remove engine

FORD V8 CARS & THUNDERBIRD

ENGINE REMOVAL: *NOTE - Procedure below is for removal of engine only* Drain crankcase and cooling system Remove hood and air cleaner Disconnect all wires, hoses, cables, lines, and brackets from engine (do not disturb radiator supply tank, remove with engine) Remove dipstick Disconnect accelerator and throttle linkage from carburetor and engine (remove accelerator cross shaft bracket) Remove power steering pump from engine and position to prevent loss of oil (unnecessary to disconnect hoses) Isolate air conditioning compressor and disconnect hoses *S e "Ford Motor Co Air Conditioning ' in Miscellaneous Section* Swing coil out of way (292"), remove coil (352",390",406") Place distributor cap near center of engine (292") Remove flywheel or converter housing-to-engine upper bolts Remove starter, dust seal, and automatic transmission filler tube bracket Remove oil filter (292") Disconnect muffler inlet pipes from exhaust manifolds and engine support insulators from frame Remove flywheel housing lower cover, disconnect clutch linkage (remove bracket from engine), disconnect converter from flywheel (secure converter in housing), and remove remaining flywheel or converter-to-engine bolts Support transmission, attach lifting hooks, Tool T53L-6000-B (292"), T58P-6000 A (352",390",406"), and sling T53-L-300-A, and remove engine

MERCURY V8 CARS

ENGINE REMOVAL: *NOTE - Procedure below is for removal of engine only* **1)** Remove hood, battery, and battery carrier Drain cooling system and crankcase Remove radiator Remove fan, spacer, and pulley assembly from water pump Remove oil filter (292") Remove coil (352",390",406") Remove engine and automatic transmission dipstick Isolate air conditioning compressor and disconnect hoses *See "Ford Motor Co Air Conditioning" in Miscellaneous Section* Remove power steering pump from engine and position to prevent loss of oil (unnecessary to disconnect hoses) Place distributor cap near center of engine (292") Disconnect all wires, hoses, cables, lines, and brackets from engine Disconnect accelerator and throttle linkage from carburetor and engine (remove accelerator cross shaft bracket) Disconnect exhaust pipes from exhaust manifolds Disconnect engine front mounts from engine

2) Synchr -m sh Cars - Remove flywheel housing lower cover Disconnect clutch linkage from flywheel housing

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Disconnect shift rods and speedometer cable from transmission. Remove propeller shaft. Disconnect engine rear mount from transmission and disconnect transmission from flywheel housing. Slide transmission rearward until input shaft clears flywheel housing. With Lifting Hooks, 6000-E (292"), 6000-BD (352",390",406"), and Lifting Sling, 6000-BA, remove engine.

3) Aut matic Transmissi n Cars - Remove converter housing lower cover and disconnect converter from flywheel. Secure converter in housing. Disconnect converter housing from engine (support transmission and converter, and rear of engine). With Lifting Hooks, 6000-E (292"), 6000-BD (352", 390", 406"), and Lifting Sling, 6000-BA, remove engine.

LINCOLN CONTINENTAL

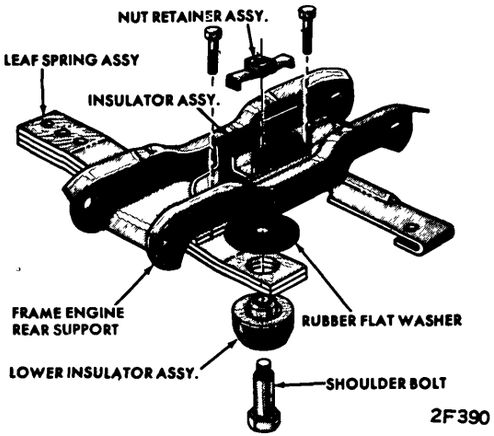
ENGINE REMOVAL: *NOTE - Following procedure is for r moval of ngin only.* Remove hood. Drain cooling system and crankcase. Remove air cleaner and air inintake duct assembly. Remove speed control unit. Remove battery. Disconnect all wires, lines, hoses, cables, and brackets from engine (disconnect and plug transmission oil cooler line at radiator). Remove transmission fluid filter. Remove fuel pump heat shield and fan shield. Remove fan, fluid fan drive and pulley as an assembly. Remove radiator. Isolate air conditioning compressor and disconnect hoses. *See "Ford Motor Co. Air Conditioning" in Miscellaneous Section.* Remove compressor and mounting bracket. Disconnect accelerator and throttle linkage from carburetor and engine (tie linkage to dash for clearance). Remove converter housing access cover and underbody splash shield from lower front of transmission. Disconnect exhaust pipes from exhaust manifolds. Disconnect power steering pump outlet line from pump. Remove oil filter. Disconnect engine front mounts from engine. Remove starter and dust seal, and generator splash shield. Disconnect converter from flywheel, engine lateral restrictor from converter housing, and remove converter housing lower retaining bolts. Support transmission and remove converter housing-to-engine upper bolts. Secure converter in housing. Install lifting eyes in each cylinder head lower front mounting bolt hole, and in rear of each exhaust manifold. With suitable lifting chains and hooks, remove engine from car.

ECONOLINE TRUCKS

ENGINE REMOVAL: *NOTE - Following procedure is for r moval of ngin and transmission assembly.* Drain cooling system and crankcase, and remove air cleaner. Disconnect all wires, hoses, cables, and lines from engine. Raise and support truck. Remove propeller shaft. Disconnect transmission shift rods from transmission. Disconnect clutch linkage from flywheel housing and underbody. Remove exhaust pipe, muffler, and tail pipe assembly. Lower truck after half-way for safety. Use Transmission Jack KRW-7020 and Engine Adapter T61E-6000-A or other suitable equipment and support engine and transmission assembly after securing engine to adapter. Disconnect engine right and left front mounts from engine, and remove right and left support members from underbody. Disconnect transmission extension from hanger bracket. Lower jack and raise truck to remove engine assembly from beneath truck.

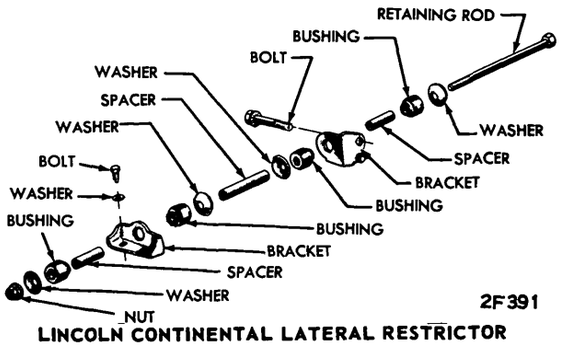
FORD 6 CYLINDER TRUCKS

ENGINE REMOVAL (F & B SERIES): Procedure is same as for Ford 6 Cyl. Cars after removing hood, fan, spacer, and pulley.



ENGINE REMOVAL (P SERIES): *NOTE - Procedure below is for removal of engine only.* Drain cooling system and crankcase. Remove driver's seat assembly, master cylinder inspection cover, and steering column cover plates. Disconnect accelerator linkage from pedal and all wires from headlight dimmer switch. Remove left wheelhouse panel and center floor plate, disconnect right side of engine rear cover panel from right wheelhouse panel, and rear flange of engine rear cover from frame crossmember and center floor plate front bracket. Remove air cleaner tube (leave air cleaner attached to engine cover). Remove engine rear cover plate (wedge frame gussets open so rear flange will clear slots). Remove accelerator bracket assembly and carburetor. Disconnect throttle control rod. Disconnect exhaust manifold from muffler inlet pipe. Disconnect all wires, cables, lines, and hoses from engine. Remove starter, radiator and fan. Disconnect engine from front mounts. Remove flywheel or converter housing cover and disconnect housing from engine. Disconnect converter from flywheel. Remove crankcase ventilation tube. Remove automatic transmission filler tube and drain transmission. Loosen engine rear support screws, raise transmission, remove engine (swing 30° to right and lift rear to clear compartment).

FORD V8 TRUCKS



ENGINE REMOVAL (F & B SERIES): Procedure is the same as for Ford V8 Cars except the following: Remove radiator and shroud assembly, fan, spacer, and belt. Disconnect power steering hoses and let system drain (unnecessary to remove pump). *NOTE* - Access cover provided in floor pan to remove converter housing bolts, accelerator assembly, and other parts.

ENGINE REMOVAL (C SERIES): Tilt the cab and drain cooling system and crankcase. Remove radiator and shroud assembly, fan, and air cleaner. Remove all wires, cables, clips, lines, and hoses from engine. Remove clutch release lever retracting spring and starter. Disconnect exhaust pipes from manifolds. Remove flywheel housing inspection cover and disconnect engine from flywheel and front mounts (support transmission). With lifting hooks (Tool T53L-6000-B) and sling (Tool T53L-300-A) remove engine.

ENGINE REMOVAL (P SERIES): *NOTE - Procedure below is for removal of engine and transmission as an assembly.* Drain cooling system and crankcase. Remove driver's seat, master cylinder inspection cover, steering column cover plate, left wheelhouse panel, and center floor plate. Disconnect accelerator linkage at pedal and all wires from headlight dimmer switch. Disconnect right side of engine rear cover from right wheelhouse panel, rear flange of engine rear cover from crossmember and center floor plate front bracket. Remove engine rear cover plate (wedge frame gussets open so plate will clear slots). Remove crossmember and air cleaner. Disconnect all wires, cables, lines, and hoses from engine and transmission (remove radiator hoses, hand brake cable and bracket). Disconnect engine from front mounts and exhaust pipes from manifolds. Remove air cleaner stud. Disconnect engine rear support, front universal joint, transmission shift rods, and clutch slave cylinder hose. With lifting hooks (Tool T53L-6000-B), sling (Tool T53L-300-A), and floor crane, remove engine and transmission assembly.

CANTILEVER SPRING ENGINE REAR MOUNT ASSEMBLY

LINCOLN CONTINENTAL LATERAL RESTRICTOR

ENGINE MOUNTINGS

METEOR 170" & 221" ENGINE

ENGINE REAR MOUNTING BRACKET ADJUSTMENT: Loosen bracket side rail attaching bolts and raise or lower bracket (with a jack) to obtain specifications shown in table below. Measure from rib on floor pan to flat surface on top of bracket.

Model	Left Side	Right Sid
170" Std. Trans.	1 1/2"±1/16"	1 1/16"±1/16"
170" Auto. Trans.	2 1/4"±1/16"	1 5/16"±1/16"
221" All Trans.	2 1/4"±1/16"	1 5/16"±1/16"

COMET & FALCON

ENGINE REAR MOUNT (CANTILEVER SPRING TYPE): Consists of a leaf type spring mounted on rear support and extending to front of car. Spring is bolted to transmission extension. Spring is insulated from support by two rubber insulators and a rubber flat washer. Spring-to-support attaching bolt is a shoulder type bolt.

***Installation** - CAUTION - To prevent high frequency high speed vibrati n caused by transmissi n extension contact with rear mount, ¼" minimum clearanc must be maintained b tween rear mount upper insulator and*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

transmission extension. Tighten spring-to-support attaching shoulder bolt until bolt bottoms (22-32 ft. lbs. torque). *CAUTION - Do not add washers between lower insulator and spring as noise and vibration would result.* Tighten other bolts to specified torque *(see "Engine Mounting Tightening Table" below).*

ENGINE MOUNT TORQUE SPECIFICATIONS: As follows:

COMET & FALCON	Ft. Lbs.
Front Support Insulator to Engine	18-24
Front Support Insulator to Bracket Nut	11-15
Rear Support Bracket to Crossmember	11-15
Rear Support to Cantilever Spring	22-32
Cantilever Spring to Trans. Ext.	18-28

FAIRLANE & METEOR 6 CYL.	Ft. Lbs.
Front Support Brkt to Engine	18-24
Front Insulator Assy. to Support Brkt.	15-21
Front Bracket to Underbody	26-34
Rear Support Insulator to Ext. Hsg.	32-42
Rear Insulator to Rear Support	10-15
Rear Support to Mounting Bracket	41-53
Rear Mounting Bracket to Underbody	41-53

GALAXIE & MONTEREY 6 CYL.	Ft. Lbs.
Front Bracket to Insulator	40-45
Front Bracket to Engine	35-40
Front Insulator to Frame	35-40
Rear Support Retainer to Ext. Housing	40-45
Rear Support to Frame	12-15

FAIRLANE & METEOR V8	Ft. Lbs.
Front Support Brkt, to Engine	29-39
Front Insulator Assy.to Support Brkt.	15-21
Front Support Brkt. to Body Bracket	41-53
Front Mounting Bracket to Underbody	26-34
Rear Support Insulator to Ext. Hsg.	32-42
Rear Insulator to Rear Support	10-15
Rear Support to Mounting Bracket	41-53
Rear Mounting Bracket to Underbody	41-53

GALAXIE & MONTEREY V8	Ft. Lbs.
Front Bracket to Crossmember	45-50
Front Insulator to Frame	35-40
Front Insulator to Engine	35-40
Rear Support Retainer to Ext. Hsg.	40-45
Rear Support to Frame	12-15

THUNDERBIRD	Ft. Lbs.
Front Insulator to Engine	35-40
Front Insulator to Intermediate Bracket	30-42
Front Intermediate Brkt. to Crossmember	30-42
Rear Support Retainer to Ext. Hsg.	25-30
Rear Support to End Bracket	30-42

LINCOLN	Ft. Lbs.
Front Insulator to Frame	45-60
Front Insulator to Engine	50-65
Rear Crossmember Brkts. to Body	20-30
Rear Support Crossmember to Support Brkt.	13-18
Rear Support Insulators to Support Member	20-30
Rear Support Insulator to Ext. Hsg.	20-30

ECONOLINE TRUCK	Ft. Lbs.
Front Insulator Assembly to Frame	11-15
Front Insulator Assembly to Engine	23-28
Rear Insulator Assembly to Engine	23-29

FORD TRUCKS	Ft. Lbs.
Front Insulator to Engine Mount (½x20)	35-45
Front Insulator to Engine Mount (7/16x20)	45-55
Rear Insulator to Engine Mount	70-90

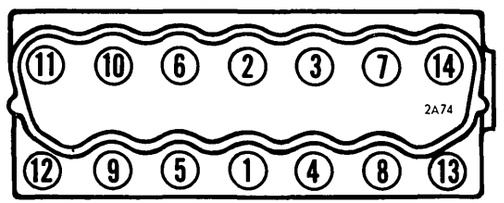
LINCOLN CONTINENTAL

ENGINE LATERAL RESTRICTOR: Consists of rubber bushed rods and spacers mounted on brackets from converter housing to underbody side rail to restrict engine side movement.

Removal - Remove outer bracket from underbody side rail. Remove inner bracket from converter housing. Remove lateral restrictor assembly.

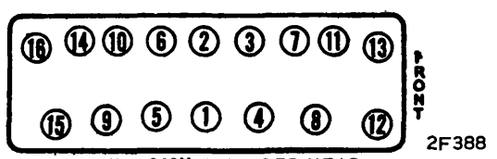
Disassembly - Remove restrictor rod retaining nut and disassemble unit. Clean all parts in solvent and replace worn or damaged parts.

Reassembly - With head of large restrictor rod in a vise, assemble all parts in same order as removed (see illustration). *NOTE - Lips of rubber bushings must be seated properly in bores of inner and outer brackets.* Torque retaining nut to 13-18 ft. lbs.



Installation - Position unit on car with outer bracket resting on underbody side rail. Insert inner bracket dowel pin into converter housing, install inner bracket retaining bolt and torque to 40-50 ft. lbs. Torque outer bracket retaining bolts to 13-18 ft. lbs.

CYLINDER HEAD & MANIFOLD



6 CYLINDER ENGINES

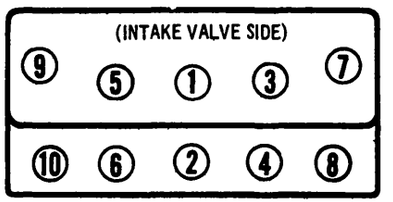
►*223" & 262" ENGINES CYLINDER HEAD BOLT NOTE:* All 262" and later production 223" engines have cylinder heads with 1/2" bolts. Previous bolt size was 7/16". Bolt torque specifications for each size bolt are different. *See below.*

CYLINDER HEAD: Removal - When removing head, install guide studs in front and rear cylinder head bolt holes on manifold side of head. Make guide studs from 7/16" - 14 x 6" or 1/2" - 13 x 6" bolts, depending on cylinder head bolt size, by cutting off bolt head, tapering end, and slotting for screwdriver engagement.

144" & 170" CYLINDER HEAD

223" & 262" CYLINDER HEAD

Installation - Coat both sides of new gasket with head gasket sealer. *CAUTION - "Sandwich" type gasket (steel core bonded between rubber-asbestos sheets) used on 223" and all 262" engines. DO NOT use sealer on this gasket.* On 144" & 170" engines, coat right side front and rear head bolts with sealer. On 223" & 262" engines, coat all left side bolts with sealer. Install head over guide studs (see "Removal" above), install two end bolts finger tight to hold head, then install remaining bolts. Tighten bolts in sequence shown in diagrams in three steps to torque limits shown in table below. **Do not disturb bolts after final step completed.**



V8 ENGINES

CYLINDER HEAD: Removal - *NOTE* - On 221" & 260" engines, loosen rocker arm stud nuts and pivot rocker arms to one side so pushrods can be removed. On 352",390" & 406" engines, observe rocker arm shaft removal procedure below.

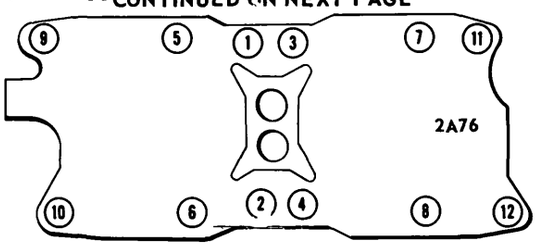
Installation - On 221" & 260" engines, coat head bolts with water resistant sealer. Coat new gasket on both sides with gasket sealer. Gaskets must be installed with word "Front" to front of engine, and word "Top" facing upwards. On 292" engine, install long cylinder head bolts at the dowel locations. On all engines, tighten bolts in sequence shown in diagrams in three steps to torque limits shown in table below. Do not disturb bolts after final step completed.

Head Bolt Specifications (Ft. Lbs.)

Engine	Step 1	Step 2	Step 3
144" & 170"	55	65	75
223" & 262"	95	105	115
221" & 260"	55	65	70
292" Pass. & MD Trks.	55	65	75
292" HD Trks	65	70	85
352",390" & 406"	70	80	90
430"	85	95	105

V8 ENGINES CYLINDER HEAD

V8 ENGINES

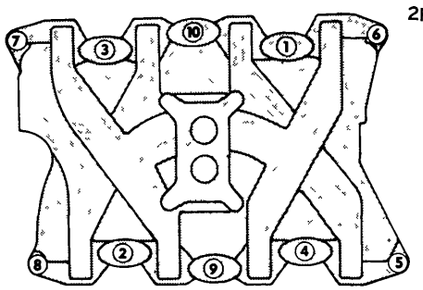


INTAKE MANIFOLD: Removal (352" & 390") - *Observe rocker arm shaft removal procedure detailed below.*

Installation (292") - Make sure gaskets are in place and tighten manifold attaching bolts to correct torque, starting from the center bolts.

Installation (221" & 260") - Coat cylinder block seal seal surfaces with oil resistant sealer. Install new seals and gaskets. **Gaskets must be interlocked with seal tabs.** Tighten manifold attaching bolts in sequence shown in diagram in three steps to following torques: **Step 1** - All bolts to 8-10 ft. lbs.; **Step 2** - All bolts to 12-15 ft. lbs. **Step 3** - Bolts 1,2,3 & 4 to 12-15 ft. lbs.

Installation (352", 390", 406") - Coat mating surfaces of manifold and cylinder heads with oil resistant sealer. Make sure front and rear manifold seals do not slip out of place when installing manifold. Tighten manifold attaching bolts to correct torque, starting from the center bolts.



CONTINUED ON NEXT PAGE

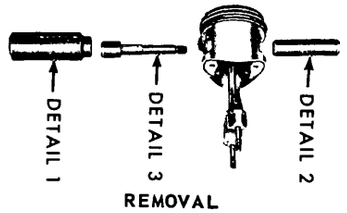
V8 221" & 260" INTAKE MANIFOLD TIGHTENING SEQUENCE

CONTINUED FROM PRECEDING PAGE

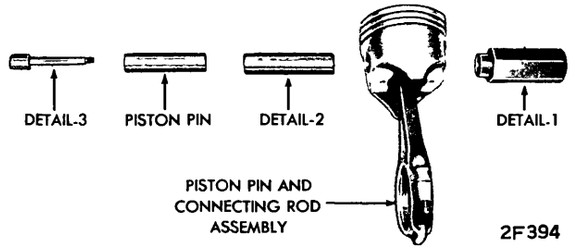
Installation (430") - Manifold gaskets must be installed with "Front" to front of engine. Tighten attaching bolts to correct torque, and in correct sequence (see diagram).

430" ENGINE INTAKE MANIFOLD TIGHTENING SEQUENCE

PISTONS



FITTING PISTONS: To check piston fit in cylinder and to determine clearance between piston and cylinder walls, position a length of ½" wide feeler stock (see table below for feeler thickness) between inverted piston and cylinder wall 90° from piston pin holes. Hold piston in bore so bottom of piston skirt is about 1½" below top of block and piston pin bore is parallel to crankshaft. *NOTE - Feeler must extend entire length of piston.* Pull feeler from cylinder with a spring scale and note reading. Specifications should agree with table below.



PISTON CLEARANCE CHART

RIBBON 0.0015 THICK & 0.500 WIDE		RIBBON 0.002 THICK & 0.500 WIDE		RIBBON 0.0035 THICK & 0.500 WIDE		RIBBON 0.006 THICK & 0.500 WIDE

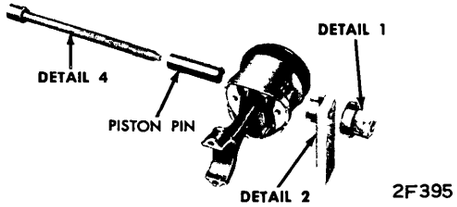
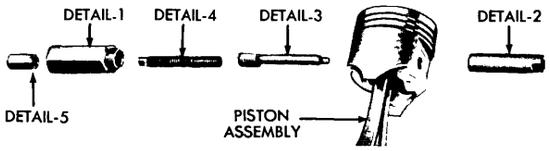
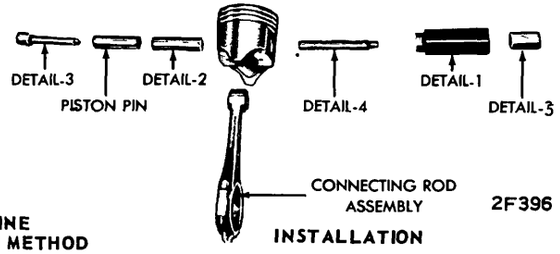
PISTON PINS
144", 170", 221" & 260" ENGINES



►*TOOL T60K-6135-A MODIFICATION NOTE:* If tool not previously modified to prevent damage to piston, make following modification so piston will not be damaged when Detail 2 of tool seats against piston pin boss: Grind a 1/16" - 45° chamfer around outer edge of Detail 2.





ARBOR PRESS METHOD

144", 170", 221" & 260" ENGINES

430" ENGINE
VISE & WRENCH METHOD

REMOVAL: Press pin out of piston and connecting rod using Tool T60K-6135-A and vise and wrench, or Tool 6135-J and arbor press, as shown in illustrations.

INSTALLATION: Lightly coat all parts with engine oil, assemble piston and connecting rod correctly and press pin into piston and connecting rod as follows: **1)** With Tool T60K-6135-A and vise and wrench, draw pin into assembly until pin seats in Detail 2. **2)** With Tool 6135-J and arbor press, press pin into assembly until Detail 2 is seated firmly in Detail 1. See *illustrations.*

430" ENGINE

REMOVAL: Press or pull pin out of piston and connecting rod assembly with Piston Pin Remover and Replacer Set, Tool 6135-F, using an arbor press or vise and wrench as shown in illustrations.

INSTALLATION: Press or pull pin into piston and connecting rod with Tool 6135-F and an arbor press or vise and wrench as shown in illustrations. Pin must be ¼" beyond face of piston boss. To check pin fit install all parts of Tool 6135-F for vise installation and place in a vise. Turn nut with torque wrench until pilot (Part No. 2 of tool) bottoms in anvil (Part No. 1 of tool). Minimum torque required to seat pilot is 20 ft. lbs. If less torque required replace connecting rod.

CRANKSHAFT & MAIN BEARINGS
ALL ENGINES

►*MAIN BEARING CAP INSTALLATION NOTE:* Caps are numbered from front of engine and should be installed in correct position with arrow on cap pointing to front of engine.

CRANKSHAFT THRUST BEARING ALIGNMENT: Install all bearing caps except thrust bearing cap and torque to specifications. Install thrust bearing cap with bolts finger tight. Pry crankshaft forward against upper half of bearings, then pry bearing cap to rear to align thrust surfaces of both bearing halves. While holding crankshaft forward, tighten thrust bearing cap bolts to specifications. Move crankshaft to rear of engine and check crankshaft endplay.

REAR MAIN BEARING OIL SEAL: *NOTE - On 292" engine, coat entire mating surface of seal retainer with oil resistant sealer before installation. On other engines, coat only rear mating surface of cap with sealer - do not use sealer forward of side seal groove. Use of sealer prevents oil leaks.*

►*OVERSIZE REAR MAIN BEARING SEAL NOTE:* When main bearing cap side seal does not compress firmly when forced into cap (cause of oil leak), an oversize seal is available for installation. DO NOT use oversize seal unless inspection shows that standard seal does not function properly.

Upper & Lower Seal Installation: *CAUTION - Use Installing & Forming Tool as listed below and follow procedure listed exactly to prevent seal shift and oil leaks.* Preform seal by hand and install into block or

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

cap (or retainer) with thumbs, seating seal at center and then working from the ends toward the center. Now place installing tool properly in block or cap as follows: Large flanged face of tool must be toward rear of engine for upper seal, and toward rear face of cap or retainer for lower seal. Tool flanges must bottom on seal groove rear flange and bearing saddle (insert removed). Hold tool firmly and strike top of tool sharply. Cut seal ends flush with block or cap (or retainer). Trim frayed ends. Install cap or retainer and tighten bolts to specifications.

Side Seal Installation: Dip side seals in light engine oil and install **immediately** into grooves. *CAUTION - DO NOT use sealer. Seals expand with oil.* Tap seals firmly into position. Do not trim ends.

Testing Seal Installation - Squirt a few drops of oil into parting lines between cap and cylinder block from the outside. Blow compressed air against seals from the inside of block. If air bubbles appear in oil, it is an indication of oil leakage.

Crankshaft Rear Seal Installing Tool

Engine	Tool No.
144",170",221" & 260"	T60K-6701 or 6701-D
223", 262" & 292"	T52L-6701-AGD or 6701-A
352", 390" & 406"	T59P-6701-A or 6701-C
430"	6701-B

ENGINE FRONT COVER

6 CYLINDER ENGINES (EXCEPT TRUCKS)

ENGINE FRONT COVER: Removal - Drain crankcase and cooling system. Remove radiator, fan, belt, pulley, and damper. Remove water pump. Remove oil pan *(see individual Car Model Pages).* Remove front cover.

Installation - Use Pilot, T61K-6019-A or 6059-E (144" & 170"), T 52L-6059-AEE or 6059-B (223") to center cover on crankshaft. Push in on tool and tighten cover bolts to specifications. Reverse removal procedure to complete installation.

221" & 260" ENGINES

ENGINE FRONT COVER: Removal - Drain cooling system and crankcase. Remove hoses from water outlet housing and water pump, then slide by-pass hose clamp toward pump. Remove air cleaner and disconnect battery ground cable. Loosen generator mounting bolts at generator and support bolt at water pump. Remove fan, spacer, pulley and drive belt. Remove Power Steering belt and compressor belt. Remove crankshaft pulley from adapter, remove crankshaft screw and washer and remove adapter. Disconnect fuel pump outlet line at pump and remove fuel pump bolts and lay pump to one side with flexible line attached. Remove oil dipstick and disconnect dipstick tube bracket and oil filler tube bracket at generator mounting bracket. Remove oil pan-to-front cover bolts, then remove front cover and water pump as an assembly.

Installation - Use Pilot T61P-6019-A to center cover on block. Use water resistant sealer on all screws and press in on tool while tightening screws to specifications. Reverse removal procedure to complete installation.

292" V8 ENGINE (EXCEPT TRUCKS)

ENGINE FRONT COVER: Removal - Drain cooling system, remove radiator, fan, belt, pulley, spacer, power steering pump pulley, and pull crankshaft damper. Remove oil pan *(see Car Model Pages),* and fuel pump. Disconnect hoses from water pump. Disconnect power steering pump from water pump (place so oil will not drain). Move generator support bracket and adjusting arm out of way. Remove front cover and water pump assembly. *NOTE* - Air conditioner compressor brackets are attached by front cover screws.

Installation - Place large diameter end of Cover Aligning Tool T52L-6059-AEE or 6059-B in bore of cover and place cover on block. Push in on tool and tighten cover bolts to specifications. Complete installation by reversing removal procedure.

352", 390" & 406" ENGINES

ENGINE FRONT COVER: Removal - Drain cooling system, remove radiator. Remove belts. Remove water pump, fan, pulley, and generator adjusting arm as an assembly. Remove power steering pump pulley. Pull crankshaft damper. Remove oil pan *(see Car Model Pages).* Remove fuel pump (unnecessary to disconnect flexible line). Remove stepped-down crankshaft sleeve with a three-jawed puller. Remove non-stepped-down sleeve with Puller, Tool T56P-6362-A. Remove front cover. *NOTE* - Air conditioner compressor brackets are attached by front cover bolts.

Installation - Use Pilot, Tool T61P-6019-B or 6059-F to center cover on crankshaft. Push in on tool and tighten cover bolts to specifications. Reverse removal procedure to complete installation.

430" ENGINE

ENGINE FRONT COVER: Removal - Drain cooling system and disconnect battery. Remove radiator supply tank, fan shield, drive belts, fluid fan and pulley assembly. Remove water pump (loosen power steering reservoir bracket mounting bolts for clearance). Remove crankshaft damper. Remove power steering pump (disconnect and plug lines). Remove fuel pump heat shield and fuel pump. Remove cup type plug from top of front cover and then remove fuel pump pushrod. Remove engine front cover.

Installation - Reverse removal procedure and note the following: 1) Power steering pump rubber insulators must be properly installed. 2) Lips of front cover seal must maintain proper contact with power steering pump.

6 CYL. & V8 TRUCK ENGINES

ENGINE FRONT COVER: Removal - Drain cooling system and crankcase. On P Series, remove hood, then remove grille, headlights, parking lights, wind deflector and hood lower weatherstrip as an assembly. Remove accelerator cross shaft. On all trucks, remove radiator, fan shroud, fan, spacer, brackets, pulleys, and damper. On V8 trucks, remove fuel pump, disconnect engine front mounts and raise engine slightly. On all trucks, remove oil pan and flywheel housing inspection cover. Remove engine front cover.

Installation - *See 292" V8 Engine above for aligning tool and procedure.* Reverse removal procedure to complete installation.

ALL ENGINES

FRONT COVER OIL SEAL REPLACEMENT: *NOTE - On 430" engine, seal must be seated in cover. No special tools required. For other engines, proceed as follows:* Remove old seal with punch and clean recess in cover. Drive new seal in cover with proper tool (see below) until seal is fully seated and make sure spring is positioned properly in seal.

Front Cover Seal Installing Tool

Engine	Tool No.
144" & 170"	T60K-6700-A or 6700-C
221" & 260"	T58P-6700-B
223", 262", 292"	T52L-6700-BEE or 6700-B
352", 390" & 406"	T59P-6700-B or 6700-B

CAMSHAFT & BEARINGS

►*CAMSHAFT REMOVAL PROCEDURE NOTE: See other sections of this Special Data for removal of Cylinder Head, Engine Front Cover, Intake Manifold, Rocker Arm Shaft Assembly, and Oil Pump. See individual Car Model pages for Oil Pan removal.*

144" & 170" ENGINES

CAMSHAFT REMOVAL: On Econoline, remove front passenger seat and engine cover. On Comet & Falcon, remove grille. On all models, remove radiator, engine front cover, oil pan and oil pump, sprockets and timing chain, distributor, fuel pump, oil filter, rocker arm shaft assembly, pushrods, cylinder head, lifters, and camshaft thrust plate. Remove camshaft.

223" & 262" ENGINES

CAMSHAFT REMOVAL: Remove headlight trim rings and grille, radiator, engine front cover, oil pan, dampers and pulleys, rocker arm shaft assembly, pushrods, distributor, fuel pump, oil filter, pushrod chamber cover, sprockets (or gears) and timing chain, and camshaft thrust plate and spacer. Raise and hold lifters clear of camshaft. On F Series Truck, disconnect engine front mounts and raise engine so camshaft can be removed through grille opening. On all models, remove camshaft.

221" & 260" ENGINES

CAMSHAFT REMOVAL: Remove engine front cover (see above), then crank engine until timing marks on sprockets are adjacent and in line between shaft centers and remove camshaft sprocket screw, washers, and fuel pump eccentric. Slide both sprockets and timing chain forward and remove as an assembly. Disconnect spark plug wires at plugs and remove from bracket on rocker cover. Disconnect coil high tension lead at coil and remove distributor cap and plug wires as an assembly. Remove coil and disconnect vacuum line at carburetor, then remove distributor. Remove carburetor to filter fuel line and disconnect heat tube at carburetor and heater hose from carburetor spacer. On Auto. Trans. Cars, disconnect throttle valve vacuum line at intake manifold and oil cooler lines at radiator. Remove radiator. Disconnect accelerator rod at carburetor and remove retracting spring, bellcrank assembly and position out of way. Disconnect temperature unit wire and engine ground strap and bellcrank assembly and position out of way. Remove intake manifold and carburetor as an assembly. Remove rocker arm covers, loosen arm stud nuts and rotate arms to one side. Remove pushrods (Keep in sequence for reinstallation). Remove valve lifters, camshaft thrust plate, and pull camshaft toward front of engine. *NOTE - Avoid damaging camshaft bearings.*

292" V8 ENGINES

CAMSHAFT REMOVAL: Remove grille, radiator, engine front cover and water pump, intake manifold, oil pan,

rocker arm shaft assemblies, pushrods, pushrod chamber cover, distributor, sprockets and timing chain, camshaft thrust plate and spacer. Raise and hold lifters clear of camshaft. Remove camshaft.

352", 390" & 406" ENGINES

CAMSHAFT REMOVAL: Remove grille (unnecessary on T-Bird), radiator, engine front cover, sprockets and timing chain, distributor, rocker arm shaft assemblies, pushrods, intake manifold, lifters, and oil pan and screen. Remove camshaft.

430" ENGINE

CAMSHAFT REMOVAL: Remove hood, air conditioning condenser (unnecessary to disconnect lines), radiator, lower center grille, engine front cover, sprockets and timing chain, rocker arm shaft assemblies, pushrods, and lifters. Remove chamshaft.

ALL ENGINES

►*CAMSHAFT BEARING INSTALLATION CAUTION:* When installing bearings, special care must be taken to align oil holes in bearings with drilled oil passages in cylinder block bearing bore. Also, bearings with 2 holes provide lubrication to valve system and extensive engine damage would result if these holes were blocked. *DO NOT install any bearing with 1 hole in a 2 hole bearing position.*

CAMSHAFT BEARING REPLACEMENT: 144" & 170" - Use Tool 6261-M & Adapter Set 6261-AB. No. 1 & No. 4 bearings are not interchangeable with any other bearing. No. 1 bearing must be installed to .100-.140" below front face of bearing bore in block. No. 4 bear- No. 4 bearing has two oil holes and must be installed so forward edge of bearing is 24 3/4"±1/64" from thrust plate mounting surface of block.

223" & 262": Use Tool T52L-6261-CEE & Adapter Set T54L-6250-B or Tool 6261-C. No. 1 bearing is not interchangeable with other bearings. No. 1 bearing must be installed to .005-.020" below front face of cylinder block. No. 3 bearing has 2 oil holes.

221" & 260": Place bearings in bores and press into position with Tool T62F-6250-A and Details 1,2 & 3. Be sure oil holes in bearings are in line with holes in cylinder block. *NOTE* - Front bearing must be installed .005-.020" below front face of cylinder block. Coat new rear plug with water resistant sealer and install with flange facing out and slightly below chamfer in bore.

292": Use Tool T52L-6261-CEE or 6261-C & Adapter Set T54L-6250-B or 6261-E. No. 1 & No. 3 bearings are not interchangeable with other bearings. No. 1 bearing must be installed to .005-.020" below front face of cylinder block. No. 3 bearing has 2 oil holes.

352" & 390": Use Tool T52L-6261-CEE or 6261-F & Adapter Set T54L-6250-B or 6261-E. None of the bearings are interchangeable. No. 1 bearing must be installed to .005-.020" below front face of cylinder block.

430": Use Tool 6261-F & Adapter Set 6261-AC. *NOTE - Camshaft bearing journals and I.D. of bearings ar st pp d (largest journal and smallest b aring at front). DO NOT int rchange bearings. Position numb r of bearing is stamped on ach b aring.* No. 1 bearing must be installed with notch on bearing to front of engine and facing down toward bottom of block; and bearing must be .005-.020" below front face edge of cylinder block bearing bore. On other bearings, split in bearing must be up toward top of cylinder block.

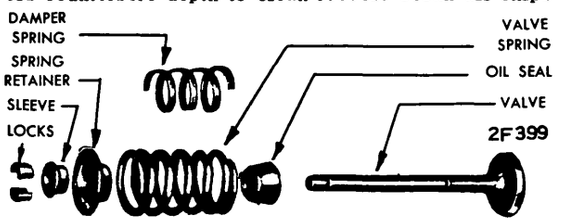
VALVE SYSTEM

ALL ENGINES

►*1962 METEOR V8 221" & 260" ENG. EXCESSIVE VALVE PUSHROD GUIDE WEAR CORRECTION & PRODUCTION CHANGE NOTE:* A new valve pushrod Part No. C20Z-6565-B, was incorporated in production approximately February 5, 1962 to minimize excessive wear in cylinder head pushrod guide area. When valve rocker arm cover removed, visually inspect this area for wear (maximum allowable wear of pushrod guide is .005"). Replace cylinder head and all pushrods with new polished type rods, if wear limit exceeded. If wear limit not exceeded, but wear is evident, replace affected pushrod with new type. *NOTE* - To measure pushrod guide wear in cylinder head, move rocker arm in such a position that the pushrod rests in worn slot of guide (this verifies that rocker arm pad is in full contact with entire top surface of valve stem). Measure by using a straight edge across affected guide and measuring with .005" wire gauge.

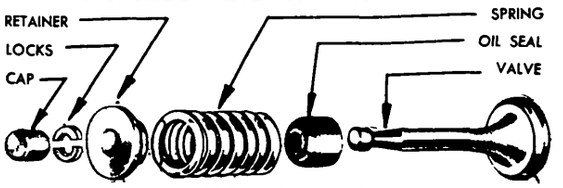
ROTATABLE VALVES: Valves operate directly in valve guide holes in cylinder head. Remove and install as follows:

Valve Removal: Use Tool 6513-EE to compress valve springs. Remove all parts of assembly.



Valve Installation: Lubricate valve guides and stems with engine oil. Apply Lubriplate to valve stem tip. Install all parts in same order as removed, making sure closed coil end of valve spring is toward cylinder head and damper spring, if used, is not caught in valve spring.

262" & 292" HD TRUCK ENGINES



EXHAUST VALVES

FREE TURNING VALVE CAP CLEARANCE CHECK: Clearance between end of valve stem and inside surface of cap with valve locks and spring retainer installed should be .0002-.004" measured with Tool 6513-CE-2. Lap open end of cap if clearance more than .004".

EXHAUST VALVE SEAT INSERT INSTALLATION: Counterbore the recess in head about .001-.002" below old counterbore depth to clean recess. Clean all chips and oil from recess. Chill new oversize insert and tool in dry ice for ½ hour. Place insert on tool with small radius on outer edge facing outward, pilot tool in guide and drive insert into recess until fully seated. DO NOT peen around insert. Reface insert. *CAUTION - Installation must be made quickly after tool and ins rt removed from dry ice.*

ROTATABLE VALVE ASSY. (WITH DAMPER)

FREE-TURNING VALVE ASSY. 2F400

VALVE GUIDES

ALL ENGINES

VALVE GUIDE REAMING (To Install Valves With Ov r- size Stems): Reamers are furnished .003" oversize with standard diameter pilot, .015" oversize reamer with .003" oversize pilot, and .030" oversize reamer with .015" oversize pilot. Always use reamers in sequence and reface valve seat after valve guide is reamed. Use Reamer Tool as follows:

Valve Guide Reaming Tool

Engine	Tool N .

430"	6085-H

VALVE TAPPET ADJUSTMENT & CHECKING MECHANICAL LIFTER TYPE ENGINE "CONVENTIONAL" TYPE ROCKER ARMS

INITIAL VALVE LASH ADJUSTMENT (After Overhaul): Check rocker arm adjusting screw for proper setting. Torque required to turn screw after interference noted must be 3 ft. lbs. minimum. Replace adjusting screw or rocker arm if necessary.

6 Cylinder: Adjust intake and exhaust valves of each cylinder in firing order (1-5-3-6-2-4) with each piston at TDC of compression stroke.

292" V8: 1) Place No. 1 piston at TDC of compression stroke. Adjust following valve clearances: No. 1,4,5 Exhaust; No. 1,2,7 Intake.

2) Turn crankshaft ½-turn or 180° (No. 4 piston at TDC). Adjust following valve clearances: No. 6 & 8 Exhaust; No. 4 & 5 Intake.

3) Turn crankshaft ¾-turn or 270° from second position above (No. 3 piston at TDC) and adjust following valve clearances: No. 2,3,7 Exhaust; No. 3,6,8 Intake.

390", 406" V8: 1) Place No. 1 piston at TDC of compression stroke. Adjust following valve clearances: 1,4,5 Exhaust; No. 1,,7,8 Intake.

2) Turn crankshaft ½-turn or 180° (No. 4 piston at TDC). Adjust following valve clearances: No. 2 & 8 Exhaust; No. 4 & 5 Intake.

3) Turn crankshaft ¾-turn or 270° from second position above (No. 3 piston at TDC) and adjust following valve clearances: No. 3, 7, 8 Exhaust; No. 2, 3, 6 Intake.

All Engines: Make final clearance check. *See TUNE-UP on Car or Truck Model Pages.*

"ZERO LASH" TYPE ROCKER ARM ENGINES

INITIAL VALVE LASH ADJUSTMENT (Aft r Ov rhaul): Adjust intake and exhaust valves of each cylinder in turn in firing order (1-5-3-6-2-4) with each piston at

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

TDC at end of compression stroke as follows:

1) Push rocker arm eccentric in toward rocker arm until recess mark on eccentric is inboard of valve stem tip (eccentric will remain in position when released and should be near limit of its travel). Push eccentric end of rocker arm down until eccentric contacts valve stem tip and all vertical and horizontal clearance in eccentric is removed.

2) Tighten rocker arm adjusting screw to remove all lash between screw and pushrod socket. *CAUTION - Do not turn screw beyond this position or valve will be forced open.* Push outward slightly on eccentric. If all vertical clearance was not removed, eccentric will move out slightly until upper edge of eccentric bottoms in rocker arm. but recess mark must still be inboard of valve stem tip.

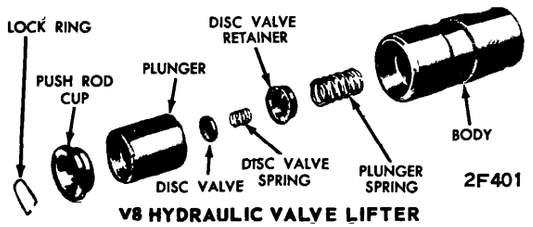
3) Continue to push eccentric outward and loosen rocker arm adjusting screw until recess mark in eccentric is centered directly over valve stem tip. Tighten adjusting screw locknut.

Final Adjustment - With engine idling at normal temperature, make minor adjustment with adjusting screw until eccentric recess mark is centered over valve stem tip during entire valve cycle of operation. Tighten adjusting screw locknut to 35 ft. lbs.

HYDRAULIC LIFTER TYPE ENGINE

HYDRAULIC LIFTER OPERATING RANGE CHECK: Clearance between valve stem and rocker arm should be .078-.218" with lifter fully collapsed. To check operating range of lifter, proceed as follows:

1) Place No. 1 piston at TDC of compression stroke. Following valves will be adjusted: No. 1, 3, 7, 8 Intake; No. 1, 4, 5, 8 Exhaust. Bleed lifter down with Tool T58P-6565-A or 6513-K and hold collapsed. Insert first step of gauge part of Tool T58P-6565-A or .078" feeler gauge between valve stem and rocker arm. If first step or gauge enters, use standard length pushrod. If first step or gauge does not enter, use .060" **shorter** pushrod (coded White). If second step of tool or .218" gauge can be inserted between valve stem and rocker arm, operating range is excessive (incorrect pushrod, excessive wear on pushrods, rocker arms, or valve stems). If all other parts of valve train are within limits, install .060" **longer** pushrod (coded Yellow).



2) Repeat above procedure with No. 6 piston at TDC of compression stroke and check the following valves: No. 2, 4, 5, 6 Intake; No. 2, 3, 6, 7 Exhaust.

►*CAUTION:* To avoid damage to valve or piston when compressing spring to remove pushrod, make sure piston is below TDC.

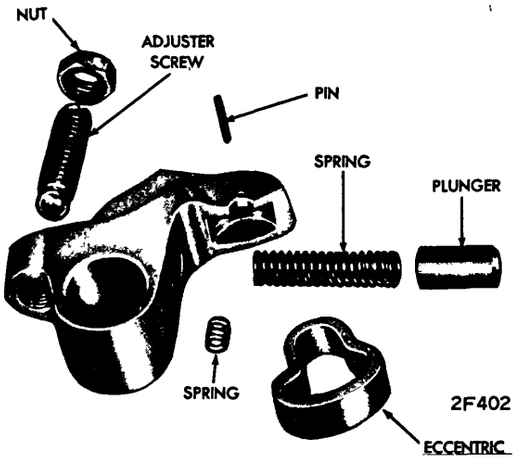
HYDRAULIC LIFTERS
V8 ENGINES

►*CAUTION:* Observe the following cautions when servicing hydraulic lifters: **1)** Lifters must be reinstalled in bores from which removed. **2)** DO NOT intermix parts of one lifter with parts of any other lifter. **3)** Absolute cleanliness must be observed to keep lifters free of lint, dust, or other foreign material.

HYDRAULIC LIFTER OVERHAUL: Rem val - Lifters can be removed with a magnet after removal of intake manifold (352" & 390" Engines), through pushrod holes (430" Engine).

V8 HYDRAULIC VALVE LIFTER

Disassembly: Remove lock ring (depress plunger fully if necessary), pushrod cup, plunger and spring. Invert plunger and remove disc valve retainer (pry up gently with a screwdriver), disc valve and spring.

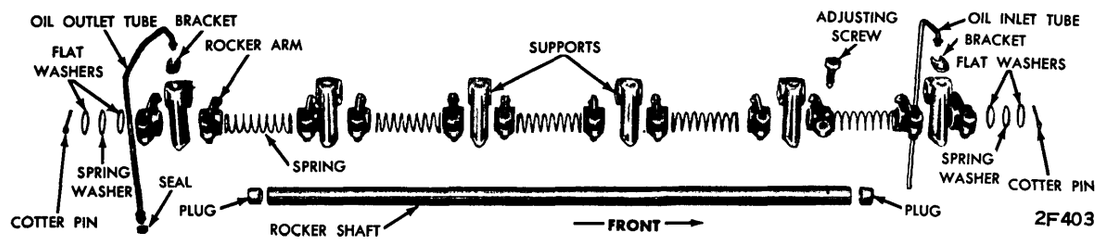


Reassembly: With plunger inverted, install disc valve, spring, and retainer. Insert plunger spring and plunger (open end up) into lifter body. Place pushrod cup on plunger and install lock ring (closed end first).

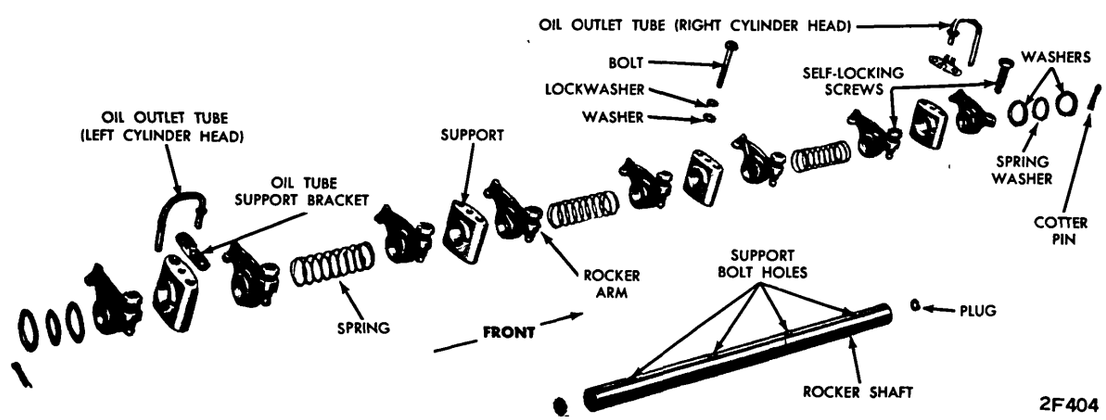
Lifter Testing: Leakdown rate should be 10-80 seconds under a 50 lb. load. Use a lifter tester according to directions of manufacturer.

ROCKER ARMS
221" & 260" ENGINES

ROCKER ARM ASSEMBLY: Removal - Remove rocker arms adjusting nuts, fulcrum seats and rocker arms.



ROCKER ARM STUD REPLACEMENT: *NOTE - .003" oversize studs (not available for service) may be used in production. Oversize studs are identified as follows: Standard stud is plain; .003" OS. stud has daub of paint on threaded end and a groove at tapered end.*



"ZERO LASH" HYDRAULIC VALVE LIFTER

.015" OS. stud has taper ab ve threaded section f r increase in diameter. To remove stud, place washer detail of Tool 6527-A over stud, thread puller detail onto stud, place sleeve detail over puller, and then nut detail onto puller. Hold puller detail stationary and turn large nut to pull stud. If stud threads are damaged, cut them off and cut notch or groove in stud so puller detail can be secured to old stud with the

CONTINUED ON NEXT PAGE

6 CYLINDER 223" & 262" ROCKER ARM ASSEMBLY

V8 292" ENGINE ROCKER ARM ASSEMBLY

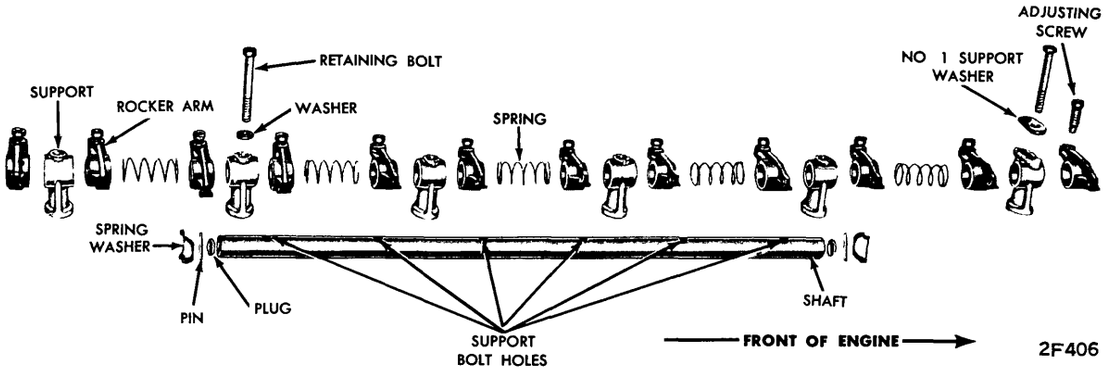
CONTINUED FROM PRECEDING PAGE

Allen set screws. *NOTE* - No reaming is required to replace a standard stud with a new standard stud. When replacing a standard stud or a .003" (Factory OS) stud with a .015" OS stud, ream stud bore with Tool 6527-B. Coat new stud with Lubriplate and drive into position with Tool 6527.

223" 6 CYL. ENGINES

"ZERO LASH" TYPE ROCKER ARMS: Conventional type aluminum rocker arm modified to hold a spring-loaded hardened eccentric cam between rocker arm and valve stem. Plunger and spring mounted on underside or rocker arm work against eccentric and hold eccentric outward during engine cycle of rocker arm movement maintaining zero clearance at valve stem tip.

Overhaul - Disassemble rocker arm and eccentric assembly by removing eccentric retaining pin. Eccentric recess depth in rocker arm should not exceed .300" measured from radius corners of front cutout (below pin hole) perpendicular to greatest depth of recess. Reassemble all parts in correct positions (see illustration). *For rocker arm shaft assembly overhaul, see "6 Cyl. & 292" V8 Engines" below.*



6 CYL. & 292" ENGINES

ROCKER ARM ASSEMBLY OVERHAUL: Removal - Remove oil inlet and outlet pipes. Loosen rocker arm adjusting screws to relieve spring tension. Loosen rocker arm shaft support retaining bolts evenly in turn, then remove rocker arm shaft assembly.

Disassembly: Remove cotter pins from ends of shaft and remove all parts, noting order in which assembled, To remove plugs from ends of shaft, pierce one plug and remove and push out other plug with a rod.

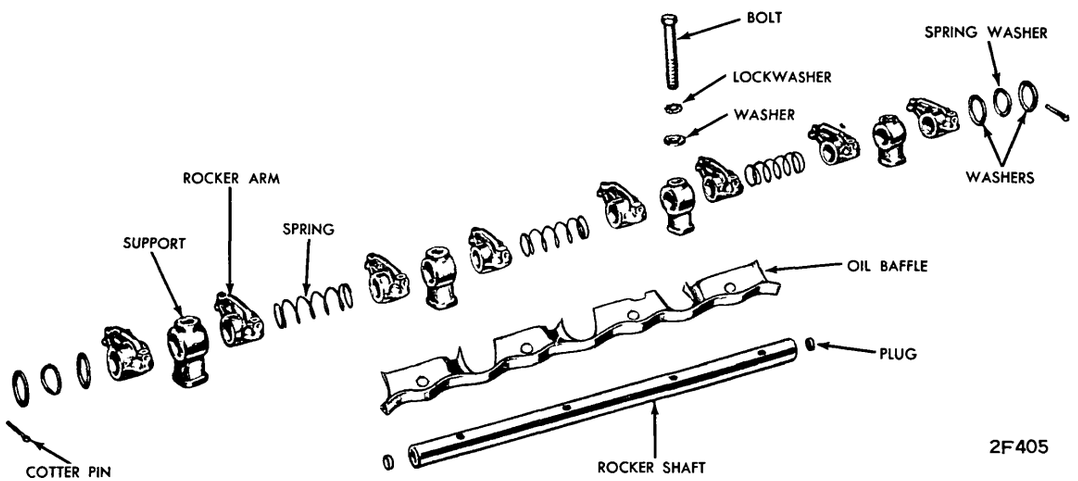
Reassembly: Lubricate all moving parts with engine oil and apply Lubriplate to rocker arm pads. Install shaft end plugs with cup side out. Install all parts in same order as removed, with oil holes in shaft facing downward.

Installation: Reverse removal procedure, making sure that inlet line "0" ring seals are in place, and that support end of outlet pipe enters locating hole in shaft to position shaft properly.

6 CYLINDER 144" & 170" ENGINE ROCKER ARM ASSEMBLY

352", 390" & 406" ENGINES (MECHANICAL LIFTERS)

ROCKER ARM ASSEMBLY OVERHAUL: Removal - Loosen rocker arm adjusting screws to relieve spring tension. Loosen rocker arm shaft support retaining bolts evenly in turn, then remove rocker arm shaft assembly.



Disassembly: *See "6 Cyl. & 292" V8 Engines" above.*

Reassembly: *See "6 Cyl. & 292" V8 Engines" above.*

Installation: Reverse removal procedure.

352", 390" & 430" ENGINES (HYDRAULIC LIFTERS)

ROCKER ARM ASSEMBLY OVERHAUL: Removal - *CAUTION - Follow procedure below exactly to prevent damage to valve train parts.* Place No. 1 piston at TDC at end of compression stroke and rotate crankshaft damper an additional 45°. Loosen right bank rocker arm shaft support bolts in sequence 2 turns at a time, starting at No. 4 (rear) cylinder. When bolts are loosened, remove rocker arm shaft assembly.

V8 352", 390", 406" & 430" ROCKER ARM ASSEMBLY

Follow same procedure for right bank rocker arm shaft bolts, starting at No. 5 (front) cylinder.

Disassembly: *"6 Cyl. & 292" V8 Engines" above.*

Reassembly: *See "6 Cyl. & 292" V8 Engines" above.*

430" ENGINE NOTE - Identification notch on rocker arm shaft must be down and to rear of engine on left bank, down and to front of engine on right bank.

Installation: *CAUTION - Follow procedure below exactly to permit hydraulic lifters to leak down and to prevent damage to valve train parts.* Place No. 1 piston at TDC of compression stroke and rotate crankshaft damper an additional 45°. Tighten right bank rocker arm shaft support bolts in sequence, 2 turns at a time, starting at No. 4 (rear) cylinder, until torque specification is reached. Follow same procedure for right bank rocker arm shaft support bolts, starting at No. 5 (front) cylinder.

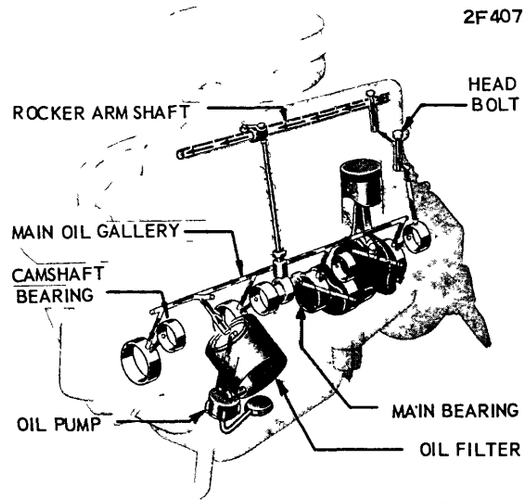
OILING SYSTEM
ENGINE LUBRICATION

144" & 170" ENGINES

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings. Oil under reduced pressure (metered by camshaft bearing) lubricates distributor drive gear and valve mechanism on cylinder head. All other parts are lubricated by oil spray or splash.

OPERATION: Rotor type oil pump mounted in crankcase at left front corner of engine. Pump draws oil through fixed strainer and intake pipe mounted on pump cover and delivers oil to full flow type filter mounted externally on front left side of crankcase. From the filter, oil passes through transverse passage to main oil gallery extending along full length of engine block directly above the camshaft. Oil is distributed through main oil gallery as follows:

Crankshaft & Camshaft Bearings - Oil passages in crankcase webs supply oil from main gallery to each crankshaft bearing and then up to corresponding camshaft bearing. Distributor drive gear is lubricated from front camshaft bearing.



Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing. Oil groove in main bearings provide continuous flow of oil to con-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

necting rod bearings.

Pist ns & Pins - Lubricated by oil spray thrown on cylinder walls from oil hole on right side of rod when this hole registers with oil hole in connecting rod journal.

144" & 170" ENGINE OILING SYSTEM

Timing Chain & Sprockets - Lubricated by splash from oil pan.

Rocker Arms, Pushrods & Valve Stems - Oil from rear camshaft bearing flows through vertical passage in block and around left rear corner cylinder head bolt to oil port at rear rocker arm shaft bracket pad. Oil then flows around this bracket bolt to hollow rocker arm shaft, and is distributed to each rocker arm for rocker arm, pushrod, and valve tip lubrication. Excess oil is discharged from rocker arm shaft at front shaft bracket. Oil from rocker chamber runs down pushrods to lubricate pushrod seat and lifter and drains back into the oil pan through cored openings in the block.

OIL FILTER: Full flow type. Mounted externally on left front corner of engine. Filter has integral bypass valve and anti-drain back diaphragm.

223" & 262 ENGINES

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings. Oil metered by No. 3 camshaft bearing lubricates rocker arms, pushrods, and valve stems. All other parts are lubricated by oil spray or directed oil return flow.

OPERATION: Gear type oil pump mounted in crankcase on right hand side draws oil through fixed oil inlet and strainer, mounted on pump cover and delivers all oil through a passage in the pump body and crankcase wall to the oil filter intake port (filter mounted on pad on right side of crankcase). Filter outlet port on filter pad is connected to main oil gallery by a vertical passage and cross-passage in the block. Main oil gallery extends along right side of crankcase and oil is distributed from this gallery as follows:

Crankshaft & Camshaft B arings - Lubricated by drilled passages in each crankcase web through which oil is supplied from main oil gallery to each crankshaft bearing. A transverse passage connects this passage with each camshaft bearing.

Connecting Rods - Crankshaft is drilled and each connecting rod bearing is lubricated from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from drilled hole in connecting rod when this hole lines up with connecting rod bearing lubricating hole.

Timing Chain & Sprockets - Lubricated through drilled passage in front end of block which directs oil from front camshaft bearing to crankshaft sprocket (camshaft journal has flat which registers with bearing supply oil hole and timing chain lubrication hole once in each revolution). Oil slinger on front end of crankshaft also throws oil onto chain.

Rocker Arms. Pushrods, & Valves - Drilled passage in No. 3 (rear intermediate) camshaft journal feeds oil at reduced pressure to drilled passage in block. A tube extending up through block and cylinder head directs this oil to the No. 6 (rear) rocker shaft bracket and into the hollow rocker arm shaft. Oil then flows through drilled passages in rocker arm to lubricate rocker arm bushing, pushrod socket and valve tip. Oil drainage from rocker arm drains down pushrods for valve lifter lubrication (below). Excess oil from rocker arm shaft flows through outlet pipe at No. 1 (front) rocker shaft bracket. This pipe terminates at drilled hole in lifter chamber directly above distributor driveshaft for distributor and drive gear lubrication (see below).

►*"ZERO LASH" ROCKER ARM NOTE:* Spring in rocker arm recess between arm and eccentric separates arm and eccentric for increased oil flow around eccentric. Rocker arm plunger and spring assembly is filled with oil to provide a cushioning effect to eccentric movement.

Valve Lifter & Fuel Pump Eccentric - Oil drainage from rocker arm flows down pushrods into lifter chamber for valve lifter and pushrod seat lubrication. A drilled hole in the lifter chamber floor directly above fuel pump eccentric on camshaft provides lubrication for the eccentric. A return hole at rear of lifter chamber allows oil to drain back into the crankcase.

Distributor & Drive Gear - Oil return pipe from rocker arm shaft terminates at drilled hole in lifter chamber. This hole is directly above distributor drive gear on camshaft and gears are lubricated by this return oil. A transverse passage in the block at the oil return pipe location in the lifter chamber directs drain oil to relieved section of distributor housing. Oil holes in housing direct oil to distributor lower bushing and drive gear.

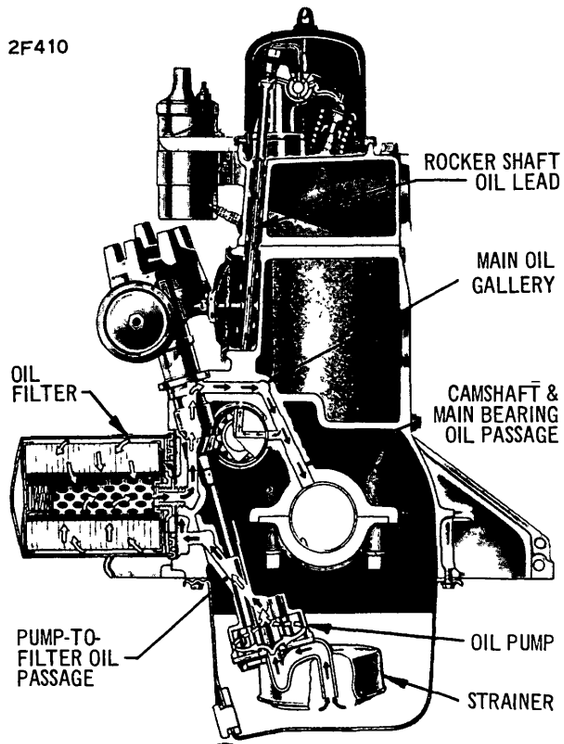
OIL FILTER: Full-flow type mounted on pad on right side of crankcase. Relief valve in filter assures engine lubrication if filter element clogged. An anti-drainback diaphragm in the filter mounting recess traps oil in filter to insure quick oil circulation when engine is started up.

221" & 260" ENGINES

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod and camshaft bearings, hydraulic lifters and pilot end of distributor shaft.

OPERATION: Rotor type oil pump mounted on inside of crankcase draws oil through fixed oil screen in oil pan and delivers all oil to full-flow type filter. A spring loaded relief valve in pump limits maximum pressure in system. Filter has an internal relief valve which by-passes all oil when filter is clogged. Oil passes from filter through passages in block to No. 1 main and camshaft bearings and to main oil gallery in right bank side of block. Oil from main oil gallery is delivered as follows:

Crankshaft & Camshaft B arings - Lubricated by drilled passages from main oil gallery to No. 2,3,4 & 5 main bearings and passages from their webs to camshaft bearings.



Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from drilled hole in each connecting rod lower end when this hole lines up with oil hole in crankshaft.

Hydraulic Lifters - Oil passes from main oil gallery to passages at rear of block leading to hydraulic lifter galleries.

Rocker Arms, Pushrods & Valv s - Lubricated by oil passing through metered hole in upper end of hydraulic lifter plunger, through hollow pushrods, to friction areas of rocker arms. Oil drains back through holes in both ends of cylinder heads and the block.

CONTINUED ON NEXT PAGE

223" & 262" ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING P AGE

Distribut r - Pilot end (lower end) of shaft is lubricated through passage from No. 1 camshaft bearing bore.

Distribut r Driv & Driven Gears, Timing Chain, Sprockets and Fu l Pump Eccentric - All splash lubricated.

OIL FILTER: Full-flow type mounted on left front side of engine. Filter has integral relief valve to permit oil to by-pass filter when filter clogged.

292" V8 ENGINE

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, Oil metered by camshaft bearings lubricates rocker arms, pushrods, and valves. All other parts are lubricated by oil spray or directed oil return flow.

OPERATION: Rotor type oil pump mounted externally on left side of crankcase draws oil through fixed oil strainer in oil pan and external oil pipe (passes through or attached to side of oil pan) and delivers all oil through a port in the pump mounting base and passages in crankcase to oil filter intake port (filter mounted on pad on left side of crankcase). Filter outlet port on crankcase connects directly with main oil gallery extending along left side of crankcase. Oil is distributed from this main oil gallery as follows:

Crankshaft & Camshaft Bearings - Lubricated by drilled passage in each crankcase web through which oil is supplied from main oil gallery to intersecting passage leading to corresponding main and camshaft bearings.

C nn cting Rod B arings - Crankshaft is drilled and each connecting rod bearing is lubricated from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from drilled hole in side of connecting rod lower end when this hole lines up with oil hole in crankpin.

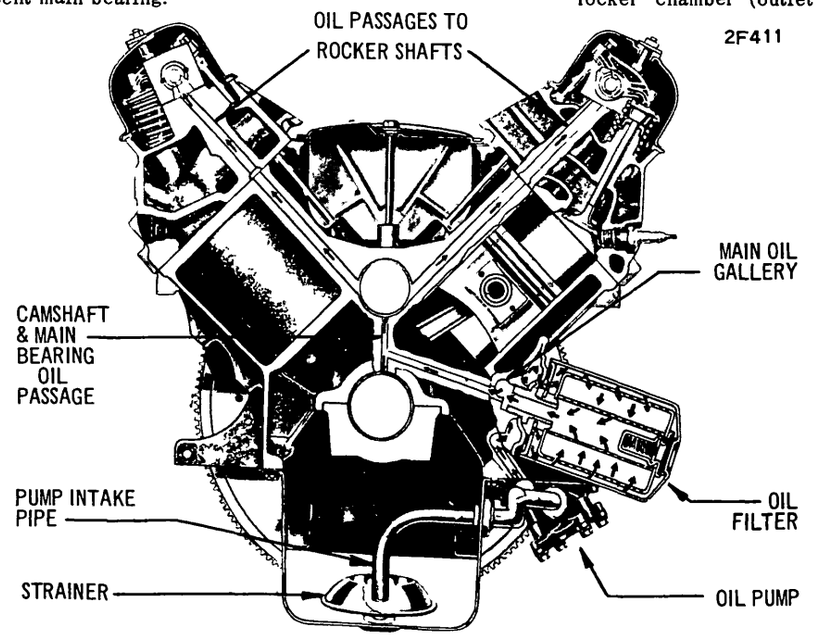
Rocker Arms, Pushrods & Valves - Drilled passages in block at No. 3 camshaft bearing extend up through block and matching passages in cylinder heads (with offset formed by channel on lower face of head) and oil then flows up through drilled passage in No. 2 rocker shaft support bracket (Right Bank), No. 3 rocker shaft support bracket (Left Bank) to hollow rocker arm shaft. Oil holes in shaft and rocker arm provide lubrication for rocker arm bushing, pushrod ball end and valve tip. Oil drainage from rocker arm drains down pushrods for valve lifter lubrication (below). Excess oil from rocker shaft flows through outlet pipe at No. 1 rocker shaft bracket (Right Bank), No. 4 rocker shaft bracket (Left Bank) for timing chain and distributor lubrication (see below).

Valve Lifters & Pushrod Seats - Oil drainage from rocker arm flows down pushrods into lifter chamber for valve lifter and pushrod seat lubrication. Oil for this purpose is also supplied by rocker shaft outlet pipes which terminate in lifter chamber. Oil in lifter chamber is returned to oil pan through large opening at rear of chamber. This oil lubricates distributor drive gear.

Distributor, Intermediate Shaft & Bushing - Lubricated by oil supplied through drilled passage from No. 5 camshaft bearing (camshaft journal is drilled and oil flows through this passage from camshaft bearing oil hole to distributor oil passage). *NOTE* - Distributor drive gear is lubricated by oil return from lifter chamber to oil pan through large opening at rear of lifter chamber.

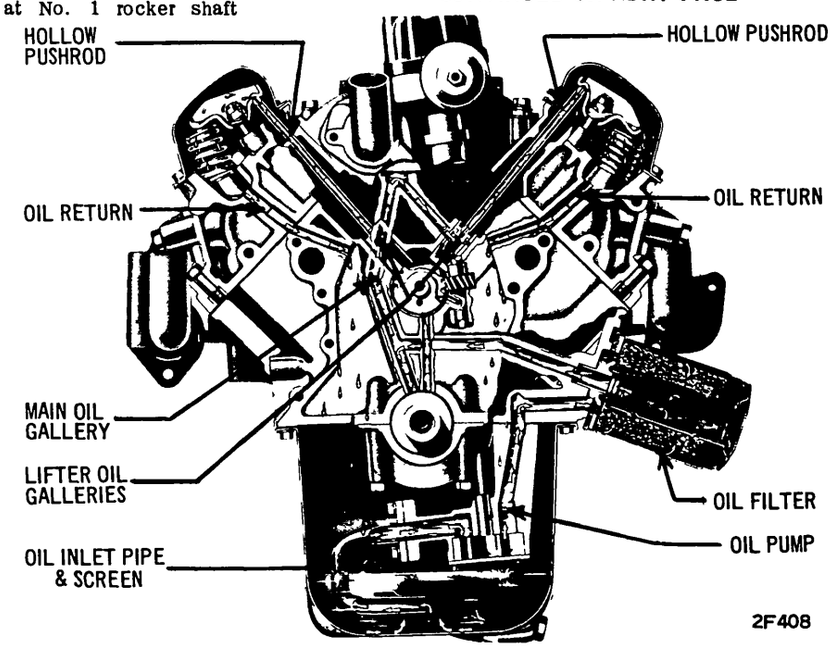
Timing Chain & Sprockets - Oil return from right bank rocker chamber (outlet pipe at No. 1 rocker shaft bracket) is channeled by trough in lifter chamber to hole in front cylinder block wall through which the oil is directed on timing chain and sprockets. Oil slinger on crankshaft also throws oil on timing chain,

OIL FILTER: Full-flow type mounted on pad on left side of crankcase. Relief valve in filter assures engine lubrication if filter element clogged. An anti-drainback diaphragm in the filter mounting recess traps oil in filter to insure quick oil circulation when the engine is started up.



352", 390" & 406" ENGINES

►*MECHANICAL LIFTER ENGINE NOTE:* On engines with mechanical lifters, engine oiling system is changed as follows: 1) Jiggle pin in main oil gallery replaced by a cap plug. 2) Passages from main oil galleries to right and left lifter galleries are plugged.



DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, hydraulic valve lifters, and rocker arms. All other parts are lubricated by oil spray or directed oil return flow.

OPERATION: Rotor type oil pump mounted in crankcase draws oil through fixed intake pipe and oil strainer mounted on pump body and delivers oil through passage in crankcase to oil filter inlet port on filter mounting pad. From the filter, oil flows through transverse passages in the front wall of the cylinder block to forward end of main oil gallery which extends the entire length of the crankcase in the floor of the lifter chamber. At a point near the rear of the engine, cross-passages connect the main gallery with the right and left valve lifter galleries which extend along the length of the crankcase in line with the valve lifters. Oil is distributed through these galleries as follows:

CONTINUED ON NEXT PAGE

V8 292" ENGINE OILING SYSTEM

221" & 260" ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING PAGE

Crankshaft & Camshaft Bearings - Front camshaft and crankshaft bearings are lubricated directly from the oil filter outlet passage (vertical passage in front cylinder wall between bearings intersects the filter cross-passage). Other camshaft and crankshaft bearings are lubricated through vertical passage in crankcase web at each bearing which extends down from main oil gallery to corresponding camshaft and crankshaft bearings (camshaft bearing bore in block is grooved to permit oil flow around bearing and on to the crankshaft bearing).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.

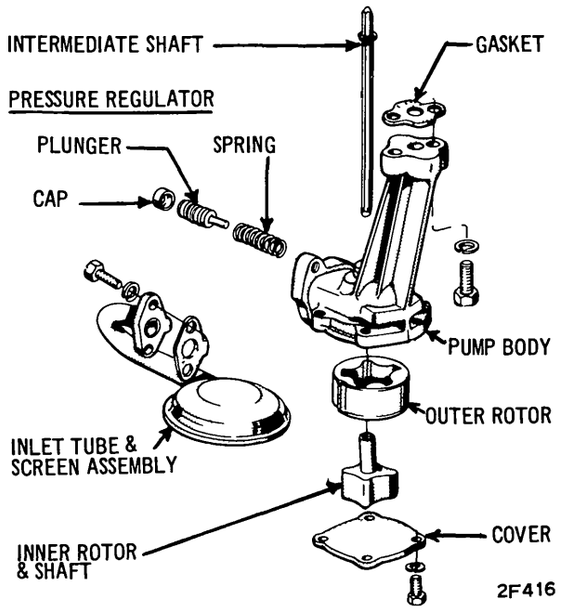
Pistons & Pins - Lubricated by oil spray thrown on cylinder wall by connecting rod of the same cylinder in opposite bank. Spray hole consists of a slot in parting face of rod bearing cap through which oil is sprayed when this slot lines up with oil hole in crankpin. *NOTE - Rods must be installed with this slot upward toward camshaft to effect this cross-lubrication.*

Valve Lifters - Right and left lifter oil galleries intersect lifter bores and lifters are supplied with oil directly from these galleries.

Rocker Arms, Pushrods & Valves - Drilled passages in block at No. 2 camshaft bearing (left bank), No. 4 camshaft bearing (right bank) extends up through block and matching passages in cylinder head (passage in head is around one cylinder head bolt with offset channel in lower face of head to connect this bolt hole with passage in block). An angle passage in the head connects cylinder head bolt hole with rocker shaft support bolt hole (No. 2 support bracket for left bank „ No. 3 bracket for right bank). Oil then flows up around bracket bolt and through an angle passage into the hollow rocker arm shaft. Oil holes in shaft and arm provide lubrication for rocker arm bushings, pushrod ends and valve tips (baffle under rocker shaft assembly shields valve stems from oil splash). Oil drainage down pushrods lubricates pushrod seat in lifter. Excess oil in rocker chamber is returned to oil pan through drain holes at each end of cylinder head and in lifter chamber.

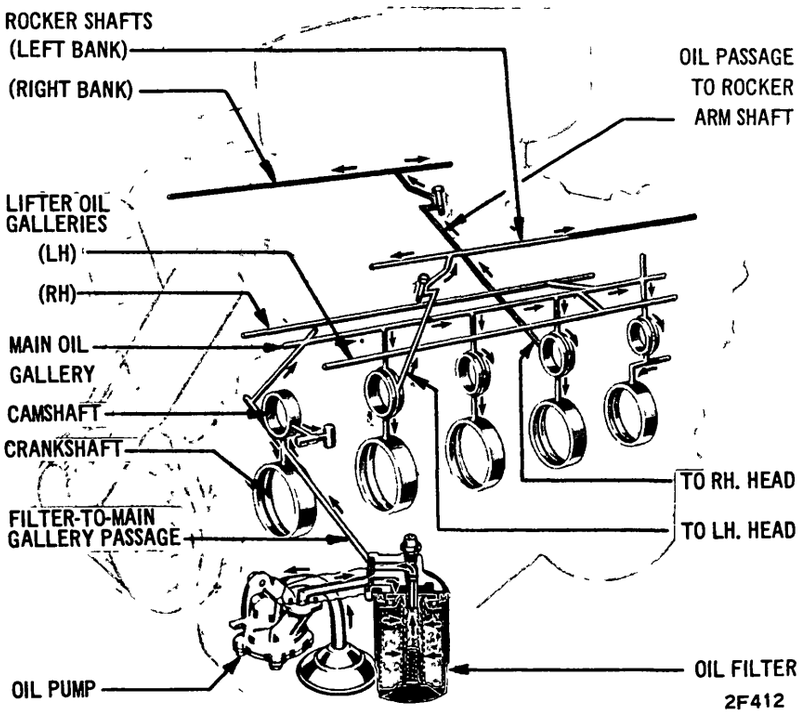
Timing Chain & Sprockets - Plug at forward end of main oil gallery has vent hole and jiggle pin to vent air trapped in gallery. Oil passing through this vent lubricates timing chain and sprockets.

Distributor & Drive Gear - Lubricated through cross-passage from No. 1 camshaft bearing (see illustration).



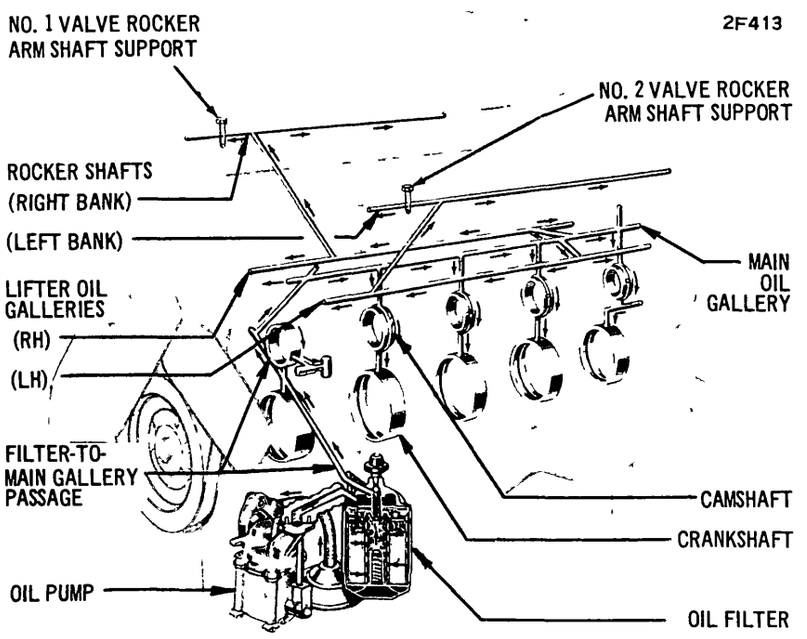
OIL FILTER: Full flow type mounted on adapter at right front of crankcase. Relief valve in filter assures engine lubrication if filter element clogged.

430" V8 ENGINE



DESCRIPTION: *Oiling system for this engine is same as for 352", 390" & 406" V8 Engines (see above) except for the following details.*

Crankshaft & Camshaft Bearings - All bearings are lubricated through vertical passages from main oil gallery (oil flow from filter is direct to main oil gallery).



CONTINUED ON NEXT PAGE

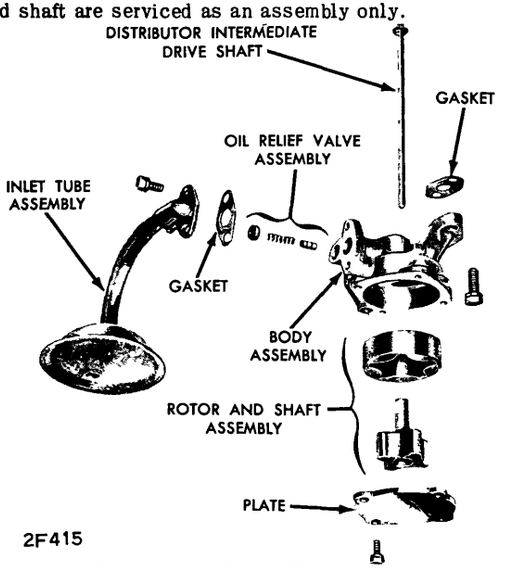
221" & 260" ENGINES OIL PUMP

V8 352", 390" & 406" ENGINE OILING SYSTEM

V8 430" ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING PAGE

Rocker Arms, Pushrods, & Valves - Drilled passages in block lead from right and left lifter oil galleries and connect with matching passages in cylinder head (passage in head is around one cylinder head bolt with offset channel in lower face of head to connect passage in block with this bolt hole). An angle passage in the head connects the cylinder head bolt with the rocker shaft support bracket hole (No. 1 support bracket for right bank, No. 2 bracket for left bank). Oil then flows up around bracket bolt and through angle passage in bracket into hollow rocker arm shaft. Oil holes in shaft and arm provide lubrication for rocker arm bushings, pushrod ends and valve tips. Oil drainage down pushrods lubricates pushrod seat in lifter. Excess oil in rocker chamber drains back into lifter chamber through holes at front and rear lower corners of head.



Timing Chain & Sprockets - Oil draining from front camshaft bearing flows onto thrust face of camshaft sprocket and is sprayed on timing chain and crankshaft sprocket.

OIL PUMP
ALL ENGINES

OIL PUMP: Removal - Remove oil pan. On 223" Engine, remove distributor. On all 6 Cyl. & 292" V8 Engines, remove oil pump and intermediate shaft. On 352", 390", 406" & 430" V8 Engines, remove oil pump after oil pan removed or drop oil pump into pan while removing pan.

Disassembly: Remove inlet tube and cover. Remove inner rotor and shaft, then remove outer race. Remove relief valve chamber cap with self-threading screw, then remove relief valve spring and plunger.

Inspection: Clean all parts and dry thoroughly. Check all parts for wear or damage and replace as necessary. Check clearances as given in table below. Rotor endplay is measured with straightedge across housing with pump assembled. *NOTE* - Outer race, inner rotor and shaft are serviced as an assembly only.

V8 352", 390", 406" & 430" ENGINE OIL PUMP

Oil Pump Specifications

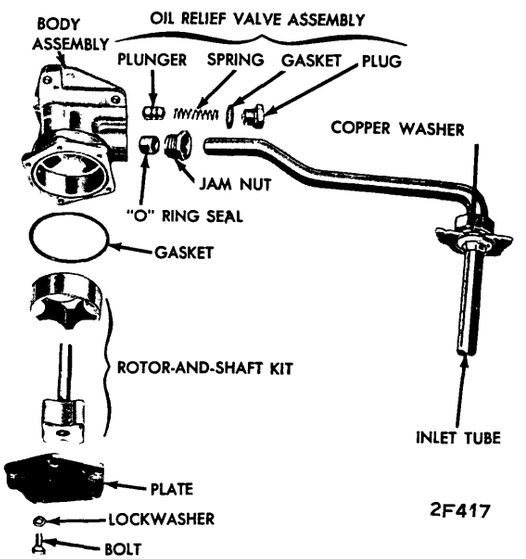
Item	All Engines
Outer Race-To-Housing	①.006-.012"
Rotor Endplay	②.0011-.0041"
Shaft-To-Housing	③.0015-.0029"
Relief Valve-To-Bore	.0015-.0029"

① - .003-.008" (V8 Truck). ② - .0010-.0035" (V8 Truck). ③ - .0025-.0039" (223" & 262" Engines).

Relief Valve Spring Specifications

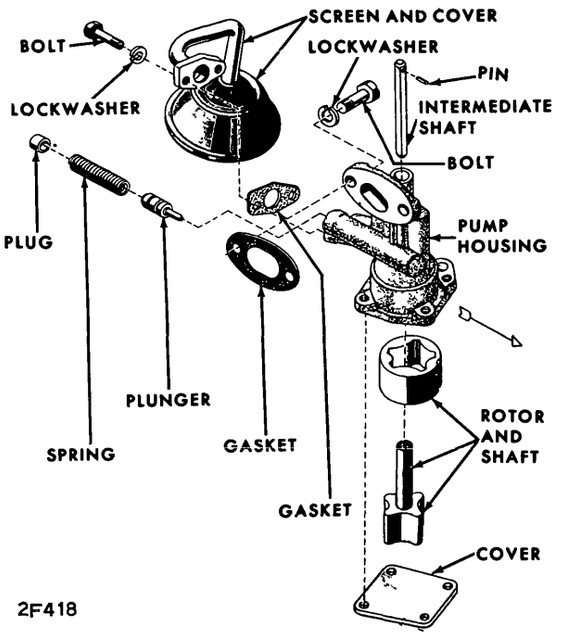
Engine	Lbs. Pressure	Length
144" & 170"	8.6-9.5	1.078"
223" & 262"	9.0-9.6	1.53"
221" & 260"	11.15-11.75	1.704"
292"	8.7-9.7	1.710"
352", 390", 406", 430"	9.0-9.6	1.530"

Reassembly: Reverse disassembly procedure. Torque cover attaching screws to 6-9 ft. lbs. (except 430" Eng.), 90-100 inch-lbs. (430" Engine).



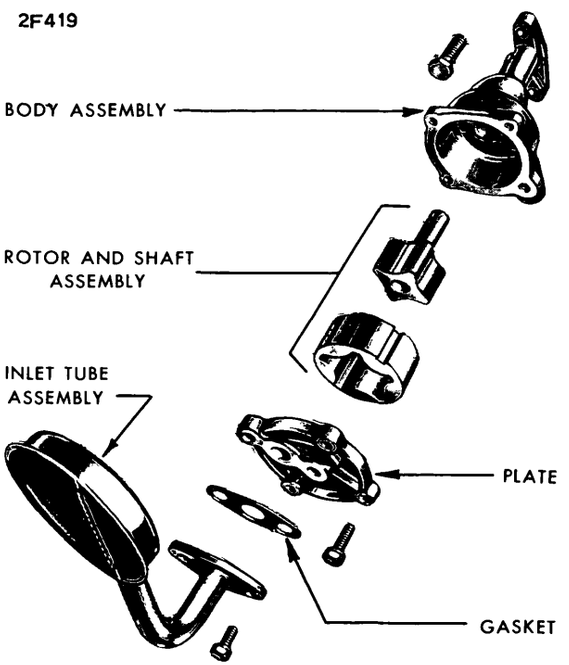
Installation: Reverse removal procedure.

ENGINE COOLING SYSTEM
WATER PUMP
ALL ENGINES



►*TOOL NOTE:* Special tool sets are available for water pump overhaul. Other suitable support plates and drivers may be used providing they support and apply pressure properly to shaft, bearing, housing, and other parts.

WATER PUMP OVERHAUL: Removal - Drain cooling system and disconnect hoses from pump. Remove belt, fan, and water pump pulley. Remove any other brackets or accessories attached to water pump (unnecessary to disconnect power steering pump hoses). Remove radiator supply tank on Continental. Remove water pump.



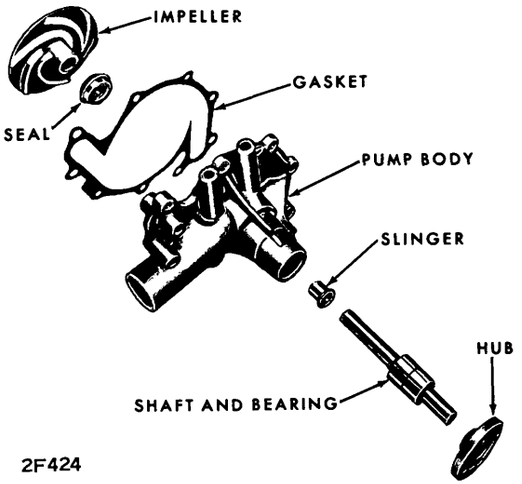
CONTINUED ON NEXT PAGE

V8 292" ENGINE OIL PUMP

223" & 262" ENGINE OIL PUMP

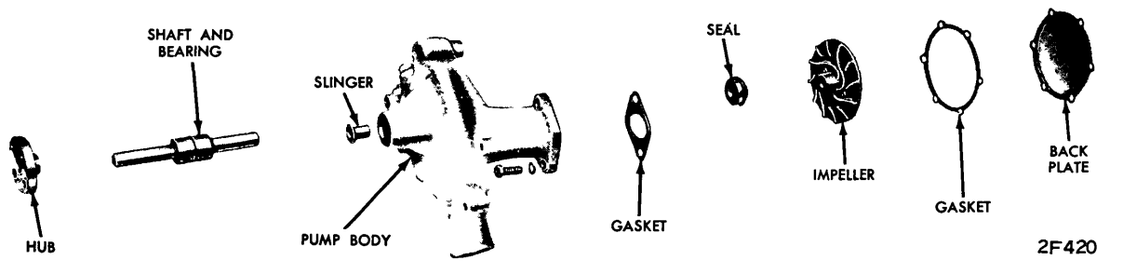
144" & 170" ENGINE OIL PUMP

CONTINUED FROM PRECEDING PAGE



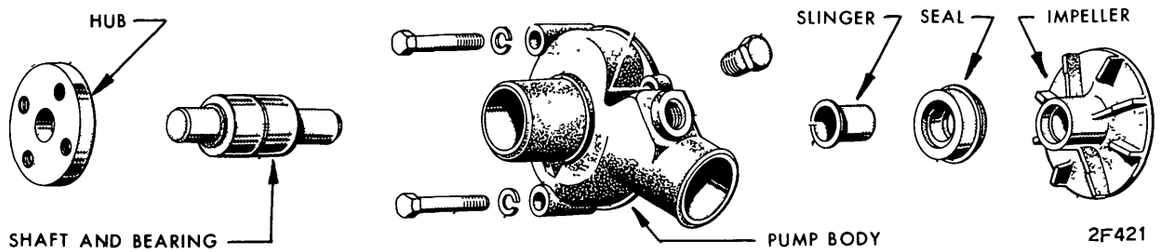
Disass mbly: Remove back plate (if equipped). Press or pull hub or pulley from shaft. Support housing and press shaft and bearing out of impeller, seal, and housing (or press shaft from housing, then press impeller from shaft). Press seal from housing. Remove slinger from shaft if slinger damaged.

R assembly: *NOTE - See table below for specifications.* Support shaft and press new slinger on shaft for specified clearance between underside of slinger flange to end of bearing race (144" & 170"), or specified distance from slinger flange to end of shaft (Others). On 144" & 170"Engines, coat shaft and bearing with a light coat of grease and press shaft into housing, with housing properly supported. On all engines, coat seal with waterproof sealer and press into housing, applying pressure to seal flange only. On all other engines, support housing and press shaft and bearing into housing until bearing is flush with hub edge of housing. On all engines, coat rubbing face of impeller with grease and press impeller on shaft with shaft properly supported until impeller-to-housing clearance is as specified. *NOTE - On pumps without back plate, impeller clearance is between front face of impeller to to rear mounting face of housing. On pumps with back plate, impeller clearance is distance rear face of impeller is below housing mounting face.* Support shaft and press hub on shaft to dimension specified from front face of hub to pump housing mounting face (front face of pulley to face of housing mounting legs on 430" Engine).



Installation: Reverse removal procedure.

Water Pump Dimensions & Clearanc s



Engin	Sling r	Impell r	Hub
144" & 170"	.220"	.005-.025"	3.94"

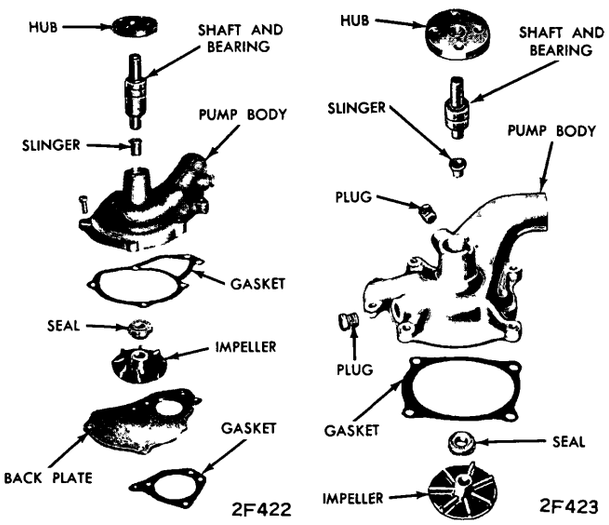
V8 352", 390", 406" & 430" ENGINE WATER PUMP

144" & 170" ENGINE WATER PUMP

POWER BOOSTER FAN

FORD & MERCURY



POWER BOOSTER FAN: Fluid coupling filled with silicone oil attached to water pump pulley at input side and to fan at output side. Unit is designed to provide driving force for maximum fan operation at low speeds and to limit top speeds of fan at higher engine speeds. This is accomplished by the torque carrying capacity of the fluid and also by the amount of fluid admitted to the coupling depending on various engine and ambient temperatures. A bi-metal strip on front of clutch moves out under higher temperatures and allows metal rod in center of clutch to move out. This rod actuates a valve inside clutch to control amount of fluid admitted to coupling from a reserve chamber. This action increases fan speed when air becomes hotter. Reverse action takes place under colder temperatures. Maximum fan speed is reached at approximately 3700 Engine RPM. Maximum fan speed at about 75MPH under extremely high ambient temperatures is 2700 RPM. Under low ambient temperatures, maximum fan speed is approximately 1500 RPM.

Trouble Shooting & Diagnosis: Poor cooling or noise may be caused by: Actuating rod sticking; Bi-metal strip deformed or kinked; Excessive fluid leakage from clutch unit.

Disassembly: Push bi-metal strip from retaining brackets and remove. Clean clutch unit with rag dipped in solvent. *CAUTION - DO NOT immerse clutch unit in any kind of liquid. Clean unit before removing actuating rod to prevent damage.* Remove actuating rod with fingers or needle-nose pliers.

Inspection: Replace entire clutch assembly if there is excess fluid leakage or if bi-metal strip kinked or

CONTINUED ON NEXT PAGE

223" & 262" ENGINE

V8 292" ENGINE

WATER PUMPS

CONTINUED FROM PRECEDING PAGE

bent. *NOTE - Bi-metal strips not interchangeable among units.* Clean actuating rod bore in clutch with crocus cloth. Clean rod in solvent and make sure rod moves freely in clutch bore. Replace damaged rod with replacement rod. *CAUTION - Replacement rod must be same length as old rod. Adjust Allen screw in service rod to obtain proper length.*

Reassembly: Reverse disassembly procedure.

LINCOLN CONTINENTAL

POWER BOOSTER FAN: Fluid coupling mounted between fan and water pump pulley. Unit is regulated by underhood temperatures to control fan RPM as engine cooling requirements change. Bi-metal coil spring on clutch front cover expands under higher temperatures and causes a plate inside unit to uncover opening between reserve and drive chambers and control amount of fluid in drive chamber. Reverse operation takes place under lower temperatures.

►*SAFETY CAUTION: Do not permit silicone oil to come in contact with the eyes as irritation will result.*

►*TESTING CAUTION:* Before testing, oil in unit must have minimum temperature of 65-70°F (park in heated garage overnight or operate engine at 1000 RPM for 20 minutes); and fan unit must be warm (operate for at least 5 minutes regardless of ambient air temperatures).

Testing & Troubl Shooting: *NOTE - Unit cannot be repaired and is service d as an assembly only. If unit does not operate properly under any of the following tests, it must be replaced.*

1) With engine stopped, fan should rotate under light finger pressure. If unit locked, replace it.

2) Make sure belt tension is properly adjusted and thermostatic spring is free of dirt and other foreign matter. Disengage spring from adjusting slot and rotate spring counterclockwise (toward No. 1 cylinder of engine) until internal valve is felt seating against a stop. Tape spring in this position. Unit should not provide engine torque to fan regardless of underhood temperatures.

3) Mark one fan blade with chalk, connect a tachometer to engine and a timing light to No. 1 spark plug. Start engine and hold light beam at fan. Marked blade of fan should be stopped between 1700 and 1900 engine RPM. If above or below this range, replace unit. Remove tape from spring and insert spring in proper adjustment position (see below).

Adjustment: Three adjustment slots in coil spring retaining bracket. End of spring should be positioned in proper slot depending on engine cooling requirements and ambient air temperaturds as follows:

Position A - Left hand slot when viewed from front of fan. Lowers underhood temperature requirements necessary to engage coupling to fan. Use this slot for high ambient air temperature zones and on cars with high engine operating temperatures.

Position B - Center slot. Use under normal operating conditions.

Position C- Right hand slot when viewed from front of fan. Permits higher underhood temperatures before drive torque applied to fan. Use in low ambient air temperature zones to increase engine operating temperature.

FUEL SYSTEM NOTES

430" ENGINE

CARBURETOR AIR INTAKE DUCT ASSEMBLY (WITH THERMOSTAT CONTROL): Thermostatically controlled valve in air intake duct assembly should be fully closed at temperatures below 75°F (for air intake from rear "heated" opening) and should start to open at 85°F. Valve should be wide open at 100°F (for air intake from outside through left radiator side air deflector). If valve does not operate satisfactorily, remove duct assembly and test operation as follows:

Duct Assembly Removal: Loosen clampscrew and slide flexible hose off end of duct. Remove wing nut retaining air cleaner on carburetor, remove nut and washer retaining duct assembly on bracket. Lift air cleaner and duct assembly off engine. Loosen two clampscrews and slide duct assembly from air cleaner.

Testing: Place duct assembly in pan of water at temperature below 75°F. (thermostat must be covered by water). Valve should be in closed "heat on" position. Heat the water slowly. At temperature of 85°F, valve should start to open (*NOTE* - If valve does not start to open, hold water temperature at 85°F for eight minutes before discarding thermostat as defective). Increase water temperature to 100°F. Valve should now be wide open in "heat off" position (*NOTE* - If valve not wide open, hold water temperature at 100°F for eight minutes before discarding thermostat as defective). If valve operation not satisfactory, remove thermostat and spring assembly and check valve shaft for binding. If valve moves freely, replace thermostat and duct assembly. If valve does not operate correctly, adjust thermostat rod as follows:

Adjustment: Increase rod length to move valve toward "heat off" position, decrease rod length to move valve toward "heat on" position.

►*FALCON TRUCK & ECONOLINE NOTE: See separate data pages for information on these models.*
►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

SERIAL NUMBER: Stamped on patent plate attached to left front door hinge pillar post. Number (example below) includes identification data.

① ② ③ ④ ⑤
2 S 12 S 100001

① - Year Model. 2 1962.
② - Assembly Plant. *See below.*
③ - Model Series. *See above.*
④ - Engine. *See below.*
⑤ - Beginning vehicle number at each assembly plant (100001 for Falcon, 500001 for Comet).

Assembly Plant Designation

A - Atlanta	**K** - Kansas City	**S** - Pilot Plant
H - Lorain	**R** - San Jose	**T** - Metuchen

Engine Code Identification

Engine	Code	Engine	Code
144" 6 Cyl. Std.	S	170" 6 Cyl. Std.	U
144" 6 Cyl. Export	D	170" 6 Cyl. Export	E

Engine Production Code Numbers: Stamped on crankcase outlet ventilation pipe boss on crankcase just forward of distributor. Indicate place, day and month of engine manufacture. Not used for licensing.

Car Build Date Code: Stamped under DATE on patent plate. Number indicates day of month, letter indicates month as follows: **A** January through **M** December (I not used).

►*ENGINE DESIGNATION NOTE:* In the following data, engines will be identified as follows: **144** (144 cu. in. engine), **170** (170 cu. in. engine).

TUNE-UP

►*ENGINE FAILING TO RETURN TO NORMAL IDLE SPEED CORRECTION:* Condition may be caused by throttle linkage binding. Check, clean, and lubricate pivot points.

►*170" ENGINE CARBURETOR HIGH FREQUENCY BUZZ CORRECTION: See "Holley Single Barrel Model 1909 Carburetor" in Carburetion Section.*

►*IMPROVED PERFORMANCE & FUEL ECONOMY ON CARS WITHOUT HEATER:* Connect water-heated carburetor spacer (already installed on engine in production) to the engine cooling system. To connect spacer, drain cooling system, and remove air cleaner. Remove pipe plugs from water pump and cylinder head. Install inlet and outlet nipples, then install hoses. Fasten hoses securely with clamps. Check for leaks. *CAUTION* - Do not allow hose to rest on exhaust manifold.

COMPRESSION PRESSURE: 170 lbs. ± 20 lbs. at cranking speed. All cylinders must be equal within 10 lbs.
VACUUM READING: 18" at idle speed.
VALVE TAPPET CLEARANCE: .016", All Valves, Hot and Cold. Use step-type feeler gauge (.015" GO, .017" NO GO). If tappet clearance set with engine cold, reset clearance after operating engine for 30 minutes at 1200 RPM to stabilize temperature.
►*SELF-LOCKING TAPPET ADJUSTING SCREW NOTE:* Torque required to turn screw after interference noted must be 3 ft. lbs. minimum.

MANIFOLD HEAT CONTROL: "Hot Spot" in intake manifold at lower center and engine coolant heated spacer between carburetor and intake manifold (Cars with heater). *For cars without heater, see IMPROVED PERFORMANCE note above.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAP: .032-.036".
Spark Plugs - Autolite BF-82. 18 mm. Torque to 15-20 ft. lbs. Plugs have tapered seat, no gasket used.

COIL: Ford & Mercury No. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) used between ignition switch and dash panel connector. Bypassed during cranking by lead from starter switch.

DISTRIBUTOR: Ford. Used as follows:

Engine & Transmission	①Distributor No.
144 Synchro-mesh	②C2DF-12127-D
144 Auto. Trans.	③C1DF-12127-F
170 Synchro-mesh	④C1GF-12127-A or ⑤C2UF-12127-A
170 Auto. Trans.	⑥C2GF-12127-A

① - Number stamped on distributor housing for identification.
② - Part No. C2DZ-12127-B. ③ - Part No. C1DZ-12127-A.
④ - Part No. C1DZ-12127-B. ⑤ - Part No. C2UZ-12127-A.
⑥ - Part No. C2DZ-12127-C.

Condenser - Ford & Mercury No. 7RA-12300-C.
Condenser Capacity - .21-.25 mfd.
Contact Point Set - Ford & Mercury No. FAA-12171-A.
Breaker Gap - .024-.026".
Cam Angle - 35-38°.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

① - Set test stand to 0°, 0" of Hg, and 300 RPM.
② - Set test stand to 0°, 0" of Hg, and 450 RPM.
③ - Set test stand to 0°, 0" of Hg, and 400 RPM.

IGNITION TIMING

Model	Std. Setting	All wabl Rang
Synchro-mesh	4° BTDC	4-9° BTDC
Auto. Trans.	10° BTDC	10-15° BTDC

►*SETTING NOTE:* Set timing with engine idling and distributor vacuum line disconnected.
Timing Mark - Notch in crankshaft pulley or damper and timing pointer on left side of chain case cover. Pointer marked "0", "3", "6", "10", "14", Align pulley notch with correct mark on pointer.

CARBURETOR

►*CARBURETOR APPLICATION: One Holley Model 1909 single barrel carburetor used on all models.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature, hot idle speed correctly set, and anti-stall dashpot correctly adjusted (see below), stop engine and proceed as follows:

Accelerator Pedal Height Adjustment - Distance from top front corner of accelerator pedal to floor mat should be 4¼". To adjust, turn threaded trunnion on accelerator connecting link. With accelerator pedal fully depressed, make sure carburetor throttle plate is fully open. Readjust pedal height as necessary.

Downshift Rod Adjustment - Disconnect accelerator return spring at manifold, and kickdown spring at rod and "Z" bar. Pull downshift rod and "Z" bar up to full limit of travel (or hold accelerator pedal depressed and pull on downshift rod only). Slide stop bolt down against "Z" bar and tighten bolt securely. Install return springs. Check throttle and downshift linkage for full travel and see that no bind exists in linkage.

Anti-Stall Dashpot Adjustment: With carburetor hot or slow idle speed correctly adjusted, hold throttle valve valve closed. Clearance between end of dashpot plunger and throttle lever with dashpot plunger fully depressed should be .120-.150". To adjust, screw dashpot in or out as required.

① - Number stamped on throttle lever side of main body flange and/or on tag attached to carburetor.

② - If Carburetors A,B,C or D have an asterisk on flange, they have all modifications found in later carburetors J,K,L and M.

Idle Setting - Initial setting 1-1½ turns open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll. Then turn screw in until engine runs smoothly. Favor a slightly rich mixture.

Idle Speed - With engine at normal operating temperature so that throttle stopscrew is resting on low step of fast idle cam, adjust throttle stopscrew for correct engine idle speed as indicated in table below. *NOTE - On automatic transmission cars, selector lever must be in "D" (Drive) position.*

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

Car Model ①	Idle Speed Setting Synchro-mesh	② Auto. Trans.
All Models (Std.)	500-550 RPM	475-525 RPM
All Models (CCV)	550-600 RPM	525-575 RPM

① - **Std.** - Without Closed Crankcase Ventilation. **CCV** - With Closed Crankcase Ventilation.

② - With transmission in "D" (Drive) position.

Float Level - 5/16"±1/64" from top of float (¼" from free end) to gasket surface of air horn with air horn inverted and float resting freely on inlet needle valve. Use Gauge 10-238 (Falcon), 9550-MFC (Comet). Adjust by bending float tab with needle nose pliers. *CAUTION - Do not allow float to press on inlet needle valve when making adjustment (may damage Viton Tipped needle).*

Fast Idle: 1500 RPM (Synchro-mesh), 1800 RPM (Auto. Trans.). Adjust with fast idle adjusting screw on highest step of fast idle cam, then turn adjusting screw to obtain proper RPM.

Automatic Choke Setting: Centered at Index.

Accelerating Pump Setting: Connect link in outer hole of pump operating lever for average (year around) temperature. Place in inner hole for high temperature or high altitude. *NOTE* - These settings supersede previous setting.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Holley Single Barrel Model 1909 Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Comet & Falcon No. C2DZ 9350-A (Electric Wipers), CODE 9350-J (Vacuum Wipers).

Fuel Pump Pressure - 3½-5½ lbs. at 500 RPM.

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator Comet & Falcon No. B9MF-10804-A.

Dash Unit - Comet No. C2GF-9280-A, Falcon No. C2DZ-9305-A.

Tank Unit - **Comet** No. COAZ-9275-C (Exc. Sta. Wgn.), No. C1AF-9275-A (Sta. Wgn.).

Falcon No. CODZ-9275-C (Exc. Sta. Wgn. & Sed. Del.), No. C1DF-9275-A (Sta. Wgn. & Sed. Del.).

Fuel Filter: Disposable type in fuel line. Replace filter every 12,000 miles (Falcon), 6,000 miles (Comet). *NOTE* - Filter must be installed with arrow on filter case pointing toward carburetor.

Air Cleaner: Dry filter element type. Clean every 6,000 miles, replace element every 30,000 miles.

►*CLEANING CAUTION:* Clean filter element by blowing compressed air from inside surface of element. DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.

►*INSTALLATION CAUTION:* Locating notch in carburetor and mating tab on air cleaner must be engaged and mark "FRONT" must be to front of engine.

BATTERY

Ford & Mercury Part No.	①Volts	Plates	②Capacity
CODZ-10654-A	12	9	40 Ampere Hr.
CODZ-10654-B	12	9	55 Ampere Hr.
B9A-10654-D	12	11	55 Ampere Hr.

① - Numbers are for dry type batteries for service replacement. ② - At 20 hour rate.

Battery Ground - Negative, to right front corner of cylinder head.

STARTER

Ford. "Positive Engagement" type. 4" and 4½" diameter types used. Different specifications for each size are listed below.

Drive - Ford & Mercury No. C2DZ-11350-A (4" Starter), No. C2DZ-11350-B (4½" Starter). Solenoid pinion shift with solenoid wound on one starter pole piece.

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 45 ozs. minimum.

Cranking Speed - 250-290 RPM, 100-150 amperes.

Performance Data - 4" Starter

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	70
8 ft. lbs.		5.0	450

Performance Data - 4½" Starter

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	70
9.6 ft. lbs.		5.0	500

① - With starter on engine and engine idling.

Starting Switch: Magnetic type, Comet & Falcon No. B6A-11450-A, controlled by ignition switch.

Neutral Safety Switch: Comet & Falcon No. C1KF-7A217-A (With Back-up Lights), No. CODF-7A217-A (Without Back-up lights).

Adjustment - *See "Ford Motor Co. 2-Speed Automatic Transmission" in Transmission Section.*

CONTINUED ON NEXT PAGE

SEE INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

GENERATOR

Ford. 25 and 30 ampere generators used. Different specifications for each type are listed below.

►*IDENTIFICATION NOTE:* Rated output of generator is stamped, painted, or stenciled on unit.

Performance Data

Amperes	Volts	Gen. RPM
25	15.0	2610
30	15.0	2525

Brush Spring Tension - 20-26 ozs.

Field Current - 1.2-1.8 amperes at 12.0 volts (hot).

Rotation - Counterclockwise at commutator end.

B lt Adjustment: Use Belt Tension Gauge T62L-8620-A or 33-73F or equivalent and measure belt tension as follows:

Belt Tension Specifications (Lbs.)

Engine	①New Belt	②Used Belt
All	90-120	60-90

① - Run belt for 5 minutes and reset tension.

② - Any belt operated 10 minutes or longer.

GENERATOR REGULATOR

Ford or Bosch. 25 and 30 Ampere Regulators used with generators of same amperage rating. See *GENERATOR* above.

►*IDENTIFICATION NOTE:* Current setting of regulator is stamped on unit.

►*SETTING CAUTION:* "Temperature Compensated" type. Set to following specifications at 75°F ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized.

Cutout Relay

Cuts In - 12.4-13.2 volts (25 Amp.), 12.0-12.8 volts (30 Amp.).

Cuts Out - 8 amps. (25 Amp.), 6-9 amps. (30 Amp.) reverse current.

Voltage Regulator

Setting - 14.6-15.4 volts at 75°F ambient temperature.

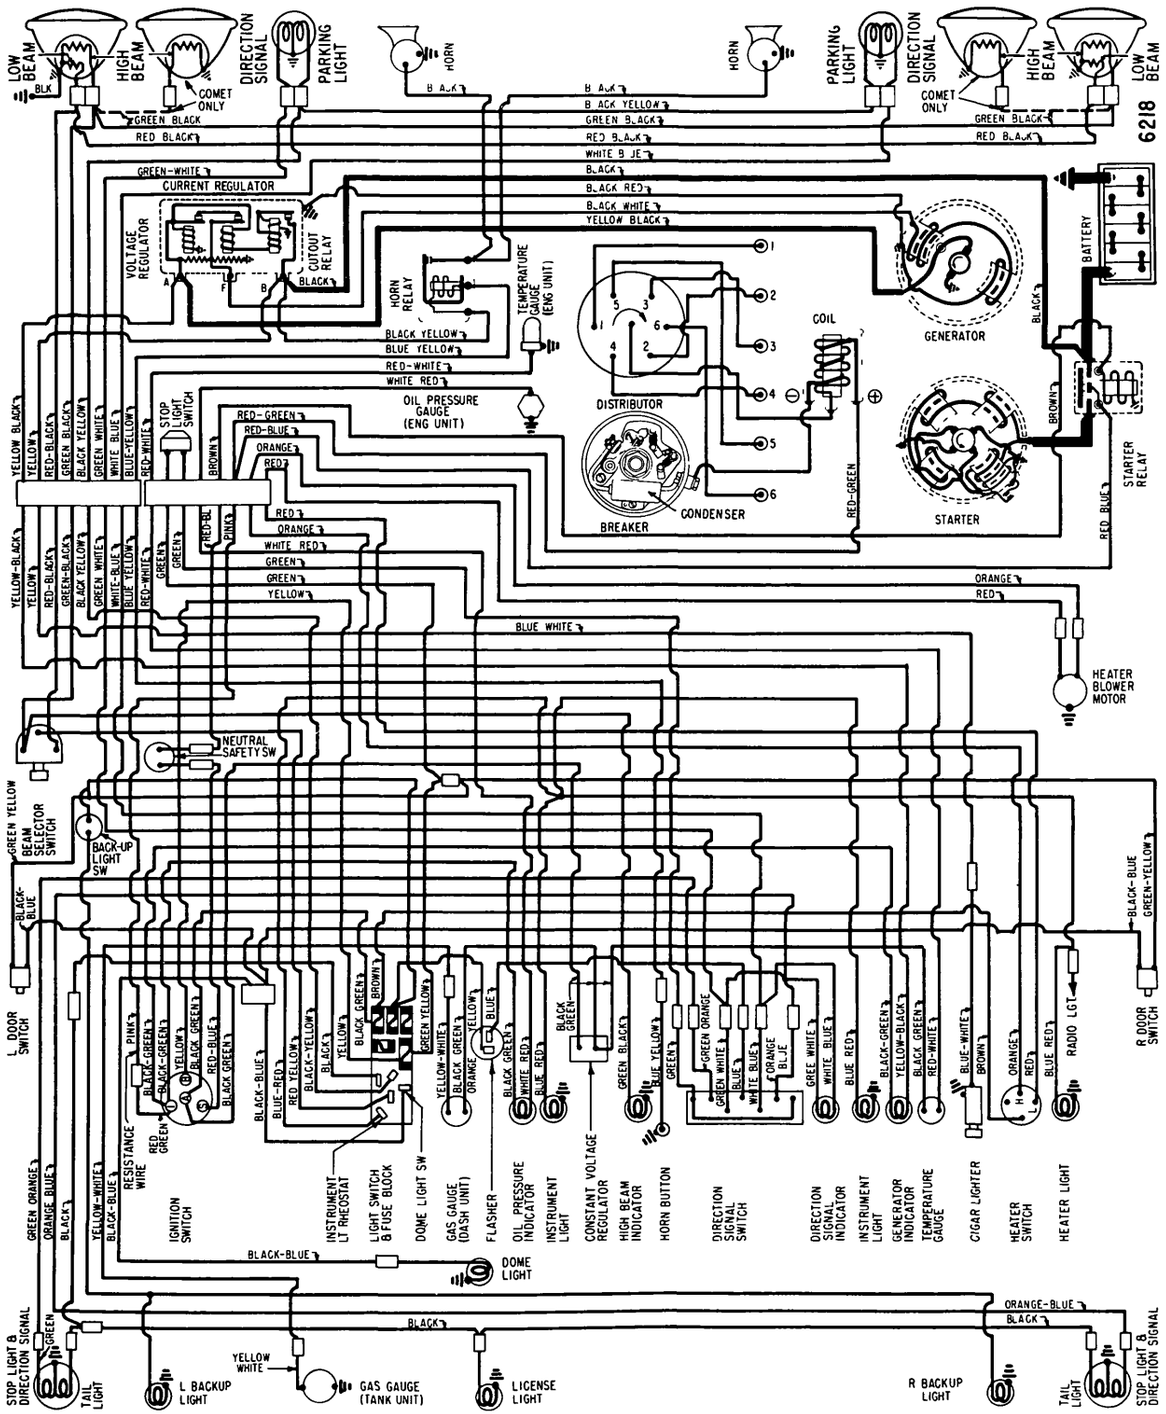
Current Regulator

Setting (25 Amp.) - 23-27 amperes.

Setting (30 Amp.) - 28-32 amperes.

►*OTHER DATA: See "Ford Motor Co. 12-Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL



St p Light Switch Location: On forward end of brake master cylinder.

Lighting Switch: Combination lighting switch and fuse junction block.

Removal - Disconnect battery. Remove switch control knob and shaft by pressing down on release button on top of switch (switch in "OFF" position). Use Tool 17470-N-51 to remove bezel nut and remove switch. Separate switch from fuse junction block.

►*COMET DIRECTION SIGNAL INTERMITTENT OPERATION CORRECTION:* May be caused by poor ground between rear bulb socket and reflector. To correct, stake bulb socket to reflector in several places with a prick punch.

CONTINUED ON NEXT PAGE

COMET & FALCON WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Speedometer Removal: Disconnect speedometer cable at speedometer head, then remove instrument cluster bezel retaining screws and remove bezel, lens, and cluster mask plate from cluster housing. Remove speedometer retaining screws and remove speedometer.

CIRCUIT BREAKERS: 18 Ampere - Protects headlight circuit. Integral with headlight switch.
12 Ampere - Protects electric windshield wipers. On right side of instrument cluster near ignition switch.

FUSES: *Fuses are located in fuse junction block of lighting switch except as noted.*
15 Amper - Instrument Panel, Dome, and All Exterior Lights (except headlights).
14 Amper - Direction Signals & Back-up Lights.
14 Amper - Heater Blower.
7.5 Amper - Radio.
Cigar Lighter - Sulphur disc on back of lighter socket.

ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl., valve-in-head. 144" and 170" engines of same design used previously.

Engin	Bore	Stroke	Displacement
144	3.50"	2.50"	144 cu. ins.
170	3.50"	2.94"	170 cu. ins.

Engin	Compr. Rati	Rated HP	Developed HP
144	8.7-1	29.4	85 at 4200 RPM
170	8.7-1	29.4	101 at 4400 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

►*LOSS OF ENGINE OIL PRESSURE CORRECTION:* May be caused by insufficient engagement of distributor drive shaft into oil pump intermediate drive shaft Make sure cup plug in bottom of pump drive rotor is installed 3/16-7/32" below rotor face so that there is 5/16" minimum engagement of distributor shaft into intermediate shaft. Also, make sure hexagon shape of intermediate shaft, and hexagon hole of distributor shaft are not rounded.

►*EXHAUST PIPE-TO-EXHAUST MANIFOLD STUD NUT NOTE:* These studs have interference threads and nuts will not hold torque if used more than once. Install new nuts whenever pipe disconnected from manifold and torque nuts to 40-50 ft. lbs.

►*FLYWHEEL RETAINING CAPSCREW SEALING CAUTION:* Flywheel attaching bolt holes in crankshaft flange are drilled through flange. Flywheel retaining capscrews **must** be coated with oil resistant sealer to prevent engine oil leak at this location which may be diagnosed as a rear oil seal leak.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Motor Co. Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Motor Co. Special Data.*
ENGINE REMOVAL: *See "Engine" in Ford Motor Co. Special Data.*

OIL PAN REMOVAL (COMET): Drain crankcase and remove dipstick. Disconnect engine front mounts, raise engine and place 2" wood blocks between mounts and engine. Let engine rest on blocks. Remove stabilizer bar attaching nuts and pull stabilizer bar down. Remove oil pan. *NOTE* - Rotate crankshaft as necessary for clearance.

OIL PAN REMOVAL (FALCON): Drain crankcase and remove dipstick. Remove clutch retracting spring. Remove front crossmember. Remove stabilizer bar retaining nuts and pull stabilizer down. Remove oil pan. *NOTE* - Rotate crankshaft as necessary for clearance.

PISTON & ROD ASSEMBLY

PISTONS

Solid skirt type with three rings.
Removal - Pistons and rods removed from above.
Clearance - .0018-.0036" at bottom of skirt.

Checking Clearance & Fitting New Pistons: *See "Pistons" in Ford Motor Co. Special Data.*

Replacement Pistons: Furnished Std. (2 sizes - Red & Blue), and .020", .030", .040", .060" Oversize with fitted pins.

Installing Pistons: Notch on piston head should be to front of engine. *See Rod Installation.*

PISTON PIN

Press fit in connecting rod, no locking device used.
Diameter - .9120-.9123" (rod hole diameter .9107-.9112").
Length - 3.010-3.030".
Pin Fit in Piston - .0001-.0003". Wear limit .0008".
Pin Removal & Installation - *See "Piston Pins" in Ford Motor Co. Special Data.*
Replacement Pins: Furnished in assembly with new pistons. *See "Replacement Pistons" above.*

PISTON RINGS

Top compression ring is chrome plated, lower compression ring is phosphate coated. Oil Ring is three-piece type with chrome plated rails.

Ring	Width	Eng Gap	Side Clearance
Compr. (1)	.0774-.0781"	.010-.020"	.0019-.0036"
Compr. (2)	.0770-.0780"	.010-.020"	.0025-.0045"
Oil (3)		.015-.055"	℄

℄ - Snug (side sealing type ring).

CONNECTING ROD

Journal Diamet r: 2.1236-2.1240" (Red), 2.1232-2.1236" (Blue). Taper wear limit .001", Out-of-round wear limit .0006".
Clearance - .0008-.0023".
Sideplay - .004-.008". Wear limit .014".
Length (Center-To-Center): 4.854-4.856" **(144);** 4.714-716" **(170).** *DO NOT interchange rods between engines.*
Installing Rods: Numbers on rods and caps must be on same side and installed in same numbered cylinder. Oil squirt hole should be toward right side of engine on all rods and notch in piston head toward front of engine.
Replacement Bearings: Furnished Std. (2 sizes Red & Blue), & .002", .010", .020", .030" Undersize.
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.

CRANKSHAFT

Journal Diameter - 2.2486-2.2490" (Code Red), 2.2482-2.2486"(Code Blue). Taper wear limit .001", Out-of-round wear limit .0006".
Bearings - Steel backed copper lead alloy.
Clearance - .0006-.0025",
Replacement Bearings: Furnished Std. (2 sizes – Red & Blue), & .002", .010", .020", .030" Undersize.
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.
End Thrust: Taken by No. 3 main bearing.
Endplay - .004-.008". Wear limit .012".
Thrust Bearing Alignment - *See "Crankshaft & Bearings" in Ford Motor Co. Special Data.*
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Bearings" in Ford Motor Co. Special Data*
Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Motor Co. Special Data.*
►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated in front of crankshaft sprocket to reduce oil leakage at front oil seal.

CAMSHAFT

Journal Diameter - 1.8095-1.8105".
Clearance - .001-.003". **Wear Limit** .006".
End Thrust: Taken by thrust plate and spacer behind camshaft sprocket.
Endplay - .001-.007". Wear limit .012".
Replacement Bearings: Furnished Std. & .015" Undersize. *NOTE* - No. 4 bearing has two oil holes and is **not** interchangeable with other bearings.
Camshaft Bearing Replacement - *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*
Camshaft Setting: Marks on both sprockets must be adjacent and in line with straightedge across shaft centers.
Timing Chain: Side guide type, 50 links.
►*TIMING CHAIN REPLACEMENT NOTE:* Replace chain and/or sprockets when deflection on slack side exceeds ½" (take up slack on driving side, measure slack on opposite side). Remove and install chain as a unit with both sprockets.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Motor Co. Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Ford Motor Co. Special Data.*

VALVES

►*ROTATABLE VALVE NOTE:* All valves are rotatable type. *See "Valve System" in Ford Motor Co. Special Data.*

Tappet Clearance: .016" All Valves, Hot & Cold. *For preliminary adjustment after overhaul, see "Valve System" in 1961 Ford Motor Co. Special Data.*

Valve	Head Diameter	①Stem Diameter
Intake	②	.3100-.3107"
Exhaust	1.261-1.276"	.3090-.3097"

Valve	Seat Angle	③Lift	④Stem Clearance
Intake	45°⑤	⑥.2405"	.0008-.0025"
Exhaust	45°⑤	⑦.2395"	.0018-.0035"

① - Std. Also furnished .003", .015", .030" Oversize.
② - 1.462-1.472" (144" Eng.), 1.522-1.532" (170" Eng.).
③ - Cam Lobe Lift. Maximum allowable lift loss .005".
④ - Wear limit .0045" Intake, .0055" Exhaust.
⑤ - Valve Face Angle 44°.
⑥ - Valve Lift .361". ⑦ - Valve Lift .359".

Valve Seat Width - .070-.080", All Valves.

Valve Stem Oil Seals - Cup type seals installed on all valve stems below upper spring retainer.

Valve Springs: Free Length - 2.00" approximately.

Valve Spring Specifications

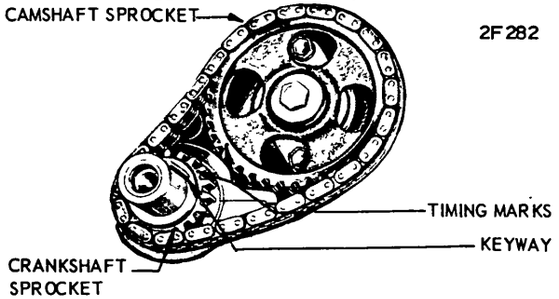
Valve	Spring Pressure	Length
Closed	①47.75-56.25 lbs.	1.585"
Open	②112-122 lbs.	1.222"

① - Wear limit 40 lbs. at 1.585".
② - Wear limit 101 lbs. at 1.222".

Valve Spring Installation: Valve spring ends must be square within 1/16". Install springs with damper (closed) coil end down toward cylinder head. Check installed height of spring from surface of cylinder head spring pad to underside of spring retainer. If height greater than 1 39/64", install .030" spacers as necessary on head under spring to bring height within limits 1 9/16"-1 39/64". *CAUTION - Install spacers only if necessary. DO NOT use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above), ream guides and install valves with oversize stems. *See "Valve System" in Ford Motor Co. Special Data.*

Valve Lifters: Barrel type. Remove from above after removing cylinder head.
Clearance - .0005-.0020". Wear limit .004".



Rocker Arm Assembly: *See "Valve System" in Ford Motor Co. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT for alignment of sprocket marks, and "Lift" under VALVES for checking of camshaft lobe wear.

Valve Timing Specifications

Intake Valves - Open 15°①BTDC. Close 37°②ALDC.
Exhaust Valves - Open45°①BLDC. Close 7°③ATDC.
① - Camlift .012". ② - Camlift .015". ③ - Camlift .014".

VALVE TIMING MARKS

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*

Crankcase Capacity: 3½ qts. refill. Add 1 qt. with filter change.

Normal Oil Pressure: 35-55 lbs. (hot) at 2000 RPM.
Pressure Regulator Valve - In pump body, not adjustable.

Oil Pressure Indicator: Indicator light on instrument panel, controlled by Engine Oil Pressure Switch, Comet & Falcon No. B6A-9278-B, located on left rear side of engine to rear of coil.

Oil Pump: Rotor type, located in crankcase.
Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*

Oil Filter: Full-flow disposable type. Replace every 6,000 miles to coincide with engine oil change.

►*OIL FILTER INSTALLATION NOTE:* Coat gasket face of filter with engine oil. Install filter on adapter until gasket contacts adapter face, then tighten ½ turn by hand. DO NOT overtighten.

Crankcase Ventilation: Conventional - Filter in oil filler cap (inlet) and outlet (road draft) tube at left front corner of engine. Clean filter in filler cap at 6000 mile intervals.
Positive - Road draft tube replaced by an adapter tubing and hose routed to ventilation valve installed in spacer between carburetor and intake manifold. Service system at regular intervals. Check valve operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 8.7 Qts. Add 1 Qt. for heater.
Pressure Valve - 13-15 lbs. radiator cap.

Thermostat: 160°F, Comet No. C1UE-8575-B, Falcon No. CODE-8575-A. 178°F (Early), Comet No. C1UE-8575-A, Falcon No. CODE-8575-B. 188°F (Later), Comet & Falcon No. C2DZ-8575-A, and replaces early 178°F.

Water Pump: Packless, sealed ball bearing type.
Pump Overhaul - *See "Cooling System" in Ford Motor Co. Special Data.*

Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator, Comet & Falcon No. B9MF-10804-A.
Dash Unit - C2GF-10883-A (Comet), C2DZ-10883-A (Falcon).
Engine Unit - CODF-10884-A (Early), C1AZ-10884-A (Later).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

FORD FAIRLANE MODELS

Fairlan	Seri s 30	Fairlane 500	Series 40
2-Door Sedan	31	2-Door Sedan	41
4-Door Sedan	32	4-Door Sedan	42

MERCURY METEOR MODELS

M teor	Seri s 30	Meteor Custom	Series 40
2-Door Sedan	31	2-Door Sedan	41
4-Door Sedan	32	4-Door Sedan	42
		2-Door Sedan (S-33)	47

SERIAL NUMBER: Stamped on patent plate attached to left front door hinge pillar. Number (example below) includes identification data.

① ② ③ ④ ⑤
2 F 31 L 100001

① - Year Model. 2 1962.
② - Assembly Plant. A - Atlanta, F - Dearborn, K - Kansas City, R - San Jose, S - Pilot Plant.
③ - Body Series. *See table above.*
④ - Engine. *See b low.*
⑤ - Beginning vehicle number at each assembly plant (100001 for Fairlane, 500001 for Meteor).

Engine Code Designation

Engin	Code Letter
170" 6 Cyl.	U
170" 6 Cyl. (Low Comp. Export)	E
221" V8	L
221" V8 (Low Comp. Export)	C
260" V8	F

Engin Producti n C de Numbers: Indicate place, day, and month of engine manufacture. Not used for licensing. Located as follows: **6 Cyl.** - Stamped on crankcase outlet ventilation pipe boss on crankcase just forward of distributor. **V8** - Stamped on front face of cylinder block above and to left of water pump mounting.

Car Build Date C de: Stamped under DATE on patent plate. Number indicates day of month, letter indicates month as follows: A January through M December (I not used).

TUNE-UP

►*170" 6 CYL. ENGINE CARBURETOR HIGH FREQUENCY BUZZ CORRECTION: See "Holley Single Barrel Model 1909 Carburetors" in Carburetion Section.*

►*V8 ENG. CARS FUEL SYSTEM POOR PERFORMANCE AND/OR "LEANING OUT" CORRECTION:* Condition may be caused by flexible fuel line being kinked. To correct, shorten line to proper length.

►*IMPROVED PERFORMANCE & FUEL ECONOMY ON CARS WITH 170" ENGINE (WITHOUT HEATER):* Connect water-heated carburetor spacer to engine cooling system. Spacer already installed, but not connected in these cars. To connect spacer, drain cooling system, and remove air cleaner. Remove plugs from water pump and cylinder head, then install outlet and inlet nipples. Connect hoses and fasten securely with clamps. Check system for leaks. *NOTE* - Do not allow hose to rest on exhaust manifold.

►*ENGINE STALLING CORRECTION (Early Cars):* May be caused by fibreglass hood insulation being drawn into carburetor air cleaner. To correct, cut a 3" diameter hole in insulation around imprint of air cleaner horn flange.

COMPRESSION PRESSURE: 170 lbs. ± 20 lbs. (6 Cyl.), 150 lbs. ± 20 lbs. (V8) at cranking speed. All cylinders must be equal within 10 lbs.

VACUUM READING: 18" (6 Cyl. & 260" V8), 16" (221" V8) at idle speed.

VALVE TAPPET CLEARANCE: 6 Cyl. - .016", All Valves, Hot and Cold. Use step-type feeler gauge (.015" GO, .017" NO GO). If tappet clearance set with engine cold, reset clearance after operating engine for 30 minutes at 1200 RPM to stabilize temperature.
V8 - Zero lash, hydraulic lifters. *For clearance adjustment and checking, see "Valves" under ENGINE below.*

►*SELF-LOCKING TAPPET ADJUSTING SCREW NOTE (6 CYL.):* Torque required to turn screw after interference noted must be 3 ft. lbs. minimum.

MANIFOLD HEAT CONTROL: "Hot Spot" in intake manifold at lower center and engine coolant heated spacer between carburetor and intake manifold (Cars with heaters). *For cars without heater, see IMPROVED PERFORMANCE note above.*

CRANKCASE VENTILATION VALVE: Service at 6000 mile intervals and check operation before performing a "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

6 CYLINDER ENGINE

FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAP: .032-.036".
Spark Plugs - Autolite No. BF-82. 18 mm. Torque to 15-20 ft. lbs. (20-30 ft. lbs. for new plug in new head). Plugs have tapered seat, no gasket used.
COIL; Ford & Mercury No. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) used between ignition switch and dash panel connector. Bypassed during cranking by lead from starter switch.
DISTRIBUTOR: Ford. Used as follows:

Application	① Distributor No.
Synchro-mesh	② C1GF-12127-A or ③ C2UF-12127-A
Auto. Trans.	④ C2GF-12127-A

① - Number stamped on distributor housing for identification,
② - Part No. C1DZ-12127-B. ③ - Part No. C2UZ-12127-A.
④ - Part No. C2DZ-12127-C.

C ndenser - Ford & Mercury No. 7RA-12300-C.
Condens r Capacity - .21-.25 mfd.
C ntact P int S t - Ford & Mercury No. FAA-12171-A.
Breaker Gap - .024-.026".
Cam Angle - 35-38°.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Advance Performance
►With Distributor On Test Stand
①C1GF-12127-A & C2UF-12127-A

Distr. Degrees	Vacuum (" of Hg)	Distr. RPM
1½-2½	0.43	700
5¼-6¼	0.92	1000
7½-8¾	1.50	1300
10-11¼	2.40	1700
11-12¼	3.00	2000
16½ max.	10.00	2000

②C2GF-12127-A

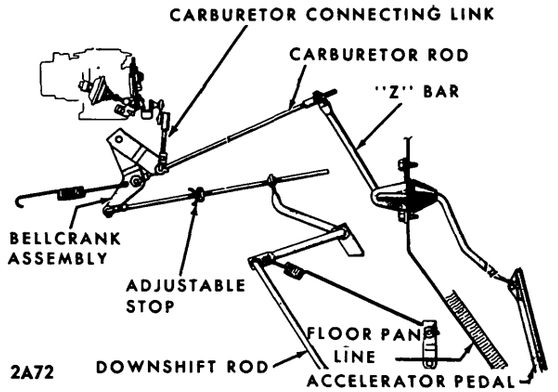
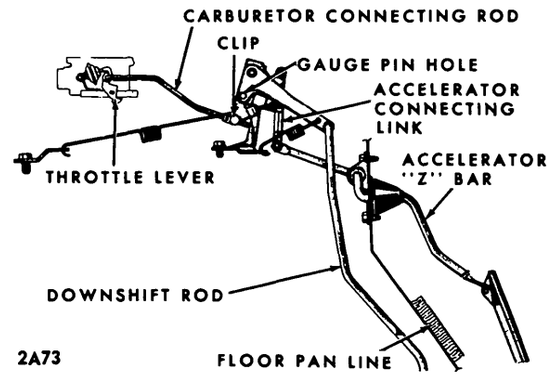
FORD FAIRLANE 6 & V8 WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE



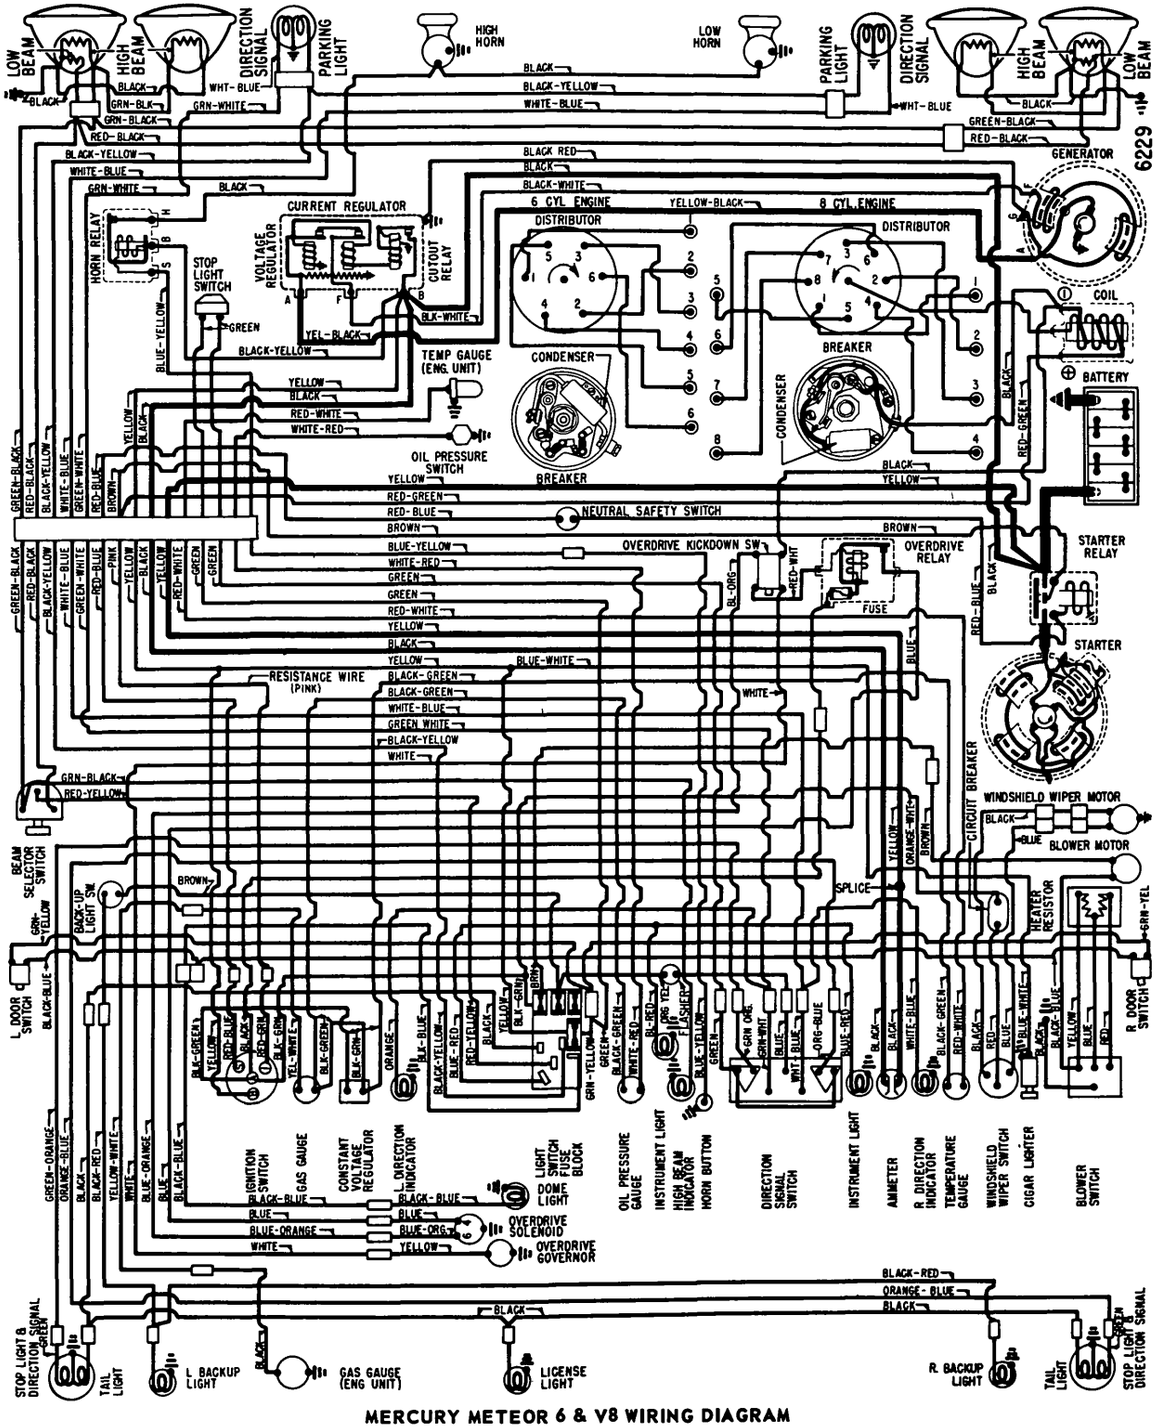
CARBURETOR

►*CARBURETOR APPLICATION: 6 Cyl. - On Holley Model 1909 single barrel carburetor used on all models. V8 - On Ford 2-Barrel carburetor used on all models.*



THROTTLE LINKAGE ADJUSTMENT (6 CYL. AUTO. TRANS.): With engine at normal operating temperature, and idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Stop engine and adjust accelerator connecting link for accelerator pedal height of 3 15/16" (Fairlane), 4 5/16" (Meteor) from top front corner of accelerator pedal to floor mat. Adjust Tinnerman nut on downshift adjusting rod so there is 2 5/16" (Fairlane), 2 1/8" (Meteor) between nut and "Z" bar. *NOTE- If downshift adjusting rod dimension must be reduced more than 1/4" for proper kickdown shift, check for bent linkage or incorrect accel rate pedal height.*

THROTTLE LINKAGE ADJUSTMENT (V8 AUTO. TRANS): With engine at normal operating temperature, and idle speed correctly set, make anti-stall dashpot adjustment (see below), then proceed as follows: Stop engine and adjust accelerator connecting link for accelerator pedal height of 3 15/16" (Fairlane), 4 5/16" (Meteor) from top front corner of accelerator pedal to floor mat.



CONTINUED ON NEXT PAGE

6 CYL. AUTO. TRANS. THROTTLE LINKAGE

V8 AUTO. TRANS. THROTTLE LINKAGE

MERCURY METEOR 6 & V8 WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Disconnect carburetor connecting rod from carburetor throttle lever and insert a 1/4" gauge pin through gauge pin holes in bellcrank. Adjust length of carburetor connecting rod for free fit into throttle lever with throttle lever held against hot idle screw. Gauge pin must be a free fit in gauging holes. Connect carburetor connecting rod and remove gauge pin.

Anti-Stall Dashpot Adjustment: With carburetor hot or slow idle speed correctly adjusted, hold throttle valve closed. Clearance between dashpot plunger and throttle lever with dashpot plunger fully depressed should be .120-.150" (6 Cyl.), .060-.090" (V8). To adjust, screw dashpot in or out as required.

POWER STEERING IDLE SPEED-UP CONTROL: Description - Device prevents engine stalling when steering linkage stops are contacted (as in parking the car). Consists of a control valve with plunger mounted on throttle linkage bellcrank and connected by a hydraulic line to power steering pump. Power steering oil pressure actuates valve.

Adjustment - With engine at correct idle speed, turn wheels against linkage stops, loosen locknuts on control valve mounting bracket, and adjust control valve to maintain same idle speed with linkage against stops. *CAUTION - DO NOT hold wheels against stops for more than 15 seconds.*

HOLLEY MODEL 1909
FAIRLANE

Engine & Trans.	① Carb. No.
6 Cyl. Synchro-mesh (Early)	C2DE-9510-C
6 Cyl. Auto. Trans. (Early)	C2DE-9510-D
6 Cyl. Synchro-mesh (Late)	C2DE-9510-N
6 Cyl. Auto. Trans. (Late)	C2DE-9510-R
6 Cyl. Taxi (Synchro-mesh)	C2DE-9510-J
6 Cyl. Taxi (Auto. Trans.)	C2DE-9510-K

METEOR

Engine & Trans.	① Carb. No.
6 Cyl. Synchro-mesh (Early)	C2GE-9510-C
6 Cyl. Auto. Trans. (Early)	C2GE-9510-D
6 Cyl. Synchro-mesh (Late)	C2GE-9510-L
6 Cyl. Auto. Trans. (Late)	C2GE-9510-M

① - This number stamped on brass tag and on main body of carburetor.

Idle Setting - Initial setting 1-1½ turns open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll. Then turn screw in until engine runs smoothly. Favor a slightly rich mixture.

Idle Speed - With engine at normal operating temperature so that throttle stopscrew is resting on low step of fast idle cam, adjust throttle stopscrew for correct engine idle speed as indicated in table below. *NOTE - On automatic transmission cars, selector lever must be in "D" (Drive) position.*

Idle Speed Setting

Car Model ①	Synchro-mesh	② Auto. Trans.
All Models (Std.)	500-550 RPM	475-525 RPM
All Models (CCV)	550-600 RPM	525-575 RPM

① - **Std.** - Without Closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.
② - In "D" (Drive) Range.

Accelerating Pump Setting - Connect link in outer hole for average (year around) temperature and in inner hole for high temperature or high altitude. *NOTE* - These settings supersede previous setting.

Float Level - 5/16"±1/64" from top of float (¼" from free end) to gasket surface of air horn with air horn inverted and float resting freely on inlet needle valve. Use Gauge 10-238 (Fairlane), 9550-MFC (Meteor). Adjust by bending float tab with needle nose pliers. *CAUTION - Do not allow float to press on inlet needle valve when making adjustment (may damage Viton tipped needle).*

Fast Idle: 1500 RPM (Synchro-mesh), 1800 RPM (Auto. Trans.). To adjust, with fast idle adjusting screw on highest step of fast idle cam, turn adjusting screw to obtain proper RPM.

►*AIR CONDITIONED CAR IDLE SPEED NOTE:* Operate air conditioner at least 20 minutes before setting idle speed, and set idle speed with air conditioning on.

Automatic Choke Setting: Centered on Index.
Throttle Linkage Adjustment: *See CARBURETOR above.*
►*OTHER DATA: See "Holley Single Barrel Model 1909 Carburetors" in Carburetion Section.*

FORD 2-BARREL CARBURETORS

Eng. & Trans. ①	Carb. No.
221" V8 Synchro-mesh (Std.)	② C20E-9510-N
221" V8 Synchro-mesh (CCV)	② C20E-9510-S
221" V8 Auto. Trans. (Std.)	② C20E-9510-R
221" V8 Auto. Trans. (CCV)	② C20E-9510-T

260" V8 Auto. Trans. (Std.)	③ C20F-9510-V,AB
260" V8 Auto. Trans. (CCV)	③ C20F-9510-Z,AD

① - **Std.** - Without Closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.
② - This number stamped on tag attached to carburetor.
③ - Stamped on carburetor main body.

See "Ford 2 & 4-Barrel Carburetors" in Carburetion Section for complete identification and part numbers.

►*STUMBLE OR HESITATION ON ACCELERATION CORRECTION (221" Engine):* Caused by using dry fuel level (initial setting only), with new resilient tipped fuel inlet needle. To correct, use wet fuel level setting. *See "Ford 2 & 4-Barrel Carburetors" in Carburetion Section.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds 1-4-6-7, LEFT barrel feeds 2-3-5-8.*

Idle Setting - Initial setting 1-1½ turns open. With engine at normal operating temperature, turn both idle adjusting screws in until engine runs roughly from lean mixture, then turn screws out until engine begins to roll. Finally, turn screws in just enough for smooth running (favor a slightly rich mixture).
Idle Speed - 500-525 RPM (Synchro-mesh), 475-500 RPM (Auto. Trans. in "D" Range).
►*AIR CONDITIONED CAR IDLE SPEED NOTE:* Operate air conditioner at least 20 minutes before setting idle speed, and set idle speed with air conditioning on.

Throttl Linkag Adjustment: *Se CARBURETOR abov .*
►*OTHER DATA: S "Ford 2 & 4-Barr l Carbur t rs" in Carbur ti n S cti n.*

CARB. EQUIPMENT

Fuel Pump; Used as follows:

Engine	Ford & Mercury Pump No.
6 Cyl.	C20Z-9350-B
6 Cyl.	① C20Z-9350-D
221" V8	C20Z-9350-A
260" V8	C20Z-9350-C

① - Use C20Z-9350-B for replacement.

Fuel Pump Pressure - 3½-5½ lbs. (6 Cyl.), 4-6 lbs. (V8).
Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator, Ford & Mercury No. B9MF-10804-A.
Dash Unit - C20Z-9305-A (Fairlane), C2YY-9280-A (Meteor).
Tank Unit - C20Z-9275-A (Fairlane & Meteor).
Fuel Filter: Disposable or replaceable element type in fuel inlet line between pump and carburetor. Replace filter element every 30,000 miles or 30 months.
Air Cleaner: Dry filter element type. Clean every 6,000 miles, replace element every 30,000 miles or sooner under severe operating conditions.
►*CLEANING CAUTION:* Remove element from cleaner body and hold in a vertical position to shake dust or dirt out by tapping element lightly against horizontal surface. Tap and rotate element until outer surface has been cleaned. Direct compressed air (if used) against inside surface only. DO NOT deform element and DO NOT oil paper or screen of element.

BATTERY

Ford & Mercury Part No.	① Volts	Plates	② Capacity
CODZ-10654-A	12	9	40 Ampere Hr.
CODZ-10654-B	12	9	55 Ampere Hr.

① - Numbers are for dry type batteries for service replacement. ② - At 20 hour rate.
Battery Ground - Negative, to cylinder head.

STARTER

Ford. "Positive Engagement" type. 4" and 4½" diameter types used on 6 Cyl., 4½" diameter type used on V8. Different specifications for each size are listed below.
Drive - Ford & Mercury No. C2DZ-11350-A (6 Cyl. 4" Starter), No. C2DZ-11350-B (6 Cyl. 4½" Starter), No. C20Z-11350-A (V8 4½" Starter). Solenoid pinion shift with solenoid wound on one starter pole piece.
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 45 ozs. minimum.
Cranking Speed - 250-290 RPM, 100-150 amperes.

Performance Data - 6 Cyl. 4" Starter

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	70
8 ft. lbs.		5.0	450

Performance Data - 6 Cyl. 4½" Starter

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	70
9.6 ft. lbs.		5.0	500

CONTINUED ON NEXT PAGE

S INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Performance Data - V8 4½" Starter

Torque	RPM	Volts	Amperes
0 ft. lbs.	Ⓒ	12.0	70
15.5 ft. lbs.		5.0	670

Ⓒ - With starter on engine and engine idling.

Starter Switch: Magnetic type, Fairlane & Meteor No. B6A-11450-A, controlled by Ignition Switch and Neutral Safety Switch No. C20A-7A247-A.

Neutral Safety Switch: Fairlane & Meteor No. C20A-7A247-A.

Adjustment - *See "Ford Motor Co. Automatic Transmission" in Transmission Section.*

GENERATOR

Ford. 30 Ampere type used.

►*IDENTIFICATION NOTE:* Rated output of generator is stamped, painted, or stenciled on unit.

Performance Data

Amperes	Volts	Gen. RPM
30	15.0	2525

Brush Spring Tension - 20-26 ozs.

Field Current - 1.2-1.8 amperes at 12.0 volts (hot).

Rotation - Counterclockwise at commutator end.

Belt Adjustment: Use Belt Tension Gauge T62L-8620-A or 33-73F or equivalent and measure belt tension as follows:

Belt Tension Specifications (Lbs.)

Engine	Ⓒ New Belt	②Used Belt
All	90-120	60-90

Ⓒ - Run belt for 5 minutes and reset tension.

② - Any belt operated 10 minutes or longer.

GENERATOR REGULATOR

Ford. 30 Ampere type for generators of same amperage rating.

►*IDENTIFICATION NOTE:* Current setting of regulator is stamped on unit.

►*SETTING CAUTION:* "Temperature Compensated" type. Set to following specifications at 75°F ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized.

Cut out Relay

Cuts In - 12.0-12.8 volts.

Cuts Out - 6-9 amps. reverse current.

Voltage Regulator

Setting - 14.6-15.4 volts at 75°F ambient temperature.

Current Regulator

Setting - 28-32 amperes.

►*OTHER DATA: See "Ford Motor Co. 12-Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Stop Light Switch Location: On upper forward end of master cylinder.

Lighting Switch: Combination lighting switch and fuse block.

Removal - Disconnect negative battery cable, then remove switch control knob by pulling on knob and pressing on release button. Remove bezel nut and bezel, then remove switch and fuse block. Remove retaining clips and remove fuse block.

Instrument Cluster: Removal - Disconnect negative battery cable and remove wiring harness from clips at top of cluster. Remove wiring harness from clamp attached to left air vent register. Disconnect speedometer cable from speedometer. On Meteor, disconnect charge indicator wire from terminal block attached to steering column right support, then remove charge indicator wire from charge indicator loops. On all cars, cover steering column, then remove five cluster screws and pull cluster from instrument panel. Disconnect all wires and lamps from cluster and remove cluster from car.

Installation - Reverse removal procedure and check operation of all instruments and lamps.

Speedometer: Removal - On all cars, remove instrument cluster. On Meteor, remove six cluster cover screws and remove cluster cover. On Fairlane, remove bezel from instrument cluster. Remove speedometer-to-cluster or housing screws and remove speedometer.

CIRCUIT BREAKERS: 18 Ampere - Headlight circuit. Integral with headlight switch.

12 Ampere - Two-speed electric windshield wipers. On lower left side of instrument panel near ignition switch.

6 Ampere - Single speed electric windshield wipers. On lower left side of instrument panel near ignition switch.

FUSES: *Fuses are located in fuse junction block of lighting switch except as noted.*

3AG 15 Ampere - Instrument Panel, Dome, & All Exterior Lights (except Headlights).

3AG 15 Ampere - Overdrive. *On Overdrive Relay.*

3AG 15 Ampere - Air Conditioner. *In feed wire.*

SFE 14 Ampere - Direction Signals & Back-up Lights.

SFE 14 Ampere - Heater Blower.

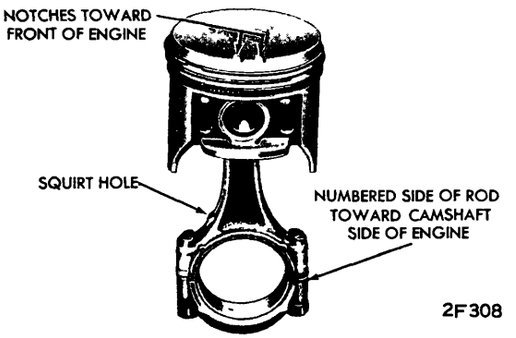
SFE 7.5 Ampere - Radio.

SFE 7.5 Ampere - Spotlight. *In feed wire.*

Cigar Lighter - Sulphur disc or reset circuit breaker on back of lighter socket.

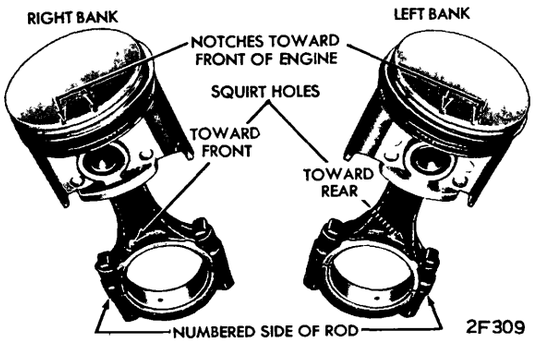
6 CYL. ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl., valve-in-head. 170" engine similar in design to Falcon & Comet engines.



Bore	Stroke	Displacement
3.50"	2.94"	170 cu. ins.

Compr. Ratio	Rated HP	Developed HP
8.7-1	29.4	101 at 4400 RPM



Compression & Vacuum Reading - *See TUNE-UP.*

►*EXCESSIVE RESONANCE & LOW MOAN CORRECTION:* Caused by improperly adjusted engine rear mounting brackets. *See "Engine" in Ford Motor Co. Special Data.*

►*LOSS OF ENGINE OIL PRESSURE CORRECTION:* May be caused by insufficient engagement of distributor drive shaft into oil pump intermediate drive shaft. Make sure cup plug in bottom of pump drive rotor is installed 3/16-7/32" below rotor face so that there is 5/16" minimum engagement of distributor shaft into intermediate shaft. Also, make sure hexagon shape of intermediate shaft, and hexagon hole of distributor shaft, are not rounded.

6 CYL. PISTON & ROD ASSEMBLY

V8 PISTON & ROD ASSEMBLY

►*EXHAUST PIPE-TO-EXHAUST MANIFOLD STUD NUT NOTE:* These studs have interference threads and nuts will not hold torque if used more than once. Install new nuts whenever pipe disconnected from manifold and torque nuts to 40-50 ft. lbs.

►*FLYWHEEL RETAINING CAPSCREW SEALING CAUTION:* Flywheel attaching bolt holes in crankshaft flange are drilled through flange. Flywheel retaining capscrews **must** be coated with oil resistant sealer to prevent engine oil leak at this location which may be diagnosed as a rear oil seal leak.

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Ford Motor Co. Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Motor Co. Special Data.*

ENGINE REMOVAL: *See "Engine" in Ford Motor Co. Special Data.*

OIL PAN REMOVAL: Drain crankcase, remove dipstick, and remove clutch retracting spring. Remove front crossmember. Remove stabilizer bar retaining nuts and pull stabilizer bar down. Remove oil pan retaining bolts, crank engine for necessary clearance, and remove oil pan.

PISTONS

Slipper-skirt type with two compression rings and one oil ring.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*ORIGINAL BORE & PISTON NOTE:* Production standard bore is 3.5000-3.5024". Pistons used in this standard bore are 2 sizes, 3.4976-3.4982" (Color Coded Red), and 3.4988-3.4994" (Color Coded Blue). Production cylinder bore also may be .003" Oversize 3.5024-3.5036" with .003" oversize pistons 3.5000-3.5006".

Removal - Pistons and rods removed from above.
Clearance - .0018-.0036" selective fit. Wear limit .006".
Fitting New Pistons: *See "Pistons" in Ford Motor Co. Special Data.*
Replacement Pistons: Furnished Std. and .020", .030", .040", .060" Oversize.
Installing Pistons: Install piston with notches in head of piston toward front of engine. *See Rod Installation.*

PISTON PIN

Press fit in connecting rod.
Diameter - .9120-.9123" (rod hole diameter .9107-.9112").
Pin Fit in Piston - .0001-.0003". Wear limit .0008".
Pin Fit in Rod - Press fit in rod. *See "Piston Pin" in Ford Motor Co. Special Data.*
Replacement Pins: Furnished Std. and .001" and .002" Oversize.

PISTON RINGS

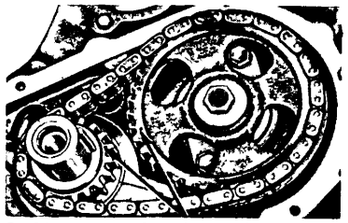
Ring	Width	End Gap	Side Clearance
Compr. (1)	.0774-.0781"	.010-.020"	.0019-.0036"
Compr. (2)	.0770-.0780"	.010-.020"	.0020-.0040"
Oil (3)		.015-.055"	①

① - Snug (side sealing type ring).

Replacement Rings: Furnished Std. and .020", .030", .040" & .060" Oversize.

CONNECTING ROD

Journal Diameter: 2.1236-2.1240" (Red)' 2.1232-2.1236" (Blue). Taper wear limit .001". Out-of-round wear limit .0006".
Clearance - .0008-.0023". Wear limit .0034".
Sideplay - .004-.008". Wear limit .014".



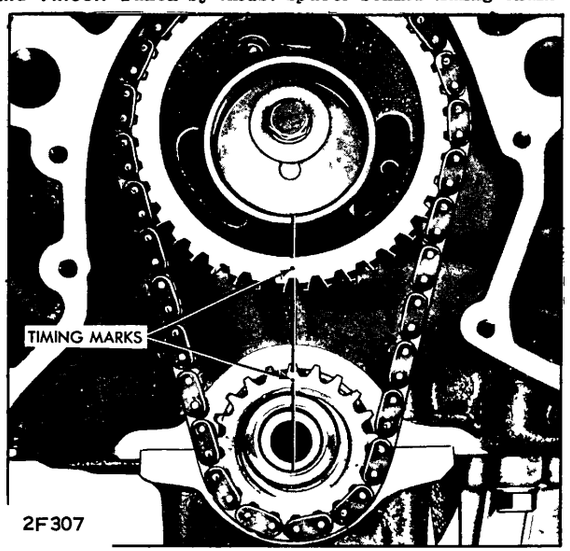
Length - 4.714-4.716" (center-to-center).
Replacement Bearings: Std. (2 sizes marked Red and Blue), and .002", .010", .020" & .030" Undersize.
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.

Installing Rods: Numbers on rods and caps must be on same side and installed in same numbered cylinder. Oil squirt hole should be toward right side of engine on all rods and notch in piston head toward front of engine.

CRANKSHAFT

Journal Diameter: 2.2486-2.2490" (Red), 2.2482-2.2486" (Blue). Taper wear limit .001", Out-of-round wear limit .0006".
Clearance - .0007-.0025". Wear limit .003".

Replacement Bearings: Std. (2 sizes marked Red and Blue), and .002", .010", .020", .030" Undersize.



2F306

6 CYL. VALVE TIMING MARKS

►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.
End Thrust: Taken by No. 3 (rear intermediate) main bearings.
Thrust Bearing Alignment - *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*
Endplay - .004-.008". Wear limit .012".
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*
Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Motor Co. Special Data.*
►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on all cars to reduce oil leakage at front oil seal. Slinger is held in place by crankshaft pulley hub. To remove slinger, remove cylinder front cover and slide slinger off crankshaft.

CAMSHAFT

►*CAMSHAFT LOBE LIFT NOTE:* When improper valve operation is indicated, check lift of each lobe. *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*
Journal Diameter - 1.8095-1.8105".
Bearings - Steel backed babbitt lined bushings.
Clearance - .001-.003". Wear Limit .006".
End Thrust: Taken by thrust spacer behind timing chain sprocket.
Endplay - .001-.007". Wear limit .012".
Replacement Bearings: Furnished Std. and .015" Undersize.
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*
Camshaft Bearing Replacement - *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*
Timing Chain: Side guide type.
►*TIMING CHAIN REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up slack on driving side, measure slack on opposite side). Remove and install chain as a unit with both sprockets.
Camshaft Setting: Timing marks on both sprockets adjacent and inline with straightedge across shaft centers.
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Motor Co. Special Data.*
Engine Front Cover Removal: *See "Engine Front Cover" in Ford Motor Co. Special Data.*

2F307

V8 VALVE TIMING MARKS

VALVES

Tappet Clearance: .016", All Valves, Hot or Cold, *For preliminary adjustment after overhaul, see "Valve System" in Ford Motor Co. Special Data.*
►*ROTATABLE VALVE NOTE:* All valves are rotatable type, *see "Valve System" in Ford Motor Co. Special Data.*

Valve	Head Diameter	①Stem Diameter
Intake	1.522-1.532"	.3100-.3107"
Exhaust	1.261-1.276"	.3090-.3097"

Valve Seat Angle	②Lift	③Stem Clearance
Intake 45° ④	.2405"	.0008-.0025"
Exhaust 45° ④	.2395"	.0018-.0035"

① - Std. Also furnished .003", .015", .030" Oversize.
② - Cam Lobe Lift. Maximum allowable lift loss .005".
③ - Wear limit .0045" Intake, .0055" Exhaust.
④ - Valve Face Angle 44°.

Valve Seat Width - .070-.080", All Valves.
Valve Stem Oil Seals - Cup type seals installed on all valve stems below upper spring retainer.
Valve Springs: Free Length - 2.00" approximately.

Valve Spring Specifications

Valve	Spring Pressure	Length
Closed	①47.75-56.25 lbs.	1.585"
Open	②112-122 lbs.	1.222"

① - Wear limit 43 lbs. at 1.585".
② - Wear limit 101 lbs. at 1.222".

Valve Spring Installation: Valve spring ends must be square within 1/16", Install springs with damper (closed) coil end down toward cylinder head. Check installed height of spring from surface of cylinder head spring pad to underside of spring retainer. If height greater than 1 39/64", install .030" spacers as necessary on head under spring to bring height within limits of 1 9/16-1 39/64". *CAUTION - Install spacers only if necessary. DO NOT use more than 2 spacers (will overstress springs and overload camshaft lobes).*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above) ream guides and install valves with oversize stems. See *"Valve System" in Ford Motor Co. Special Data.*

Valve Lifters: Mechanical, barrel type. Removed from above by using magnet placed in pushrod seat, after removing rocker arm assembly and pushrods.

Diameter - .8740-.8745". **Clearance** - .0005-.0020".

Rocker Arm Assembly: See *"Valve System" in Ford Motor Co. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT for alignment of camshaft sprockets.

Valve Timing Specifications

Intake Valves - Open 15° ①BTDC. Close 37° ②ALDC.
Exhaust Valves - Open 45° ①BLDC. Close 7° ③ATDC.
① - Camlift .012". ② - Camlift .015". ③ - Camlift .014".

V8 ENGINE

ENGINE SPECIFICATIONS: Own. 90° V8, valve-in-head. 221" and 260" engines of conventional design. Intake manifold rests directly on cylinder block to form the pushrod chamber cover. Valve rocker arms are individually mounted on studs which are pressed into cylinder block.

Engine	Bore	Stroke	Displacement
221"	3.50"	2.87"	221 cu. ins.
260"	3.80"	2.87"	260 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
221"	8.7-1	39.2	145 at 4400 RPM
260"	8.7-1	46.2	164 at 4400 RPM

Compression & Vacuum Reading - See *TUNE-UP.*

►*EXCESSIVE RESONANCE OR MOAN CORRECTION:* Caused by improperly adjusted engine rear mounting brackets. See *"Engine" in Ford Motor Co. Special Data.*

►*FLYWHEEL RETAINING CAPSCREW SEALING CAUTION:* Flywheel attaching bolt holes in crankshaft flange are drilled through flange. Flywheel retaining capscrews **must** be coated with oil resistant sealer to prevent engine oil leak at this location which may be diagnoses as a rear oil seal leak.

CYLINDER HEAD & MANIFOLD: See *"Cylinder Head & Manifold" in Ford Motor Co. Special Data.*
TIGHTENING TORQUES: See *"Tightening Specifications" in Ford Motor Co. Special Data.*
ENGINE REMOVAL: See *"Engine" in Ford Motor Co. Special Data.*

OIL PAN REMOVAL: Drain crankcase and remove dipstick. Remove front crossmember. Remove oil pan retaining bolts, crank engine for necessary clearance, and remove oil pan. *NOTE - When installing pan, tabs of oil pan front and rear seals must be over oil pan gasket.*

PISTONS

Slipper-skirt type with two compression rings and one oil ring.

►*ORIGINAL BORE & PISTON NOTE:* As follows:

	221"	260"
Std. Bore	3.5000-3.5024"	3.8000-3.8024"
Red Pistons	3.4976-3.4982"	3.7976-3.7982"
Blue Pistons	3.4988-3.4994"	3.7988-3.7994"
.003" OS Bore	3.5024-3.5036"	3.8024-3.8036"
.003" OS Pistons	3.5000-3.5006"	3.8000-3.8006"

Removal - Pistons and rods removed from above.
Clearance - .0018-.0036". Wear Limit .006".
Fitting New Pistons: See *"Pistons" in Ford Motor Co. Special Data.*
Replacement Pistons: Furnished Std. (221" & 260"), and .020", .030", .040", .060" (221") Oversize.
Installing Pistons: Install piston with notches in head of piston toward front of engine. See *Rod Installation.*

PISTON PIN

Press fit in connecting rod.
Diameter - .9120-.9123" (rod hole diameter .9107-.9112").
Pin Fit in Piston - .0001-.0003". Wear limit .0008".
Pin Fit in Rod - Press fit in rod, see *"Piston Pin" in Ford Motor Co. Special Data.*
Replacement Pins: Furnished Std. and .001" and .002" Oversize.

PISTON RINGS

Top compression ring is chrome plated. Lower compression ring is phosphate coated. Oil ring has two chrome plated steel rails and a serrated spring spacer.

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0774-.0781"	.010-.020"	.0019-.0036"
Compr (2)	.0770-.0780"	.010-.020"	.0020-.0040"
Oil (3)		.015-.055"	①

① - Snug (side sealing type ring).

Replacement Rings: Furnished Std. and .020", .030", .040" & .060" Oversize.

CONNECTING ROD

Journal Diameter: 2.1236-2.1240 (Red), 2.1232-2.1236" (Blue). Taper wear limit. 001", Out-of-round wear limit .0006".

Clearance - .0009-.0025". Wear limit .0035"
Sideplay - .006-.016". Wear limit .019".

Length - 5.154-5.156" (center-to-center).
Replacement Bearings: Std. (2 sizes marked Red and Blue) and .002", .010", .030" Undersize.

►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.

Installing Rods: Install rods in correct numbered cylinder with oil squirt hole to center of engine and notches in piston head to front of engine.

CRANKSHAFT

Journal Diameter: 2.2486-2.2490" (Red), 2.2482-2.2486" (Blue). Taper wear limit .001", Out-of-round wear limit .0006".
Clearance - .0006-.0026". Wear limit .0034".

Replacement Bearings: Std. (2 sizes marked Red and Blue), and .002", .010", .020", .030" Undersize.
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.
End Thrust: Taken by No. 3 (rear intermediate) main bearing.
Thrust Bearing Alignment - See *"Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*
Crankshaft Rear Oil Seal Installation: See *"Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*
Crankshaft Front Oil Seal Installation: See *"Engine Front Cover" in Ford Motor Co. Special Data.*
►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on all cars to reduce oil leakage at front oil seal. Slinger is held in place by crankshaft pulley hub. To remove slinger, remove crankshaft front cover and slide slinger off crankshaft.

CAMSHAFT

►*CAMSHAFT LOBE LIFT NOTE:* When improper valve operation is indicated, check lift of each lobe. See *"Camshaft & Bearings" in Ford Motor Co. Special Data.*

Journal Diameter: (1) 2.0805-2.0815", (2) 2.0655-2.0665", (3) 2.0505-2.0515", (4) 2.0355-2.0365", (5) 2.0205-2.0215".
Bearings - Steel backed babbitt lined bushings.
Clearance - .001-.003". Wear Limit .006".

End Thrust: Taken by thrust spacer behind timing chain sprocket.
Endplay - .001-.007". Wear limit .012".
Replacement Bearings: Furnished Std. and .015" Undersize.
Camshaft Removal & Installation: See *"Camshaft & Bearings" in Ford Motor Co. Special Data.*
Camshaft Bearing Replacement - See *"Camshaft & Bearings" in Ford Motor Co. Special Data.*
Timing Chain: Side guide type.
►*TIMING CHAIN REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up slack on drive side, measure slack on opposite side). Remove and install chain as a unit with both sprockets.
Camshaft Setting: Timing marks on both sprockets adjacent and in line with straightedge across shaft centers.
Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Ford Motor Co. Special Data.*
Engine Front Cover Removal: See *"Engine Front Cover" in Ford Motor Co. Special Data.*

VALVES

►*EXCESSIVE PUSHROD GUIDE WEAR CORRECTION & VALVE PUSHROD ASSEMBLY PRODUCTION CHANGE:* See *"Valve System" in Ford Motor Co. Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Tappet Clearance: Zero lash, hydraulic lifters. *For hydraulic lifter operating range, check, see "Valve System" in Ford Motor Co. Special Data.*

Valve	Head Diameter	①Stem Diameter
Intake	1.582-1.597"	.3100-.3107"
Exhaust	1.381-1.396"	.3090-.3097"

Valve	Seat Angle	②Lift	③Stem Clearance
Intake	45°④	.2375"	.0008-.0025"
Exhaust	45°④	.2375"	.0018-.0035"

① - Std. Also furnished .003", .015", .030" Oversize.
② - Cam Lobe Lift. Maximum allowable lift loss .005".
③ - Wear limit .0045" Intake, .0055" Exhaust.
④ - Valve Face Angle 44°.

Valve Seat Width - .060-.080", All Valves.

Valve Stem Oil Seals - Cup type seals installed on all valve stems below upper spring retainer.

Valve Springs: Free Length - 2 5/32" approximately.

Valve Spring Specifications

Valve	Spring Pressure	Length
Closed	①57-63 lbs.	1.770"
Open	②161-178 lbs.	1.380"

① - Wear limit 52 lbs. at 1.770".
② - Wear limit 145 lbs. at 1.380".

Valve Spring Installation: Valve spring ends must be square within 1/16". Install springs with damper (closed) coil end down toward cylinder head. Check installed height of spring from surface of cylinder head spring pad to underside of spring retainer. If height greater than 1 25/32", install .030" spacers as necessary on head under spring to bring height within limits of 1 3/4-1 25/32". *CAUTION - Install spacers only if necessary. DO NOT use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above) ream guides and install valves with oversize stems. *See "Valve System" in Ford Motor Co. Special Data.*

Valve Lifters: Hydraulic. Removed from above by using magnet placed in pushrod seat after removing intake manifold and pushrods.
Diameter - .8740-.8745". **Clearance** - .0005-.0020".
Hydraulic Lifter Overhaul - *See "Valve System" in Ford Motor Co. Special Data.*
Hydraulic Lifter Operating Range - *See "Valve System" in Ford Motor Co. Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.
Rocker Arm Stud Replacement - *See "Valve System" in Ford Motor Co. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valve - Opens 21° ① BTDC. Close 51° ② ALDC.
Exhaust Valve - Opens 57° ① BLDC. Close 15° ② ATDC.
① - Camlift .003". ② - Camlift .006".

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*
Crankcase Capacity: 3½ qts. (6 Cyl.), 4 qts. (V8) refill. Add 1 qt. for filter change.
Normal Oil Pressure - 35-55 lbs. at 2000 RPM.
Pressure Regulator Valve - In pump body, not adjustable.
Oil Pressure Indicator (Ford Fairlane): Indicator light on instrument panel controlled by Engine Oil Pressure Switch No. B6A-9278-B.
Oil Pressure Gauge (Mercury Meteor): King-Seeley "CV" (Constant Voltage) type with Gauge Voltage Regulator Ford & Mercury No. B9MF-10804-A.
Dash Unit - Meteor No. C2YY-9273-A.
Engine Unit - Meteor No. B7T-9278-A.
Oil Pump: Rotor type driven by distributor shaft. Located in crankcase.
Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*
Oil Filter: Full-flow, disposable type. Replace every 6,000 miles.
Filter Replacement - Coat gasket surface of filter with oil, thread filter on bracket by hand until gasket contacts adapter face, then tighten filter an additional ½ turn. Run engine and check for leaks.
CAUTION - DO NOT overtighten.
Crankcase Ventilation: Conventional - Filter in oil filler cap (inlet) and ventilation (road draft) tube at front of engine (6 Cyl.), rear of engine (V8). Clean and lubricate filler cap every 6,000 miles.
Positive - Road draft tube replaced by vacuum regulator valve and necessary hoses and tubing to connect regulator valve to engine ventilation outlet and to spacer between carburetor and manifold. Service system at 6,000 mile intervals and check valve operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 8½ qts. (6 Cyl.), 13½ qts. (V8). Add 1 qt. for heater.
Pressure Valve - 12-15 lb. radiator filler cap.
Thermostat: 160°F. Fairlane & Meteor No. C1UZ-8575-B (replaces early CODE-8575-A).
188°F. Fairlane & Meteor No. C2DZ-8575-A (replaces early 178°F CODE-8575-B. C1UZ-8575-A & C2UZ-8575-A).
Water Pump: Packless, sealed ball bearing type.
Pump Overhaul - *See "Cooling System" in Ford Motor Co. Special Data.*
Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator B9MF-10804-A.
Dash Unit - C2OZ-10883-A (Fairlane), C2YY-10883-A (Meteor).
Engine Unit - CODF-10884-A (Early), C1AZ-10884-A (Later).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

D - Dallas	**N** - Norfolk	**U** - Louisville
E - Mahwah	**P** - St. Paul	**W** - Wayne
G - Chicago	**R** - San Jose	**Z** - St. Louis

Engin Production Cod Numbers: Indicate place, day and month of engine manufacture. Not used for licensing.
Car Build Dat C d : Stamped under DATE on patent plate. Number designates day of month, letter designates month as follows: **A** January through **M** December.

TUNE-UP

►*AIR CLEANER "BUZZ" NOISE CORRECTION:* "Buzz" may occur when accelerating from fully stopped position, or when operation at fast idle. Caused by air vibrating against its lower brace. To correct, overbend brace at existing bend.
COMPRESSION PRESSURE: 150 lbs.±10 lbs. at cranking speed. Maximum variation between cylinders 10 lbs.
VACUUM READING: 18" at idle speed.
VALVE TAPPET CLEARANCE: "Zero Lash" type used. Long recess mark on lower side of rocker arm eccentric cam must be centered over valve stem when engine is idling. To make minor adjustment, turn rocker arm adjusting screw. For initial adjustment and checking, *see "Valve System" in Ford Motor Co. Special Data.*
MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve is closed when engine is at normal temperature and running at slow idle, and opens when operating at high RPM. Spring is installed with ¾ turn windup and hooked over stop pin.
CRANKCASE VENTILATION VALVE: Service at 6000 mile intervals and check operation before performing a a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAP: .032-.036".
Spark Plugs - Autolite BTF-6 (Std.), BF-82 (Economy Carb.). 18 mm. Torque to 15-20 ft. lbs. (20-30 ft. lbs. for new plug in new head). Plugs have tapered seat, no gasket used.
COIL: Ford & Mercury No. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) used between ignition switch and multiple connector on dash. Bypassed during cranking by lead from multiple connector to starter solenoid.
DISTRIBUTOR: Ford. Used as follows:

Model	① Distributor No.	Type
Synchro-mesh	② C1AF-12127-E	Loadomatic
	③ C2AF-12127-E	Loadomatic
Taxi	④ C1AE-12127-F	Loadomatic
Auto. Trans.	⑤ C2AF-12127-D	Step-Stop
	⑥ C2AF-12127-F	Step-Stop

① - Stamped on distributor housing for identification.
② - Part No. C1AZ-12127-A.
③ - Part No. C2AZ-12127-E.
④ - Part No. C2AZ-12127-C.
⑤ - Part No. C1AF-12127-D.
⑥ - Part No. C2AZ-12127-F.

Condenser - Ford & Mercury No. 7RA-12300-C.
Condenser Capacity - .21-.25 mfd.
Contact Point Set - Ford & Mercury No. FAA-12171-A.
Breaker Gap - .024-.026".
Cam Angle - 35-38°.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Advance Performance
►With Distributor On Test Stand
① C1AF-12127-E

Distr. Degrees	Vacuum (" of Hg)	Distr. RPM
0	0.25	350
1-2	0.48	500
6-7	1.93	1100
10¼-11½	4.80	2000

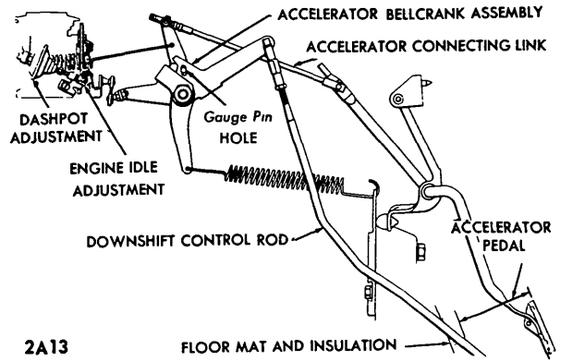
② C1AF-12127-D

Test	Distr. Degrees	Vacuum (" of Hg)	Distr. RPM
A	3½-4½	1.08	800
A	6¼-7¼	1.70	1000
B	7½-8½	2.38	1200
C	7½-8½	5.63	2000
C	9-10½	6.50	1450
D	13 max	10 min.	

A - Adjust primary spring. **B** - Adjust stop washers.
C - Adjust spring washers. **D** - Replace breaker plate assembly.
① - Set test stand to 0°, 0" of Hg, and 250 RPM.
② - Set test stand to 0°, 0" of Hg, and 400 RPM.

IGNITION TIMING

Model	Std. Setting	Allowable Rang
Synchro-mesh	6° BTDC	2-11° BTDC
Auto. Trans.	12° BTDC	2-17° BTDC



►*SETTING NOTE:* Set timing with engine idling and distributor vacuum line disconnected.
Timing Mark - Pointer on chain case cover and crankshaft damper marked with 9 timing marks from TDC to 16 (16° BTDC) in 2° increments. Align pointer with correct mark on damper.

CARBURETOR

►*CARBURETOR APPLICATION: One Holley Model 1904 or 1908 1-barrel carburetor used on all models.*

THROTTLE & DOWNSHIFT LINKAGE ADJUSTMENT: Make engine idle speed and anti-stall dashpot adjustments (see below), then proceed as follows: Stop engine and make sure carburetor throttle lever is against idle adjusting screw. Adjust accelerator connecting link for accelerator pedal height of 3 11/16" from top front corner of accelerator pedal to floor mat. Adjust downshift control rod length so a ¼" gauge pin will fit freely several times in gauge pin holes in accelerator bellcrank assembly.
Anti-Stall Dashpot Adjustment: With carburetor hot or slow idle speed correctly adjusted, hold throttle valve closed. Clearance between dashpot plunger and throttle lever with dashpot plunger fully depressed should be .060-.090". Adjust by loosening locknut and turning dashpot in bracket.

CONTINUED ON NEXT PAGE

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

HOLLEY MODEL 1904 & 1908

Model ①	② Carburetor No.
Synchro-mesh (Std.)	③ C2AE-9510-A
Synchro-mesh (CCV)	③ C2AE-9510-B
Auto. Trans. (Std.)	③ C2AE-9510-E
Auto. Trans. (CCV)	③ C2AE-9510-F
Economy (Synchro-mesh)	④ C2AE-9510-C
Economy (Auto. Trans.)	④ C2AE-9510-D
Economy	④ C2AE-9510-AS

① - **Std.** - Without Closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.

② - Stamped on fuel inlet boss.

③ - Part No. C2AZ-9510-(with same suffix).

④ - Part No. C2AZ-9510-H.

Idle Setting - Initial setting 1-1½ turns open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll. Then turn screw in until engine runs smoothly. Favor a slightly rich mixture.

Idle Speed - 500-525 RPM (Synchro-mesh), 450-475 RPM (Auto. Trans. in "D").

Fuel Level - 11/16"±1/32" below power valve mounting surface (remove power valve and use Tool T52L-9550-AGE for Ford, 9550-AE-3 for Mercury). Fuel should touch end of "low" pin, but not touch end of "high" pin.

Accelerating Pump - Inner hole for average or hot weather operation, outer hole for cold weather operation.

Fast Idle: No adjustment (will be correct when hot or slow idle correctly set).

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA: See "Holley Single Barrel Model 1904 & 1908 Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

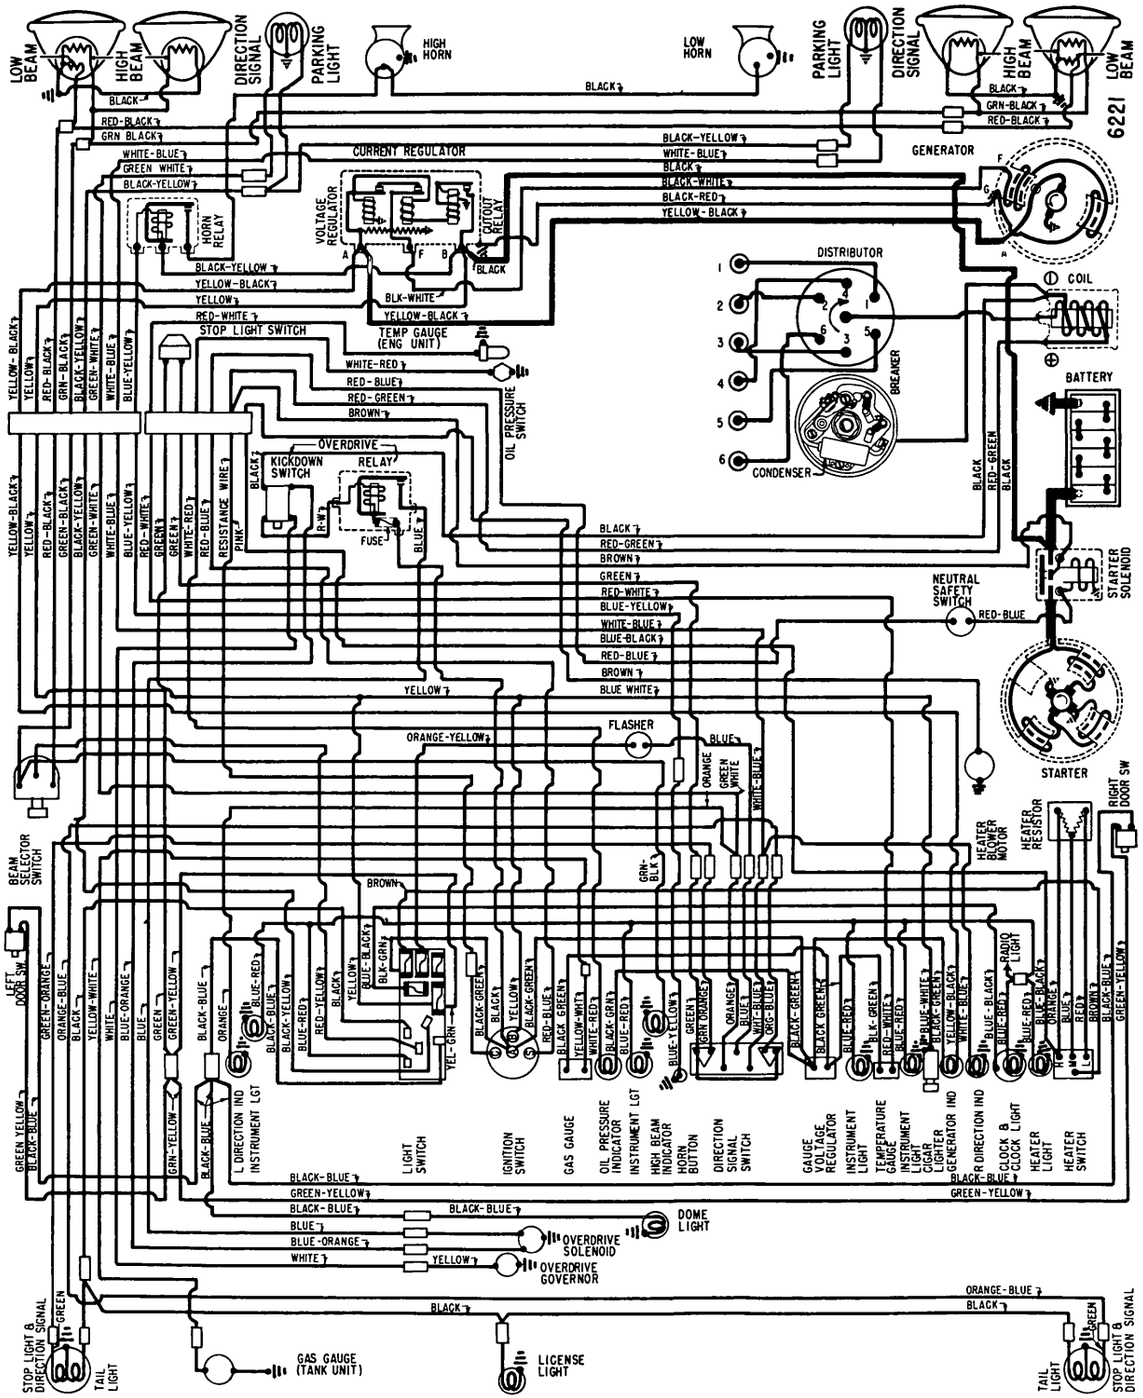
Fuel Pump: Carter. Ford & Mercury Nos. C2AZ-9350-B,D.
Fuel Pump Pressure - 3½-5½ lbs. at 500 RPM.

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) with Gauge Voltage Regulator Ford & Mercury No. B9MF-10804-A.
Dash Unit - Ford No. C2AZ-9350-A (Galaxie), Mercury No. C2MY-9280-A (Monterey).
Tank Unit - Ford & Mercury No. COAZ-9275-C (Exc. Sta. Wgn.), C1AF-9275-A (Sta. Wgn.).

Fuel Filter: Disposable element type. Replace element every 30,000 miles.

Air Cleaner: Dry filter element type. Clean every 6,000 miles, replace element every 30,000 miles.

►*CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. If compressed air used, direct air stream from inside surface of filter element. DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.



ELECTRICAL

►*SEE FORD GALAXIE & MERCURY MONTEREY V8 PAGES (FOLLOWING) FOR BATTERY, STARTER, GENERATOR, GENERATOR REGULATOR, ALTERNATOR, ALTERNATOR REGULATOR, CIRCUIT BREAKER AND FUSE DATA.*

ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl., valve-in-head. 223 cubic inch engine of same design used previously except that a vibration damper has been installed

CONTINUED ON NEXT PAGE

FORD GALAXIE 6 CYL. WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

at the upper side of the timing chain to minimize timing chain noise.

B re	Strok	Displacement
3.62"	3.60"	223 cu. ins.
Compr. Ratio	**Rat d HP**	**Developed HP**
8.4-1	31.54'	138 at 4200 RPM

Compr ssi n & Vacuum R ading - *See TUNE-UP.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Motor Co. Special Data.*

TIGHTENING TORQUES: *Se "Tightening Specifications" in Ford Motor Co. Special Data.*

ENGINE REMOVAL: *Se "Engine" in Ford Motor Co. Special Data.*

OIL PAN REMOVAL (FORD): Drain crankcase and remove flywheel housing inspection cover and dipstick. On Station Wagons; remove stabilizer bar-to-lower control arm and frame rail retaining nuts and move stabilizer bar as far forward as possible. On All Models, remove crankcase ventilation tube assembly. Remove oil pan retaining screws, rotate crankshaft for clearance, and remove oil pan.

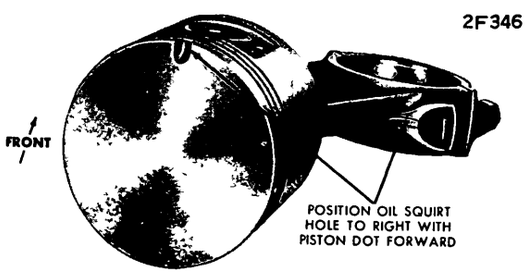
OIL PAN REMOVAL (MERCURY): Drain crankcase and remove dipstick. Remove stabilizer bar-to-lower control arm nuts and loosen right and left stabilizer bar-to-frame clamps. Pry stabilizer bar to right and pull arms downward for clearance. Remove oil pan.

PISTONS

Autothermic type. Solid skirts with three rings.

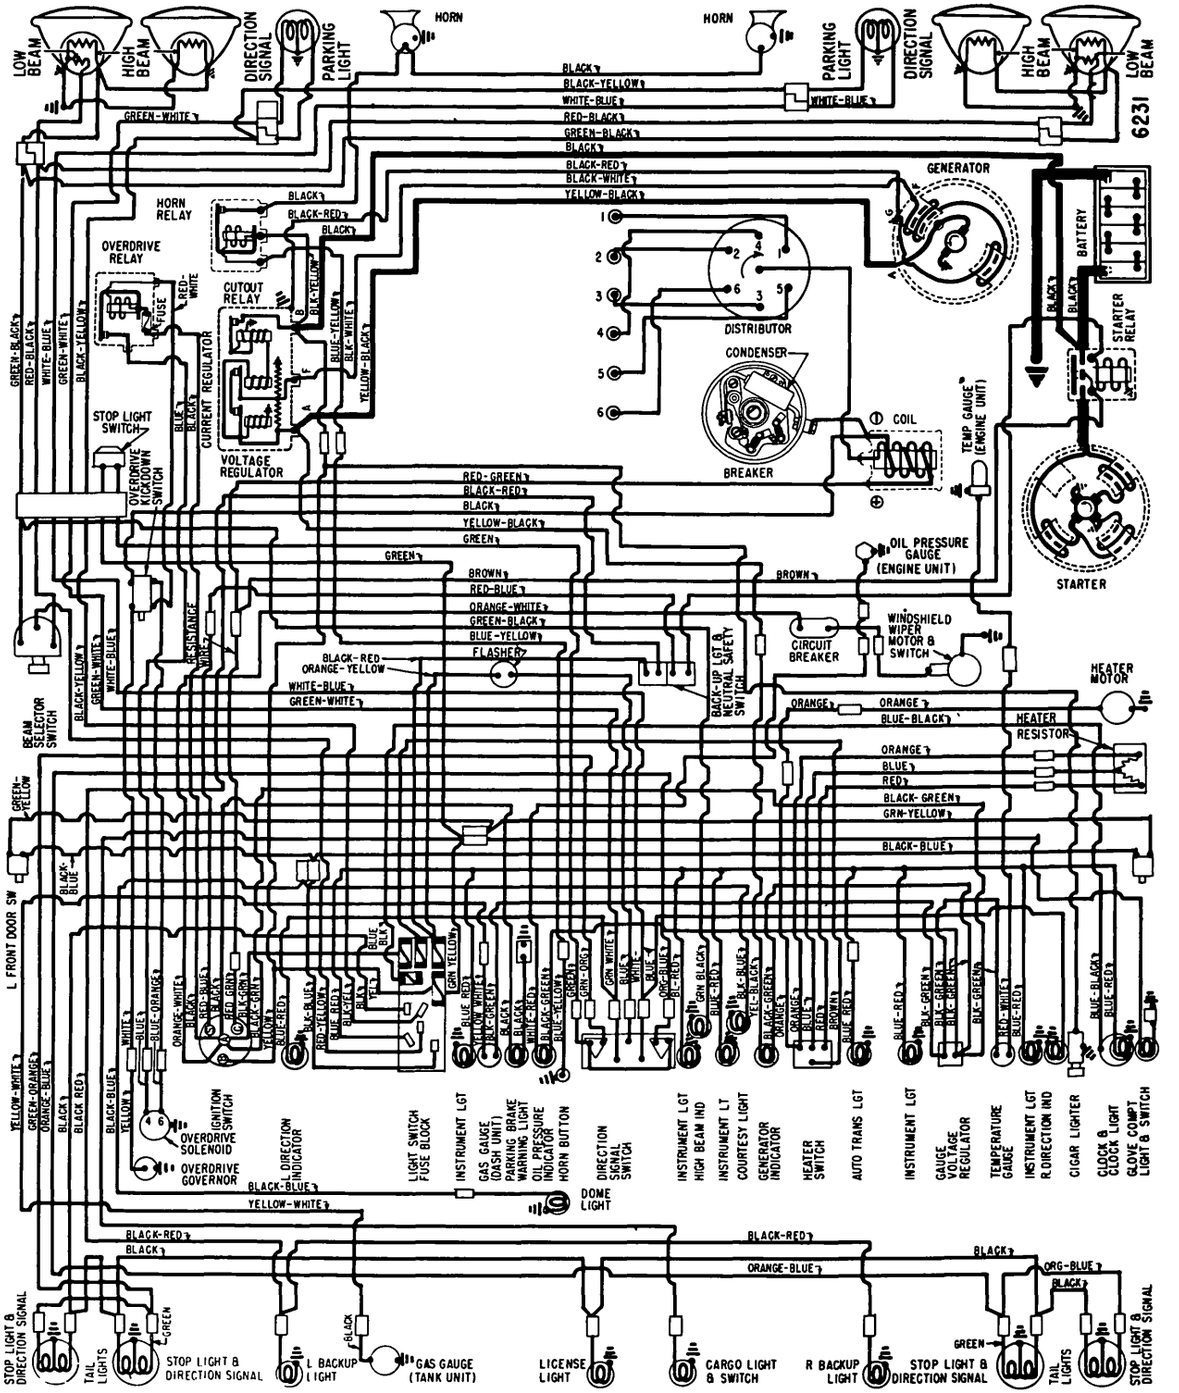
►*ORIGINAL BORE & PISTON NOTE:* Production standard cylinder bore range is 3.6250-3.6274". Pistons used in this standard bore are 2 sizes: 3.6236-3.6242" (color coded Red), and 3.6248-3.6254" (Color coded Blue). Production cylinder bore also may be .003" Oversize (3.6274-3.6286") with .003" Oversize pistons (3.6260-3.6266").

R m val - Pistons and rods removed from above.



Cl arance - .0008-.0026" at bottom of skirt.

Fitting N w Pist ns: *See "Pistons" in Ford Motor Co. Sp cial Data.*



R plac m nt Pistons: F rd - Furnished Std. (1 size only), and .020", .030", .040", .060" Oversize with fitted pins. **Mercury** - Furnished Std. (2 sizes - Red & Blue), and .020", .030", .040" Oversize with fitted pins.

Installing Pistons: Install piston with indentation in head of piston toward front of engine. *See Rod Installation.*

CONTINUED ON NEXT PAGE

PISTON & ROD ASSEMBLY

MERCURY MONTEREY 6 CYL. WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

PISTON PIN

Floating type with lock ring at each end.
Diameter - .9120-.9123". **Length** - 3.010-.3.030".
Pin Fit in Piston - .0001-.0003". Wear limit .0008".
Pin Fit in Rod Bushing - .0001-.0005". Wear limit .001".
Replacement Pins: Std. (Code Green), .001" (Code Blue), .002" (Code Yellow) Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1)	.0929-.0936"	.010-.020"	①.0019-.0036"
Compr. (2)	.0930-.0940"	.010-.020"	①.0015-.0035"
Oil (3)		.015-.055"	②

① - Wear limit .006".
② - Snug - side sealing type ring.
Replacement Rings: Std., & .020", .030", .040" Oversize. Also .060" Oversize on Ford.

CONNECTING ROD

Journal Diameter - 2.2984-2.2988" (Red), 2.2980-2.2984" (Blue).
Clearance - .0006-.0025". Wear limit. .0035".
Side Clearance - .003-.009". Wear limit .012".
Length - 6.258-6.262" center-to-center.
Replacement Bearings: Std. (2 sizes marked Red and Blue), and .002", .010", .020", .030" Undersize.
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.
Installing Rods: Install rod in piston so that oil squirt hole is to **right** when indentation on piston head is to front of engine. Rods and caps are numbered 1 to 6. Numbers on rods and caps must be on same side and installed in same numbered cylinders.

CRANKSHAFT

Journal Diameter - 2.4984-2.4988" (Red), 2.4980-2.4984" (Blue).
Bearings - Steel backed copper lead alloy.
Clearance - .0006-.0028". Wear limit .0038".
Replacement Bearings: Std. (2 sizes marked Red and Blue), and .002", .010", .020", .030" Undersize.
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.
End Thrust: Taken by rear intermediate (No. 3) bearing.
Thrust Bearing Alignment - *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*
Endplay - .004-.008". Wear limit .012".
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*
Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Motor Co. Special Data.*
►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on all car and truck engines to reduce oil leakage at front oil seal. Slinger is held in place by crankshaft pulley hub. To remove slinger, remove cylinder front cover and slide slinger off crankshaft.

CAMSHAFT

►*CAMSHAFT NON-INTERCHANGEABILITY CAUTION:* Different camshafts used in Adjustable and Zero Lash type engines. DO NOT interchange camshafts unless rocker arm and shaft assemblies are also changed.

Journal Diameter - 1.9255-1.9265".
Clearance - .001-.003". Wear limit .006".

End Thrust: Taken by thrust plate and spacer behind camshaft sprocket. *NOTE* - Chamfer on inside of spacer must be toward camshaft journal.
Endplay - .001-.007". Wear limit .012".
Replacement Bearings: Finished bearings furnished Std. & .015" Undersize. *CAUTION* - No. 3 bearing is **not** interchangeable with other bearings.

Camshaft Bearing Replacement - *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*

Timing Chain: Side guide type, 56 links. Replace chain when side deflection exceeds ½" on slack side (establish reference mark on block with sprocket turned so that all slack removed, then turn sprocket in opposite direction so that slack is present, measure deflection by pressing out on chain midway between sprockets).

TIMING CHAIN VIBRATION DAMPER: Retained by camshaft thrust plate retaining screws behind camshaft sprocket.
Removal - Remove camshaft and crankshaft sprockets and timing chain assembly. Remove damper from camshaft thrust plate.
Installation - Reverse removal procedure.
Timing Chain Damper Clearance: There should be .030-.070" clearance between snubber pad of damper and timing chain when all slack is removed from chain.
Camshaft Setting: Sprockets are marked by "0" at one tooth. Mesh chain so that there are 12 pins between "0" marks with marks on driving side of chain.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Motor Co. Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Ford Motor Co. Special Data.*

VALVES

"Zero Lash" Type - For initial adjustment and checking, *see "Valve System" in Ford Motor Co. Special Data.* For minor operating adjustment, *see TUNE-UP above.*

Valve	Head Diameter	①Stem Diameter
Intake	1.775-1.785"	.3416-.3423"
Exhaust	1.505-1.520"	.3398-.3405"

Valve	Seat Angle	②Lift	③Stem Clearance
Intake	45°④	.260"	.0010-.0024"
Exhaust	45°④	.260"	.0028-.0042"

① - Furnished also with .003", .015", .030" Oversize
② - Cam Lobe Lift. Wear limit .005".
③ - Wear limit .0045" Intake, .0055" Exhaust.
④ - Valve Face Angle 44°.

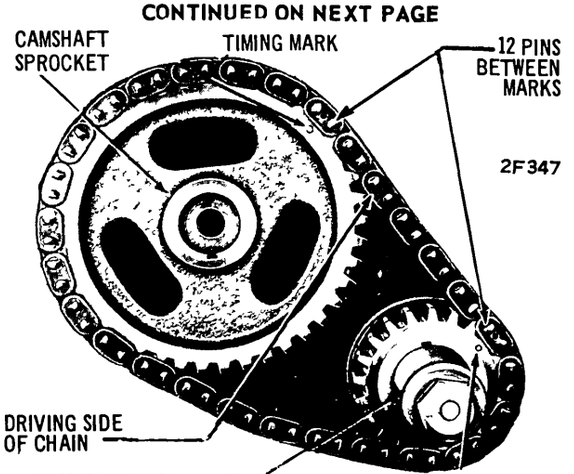
►*ROTATABLE VALVE NOTE:* All valves are rotatable type. *See "Valve System" in Ford Motor Co. Special Data.*

Valve Seat Width - .070-.090", all valves.
Valve Stem Oil Seals - Umbrella type seals used on all valve stems. Install with cupped side down.
Valve Springs: Free Length - 2.33".

Valve Spring Specifications

Valve	Spring Pressure	Length
Closed	①97-105 lbs.	1.780"
Open	②160-178 lbs.	1.410"

① - Wear limit 88 lbs. at 1.780".
② - Wear limit 144 lbs. at 1.410".



Valve Spring Installation: Spring ends must be square within 1/16". Install springs with damper (closed) coil end down toward cylinder head. Check installed height of spring which must not exceed 1 25/32" from surface of cylinder head spring pad to underside of spring retainer. If height greater, install .030" spacers as necessary on head under spring to bring height within limits of 1 3/4-1 25/32". *CAUTION - Install spacers only if necessary. DO NOT use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above), ream guides and install valves with oversize stems. *See "Valve System" in Ford Motor Co. Special Data.*

Valve Lifters: Mushroom type. Remove from below with camshaft out.
Clearance - .0011-.0027". Wear limit .0055".

Rocker Arm Assembly: "Zero Lash" type to provide no valve operating clearance. *See "Valve System" in Ford Motor Co. Special Data.*

CONTINUED ON NEXT PAGE

6 CYL. VALVE TIMING MARKS

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT for alignment of sprocket marks, and "Lift" under VALVES for checking of camshaft lobe wear.

Valve Timing Specifications

Intake Valves - Open 23° ① BTDC. Close 59° ② ALDC.
Exhaust Valves - Open 71° ① BLDC. Close 10° ② ATDC.
① - Camlift .002". ② - Camlift .005".

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*

Crankcase Capacity: 4 qts. refill, 5 qts. with filter change.

Normal Oil Pressure: 35-55 lbs. at 2000 RPM.

Pressure Regulator Valve - In pump body, not adjustable.

Oil Pressure Indicator: Indicator light on instrument panel controlled by Oil Pressure Switch, Ford & Mercury No. B6A-9278-B (Alternate FDH or FDA-9278-A), mounted on right side of engine above starter.

Oil Pump: Gear type early, Rotor type later. Rotor type only furnished for replacement. Pump located in crankcase.
Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*

Oil Filter: Disposable type. Replace every 6,000 miles.

Crankcase Ventilation: Conventional - Filter in oil filler cap (inlet) and outlet pipe at rear of crankcase at left side. Clean filter in filler cap everu 6,000 miles.
Positive - Outlet pipe replaced by adapter and tube into intake manifold just below carburetor. Ventilation valve located at manifold end of tube. Clean valve every 6,000 miles and check operation before performing a "Tune-Up" for ignition and carburetion troubles.
See "Closed Crankcase Ventilation Systems" in Carburetion Section.

ENGINE COOLING SYSTEM

Water Capacity: 15 qts. Add 1 qt. for heater.
Thermostat: Ford & Mercury No. COAZ-8575-A (160°), No. COAZ-8575-B or C2AZ-8575-A (178°) for use with permanent anti-freeze.
Pressure Valve: Radiator filler cap, Ford & Mercury No. B8A-8100-A. 12-15 lb. type.
Water Pump: Packless, sealed ball bearing type. *See "Cooling System" in Ford Motor Co. Special Data.*
Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator, Ford & Mercury No. B9MF-10804-A.
Dash Unit - C2AZ-10883-A (Ford), C2MY-10883-A (Mercury).
Engine Unit - Ford & Mercury Nos. B7A or C1AZ-10884-A.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*THUNDERBIRD JACKING & HOISTING PRECAUTIONS: Before jacking or hoisting, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

① - Body Style 71A. ② - Body Style 71C.
③ - Body Style 71B. ④ - Body Style 71D.

SERIAL NUMBER: Stamped on patent plate attached to left front door hinge pillar post. Number (example below) includes identification data.

① ② ③ ④ ⑤
2 E 51 W 100001

① - Year Model. 21962.
② - Assembly Plant. *See below.*
③ - Body Series. *See above.*
④ - Engine. *See below.*
⑤ - Beginning vehicle number at each assembly plant (100001 for Ford & Thunderbird, 500001 for Mercury).

Assembly Plant Designation

A - Atlanta	N - Norfolk	U - Louisville
D - Dallas	P - St. Paul	W - Wayne
E - Mahwah	R - San Jose	Y - Wixom
G - Chicago	S - Pilot Plant	Z - St. Louis
J - Los Angeles		

Engine Code Designation

Engine	Code Letter
292" Engine 2-Bbl. Carb.	W
292" Engine 2-Bbl. Carb. (Export)	T
352" Engine 2-Bbl. Carb.	X
390" Engine 4-Bbl. Carb. (Std.)	Z
390" Engine 4-Bbl. Carb. (High Perf.)	Q
390" Engine 4-Bbl. Carb. (Police Interceptor)	P
390" Engine Three Carbs. (Super High Perf.)	M
390" Engine 4-Bbl. Carb. (Export)	R
406" Engine 4-Bbl. Carb. (High Perf.)	B
406" Engine Three Carbs. (Super High Perf.)	G

Engine Production Code Numbers: Indicate plate, day and month of engine manufacture. Not used for licensing.

Car Build Date Code: Stamped under DATE on patent plate. Number designates day of month, letter designates month as follows: A January through M December (I not used).

►*ENGINE DESIGNATION NOTE:* In the following data pages, engines will be referred to by cubic inch displacement (for example, **292**), with special difference pointed out as necessary (for example, **390 Hi Perf.**).

TUNE-UP

►*390" ENGINE STALLING, ROUGH, OR EXCESSIVE SMOKING ON STARTING CORRECTION:* May be caused by too slow Fast Idle Setting or insufficient choke plate pull-down. *See "Ford 2 & 4-Barrel Carburetors" in Carburetion Section.*

COMPRESSION PRESSURE: 292 - 160±20 lbs., **352,390 & 406** - 180±20 lbs. All at cranking speed. Maximum variation between cylinders 10 lbs.

VACUUM READING: 18" at idle speed.

VALVE TAPPET CLEARANCE: 292 - .019" Cold, .018" Hot, All Valves. Adjust to .019" clearance while engine is cold, then check for .018" clearance after running engine for 30 minutes to normalize temperature. Minimum torque required to turn self-locking tappet adjusting screw must be 3 ft. lbs. minimum after interference noted.

352 & 390 Std. - Zero lash, hydraulic lifters.

390 Hi Perf. & Police - .028" Cold, .025" Hot, All Valves.

406 Hi Perf. - .025". Int. & Exh. Cold.

MANIFOLD HEAT CONTROL: 292 - Automatic thermostatically controlled valve (Spring & Counterweight) located in outlet of right exhaust manifold. When valve is closed (Heat on) right manifold exhaust gases are directed to heat riser passages and out to left exhaust manifold. When valve open (heat off) more of right manifold gases are permitted to flow directly out exhaust system.

352,390 & 406 - None used. Engine coolant heated spacer installed between carburetor and intake manifold.

CRANKCASE VENTILATION VALVE: Service at 6,000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 292 - 1-5-4-8-6-3-7-2. **352,390 & 406** - 1-5-4-2-6-3-7-8.

Cylinders - RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .032-.036" (Exc. 406 Super Hi-Perf.), .025" (406 Super Hi-Perf.).

Spark Plugs - Autolite BF-82 (292), BF-42 (352,390 Std., 406 Hi. Perf.), BF-32 (390 Hi-Perf. & Police; 406 Super Hi-Perf.). 18 mm. Torque to 15-20 ft. lbs. (20-30 ft. lbs. new plug in new head). Plugs have tapered seat and no gasket is used.

COIL: Ford & Mercury No. B6A-12029-B.

Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.

Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) used between ignition switch and multiple connector on dash. Bypassed during cranking by lead from multiple connector to starter solenoid.

DISTRIBUTOR: Ford. Used as follows:

Engine	Distributor No.
292	①**COAF-12127-A**
352 Synchro-mesh	①**COAF-12127-E**
352 Auto. Trans.	①**COAF-12127-D**
390 Std. Ford & Mercury	①**C2AF-12127-A**
390 Std. Thunderbird	①②**C2SF-12127-A**
390,406 All Hi-Perf.	①③**COAF-12127-K**
390 Police	①④**C2AF-12127-D**
390 Export	⑤**C1SF-12127-B**

① - Stamped on distributor housing for identification.
② - Part No. C2SZ-12127-A.
③ - Double Breaker, Centrifugal Advance Only type.
④ - Part No. C2AZ-12127-B. ⑤ - Part Number.

Condenser - Ford & Mercury No. 7RA-12300-C (COAF-12127-K), No. B9AF-12300-A (Others). **Capacity** - .21-.25 mfd.

Contact Point Set - Ford & Mercury No. FDS-12171-A (2 sets - COAF-12127-K); No. B7A-12171-A (1 set - Others).

Breaker Gap - .014-.016" (Single Breaker Type), .019-.021" (Double Breaker Type - set both sets to same gap).

Cam Angle (Single Breaker) - 26-28½°.

Cam Angle (Double Breaker) - 33° (each set), 33° (total dwell). Maximum variation between point sets 1°.

Breaker Arm Spring Tension - 17-20 ozs. (Single Breaker Type), 27-32 ozs. (Double Breaker Type).

Rotation - Counterclockwise viewed from above.

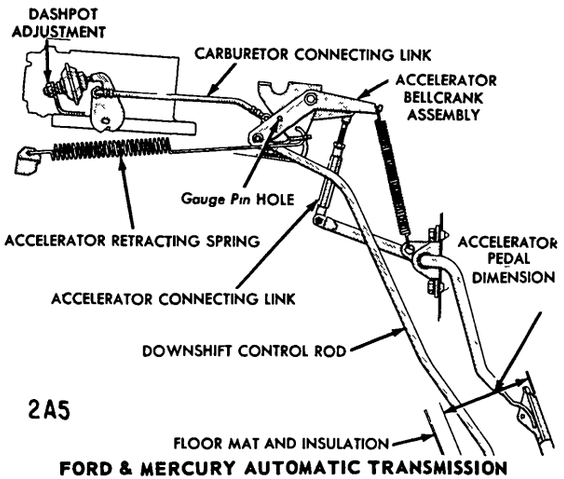
IGNITI N TIMING

Engine	Synchro-mesh	Auto. Trans.
292	①5° BTDC	②12° BTDC
352	①5° BTDC	③ 8° BTDC
390 Std.		③ 8° BTDC
390 Police	② 12° BTDC	②12° BTDC
390 All Hi Perf.	④ 14° BTDC	
406 All Hi-Perf.	⑤ 8° BTDC	

① - Allowable range 2-10° BTDC.
② - Allowable range 2-17° BTDC.
③ - Allowable range 2-13° BTDC.
④ - Allowable range 2-19° BTDC.
⑤ - Allowable range 2-8° BTDC.

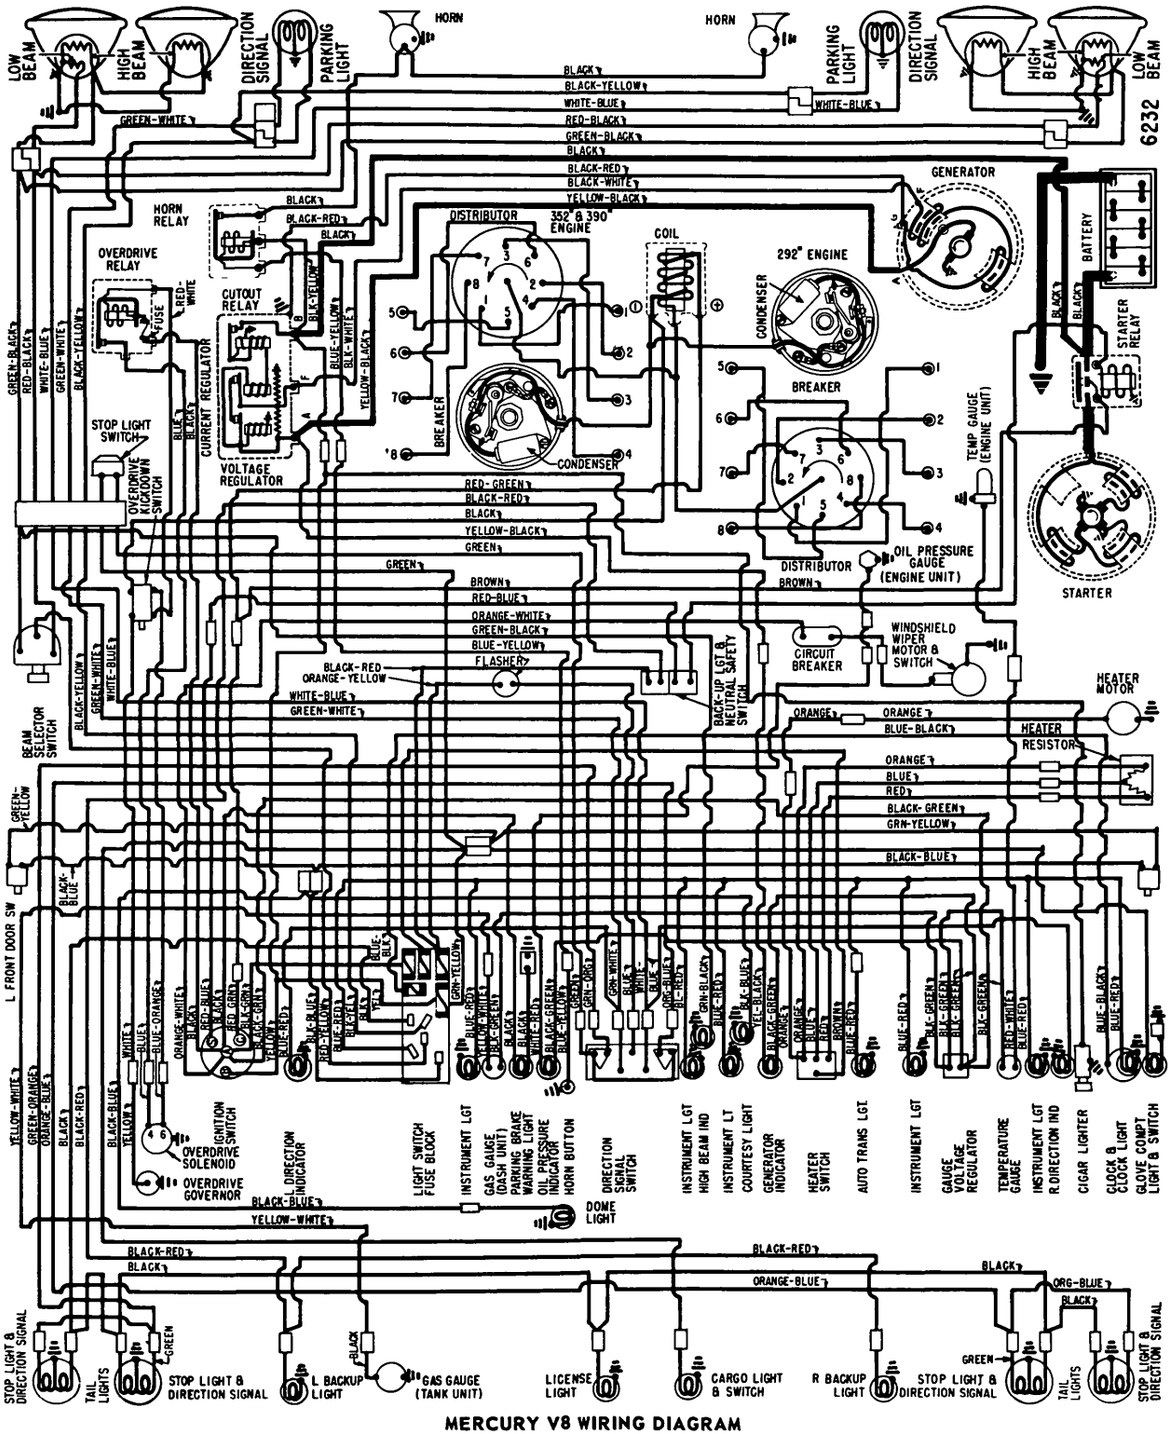
►*SETTING NOTE:* Set timing with distributor vacuum line disconnected.

Timing Mark - Timing pin located in crankshaft pulley and pointer on engine front cover with 5 timing marks from 0 to 14° BTDC (292), 4 timing marks from 0 to 10° BTDC (352 & 390). Align pin with correct mark on pointer.



CARBURETOR

►*CARBURETOR APPLICATION: As follows:*



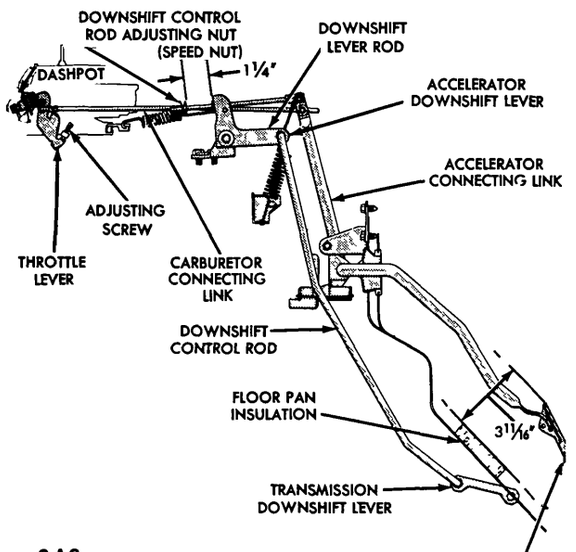
Engine	Carburetor
292	One Ford 2-Barrel
352	One Ford 2-Barrel
390 Std. & Police	One Ford 4-Barrel
390 & 406 Hi-Perf.	One Holley 4-Barrel
390 & 406 Super Hi-Perf.	Three Holley 2-Barrel

THROTTLE & DOWNSHIFT LINKAGE ADJUSTMENT (2-Speed Automatic Transmission): Make engine idle speed and anti-stall dashpot adjustments (see below), then proceed as follows: Stop engine and make sure carburetor throttle arm stopscrew is against hot idle step of carburetor fast idle cam. Adjust accelerator connecting link for accelerator pedal height of 3 11/16" (Ford), 3 1/2" (Mercury) from top front corner of accelerator pedal to floor mat. Disconnect carburetor connecting link at carburetor, insert a 1/4" gauge pin

CONTINUED ON NEXT PAGE

FORD & MERCURY AUTOMATIC TRANSMISSION THROTTLE LINKAGE

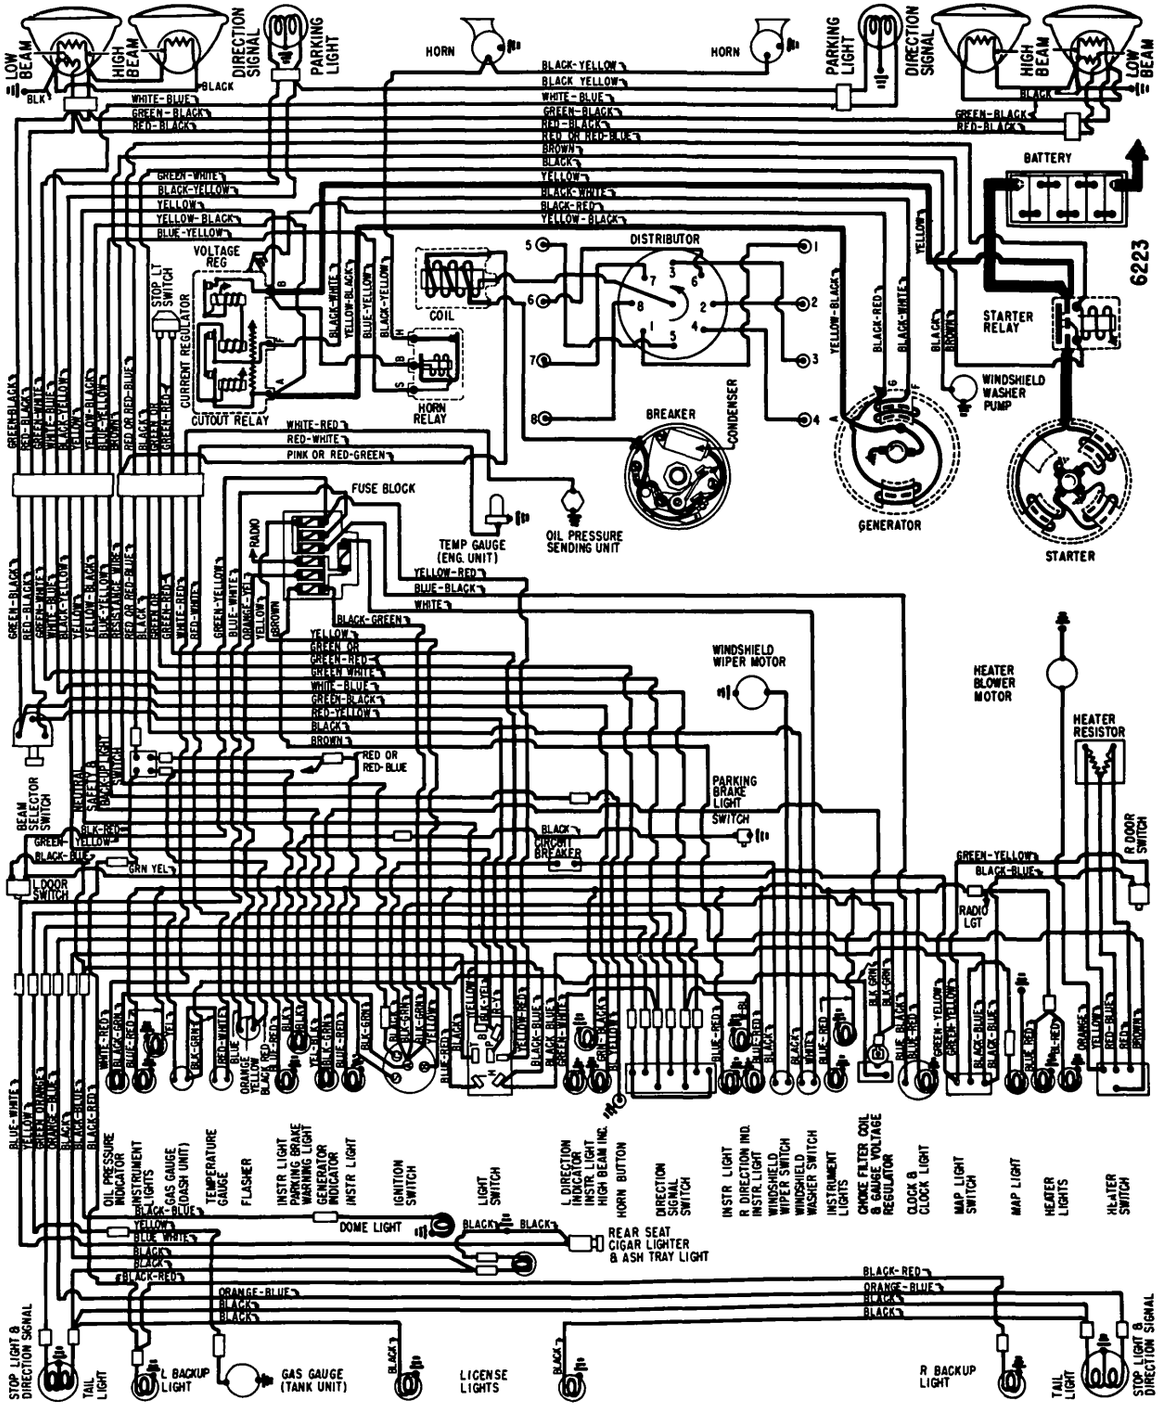
MERCURY V8 WIRING DIAGRAM



CONTINUED FROM PRECEDING PAGE

through holes in bellcrank assembly, and adjust carburetor connecting link so gauge pin will slide in and out of holes freely several times when connecting link is connected to carburetor.

THROTTLE & DOWNSHIFT LINKAGE ADJUSTMENT (3-Speed Automatic Transmission - Ford & Mercury): Make engine idle speed and anti-stall dashpot adjustments (see below), then proceed as follows: Stop engine and make sure carburetor throttle lever is against idle adjusting screw. Disconnect carburetor connecting link from accelerator bellcrank. Insert 1/4" gauge pin through holes in bellcrank assembly. Lift connecting link to normal operating position, maintain forward pressure on link so carburetor throttle lever is firmly against idle adjusting screw, and adjust length of link so sleeve fits freely into bellcrank lever. **Rotate sleeve one full turn counterclockwise to lengthen link.** Remove gauge pin and connect link. Make sure gauge pin will still enter gauging holes freely (adjust connecting link again as necessary). Adjust accelerator connecting link so pedal height is 3 11/16" (Ford), 3 1/2" (Mercury) from top front corner of pedal to floor mat.



THROTTLE & DOWNSHIFT LINKAGE ADJUSTMENT (3-Speed Automatic Transmission - Thunderbird): Make engine idle speed and anti-stall dashpot adjustments (see below), then proceed as follows: Make sure carburetor throttle lever is against idle adjusting screw. Disconnect carburetor connecting link at carburetor and adjust link to obtain accelerator pedal height of 3 11/16" from top front corner of pedal to floor mat. Place speed nut on downshift lever rod 1 1/4" from for-

2A6

THUNDERBIRD AUTOMATIC TRANSMISSION THROTTLE LINKAGE

FORD THUNDERBIRD WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

ward face of bushing in downshift lever (distance from bellcrank to nut will be 1 1/4").

Anti-Stall Dashpot Adjustment: With carburetor hot or slow idle speed correctly adjusted, hold throttle valve closed. Clearance between dashpot plunger and throttle lever with dashpot plunger fully depressed should be .060-.090". Adjust by loosening locknut and turning dashpot in bracket.

Manual Throttle Control Adjustment (Ford & Mercury Air Conditioned Cars): Attach a tachometer to engine and place transmission selector lever in "N" or "P". Turn air conditioning on and make sure magnetic clutch is engaged. Using hand throttle, bring engine speed to 750-1000 RPM and secure stop closest to throttle control handle against cable armor so engine cannot be operated higher than above range with hand throttle.

FORD 2-BARREL CARBURETORS

Engine & Transmission ①	②Carburetor No.
292 Synchro-mesh (Std.)	C2AE-9510-Y

390 Police Synchro-mesh (CCV)	C2AE-9510-AN
390 Police Auto. Trans. (Std. & CCV)	C2AE-9510-AR
390 Thunderbird (Early)	C2SE-9510-C
390 Thunderbird (Late)	⑥ C2SF-9510-B

HOLLEY TRIPLE (2-BBL.) CARBURETORS

Engine	⑤Carburetor No.
390 & 406 Pass. Cars	Center C1AE-9510-AV
390 & 406 Pass. Cars	Front & Rear C1AE-9510-AU
390 Thunderbird	Center C2SE-9510-A
390 Thunderbird	Front & Rear C2SE-9510-E

HOLLEY 4-BARREL CARBURETORS

Engine & Transmission ①	⑤ Carburetor No.
390,406 Hi-Perf. Synchro-mesh (CCV)	C1AE-9510-AM

① - **Std.** - Without closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.

② - This number stamped on tag attached to carburetor. *See "Ford 2 & 4-Barrel Carburetors" & "Holley 2 & 4-Barrel Carburetors" in Carburetion Section for complete identification data and parts numbers.*

③ - Thunderbird. ④ - Ford & Mercury.

⑤ - This number stamped on choke plate flange.

⑥ - Stamped on carburetor main body.

►*MANIFOLD FUEL DISTRIBUTION (292): Carburetor RIGHT barrels feeds Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*MANIFOLD FUEL DISTRIBUTION (352,390 & 406): Carburetor RIGHT barrels feed Cyls. 1-4-6-7, LEFT barrels feed 2-3-5-8.*

Idl Setting - Initial setting 1-1½ turns open (¾-1¼ turns open on Front & Rear carburetors on 3 Carb. Cars). With engine at normal operating temperature, turn both idle adjusting screws in until engine runs roughly from lean mixture, then turn screws out until engine begins to roll. Finally, turn screws in just enough for smooth running (favor a slightly rich mixture).

Idle Speed - As follows:

Engine	Idle Speed
292 & 352 Synchro-mesh	500-525 RPM
292 & 352 Auto. Trans. ①	450-475 RPM
390 Std. Auto. Trans. ①	475-500 RPM
390 Police Synchro-mesh	575-600 RPM
390 Police Auto. Trans. ①	550-575 RPM
390 All Hi Perf. Synchro-mesh	675-700 RPM
406	675-700

① - Automatic Transmission in either "Drive" position.

►*AIR CONDITIONED CAR IDLE SPEED NOTE:* Operate air conditioner at least 20 minutes before setting idle speed, and set idle speed with air conditioning on.

ACCELERATING PUMP SETTING (292,352,290,406 Eng.):

Place operating link in No. 2 hole (year around), No. 3 hole (Extremely low temperature), No. 1 hole (High Temperature or High Altitude) position of overtravel lever.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Ford 2 & 4-Barrel Carburetors" & "Holley 2 & 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Fuel only or Fuel & Vacuum as follows:

Model	Carter	AC
292,352,390,406 Std.	C2AZ-9350-C	
292,252,390,406 Air.Cond.	C2AZ-9350-A	
390 Thunderbird	C2SZ-9350-A	
390 Thunderbird 3 Carbs.	C2SZ-9350-B	
4 & 6-Bbl. Carb. Special		COAE-9350-F

Fuel Pump Pressure - 4-6 lbs. at 500 RPM.

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) with Gauge Voltage Regulator Ford & Mercury No. B9MF-10804-A.

Dash Unit - Z2AZ-9305-A (Ford), C2MY-9305-A (Mercury).

Tank Unit - COAZ-9275-C (Pass. Cars), C1AF-9275-A (Sta. Wgn.), C1SF-9275-C (Thunderbird).

Radio Suppression Choke Filter (Thunderbird) - Located in feed circuit mounted on gauge voltage regulator.

►*MERCURY MONTEREY EXCESSIVE "EMPTY" FUEL RESERVE CHANGE:* Normal reserve when gauge registers Empty is 2 gallons. If desired, this can be reduced approximately 1 gallon by bending gauge float arm down 3/10".

Fuel Filter: Disposable element type (all engines). Located integrally with fuel pump (350,390 engines with Air Cond.), in line between fuel pump and carburetor (all others). Replace filter element every 30,000 miles. *NOTE* - To reassemble integral type, tighten housing by hand until housing contacts gasket then advance 1/8 turn.

Air Cleaner: Dry filter element type. Clean every 6,000 miles, replace element every 30,000 miles.

►*CLEANING CAUTION:* Remove element from cleaner body and hold in vertical position to shake dust or dirt out by tapping element lightly against horizontal surface. Tap and rotate element until outer surface has been cleaned. Direct compressed air (if used) against inside surface only. DO NOT deform element and DO NOT oil paper or screen of element.

BATTERY

Ford Part No. ①	Volts	Plates	②Capacity
B9A-10654-D ③	12	11	55 Ampere Hr.
B9A-10654-E ④	12	13	65 Ampere Hr.
B9A-10654-F ⑤	12	11	70 Ampere Hr.

① - Numbers are for dry type batteries for service replacement. ② - At 20 hour rate.

③ - Replaces original battery with red filler caps.

④ - Replaces original battery with gray filler caps.

⑤ - Replaces original battery with yellow filler caps.

Battery Ground - Negative, to engine.

Engine Ground - Converter or flywheel housing to frame (6 Cyl.); Rear of cylinder head or intake manifold to body (V8).

STARTER

Ford & Mercury No. C2AZ-11002-A (Except T-Bird), N. C2SZ-11002-A (T-Bird).

Armature - Ford No. B6A-11005-B (Ford & T-Bird), Mercury No. C2AZ-11005-A (Mercury).

Drive - Bendix "Folo-Thru" (Rubber Type). Ford & Mercury No. C2AZ-11350-B.

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 48-58 ozs.

Cranking Speed - 150-180 RPM, 155-190 amperes.

Performance Data - C2AZ-11002-A

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	110
14.8 ft. lbs.		5.0	580

Performance Data - C2SZ-11002-A

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	70
15.5 ft. lbs.		5.0	670

① - With starter on engine and engine idling.

Starting Switch: Magnetic type, Ford and Mercury No. B6A-11450-A, controlled by ignition and neutral safety switch (Auto. Trans.).

Neutral Safety Switch Adjustment (Aut. Trans.) - *See "Ford Motor Co. Automatic Transmissions" in Transmission Section.*

GENERATOR

Ford. Used as follows:

Car & Equipment	Generator
Ford & Mercury Std.	30 Amp.
Thunderbird Std.	35 Amp.
Ford & Mercury Air Cond.	30 or 35 Amp.
Thunderbird Air Cond.	40 Amp.

►*IDENTIFICATION NOTE:* Rated output of generator is stamped, painted, or stenciled on unit.

	Performance Data		
Generator	Amperes	Volts	Gen. RPM
6 Cyl. Std. ①	30	15.0	2525
V8 Std. ①	30	15.0	2500
Air Cond. ①	30 or 35	15.0	2670
T-Bird Std.	35	15.0	2670
T-Bird Air Cond.	40	15.0	2650

① - Ford & Mercury.

CONTINUED FROM PRECEDING PAGE

Brush Spring Tension - 20-26 ozs.
Field Current - 1.2-1.8 amperes at 12.0 volts (hot).
Rotation - Counterclockwise at commutator end.
Belt Adjustment: Use Belt Tension Gauge T62L-8620-A or 33-73F or equivalent and measure belt tension as follows:

Belt Tension Specifications (Lbs.)

Engine	①New Belt	②Used Belt
223 & 292	90-120	60-90
352, 390, 406	100-130	80-110

① - Run belt for 5 minutes and reset tension.
② - Any belt operated 10 minutes or longer.

GENERATOR REGULATOR

Ford or Basch. 30, 35, and 40 Ampere Regulators used with generators of same amperage rating. *See GENERATOR above.*
►*IDENTIFICATION NOTE:* Current setting of regulator is stamped on unit.
►*SETTING CAUTION:* "Temperature Compensated" type. Set to following specifications at 75°F ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized.

Cut out Relay

Cuts In - 12.0-12.8 volts (30 Amp.); 12.2-13.0 volts (35 Amp. - Ford); 12.4-13.2 volts (35 Amp. - T-Bird & Mercury); 12.4-13.2 volts (40 Amp.).
Cuts Out - 6-9 amps. (30 Amp.); 8 amps. (35 & 40 Amp.) reverse current.

Voltage Regulator

Setting - 14.6-15.4 volts at 75°F ambient temperature.

Current Regulator

Setting (30 Amp.) - 28-32 amperes.
Setting (35 Amp.) - 33-37 amperes.
Setting (40 Amp.) - 38-42 amperes.
►*OTHER DATA: See "Ford Motor Co. 12-Volt Regulators" in Electrical Section.*

ALTERNATOR

Leece-Neville. 60 Ampere, three-phase type, with internal (radially mounted) rectifiers.
Rated Output - 60 amperes at 14.0 volts and 3300 RPM (Cold), 4100 RPM (Hot).
Cut-In Speed - 760 RPM.
Brush Spring Tension - 8-10 ozs.
Field Current - 2.4-3.0 amperes at 12.0 volts and 75°F.
►*OTHER DATA: See "Leece-Neville Alternator & Regulator" in Electrical Section.*

ALTERNATOR REGULATOR

Leece-Neville. 60 ampere, three-unit type, consisting of Load Relay, Voltage Regulator, and Current Regulator.

Load Relay

Closing Voltage - 5.6-6.4 volts.

Voltage Regulator

Setting - 13.5-14.3 volts (upper contacts), .1-.3 volts lower (lower contacts) at 75°F ambient temperature.

Current Regulator

Setting - 58-62 amperes.
►*OTHER DATA: See "Leece-Neville Alternator & Regulators" in Electrical Section.*

MISC. ELECTRICAL

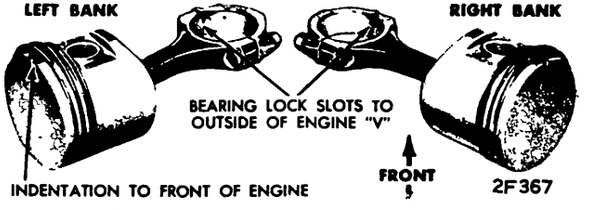
Stop Light Switch Location: On forward end of brake master cylinder.
Lighting Switch: Combination lighting switch and fuse junction block.
Removal - Disconnect battery. Remove switch control knob and shaft by pressing spring-release button on top of switch (switch in "off" position). Unscrew retaining nut and remove switch. Remove retaining clip (Ford & Mercury) and separate switch from fuse junction block (All Cars).
Instrument Cluster Removal: Ford - Disconnect battery and remove steering column cover plate. Turn automatic transmission indicator needle down on shifting shaft. Disconnect speedometer cable and instrument cluster wiring harness from retaining clips at rear of panel. Protect steering column from scratches. Remove instrument panel retaining screws and pull cluster from panel and lay on steering column. Disconnect the wires to the gauges and instruments, remove the lights, and remove cluster assembly. *NOTE* - Individual instruments may be removed after assembly removed.
Mercury - Disconnect battery. Disconnect speedometer cable and remove wires from retaining clip on clock right hand retaining nut. Remove wires from two clips holding harness to back of instrument cluster. Protect steering column from scratches. Remove automatic transmission selector lever cover as follows: Pull trim from below selector dial, remove pointer mechanism attaching screws from bottom of steering column and remove selector cover-to-instrument panel attaching screws. Remove selector cover. *NOTE* - It may be necessary to remove screw on bottom side of steering column which attaches shroud to steering column. Remove instrument cluster-to-instrument panel retaining screws (four long screws on top, four short screws on bottom, two screws just above steering column). Pull instrument cluster forward and lay on steering column. Remove wires from gauges and lights.
Speedometer Removal (Thunderbird): Remove chrome trim ring (attached by one screw). Remove speedometer mounting screws and pull speedometer from instrument panel so speedometer cable can be disconnected and pilot lights removed. Remove speedometer. *NOTE* - When installing, pilot lights must be secured in mounting holes. Top pilot light is high beam indicator.

CIRCUIT BREAKERS: 18 Ampere - Protects headlight circuit. Integral with headlight switch.
12 Ampere - Protects 2-Speed electric windshield wipers. On instrument panel to left of steering column.
6 Ampere - Protects single speed windshield wipers. Located on instrument panel to left of steering column.

FUSES: *NOTE - On Ford & Mercury, fuses are located in fuse junction block of lighting switch. On Thunderbird, fuses are in fuse block on left hand air duct. All fuses are in above locations except as noted.*
15 Ampere - Park, Tail, Dash, Dome lights.
15 Ampere - Overdrive. On overdrive relay.
15 Ampere (T-Bird) - Cigar lighter feed circuit.
14 Ampere - Heater blower.
14 Ampere - Back-up Lights & Turn Signals.
14 Amp. - Windshield Washer Pump. In feed wire.
7.5 Amper - Spotlight. In feed wire.
7.5 Amper - Radio.
4 Amp. (T-Bird) - Instrument panel rheostat. In feed wire.
2 Amp. (Ford & Mercury) - Clock.
1 Amp. (T-Bird) - Clock.
Cigar Lighter - Sulphur disc or reset circuit breaker on back of lighter socket.

ENGINE

ENGINE SPECIFICATIONS: Own. 90° V8, valve-in-head 292",352",390",406" engines of same design used previously (406" engine is similar in design to 390").



Engine	Bore	Stroke	Displacement
292	3.75"	3.30"	292 cu. ins.
352	4.00"	3.50"	352 cu. ins.
390	4.05"	3.78"	390 cu. ins.
406	4.13"	3.78"	406 cu. in.

Engine	Compr. Ratio	Rated HP	Developed HP
292	8.8-1	45.00	170 at 4200 RPM
352	8.9-1	51.20	220 at 4300 RPM
390 Std.	9.6-1	52.49	300 at 4600 RPM
390 Police	9.6-1	52.49	330 at 5000 RPM
390 Hi Perf.	10.6-1	52.49	375 at 6000 RPM
390 ①	11.1-1	52.49	401 at 6000 RPM
406 Hi-Perf.	11.4-1	54.58	385 at 5800 RPM
406 ①	11.4-1	54.58	405 at 5800 RPM

① - Super Hi-Performance (3 Carburetors)
Compression & Vacuum Reading - *See TUNE-UP.*

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Ford Motor Co. Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Motor Co. Special Data.*
ENGINE REMOVAL: *See "Engine" in Ford Motor Co. Special Data.*
►*CYLINDER OVERSIZE BORE NOTE (406" ENG.):* Manufacturer recommends no oversize boring of cylinder block.
►*ENGINE COMPARTMENT RATTLING NOISE CORRECTION (292 Eng.): Caused by incorrectly anch red counterweight on exhaust manifold heat control valv. When counterweight can be rotated 360° on shaft, replace it.*
OIL PAN REMOVAL: 292 - Drain crankcase and disconnect oil pump inlet tube at pump. Remove oil pan retaining screws and remove oil pan. *NOTE* - On Mercury, remove ends of stabilizer bar from mounting studs and pull ends of bar down to provide clearance for oil pan removal.
352, 390, 406 Engines - Drain crankcase and remove dipstick. Remove flywheel housing lower cover. On Mercury, remove stabilizer bar from mounting studs and pull ends of bar down for clearance. On all cars,

CONTINUED ON NEXT PAGE

V8 ENGINE PISTON & ROD ASSEMBLY

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

remove oil pan retaining screws and let pan rest on frame crossmember. Crank engine for necessary clearance between crankshaft counterweight and rear of oil pan. Swing oil pump pick-up tube and screen out of way or let drop into oil pan. Remove oil pan by moving forward and tilting down.

390 (T-Bird) - Drain crankcase and cooling system. Disconnect radiator upper hose at supply tank. Remove oil pan retaining screws and let pan rest on underbody crossmember. Rotate crankshaft so counterweight will clear pan and move pan forward. Raise engine so there is tension on front engine mounts, disconnect mounts and raise engine so oil pump retaining bolts can be removed. Remove oil pan and pump.

PISTONS

Autothermic type. Solid skirts with three rings.

►*ORIGINAL BORE & PISTON NOTE:* Production standard cylinder bore range is .0024" for all engines except 406" engine. *Manufacturer recommends no reboring of 406" engine cylinder block.* Pistons in standard bore are 2 sizes color coded Red & Blue. *See table below for specifications:*

Engine	Production Cylinder Bore	Bore
292		3.7500-3.7504"
352		4.0000-4.0024"
390		4.0500-4.0524"
406		4.1300-4.1336"

Production Piston Size

Engine	Red	Blue
292	3.7486-3.7492"	3.7498-3.7504"
352	3.9982-3.9988"	3.9994-4.0000"
390	4.0477-4.0483"	4.0489-4.0495"
406	4.1258-4.1264"	4.1270-4.1276"

Removal - Pistons & rods removed from above.

Clearance - **292** .0008-.0026". **352** .0012-.0030". **390, 406** .0017-.0035". Wear limit .006" (All).

Checking Clearance & Fitting Pistons - *See "Pistons" in Ford Motor Co. Special Data.*

Installing Pistons - Install pistons with notch in piston head toward front of engine. *See Rod Installation.*

Replacement Pistons: Ford - Furnished Std. (one size only) All engines, and .020", .030", .040" (All Engines except 406), .060" (292, 352) oversize with fitted pins.

Mercury - Furnished Std. (2 sizes - Red & Blue), and .020", .030", .040" oversize with fitted pins.

PISTON PIN

Floating type with lock ring at each end.

Diameter - **292** .9120-.9123". **352,390,406** .9750-.9753".

Length - **292** 3.010-3.030". **352,390,406** 3.156-3.170".

Clearance In Piston - .0001-.0003". Wear limit .0008".

Clearance in Rod - .0001-.0005". Wear limit .001". Light thumb press fit at 70°F.

Replacement Pins: Std. (Green), .001" (Blue), .002" (yellow) Oversize.

PISTON RINGS

Two compression rings and one oil ring per piston. Oil ring is "side sealing" type (two steel rails with spring spacer between).

292 Engine

Ring	Width	End Gap	Side Clearance
Compr. (1)	.0775-.0780"	.010-.020"	Ⓒ.0020-.0035"
Compr. (2)	.0770-.0780"	.010-.020"	Ⓒ.0020-.0040"
Oil (3)		.015-.055"	②

352 & 390 Engines

Ring	Width	End Gap	Side Clearance
Compr. (1)	.0774-.0781"	.015-.025"	Ⓒ.0024-.0041"
Compr. (2)	.0930-.0940"	.015-.025"	Ⓒ.0020-.0040"
Oil (3)		.015-.055"	②

Ⓒ - Wear limit .006".

② - Snug. Side sealing type ring.

Replacement Rings: Furnished Std. & .020", .030", .040" Oversize. Also .060" Oversize for Ford 292 & 352 engines.

CONNECTING ROD

Length (Center-to-Center) - **292** 6.320-6.324", **352** 6.538-6.542", **390 & 406** 6.486-6.490".

Journal Diameter (Std. Size)

Engine	Red	Blue
292	2.1884-2.1888"	2.1880-2.1884"
352,390,406	2.4384-2.4388"	2.4380-2.4384"

Clearance: 292 .0005-.0024". Wear limit .0034".

352,390,406 Std. .0007-.0028". Wear limit .0038".

390 (Mechanical Lifters) - .0009-.0029". Wear limit .0038".

Sideplay - .006-.016". Wear limit .019".

Installing Rods: Install rods in correct numbered cylinder with squirt hole to center of engine, bearing lock slots to outside of engine, and notch in piston head to front of engine.

Replacement Bearings: Std. (2 sizes marked Red and Blue), and .002", .010", .020", .030", .040" Undersize.

►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.

CRANKSHAFT

Journal Diameter (Std. Size)

Engine	Red	Blue
292	2.4984-2.4988"	2.4980-2.4984"
352,390,406	2.7488-2.7492"	2.7484-2.7488"

Main Bearing Clearance

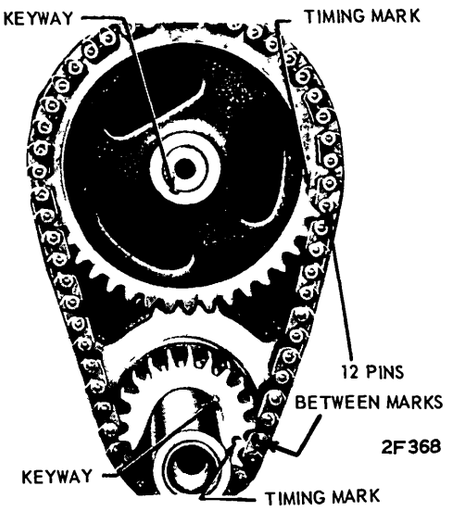
Engine	Clearance	Wear Limit
292	.0006-.0030"	.0042"
352 & 390 Std.	.0006-.0031"	.0039"
390 Ⓒ, 406	.0008-.0012" (No. 1)	.0039"
	.0010-.0031" (Others)	.0039"

Ⓒ - 390 with Mechanical lifters.

Replacement Bearings: Furnished Std. (2 sized marked Red and Blue), and .002", .010", .020", .030", .040" Undersize.

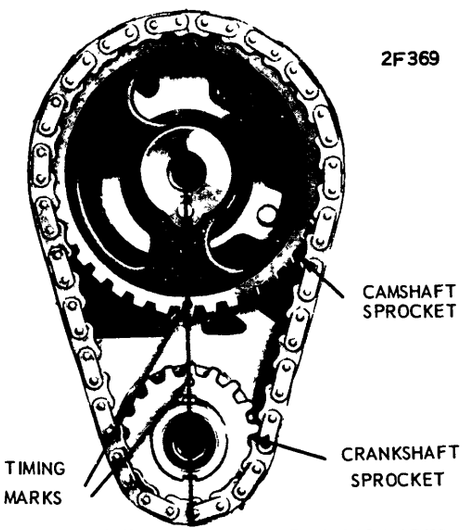
►*STANDARD SIZE NOTE:* **Red** marked bearings increase clearance, **Blue** marked bearings decrease clearance.

End Thrust: Taken by No. 3 (center) main bearing



Thrust Bearing Alignment - *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*

Endplay - .004-.008". Wear limit .012".



Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Motor Co. Special Data.*

►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on all car and truck engines to reduce oil leakage at front oil seal. Slinger is held in place by crankshaft pulley hub and cylinder front cover. To remove slinger, remove cylinder front cover and slide slinger off crankshaft.

V8 292 VALVE TIMING MARKS

V8 352", 390", 406" ENGINES VALVE TIMING MARKS

CAMSHAFT

Journal Diameter - **292** 1.9255-1.9265", **352,390, 406** 2.1238-2.1248".

Bearings - Steel backed babbitt lined bushings.

Clearance - .001-.003". Wear limit .006".

End Thrust: 292 - Taken by thrust plate and spacer located between camshaft sprocket and shoulder on camshaft. **Endplay** - .001-.007". Wear limit .012". **352,390,406** - Controlled by spring-loaded thrust button on fuel pump eccentric bolt.

Replacement Bearings: Std. and .015" undersize.

Camshaft Bearing Replacement - *See "Camshaft &*

CONTINUED FROM PRECEDING PAGE

Bearings" in Ford Motor Co. Special Data.

Camshaft Removal & Installation: See *"Camshaft & Bearings" in Ford Motor Co. Special Data.*

Timing Chain: Side guide type. **Length** - 56 links (292), 48 links (352,390,406).

►*TIMING CHAIN REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up slack on driving side, measure slack on opposite side). Remove and install chain as a unit with both sprockets.

Camshaft Setting (292): Sprockets marked by round depression on one tooth. Mesh chain so that there are 12 chain link pins between timing marks on sprockets when marks are on drive side.

Camshaft Setting (352,390,406): Timing marks on both sprockets adjacent and in line across shaft centers.

Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Ford Motor Co. Special Data.*

Engine Front Cover Removal: See *"Engine Front Cover" in Ford Motor Co. Special Data.*

VALVES

Tappet Clearance: 292 - .019" Cold, .018" Hot. All valves. *For preliminary adjustment after overhaul, see "Valve System" in Ford Motor Co. Special Data.*

352 & 390 Std. - Zero lash, hydraulic lifters. *For hydraulic lifter operating range check, see "Valve System" in Ford Motor Co. Special Data.*

390 Police & Hi-Perf. - .028" Cold, .025" Hot. All valves. *For preliminary adjustment after overhaul, see "Valve System" in Ford Motor Co. Special Data.*

406 Hi-Perf. - .025" Int. & Exh. Cold. *For preliminary adjustment after overhaul, see "Valve System" in Ford Motor Co. Special Data.*

292 Engine

Valve	Head Diameter	①Stem Diameter
Intake	1.642-1.652"	.3416-.3423"
Exhaust	1.505-1.520"	.3398-.3405"

Valve	Seat Angle	②Lift	Stem Clearance
Intake	45°③	.264"	④.0010-.0024"
Exhaust	45°③	.262"	⑤.0028-.0042"

352 & 390 Std. Engines (Hydraulic Lifters)

Valve	Head Diameter	①Stem Diameter
Intake	2.022-2.037"	.3711-.3718"
Exhaust	1.551-1.566"	.3693-.3700"

Valve	Seat Angle	②Lift	Stem Clearance
Intake	45°③	.232"	④.0010-.0024"
Exhaust	45°③	.232"	⑤.0028-.0042"

390 Police & All Hi Perf. Engines (Mechanical Lifters)

Valve	Head Diameter	①Stem Diameter
Intake	2.022-2.037"	.3711-.3718"
Exhaust	1.551-1.566"	.3701-.3708"

Valve	Seat Angle	②Lift	Stem Clearance
Intake	45°③	.2636"	④.0010-.0024"
Exhaust	45°③	.2636"	⑥.0020-.0034"

406 Hi-Perf. Engines

Valve	Head Diameter	①Stem Diameter
Intake	2.022-2.037"	.3711-.3718"
Exhaust	1.551-1.566"	.3693-.3700"

Valve	Seat Angle	②Lift	Stem Clearance
Intake	45°③	.298"	④.0010-.0024"
Exhaust	45°③	.298"	⑤.0028-.0042"

①- Furnished with .003", .015" & .030" oversize stems.
②- Cam lobe lift. Wear limit .005".
③- Valve Face Angle 44°.
④- Wear limit .0045". ⑤- Wear limit .0055".
⑥- Wear limit .0047".

Valve Seat Width - .070-.090" (All Engines).

Valve Stem Oil Seals - Umbrella type seals used on all valves. Install seals with cup side down over valve guide.

►*ROTATABLE VALVE NOTE: All valves are rotatable type. See "Valve System" in Ford Motor Co. Special Data.*

Valve Springs: *NOTE - Valve damper spring used inside valve spring on all 390 Engines. Install damper spring inside valve spring so coil end of damper is 135° counterclockwise from coil end of valve spring.*

Spring Specifications - 292

Valve	Spring Pressure	Length
Closed	71-79 lbs. ①	1.780"
Open	161-177 lbs. ②	1.390"

Spring Specifications - 352

Valve	Spring Pressure	Length
Closed	94-104 lbs. ③	1.820"
Open	180-198 lbs. ④	1.420"

⑤Spring Specifications - 390 Std.

Valve	Spring Pressure	Length
Closed	74-84 lbs. ⑥	1.820"
Open	190-208 lbs. ⑦	1.420"

⑤Spring Specifications - 390 Police & All Hi Perf. 406 Hi-Perf. Engine

Valve	Spring Pressure	Length
Closed	80-90 lbs. ⑧	1.820"
Open	255-280 lbs. ⑨	1.320"

①- Wear limit 64 lbs. at 1.780".
②- Wear limit 145 lbs. at 1.390".
③- Wear limit 85 lbs. at 1.820".
④- Wear limit 162 lbs. at 1.420".
⑤- Spring and damper assembly together.
⑥- Wear limit 67 lbs. at 1.820".
⑦- Wear limit 171 lbs. at 1.420".
⑧- Wear limit 72 lbs. at 1.820".
⑨- Wear limit 230 lbs. at 1.320".

Spring Free Length - 292 - 2.33", 352 - 2.26", 390 Std. & 406 - 2.15", 390 Police & All Hi-Perf. - 2.06".

Valve Spring Installation: Spring ends must be square within 1/16". Install springs with damper (closed) coil end down toward cylinder head. *NOTE - On 390 Engines, end with damper spring coil must be 135° counterclockwise from coil end of valve spring.* Check installed height of spring which must not exceed maximum (in table below) from surface of cylinder head spring pad to underside of spring retainer. If height greater, install .030" spacers as necessary on head under spring to bring height within limits listed in table below. *CAUTION - Install spacers only if necessary. DO NOT use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Spring Height Specifications

Engine	Installed Height
292	1 3/4-1 25/32"
352 & 390 Std.	1 13/16-1 27/32"
390 Police & All Hi-Perf. & 406	1 5/16-1 21/64"

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above), ream guides and install valves with oversize stems. *See "Valve System" in Ford Motor Co. Special Data.*

Valve Lifters: (292) Mechanical, mushroom type. Remove from below after removing camshaft.

Clearance - .0011-.0027". Wear limit .0055".

Valve Lifters (352 & 390): Hydraulic (Std. Engine). Mechanical (Hi-Perf. & Police Engines), barrel type. Can be removed through pushrod holes without disturbing chamber cover or manifold.

Clearance - .0005-.0020". Wear limit .005".

Valve Lifters (406): Mechanical type. Can be removed through pushrod holes without disturbing chamber cover or manifold.

Clearance - .0005-.0020".

Hydraulic Lifter Overhaul - *See "Valve System" in Ford Motor Co. Special Data.*

Hydraulic Lifter Operating Range - *See "Valve System" in Ford Motor Co. Special Data.*

Rocker Arm Assembly: *See "Valve System" in Ford Motor Co. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT for alignment of sprocket marks, and "Lift" under VALVES for checking of camshaft lobe wear.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*

Crankcase Capacity: 5 qts. refill, 6 qts. with filter change.

Normal Oil Pressure - 292, 352, 390 Std., 406 35-55 lbs. at 2000 RPM. **390 Hi-Perf. & Police** 52-72 lbs. at 2000 RPM.

Pressure Regulator Valve - In pump body, not adjustable.

Oil Pressure Indicator: Indicator light on instrument panel controlled by Engine Oil Pressure Switch, Ford & Mercury No. B6A-9278-B.

Oil Pump: Rotor type driven by distributor through intermediate drive shaft. Located outside crankcase on left side (292), inside crankcase at front (353,390 & 406).

Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*

Oil Filter: Full-flow, disposable type. Replace every 6,000 miles.

Filter Replacement - Coat gasket face of filter with oil, thread filter on bracket by hand until gasket contacts adapter surface, then tighten filter an additional ½-turn. Run engine and check for leaks. *CAUTION - DO NOT overtighten.*

Crankcase Ventilation: Conventional - Filter in oil filler cap (inlet) and ventilation (road draft) tube at rear of engine. Clean and lubricate filler cap filter every 6,000 miles.

Positive - Road draft tube replaced by an adapter, tubing, and hose routed to ventilation valve installed in intake manifold. Service system at regular intervals and check valve operation before performing a "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 19 qts. Add 1 qt. for heater.

Pressure Valve: 12-15 lb. radiator filler cap.

Thermostat: Located in water outlet connector. Ford & Mercury No. COAZ-8575-A (160°), COAZ-8575-B or C2AZ-8575-A (178°) for use with permanent anti-freeze.

Water Pump: Packless, sealed ball bearing type.

Pump Overhaul - *See "Cooling System" in Ford Motor Co. Special Data.*

Fluid Fan Drive: Used on Air Conditioned Cars. *See "Cooling System" in Ford Motor Co. Special Data.*

Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type used with Gauge Voltage Regulator, Ford & Mercury No. B9MF-10804-A.

Dash Unit - Ford & Mercury No. C2AZ-10883-A (Pass.), C2SZ-9307-A (Thunderbird).

Engine Unit - Ford & Mercury No. B7A-10884-A (Exc. Air Cond. Cars), C1AZ-10884-A (Air Cond. Cars).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate on base of left front door pillar. Number (example below) includes identification data.

① ② ③ ④ ⑤
2 Y 86 H 400001

① - Model Year. 2 1962.
② - Assembly Plant. Y Wixom.
③ - Body Series Code. See below.
④ - Engine. H 430" Domestic. K 430" Export.
⑤ - Beginning vehicle number.

Body Series Table

Body Type	Code No.
4-Door Sedan	82
4-Door Hardtop	84
4-Door Convertible	86

VEHICLE SPECIFICATION CODE: Vehicle specification codes (on Patent Plate) contain Body Style, Color, Trim and Day and Month vehicle was assembled.

Engine Production Code Number: Stamped on cylinder block directly in front of left hand cylinder head and indicates place, year, month, day of month and plant inspector. Not used for licensing.

TUNE-UP

►*ENGINE STRAVING AT HIGH SPEEDS (CAR RESTARTS AFTER SHORT PERIOD) CORRECTION:* Check fuel pump pushrod for excessive wear (compare with new pushrod). Replace if necessary.

►*HARD COLD STARTING CORRECTION:* May be caused by gummed-up choke and/or carburetor linkage. Clean all carburetor linkage pivot points with a commercial solvent, lacquer thinner or denatured alcohol. Rinse parts with kerosene and dry with air. DO NOT OIL any pivot points. Give automatic choke a functional check to insure adjustments are correct.

►*AUTOMATIC CHOKE STICKING CORRECTION: See "Carter ABD Carburetors" in Carburetion Section.*

COMPRESSION PRESSURE: 180±20 lbs. All cylinders must be equal within 10 lbs.

VACUUM READING: Steady 17-18" at idle speed.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: Water jacketed intake manifold with thermostat controlled circulation eliminates need of heat valve.

CARBURETOR AIR INTAKE DUCT ASSEMBLY: *See FUEL SYSTEM NOTES in Ford Motor Co. Special Data.*

CRANKCASE VENTILATION VALVE: Service at 24,000 mile intervals and check operation before performing a "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-4-2-6-3-7-8.
Cylinders - RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.
SPARK PLUG GAP: .032-.036".
Spark Plugs - Autolite No. BF-42. 18 mm. Torque to 15-20 ft. lbs. Plugs have tapered seats, no gasket used.

COIL: Linc In N. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - COLF-12250-A (Resistance Wire). 1.3-1.4 ohms at 75°F.

►*COIL RESISTOR NOTE:* Pink Ignition Resistor Wire Assembly is connected to a small pigtail from ignition switch and to a multiple quick disconnect at left side of dash panel. Resistor Assembly is bypassed during cranking by lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: Lincoln No. C1VF-12127-A.
Condenser - Lincoln No. B9AF-12300-A.
Capacity - .21-.25 mfd.
Contact Point Set - Lincoln No. B8Q-12171-A.
Breaker Gap - .014-.016".
Cam Angle - 26-28½°.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Counterclockwise viewed from above.

Automatic Advance ①

Degrees	Distr. RPM	Degrees	Eng. RPM
0	300	0	600
1-2	550	2-4	1100
6-7¼	1100	12-14½	2200
14½-15¾	2000	29-31½	4000

① - Adjust Test Stand to 0° at 200 RPM, with vacuum diaphragm disconnected.

Vacuum Spark Control: Integral type mounted in distributor housing and linked directly to breaker plate.

Vacuum Advance ②

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
½-3½	1-7	7
6-9	12-18	12
8½-11½	17-23	16
9½-12½	19-25	18

② - Adjust Test Stand to 0° at 1000 RPM and 0" of Hg.

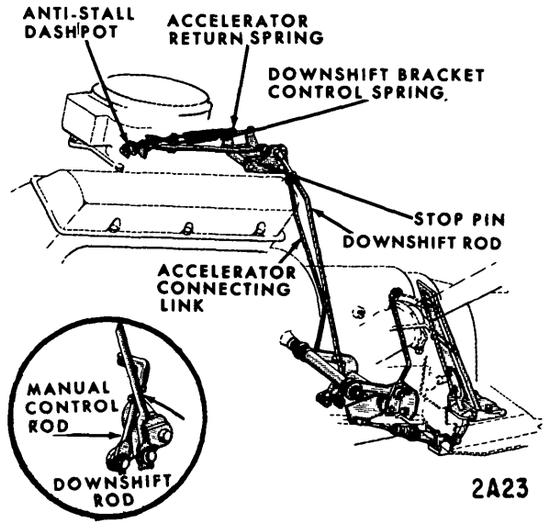
IGNITION TIMING

Setting - 8° BTDC. *Manufacturer recommends that previous allowable range specification (2-13° BTDC) not be followed as pre-ignition may occur on some engines when set ahead as much as 5°.* Set timing with vacuum line disconnected and carburetor opening taped closed.
Timing Mark - Sawtoothed pointer marked 0°, 3°, 6°, 10° BTDC. Raised dot at TDC of crankshaft damper should align with proper sawtoothed mark of pointer on cover.

CARBURETOR

►*CARBURETOR APPLICATION: Carter ABD 2-Barrel Carburetor used on all models.*

Throttle Linkage Adjustment: Make adjustments in the following sequence.
Engine RPM Adjustment – Bring engine to normal operating temperature, connect tachometer and place selector lever in D2. Hold throttle lever against hot idle screw and adjust engine idle speed to 450-475 RPM. *NOTE* - Trip fast idle cam to be sure automatic choke has positioned the lever against hot idle screw.
Anti-Stall Dashpot Adjustment - With carburetor lever against hot idle screw and dashpot plunger fully depressed, clearance between dashpot plunger and lever should be .090-.150". To adjust, loosen locknut and turn dashpot in mounting bracket.
Down Shift Rod Adjustment - Loosen downshift rod locknut and disconnect rod from ball stud on bellcrank assembly, then slide spring clip off rod. *NOTE* - Be sure movable outer bracket of bellcrank is against stop pin on inner mounting bracket on bellcrank assembly. Hold downshift rod upward against transmission internal stop and adjust length of rod until hole in rod is aligned with ball stud on bellcrank assembly. Lengthen rod one turn and position it on ball stud. Slide spring clip over end of rod to lock rod to ball stud. Tighten locknut securely. *CAUTION* - If bellcrank outer bracket does not remain against stop pin, lengthen downshift rod an additional turn.
Accelerator Pedal Height Adjustment - *CAUTION - Make this adjustment at the accelerator connecting link only.* Stop engine and measure distance from top of accelerator pedal to carpet. **Nominal measurement should be approximately 3¼".** Depress accelerator pedal and check detent feel and kickdown action of bellcrank. Adjust height to obtain proper downshift rod operation. *NOTE* - Throttle plates in carburetor must be fully opened before making this adjustment. Road test to check kickdown operation.



CARTER ABD 2-BARREL

Carter ABD. Used as follows:

Model	Carter No.	① Lincoln No.
Std. ②	3327S	③ C2VE-9510-B
Std. ④	3329S	③ C2VE-9510-D
Air Cond. ②	3328S	③ C2VE-9510-A
Air Cond. ④	3330S	③ C2VE-9510-E

① - Number stamped on air horn near inlet valve & seat.
② - 0-5,000 ft. Alt. ③ - Part No. C2VE-9510-C.
④ - 5,000-10,000 ft. Alt.

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL THROTTLE LINKAGE

S INDEXES on Pgs. 4 to 9 for complet CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*AUTOMATIC CHOKE CAUTION:* Do not loosen center screw holding water jacket assembly to choke housing. Remove this screw only if jacket gasket is to be replaced or jacket cleaned. Slot blade of a suitable size screwdriver to remove screw. Choke is adjusted in the usual manner without loosening center screw.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1-4-6-7, LEFT barrel feeds 2-3-5-8.*

Idle Mixture & Speed Setting - Initial setting for idle mixture screws is ½-2½ turns open. Initial setting for idle air (idle speed) adjusting screw is 3½ turns open. *NOTE - Air conditioner should be "off" and air cleaner removed so hot idle compensator valve can be held closed when making adjustments.* With engine at normal operating temperature, adjust idle air screw for idle speed of 450-475 RPM in D1 or D2 position, then adjust each idle mixture screw for smoothest idle, highest vacuum reading and engine RPM. Recheck, and, if necessary, reset idle speed and readjust idle mixture setting.

Float Level - With bowl cover gasket removed, distance from top machined surface of main body to top of each float at free end with float shaft retainer pressed down and float assembly in uppermost position against inlet needle should be 5/16". Use 5/16" tab of Gauge 9550-DB (or Tool T109-280) to check level.

Accelerating Pump - With pump operating rod in hole furthest from throttle shaft (marked "W") and throttle lever in closed position, distance from top of accelerator plunger to top surface of fuel bowl cover should be 17/32". To adjust, bend pump operating rod.

Fast Idle: With fast idle adjusting screw on low step of fast idle cam, engine speed should be 600-650 RPM (Transmission selector lever in "D2" range).

Automatic Choke: Centered at index.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter ABD 2-Bbl. Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

►*ENGINE STARVING AT HIGH SPEEDS (CAR RESTARTS AFTER SHORT PERIOD) CORRECTION: See TUNE-UP above.*

Fuel Pump: Lincoln No. C1VE-9350-B. Fuel only.
Pressure - 4.5-6.5 lbs. at 500 RPM.

DISPOSABLE TYPE FUEL FILTER: Lincoln No. CODE-9155-A.

Installation - To save damage to filter and possibility of leaks, proceed as follows:

1) Use only the filter hex connection adjacent to mating part for applying torque.

2) Bend filter line so that normal free floating position of the end of line is in proper alignment with filter to avoid induction stress on filter case.

3) Use second wrench on filter hex connection to avoid transferring stress through filter case and tighten fuel filter inlet to fuel pump hand tight plus 2½ turns. Tighten fuel filter outlet to fuel line to 180-200 inch lbs.

Replacement - Remove fuel filter to carburetor fuel tube, and old filter assembly. Remove brass nipple from pump outlet. Install new filter in fuel pump outlet. *CAUTION - DO NOT transfer fluid from thru gh filter case when installing filter or fuel tube.* Assemble filter to carburetor fuel tube at filter end then to carburetor. Check for leaks.

DISPOSABLE FUEL FILTER FLOW CHECKS: Check fuel flow at both inlet and outlet side of fuel filter Minimum flow required for engine operation is 1 pint within 20 seconds at 500 RPM. Static pressure will not vary because of restricted filter. Procedure for checking fuel pump pressure remains the same.

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) type with gauge voltage regulator, Lincoln No. B9MF-10804-A.

Dash Unit - Lincoln No. C1VF-9280-B.

Tank Unit - Lincoln No. C1VF-9275-F.

Air Cleaner: Dry filter element type Std. Clean element as required. Replace every 30,000 miles.

►*CLEANING CAUTION:* Tap or shake element lightly to clean. Compressed air may be used if directed against inside (opposite to air intake flow). Replace element if damaged. DO NOT WASH element in any liquid and DO NOT LUBRICATE.

Automatic Speed Control: *See "Cruise Control" in Carburetion Section.*

BATTERY

Lincoln No. C1VY-10655-A. 12 volt, 13 plate, 80 ampere hour capacity (20 hour rate).
Battery Ground - Negative, to body.
Engine Ground - Starter to body sheet metal.

STARTER

Lincoln No. C2VY-11002-A. Positive engagement type.

Armature - Lincoln No. C2OZ-11005-A.

Drive - Lincoln No. C2OZ-11350-A. Solenoid pinion shift.

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 40 ozs.

Cranking Speed - 150 RPM (warm engine), 9.5 volts, 250 amps. draw.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	9500	12.0	70

Starting Switch: Lincoln No. B6A-11450-A, magnetic type, controlled by ignition and starter switch Lincoln No. C0LF-11572-A and Neutral Safety Switch Terminal Block Lincoln No. C1VP-7B217-B.

Neutral Safety Switch Terminal Block Adjustment: *See "Lincoln Automatic Transmission" in Transmission Section.*

GENERATOR

►*GENERATOR PULLEY NOISE CORRECTION & PRODUCTION CHANGE NOTE:* Condition may be caused by armature shaft diameter stack-up and thread length differences. Replace armature assembly (if found to have a threaded length in excess of ½") with a new armature which has a shaft thread length of ½". If loose, replace pulley. The above changes were made in production beginning Dec. 1, 1961.

Lincoln No. C1VF-10002-C.
Armature - Lincoln No. C1VF-10027-A (armature & bearing).

Performance Data

Amperes	Volts	Gen. RPM
40	15.0	2650

Brush Spring Tension - 20 ozs. minimum.
Field Current - 1.5-2.0 amps. at 10.0 volts (hot).
Rotation - Counterclockwise at commutator end.

Belt Adjustment: Use Belt Tension Gauge T62L-8620-A or 33-73F or equivalent and measure belt tension as follows:

Belt Tension Specifications (Lbs.)

Belt	①New	②Used
Generator & Water Pump	110-120	90-100
Air Cond. Compressor & Water Pump	120-150	90-120

① - Run belt for 5 minutes and reset tension.
② - Any belt operated 10 minutes or longer.

GENERATOR REGULATOR

Lincoln No. C2VY-10505-A. Double Contact type of same design used previously. Regulator terminal wire leads are sealed (see "Testing Note" below).

►*REGULATOR TESTING NOTE:* Regulator "FLD", "ARM", and "BAT" wires are sealed at the regulator. All regulator wires end in two multiple connectors which mate with generator and gauge feed wiring harnesses. When testing generator and regulator, connect all test leads at the battery and generator. DO NOT attempt to pierce sealed connection.

►*SETTING CAUTION:* "Temperature Compensated" type. Set to following specifications at 75°F ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized.

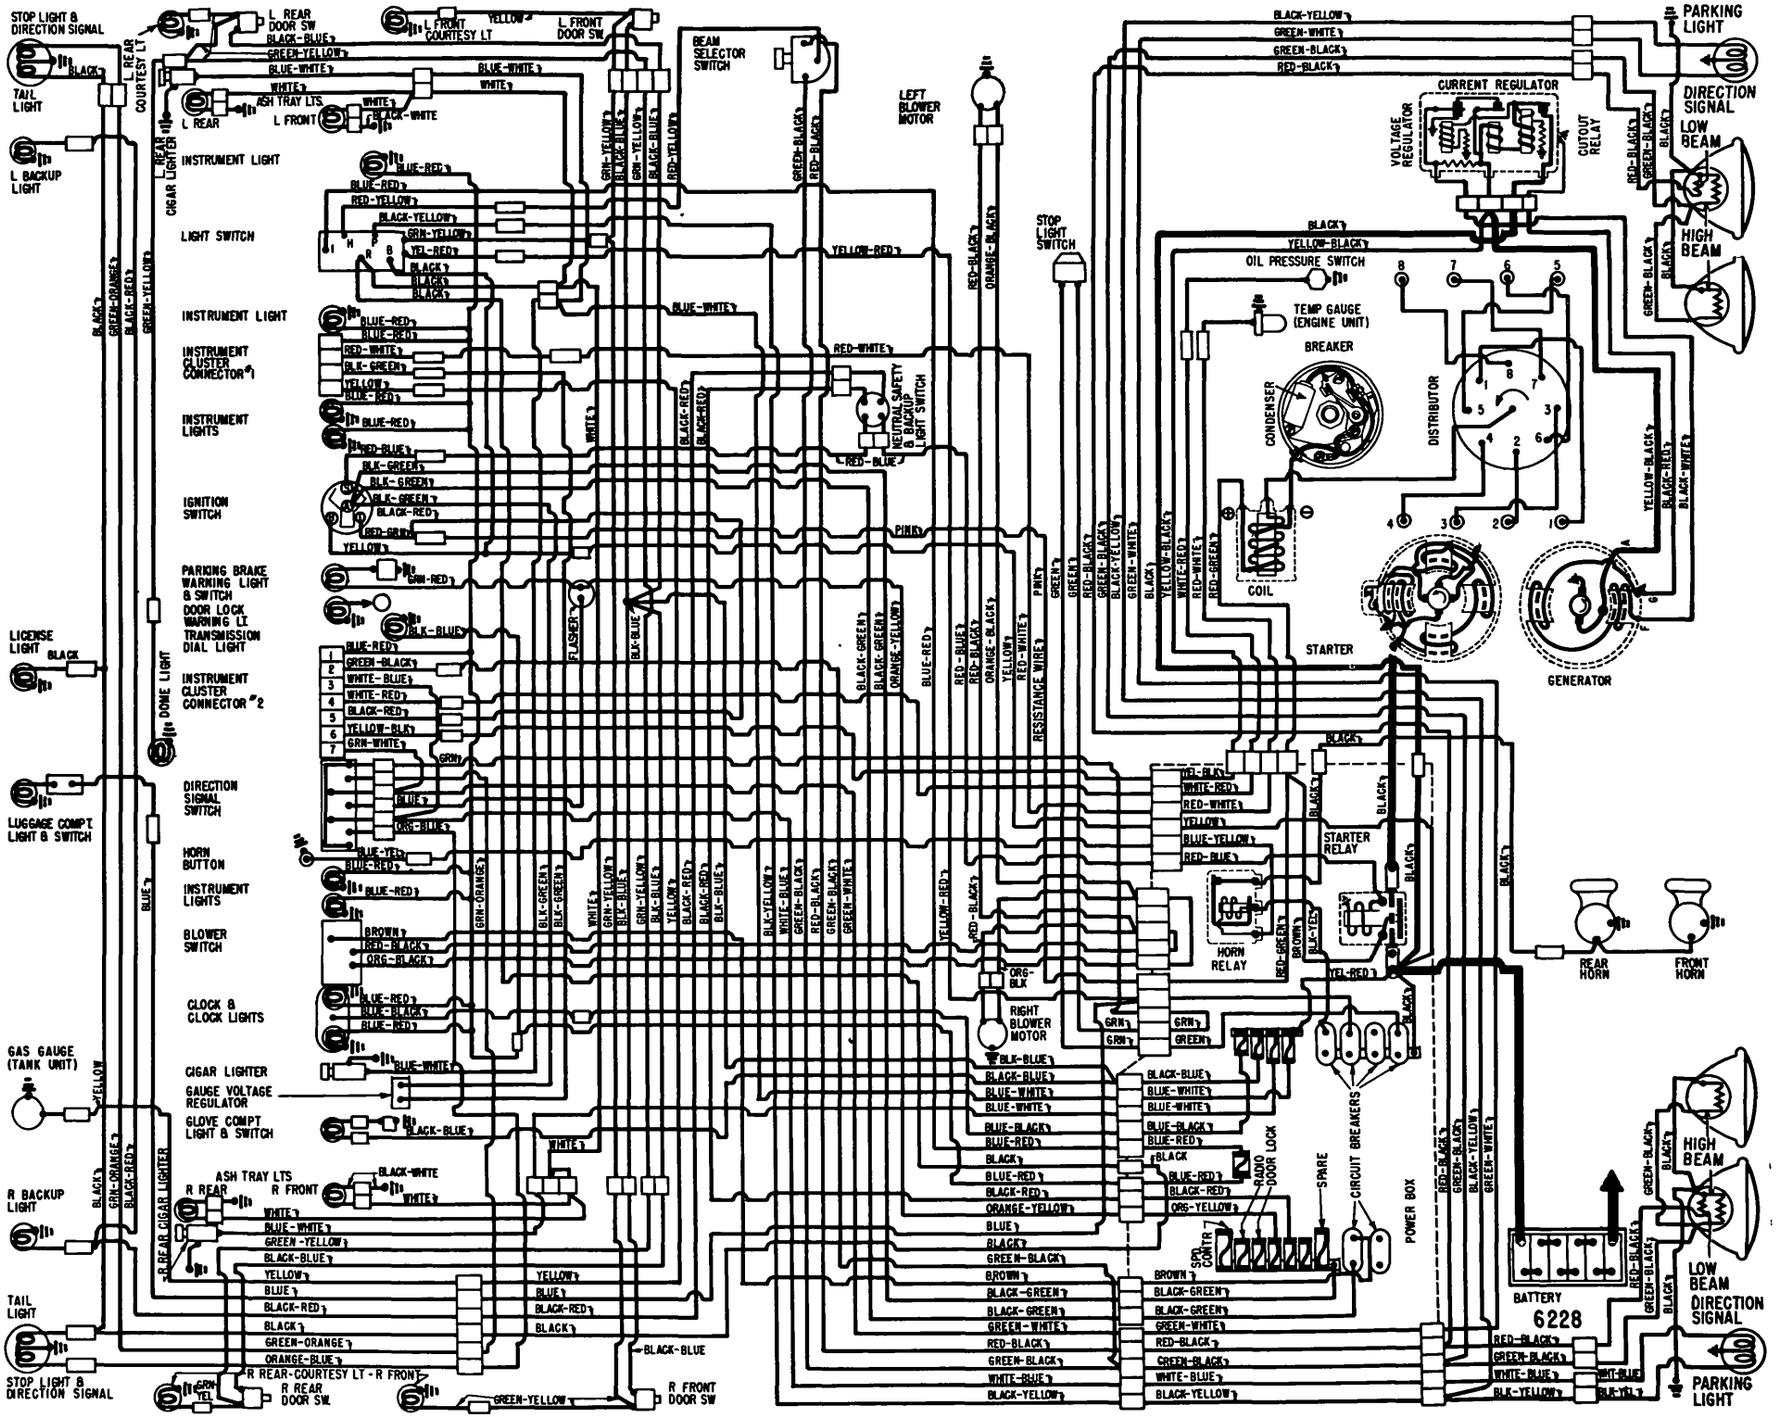
Cutout Relay

Cuts In - 12.3-13.0 volts.
Cuts Out - 8 amperes discharge current.
Air Gap - .008-.012".

Voltage Regulator

Setting - 14.7-15.3 volts at 75°F. Variation between upper and lower contacts not to exceed .3 volt.
Air Gap - .037" (Lower Contacts Closed), .040" (Upper Contacts Closed).

Current Regulator



Setting - 38-42 amperes.
Air Gap - .033-.036".

►*OTHER DATA: See "Lincoln 12-Volt (Double Contact) Regulators" in Electrical Section.*

CONTINUED ON NEXT PAGE

S INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

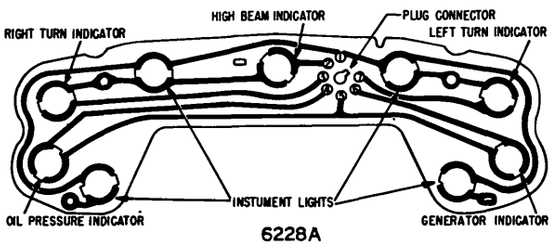
LINCOLN CONTINENTAL 1962

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

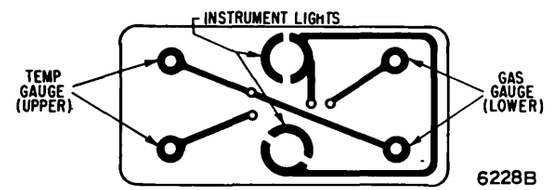
Instrument panel has upper and lower clusters. Upper cluster (three housings) can be serviced from front. Lower cluster (controls) removable in two sections.

Speedometer Removal: Loosen screws on bottom of housing and pull bezel away. Remove light shields. Remove attaching screws and pull speedometer from housing. To install, reverse removal procedure.



Speedometer Housing Printed Circuit Board Removal: Remove negative cable from battery. Remove clock by removing attaching screw and lifting up and away. Remove attaching wires. Remove speedometer cable from speedometer housing. Remove hood release handle from bracket and remove lower left instrument panel cover. Remove lower section of left vent from car. Remove main light switch from lower left cluster and remove ignition switch. With 5/16" socket, remove mounting plate-to-speedometer housing screws. Disconnect plug from printed circuit board then remove housing. Remove bulb sockets, then remove attaching screws. To install reverse removal procedure.

Gauge Housing Printed Circuit Board Removal: Loosen screw below gauge housing and pull bezel out. Remove plate attaching screws and pull gauges from housing. Disconnect connector from printed circuit board, then remove lamp sockets. Remove gauges from printed circuit board, then remove attaching screw. Remove printed circuit board from plate. To install, reverse removal procedure.



Instrument Lamp Removal: Fuel & Temperature Gauge - Loosen screw below housing and pull bezel out. Remove plate attaching screws and pull gauges from housing. Disconnect connector from printed circuit board, then remove socket and replace lamp(s).

Speedometer Housing - Loosen screws below housing and pull bezel out. Carefully replace lamp (s). *NOTE - Do not press socket out of printed circuit board.* To replace high beam or two upper background lights, remove speedometer.

Clock - Remove screw below clock and remove clock. disconnect wires, then replace bulb.

INSTR. CLUSTER PRINTED CIRCUIT (2)

INSTR. CLUSTER PRINTED CIRCUIT (1)

POWER BOX NOTE: A power box mounted on right side of dash panel in engine compartment contains fuse panel, starter and horn relays, power circuit breakers and dash panel wiring connector assemblies. Power box acts as a distribution point for all circuits. A decal inside cover gives circuit breaker and fuse application, ratings, location, and wiring color codes. Fuses may be removed by using ignition key. Heater and air conditioning circuit breakers are installed individually and can be lifted from their spring-loaded holders. Other circuit breakers are mounted on a bus bar and should be removed from holder as an assembly.

Lighting Switch Removal: Disconnect battery negative (ground) cable. Press inward on headlamp switch spring release button and carefully remove switch knob and shaft. Remove switch bezel nut and bezel. Lower switch below panel, note wire color codes and disconnect wires.

Stop Light Switch Location: On lower side of brake master cylinder. *CAUTION* - After replacing switch, depress brake pedal to check for leaks. Check brake fluid level in master cylinder.

CIRCUIT BREAKERS: 18 Ampere - Protects headlights. Integral with headlight switch.
12 Ampere - Protects Instrument Panel, Dome, Trunk, Tail, License, and Parking Lights. In Power Box.

FUSES: All fuses are in Power Box.
15 Ampere - Instrument panel and left rear door cigar lighters.
15 Ampere - Right rear door cigar lighter.
14 Ampere - Interior lights.
14 Ampere - Speed Control.
14 Ampere - Door Open Warning Light circuit feed.
10 Ampere - Electric Antenna.
7.5 Ampere - Back-up lights.
7.5 Ampere - Radio.
7.5 Ampere - Direction Signals and Stop Lights.
4 Ampere - Instrument Panel Rheostat.
2 Ampere - Clock.
Sulphur Disc or Reset Circuit Breaker - In socket of each cigar lighter.

ENGINE

ENGINE SPECIFICATIONS: Own V8, valve-in-head, of same design as previous models.

Bore	Stroke	Displacement
4.30"	3.70"	430 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
10.0-1	59.17	300 at 4100 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Remove dipstick, and turn crankshaft so No. 1 piston is 15° BTDC (use crankshaft timing marks). Remove generator splash shield and auto. trans. line bracket bolt. Remove engine front support insulator-to-mounting pad nut. Raise engine approximately 1" (use block of wood on jack placed under leading edge of oil pan), and insert a ¾" wood block between insulator and underbody engine support pads. Remove both stabilizer arm bolts, washers, insulators, spacers, and nuts. Lower stabilizer arms for clearance. Remove oil pan bolts and free oil pan from block. Remove oil pump pick-up tube and screen assembly bolts, and drop assembly in oil pan. Remove oil pan from under vehicle.

ENGINE LATERAL RESTRICTOR: *See "Engine Mountings" in Ford Motor Co. Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Motor Co. Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Motor Co. Special Data.*

ENGINE REMOVAL: *See "Engine" in Ford Motor Co. Special Data.*

PISTONS

Step head, slipper type, aluminum alloy with a steel strut. Piston pin is interference fit in piston. Retaining rings are not used.

Removal - Piston & Rod removed from above.

Clearance - .0011-.0029".

Fitting New Pistons: *See "Pistons" in Ford Motor Co. Special Data.*

Installing Pistons: Pistons for right and left hand cylinders are NOT interchangeable. Install piston so indentation notch on head of piston is toward front of engine. *See Rod Installation.*

Replacement Pistons: Std., .003", .020", .030", .040" Oversize.

PISTON PIN

Press fit in connecting rod, no retaining device.

Diameter - .9749-.9752". **Length** - 3.48-3.50".

Clearance in Piston - .0002-.0004". **Wear Limit** - .0008".

Piston Pin Removal & Installation: *See "Pistons Pins" in Ford Motor Co. Special Data.*

Replacement Pins: Standard size. Furnished with new pistons only.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0774-.0781"	.015-.025"	ℂ .0014-.0031"
Compr.(2)	.0930-.0940"	.015-.025"	ℂ .0010-.0030"
Oil (3)		.025-.038"	②

ℂ - Wear limit .006". ② - Snug. Side sealing type.

Installing Rings: Install second compression ring with outside counterbore down. Oil ring expander spacer gap must be opposite notch in piston head with segment gaps 1" on each side. Compression ring gaps must be 150° on each side of expander spacer gap.

Replacement Rings: Furnished Std. .020", .030", .040" Oversize.

CONNECTING ROD

Length (Center-to-Center) - 6.599-6.601".

Journal Diameter - 2.5998-2.6001" (Code Red), 2.5992-2.5995" (Code Blue).

Lower Bearing - Copper lead alloy, steel back.

Clearance - .0007-.0020". **Wear Limit** - .0038".

Side Clearance - .005-.015". **Wear Limit** - .018".

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Replacement Bearings: Std. (2 sizes marked RED and BLUE for selective fit), .002", .010", .020", .030" Undersize.

►*NOTE:* Any combination of RED and BLUE standard bearing inserts may be used to obtain desired clearance. If necessary, regrind journals and install undersize bearings.

Installing Rods: Install rod in correct numbered cylinder with notch on head of piston toward front of engine and oil squirt hole in rod facing inward and rod number facing outward toward outer side of cylinder block.

CRANKSHAFT

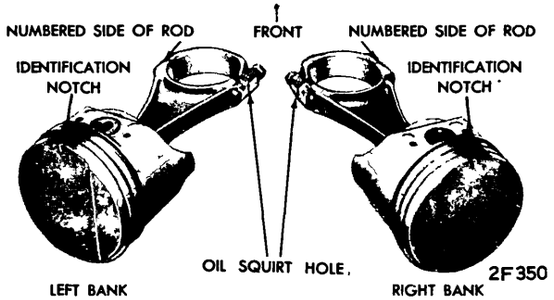
Journal Diameter - 2.9000-2.9003" (Code Red), 2.8994-2.8997" (Code Blue).
Out-of-Round Limits - .0004". **Wear Limit** - .0006".
Bearings - Copper-lead alloy, steel back.
Clearance - .0008-.0024". **Wear Limit** - .0039".

End Thrust: Taken by No. 3 (center) main bearing.
Endplay - .004-.008". **Wear Limit** - .012".

Crankshaft Thrust Bearing Alignment: *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*

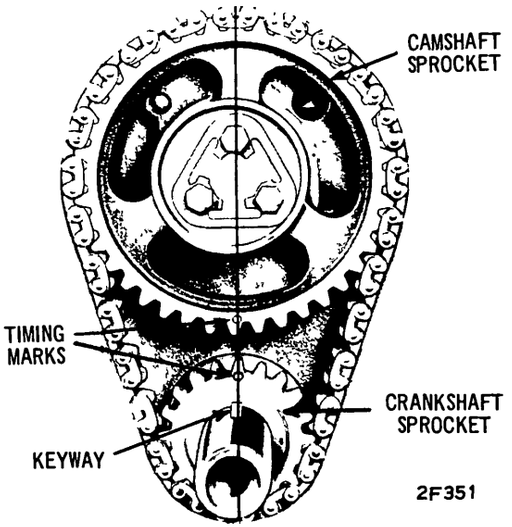
Replacement Bearings: Std. (2 sizes marked RED and BLUE for selective fit), .002", .010", .020", .030" Undersize.

►*NOTE:* Any combination of RED and BLUE standard bearing inserts may be used to obtain desired clearances. If necessary, regrind journals and install undersize bearings.



Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Motor Co. Special Data.*

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Motor Co. Special Data.*



►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on engine to reduce oil leakage at front oil seal. Slinger is held in place by crankshaft pulley hub. To remove slinger, remove cylinder front cover and slide slinger off crankshaft.

CAMSHAFT

Journal Diameter - (1) 2.3243-2.3248", (2) 2.3093-2.3098", (3) 2.2943-2.2948", (4) 2.2793-2.2798", (5) 2.2643-2.2648".
Out-of-Round Limits - .0005". **Wear Limit** - .001".
Bearings - Babbitt lined, steel backed.
Clearance - .0012-.0027". **Wear Limit** - .005".

PISTON & ROD ASSEMBLY

VALVE TIMING MARKS

Endplay - Thrust to rear. Taken by thrust face of camshaft sprocket riding against front surface of block.

Camshaft Bearing Service: *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*

Replacement Bearings: Std. and .015" Undersize.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Motor Co. Special Data.*

Camshaft Setting - Timing marks should be adjacent and in line with straightedge across shaft centers.

Timing Chain Deflection: Not more than ½" deflection from straight to outward deflected position.

Timing Chain Cover Seal Installation (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Motor Co. Special Data.*

Engine Front Cover Removal & Installation: *See "Engine Front Cover" in Ford Motor Co. Special Data.*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters.

Valve	Head Diameter	Stem Diameter
Intake	1.955-1.970"	①
Exhaust	1.645-1.660"	②

Valve	③Seat Angle	④Lift	Stem Clearance
Intake	45°	.2316"	⑤ .0008-.0018"
Exhaust	45°	.2316"	⑥ .002-.003"

① - Std., .3712-.3717" (Code Red), .3717-.3722" (Code Green) and .003", .015", .030" Oversize.
② - Std., .3701-.3705" (Code Red), .3705-.3709" (Code Green) and .003", .015", .030" Oversize.
③ - Face angle 44° (Intake & Exhaust).
④ - Cam lobe lift. Wear loss limit .005".
⑤ - Wear limit. 0045". ⑥ - Wear limit .0055".

Valve Seat Width - .070-.090" Intake and Exhaust.

Valve Stem Oil Seals - Umbrella type seals used on all valves. Install seals with cup side down over guide.

Oversize Valve Stem Installation: *See "Valve System" in Ford Motor Co. Special Data.*

Valve Springs: Roto-Coil design valve rotators used on all exhaust valves eliminating spring retainer and sleeve. No damper springs used.

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Closed	65-75 ①	1.640"
Open	179-199 ②	1.230"

① - Wear limit 58 lbs. at 1.640".
② - Wear limit 161 lbs. at 1.230".

Valve Spring Installation: Spring ends must be square within 3/64". Install springs with damper (closed) coil end down toward cylinder head. Check installed height of spring which must not exceed 1 21/32" from surface of cylinder head spring pad to underside of spring retainer. If height greater, install .030" spacers as necessary on head under spring to bring height within limits of 1 5/8-1 21/32". *CAUTION - Install spacers only if necessary. DO NOT use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum .0045" (Intake), .0055" (Exhaust), ream valve guides and install valves with oversize stems. *See "Valve System" in Ford Motor Co. Special Data.*

Valve Lifters: Hydraulic barrel type. No adjustment.
Diameter - .8740-.8745".
Clearance in Lifter Bore - .0005-.0020".
Wear Limit - .005".
Hydraulic Lifter Operating Range Check - *See "Valve System" in Ford Motor Co. Special Data.*
Hydraulic Lifter Overhaul - *See "Valve System" in Ford Motor Co. Special Data.*

Rocker Arm Assembly: *See "Valve System" in Ford Motor Co. Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: Following valve opening and closing points are with camlift as indicated.*

Valve Timing Specifications

Intake Valves - Open 22° BTDC ①. Close 68° ALDC ②.
Exhaust Valves - Open 63° BLDC ①. Close 27° ATDC ②.

① Camlift .002". ② - Camlift .005".

Valve Timing Check: Install a quadrant on crankshaft damper. Remove right rocker arm assembly. Install Dial Indicator Tool 6565 and Indicator Adapter Tool 6565-AB on cylinder head using Holding Fixture Tool 4201-D. Pushrod must be in lifter socket and actuating point of indicator in same plane as pushrod movement. Make sure timing pointer is not bent. Turn engine slowly until lifter is on heel of camshaft lobe. Set indicator on zero and turn engine slowly until indicator registers cam lobe lift shown in Valve Timing Table above. Compare crankshaft degrees indicated on quadrant with Valve Timing Table above. Continue to rotate engine to check valve closing specifications in same manner. If reading not correct, check for bent pointer, worn timing chain or sprocket before replacing camshaft.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*

Crankcase Capacity: 5 qts. refill. Add 1 qt. with filter change.

Normal Oil Pressure: 35-55 lbs. at 2000 RPM.

Pressure Regulator Valve - In pump body, not adjustable.

Oil Pressure Indicator: Light on instrument panel. Light goes on when ignition switch turned on or when oil pressure is low.

Oil Pressure Switch - Lincoln No. B6A-9278-B.

Oil Pump: Rotor type mounted inside oil pan on lower left corner of block. Driven by distributor through an intermediate shaft.

Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*

Oil Filter: Full-flow disposable type. Mounted on lower left front corner of cylinder block. Replace element every 4000 miles or 4 months. *NOTE* - Replacement filter Lincoln No. C1AZ-6731-A. Use no other filter.

Installation - Coat gasket with light film of oil. Screw filter onto adapter (by hand) until snug. Then tighten ¼ turn additional. DO NOT OVERTIGHTEN.

►*OIL FILLER CAP NOTE:* Disposable type. Replace every 12,000 miles or 12 months.

Crankcase Ventilation: Standard Cars - Filter in oil filler cap and ventilator tube at rear of engine. Replace oil filler cap every 12,000 miles or 12 months.

Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Three stage engine warm-up and cooling system with temperature controlled water jacketed intake manifold. Additional thermostat installed in front face of each cylinder bank.

NOTE - Cylinder block thermostats are accessible by removing water pump.

Water Capacity: 25 qts. (with heater).

Pressure Valve: 12-15 lb. radiator filler cap, Lincoln No. B8A-8100-A.

Thermostat: 157-162°F (No. 8BE-8575-B); 178°F (No. C2VY-8575-A): Located in water outlet connection. Two 137-142°F (B9S-8575-B) thermostats located in front face of cylinder banks.

Water Pump: Packless, sealed ball bearing type. *See "Cooling System" in Ford Motor Co. Special Data.*

Temperature Gauge: King-Seeley Electric Constant Voltage ("CV") type with Gauge Voltage Regulator Lincoln No. B9MF-10804-A.

Dash Unit - Lincoln No. C1VF-10883-A.

Engine Unit - Lincoln No. C1AZ-10884-A.

Power Booster Fan: Std. on Air Cond. Cars. *See "Cooling System" in Ford Motor Co. Special Data.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate on rear face of left front door inner panel. Number (example below) includes identification data.

① ② ③ ④
E10 S H 205001

① - Series Code (letter and first two digits of series designation). See below.
② - Engine Type. See below.
③ - Assembly Plant. H Lorain
④ - Consecutive unit number starting with 205001 for August 1961 through 339999 for September 1962.

Series Code Designation

Model	Series	Code
Econoline Regular Pick-Up	E103	E10
Econoline Heavy Pick-Up	E104	E10
Falcon Station Bus	E110	E11
Falcon Club Wagon	E120	E12
Falcon Deluxe Club Wagon	E130	E13
Econoline Regular Van	E143	E14
Econoline Heavy Van	E144	E14

Engine	Engine Code Designation	Code
144" 6 Cyl.		S
144" 6 Cyl. Low Compr. Export		K
170" 6 Cyl.		T
170" 6 Cyl. Low Compr. Export		M

►*ENGINE DESIGNATION NOTE: In the following data pages, engines will be referred to as follows:* 144" 6 Cyl. as 144; 170" 6 Cyl. as 170.

►*FORD P-100 SERIES (144" ENGINE) SPECIFICATIONS NOTE: Data below applies to this model.*

TUNE-UP

COMPRESSION PRESSURE: 170 lbs.±20 lbs. at cranking speed. All cylinders must be equal within 10 lbs.

VACUUM READING: 18" at idle speed.

VALVE TAPPET CLEARANCE: .018" Intake & Exhaust, Hot & Cold. Can be set with engine cold but must be rechecked with engine at operating temperature and idling. Use feeler gauge (.017" GO, .019" NO GO).

►*SELF-LOCKING TAPPET ADJUSTING SCREW NOTE:* Torque required to turn screw after interference noted must be 3 ft. lbs. minimum.

MANIFOLD HEAT CONTROL: "Hot Spot" in intake manifold at lower center and engine coolant heated spacer between carburetor and intake manifold.

CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals (4000 mile intervals under stop and go operation), and check operation before performing a "Tune-Up" for ignition and carburetion troubles. See *"Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .032-.036".

Spark Plugs - Autolite BF-82. 18 mm. Torque to 15-20 ft. lbs. Plugs have tapered seat, no gasket used.

COIL: Ford No. B6A-12029-B.

Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.

Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) used between ignition switch and multiple connector on dash. Bypassed during cranking by lead from starter switch.

DISTRIBUTOR: Ford. "Loadomatic" type used as follows:

Engine	①Distributor No.
144	C0DF-12127-A, C2DF-12127-A,D,E
170	C1DF-12127-B, C2UF-12127-A,B

① - Stamped on distributor housing.

Condenser - Ford No. 7RA-12300-C.
Condenser Capacity - .21-.25 mfd.
Contact Point Set - Ford No. FAA-12171-A.
Breaker Gap - .024-.026". **Cam Angle** - 35-38°.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Advance Performance
►**With Distributor On Test Stand**
①C0DF-12127-A & C2DF-12127-A ②E

Distr. Degrees	Vacuum ("of Hg)	Distr. RPM
0	0.33	400
½-1½	0.78	600
3½-4½	1.30	800
10-12	3.45	1400
12½-15	5.00	1800
12¾-15½	5.35	2000
16½ max.	10.00	2500

①C1DF-12127-B

Distr. Degrees	Vacuum ("of Hg)	Distr. RPM
1½-2½	0.43	700
5¼-6¼	0.92	1000
7½-8¾	1.50	1300
10-11¼	2.40	1700
11-12¼	3.00	2000
16½ max.	10.00	2000

① - Set test stand to 0°, 0" of Hg, and 300 RPM.
② - Set test stand to 0°, 0" of Hg, and 450 RPM.

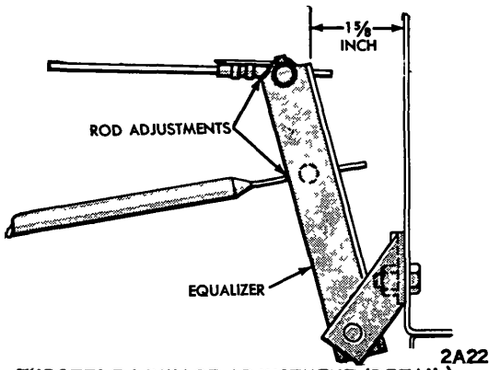
IGNITION TIMING

Setting - 4° BTDC. Allowable range 4-9° BTDC. Set timing with engine idling and distributor vacuum line disconnected.

Timing Mark - Notch in crankshaft pulley and timing pointer on left side of chain case cover. Pointer marked "0", "3", "6", "10". Align pulley notch with correct mark on pointer.

CARBURETOR

►*CARBURETOR APPLICATION: One Holley Model 1904 or 1908 single barrel carburetor*



THROTTLE LINKAGE ADJUSTMENT: Depress accelerator pedal to wide open throttle position and hold in this position while making the following adjustments Adjust accelerator pedal connecting rod at equalizer on engine so there is 1 5/8" between upper end of equalizer and engine rear cover panel. Adjust carburetor-to-equalizer connecting rod at equalizer to obtain full throttle opening.

HOLLEY MODEL 1904 & 1908

Engine	①Carburetor No.
144	C2UE-9510-A
144 (P-100 Series Truck)	C2UE-9510-D
144 (CCV)②	C2UE-9510-B
170 (Early)	C1UE-9510-D
170 (Late)	C2UE-9510-C
170 (Later)	C2UE-9510-E

① - Stamped on carburetor main body.
② - With Closed Crankcase Ventilation.

Idle Setting - Initial setting 1-1½ turns open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll. Then turn screw in until engine runs smoothly. Favor a slightly rich mixture.

THROTTLE LINKAGE ADJUSTMENT (DETAIL)

Idle Speed - 525-575 RPM.

Fuel Level - 23/32"±1/32" below power valve mounting surface (remove power valve and use Tool T52L-9550-AGE). Fuel should touch end of "low" pin, but not touch end of "high" pin.

Accelerating Pump - Inner hole for average or hot weather operation, outer hole for cold weather operation.

Fast Idle: No adjustment (will be correct when hot or slow idle correctly set).

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Holley Single Barrel Model 1904 & 1908 Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Fuel only. Ford No. C2DZ-9350-A.
Pressure - 3½-5½ lbs. at 500 RPM.

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator Ford No. B7A-10804-B.
Dash Unit - Ford No. C1TF-9280-A.
Tank Unit - Ford No. C0DZ-9275-A.

Fuel Filter: Disposable type in line between fuel pump and carburetor. Replace every 8,000 miles or when clogged. *NOTE* - To replace, position new filter in rubber sleeves so fuel flow arrow on filter points away from pump.

Air Cleaner: Oil Bath type. Clean every 4,000 miles and refill reservoir with engine oil (SAE 30 above 32°F, SAE 20 below 32°F)

ELECTRICAL

►*SEE FALCON CAR DATA PAGES FOR BATTERY, STARTER, GENERATOR, REGULATOR, CIRCUIT BREAKER AND FUSE DATA.*

ENGINE

ENGINE SPECIFICATIONS: Own. 6 Cyl., valve-in-head. 144" and 170" engines of same design used previously.

Engine	Bore	Stroke	Displacement
144	3.50"	2.50"	144 cu. ins.
170	3.50"	2.94"	170 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
144	8.7-1	29.4	85 at 4200 RPM
170	8.7-1	29.4	101 at 4400 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Motor Co. Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Motor Co. Special Data.*

ENGINE REMOVAL: *See "Engine" in Ford Motor Co. Special Data.*

OIL PAN REMOVAL: Raise engine compartment cover, remove dipstick, then raise and support truck. Drain crankcase. Remove oil pan retaining screws, crank engine as necessary for clearance, then remove oil pan. Remove oil pump inlet tube and screen assembly.

►*OTHER ENGINE DATA: See Falcon Car Data Pages.*

ENGINE OILING SYSTEM

ENGINE OILING SYSTEM: *See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*

Crankcase Capacity: 3½ qts. Add 1 qt. for filter.

Normal Oil Pressure: 35-55 lbs. at 2000 RPM.

Pressure Regulator Valve - In pump body, not adjustable.

Oil Pressure Indicator: Indicator light on instrument panel controlled by Engine Oil Pressure Switch, Ford No. B6A-9278-B, located on right side of engine above starter.

Oil Pump: Rotor type. Mounted in crankcase.

Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*

Oil Filter: Full-flow type. Replace every 8,000 miles or twice a year.

►*OIL FILTER INSTALLATION NOTE:* Coat gasket face of filter with engine oil. Install filter on adapter until gasket contacts adapter face, then tighten ½ turn by hand. DO NOT overtighten.

Crankcase Ventilation: Conventional - Filter in oil filler cap (inlet) and outlet pipe at rear of engine. Clean system every 4,000 miles (On Highway) 500 miles (Off Highway), or sooner under severe operating conditions.

Positive - Road draft tube replaced by an adapter, tubing, and hose routed to ventilation valve installed in intake manifold or in spacer between carburetor and intake manifold. Service system each 8,000 miles (4,000 miles or 3 months for "Stop & Go" operation), and check valve operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

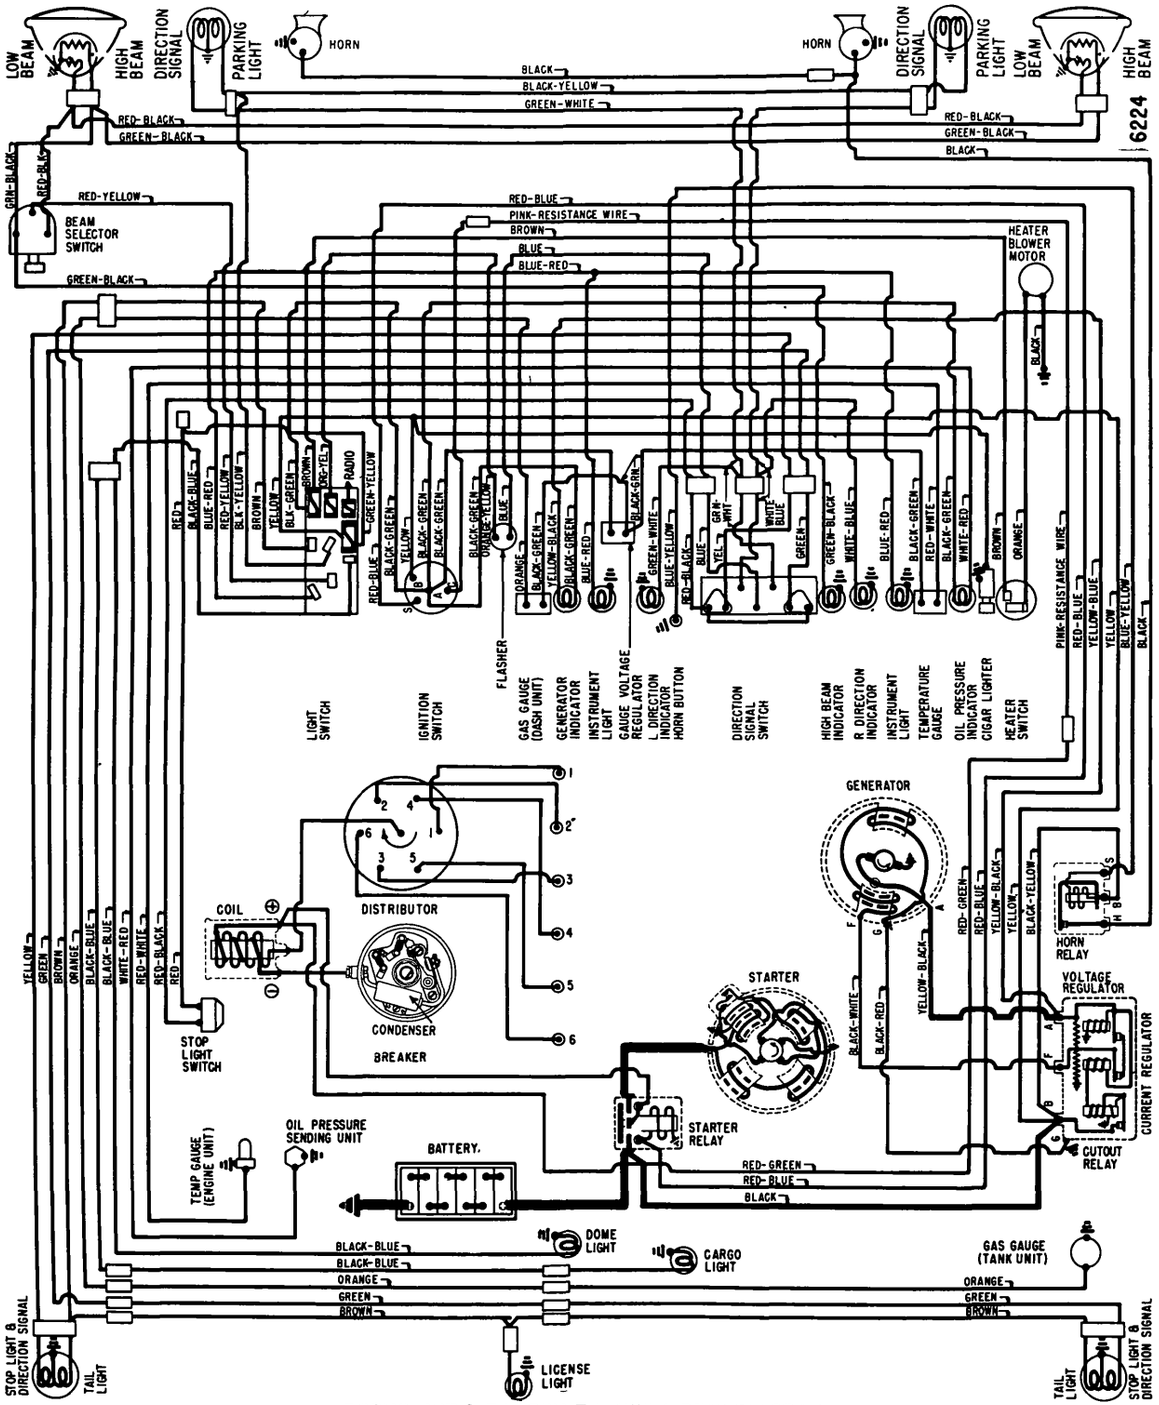
ENGINE COOLING SYSTEM

Water Capacity: 9 qts. Add 1 qt. for heater.

Pressure Valve: 12-15 lb. Radiator Filler Cap, Ford No. C1UU-8100-A.

Thermostat: As follows:

Type	Early	Later
160°F	C1UE-8575-B	C1UZ-8575-B
178°F	C1UE-8575-A	C1UZ-8575-A



Water Pump: Packless sealed ball bearing type.

See "Cooling System" in Ford Motor Co. Special Data.

Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type with a Gauge Voltage Regulator Ford No. B7A-10804-B.

Dash Unit - Ford No. C1UF-10883-A.

Engin Unit - Ford No. CODF-10884-A.

ECONOLINE & FALCON TRUCKS WIRING DIAGRAM

►*ECONOLINE & FALCON TRUCK NOTE: See separate data pages for these models.*

►*P-100 SERIES (144" ENGINE) DATA NOTE: For all data on this model, see Econoline & Falcon Truck pages.*

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate on rear face of left front door inner panel, or on left front cab pillar, or glove box door, or right hand dash panel, depending on truck model. Number (example below) includes identification data.

① ② ③ ④
F10 J U 205001

① - Series Code (letter and first two digits of series designation). *See below.*
② - Engine Type. *See below.*
③ - Assembly Plant. *See below.*
④ - Consecutive unit number starting with 205001 for August 1961 through 339999 for September 1962.

Truck Model Series

Letter	Type	Letter	Type
F	Conventional	P	Parcel Delivery
B	School Bus	C	Tilt Cab

Number	Size
100, 250, 350, 400	Light Duty
500, 550, 600	Medium Duty

Engine Type

Engine	Code Letter
223" 6 Cyl.	J
223" 6 Cyl. Export	A
262" 6 Cyl.	B
292" V8 2-Bbl. Carb. Medium Duty	C
292" V8 4-Bbl. Carb. Heavy Duty	D

Assembly Plant

A - Atlanta	H - Lorain	E - Mahwah
G - Chicago	U - Louisville	R - San Jose
D - Dallas	N - Norfolk	S - Pilot Plant
K - Kansas City	P - St. Paul	

►*ENGINE DESIGNATION NOTE: In the following data pages, engines will be referred to as follows:*

Engine	Designation
6 Cyl. 223"	223
6 Cyl. 262"	262
V8 292" 2-Bbl. Carb. Medium Duty	292MD
V8 292" 4-Bbl. Carb. Heavy Duty	292HD

TUNE-UP

COMPRESSION PRESSURE: 150 lbs. ± 20 lbs. at cranking speed. Cylinders must be equal within 10 lbs.

VACUUM READING: 18" at idle speed.

VALVE TAPPET CLEARANCE: Can be set with engine cold but must be rechecked with engine at operating temperature and idling. Use step-type feeler gauge (.001" undersize for "go"; .001" oversize for "no go"). **Cold Clearance** - .019" Intake & Exhaust, All Engines. **Hot Clearance** - **223 & 262** - .019" All Valves. **292** - .018" All Valves.

►*SELF-LOCKING TAPPET ADJUSTING SCREW NOTE:* Torque required to turn screw after interference noted must be 3 ft. lbs. minimum.

MANIFOLD HEAT CONTROL: 223 & 292MD - Automatic thermostatic type located at center of exhaust manifold (6 Cyl.), between crossover pipe and right exhaust manifold (292 MD). Valve is closed when engine is at normal temperature and running at slow idle, and opens when operating at high RPM. Spring is installed with ¾-turn windup and hooked over stop pin. Valve must operate freely. Lubricate every 4000 miles with special Exhaust Gas Control valve solvent, Ford No. COAA-19A501-A.
262 - "Hot Spot" in intake manifold at lower center and engine coolant heated spacer between carburetor and intake manifold.
292HD - None used.

CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals (4000 miles on P Series), and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION
6 CYLINDER ENGINES

FIRING ORDER: 1-5-3-6-2-4
SPARK PLUG GAP: 223 - .032-.036". **262** - .028-.032".
Spark Plugs - Autolite BTF-6 (223), BTF-3 (262). 18 mm. Torque to 15-20 ft. lbs. Plugs have tapered seat, no gasket used.
COIL: Ford No. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) in wiring harness between ignition switch and dash panel connector. Bypassed during cranking by lead from starter switch.
DISTRIBUTOR: Ford. Used as follows:

Engine	①Distributor No.	Distributor Type
223	②C2AF-12127-E	Loadomatic
262	③C1TF-12127-D	Step-Stop

① - Stamped on distributor housing for identification.
② - Part No. C2AZ-12127-A
③ - Also daub of blue paint on distributor housing.
Condenser - Ford No. 7RA-12300-C.
Condenser Capacity - .21-.25 mfd.
Contact Point Set - Ford No. FAA-12171-A.
Cam Angle - 35-38°.
Breaker Gap - .024-.026".
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Advance Performance
►With Distributor On Test Stand
①C2AF-12127-E

Distr. Degrees	Vacuum (" of Hg)	Distr. RPM
0	0.25	350
1-2	0.38	500
6-7	1.93	1100
10¾-11½	4.80	2000

①C1TF-12127-D

Test	Distr. Degrees	Vacuum ("of Hg)	Distr. RPM
A	0-1¼	0.42	400
A	5-6	1.03	800
A	7¾-8¾	1.62	1000
B	8½-9½	2.32	1200
C	8½-9½	5.65	2000
C	10¾-12¼	7.30	1600
D	13 max.	10.00 min.	1600

① -Set test stand at 0°, 0" of Hg, and 250 RPM.
A - Adjust primary spring. B - Adjust stop washers.
C - Adjust spring washers. D - Replace breaker plate assembly.

V8 ENGINES

FIRING ORDER: 1-5-4-8-6-3-7-2
Cylinders - RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.
SPARK PLUG GAP: 292MD - .032-.036". **292HD** - .028-.032".
Spark Plugs - Autolite BTF-6 (292MD), BTF-3 (292HD). 18 mm. Torque to 15-20 ft. lbs. Plugs have tapered seat, no gasket used.
COIL: Ford No. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - Pink resistance wire (1.30-1.40 ohms at 75°F) in wiring harness between ignition switch and dash panel connector. Bypassed during cranking by lead from starter switch.
DISTRIBUTOR: Ford. Centrifugal & Vacuum Advance type used on 292MD. Centrifugal Advance only type used on 292HD.

Engine	①Distributor No.
292MD	COTF-12127-B
292HD	②COTF-12102-C

① - Stamped on distributor housing for identification.
② - Part No. COTZ-12127-A.
Condenser - Ford No. B9TF-12300-A (COTF-12127-B), No. B7A-12300-C (COTF-12102-C). **Capacity** - .21-.25 mfd.
Contact Point Set - Ford No. B7A-12171-A (COTF-12127-B), No. B8Q-12171-A (COTF-12102-C).
Cam Angle - 26-28½°.
Breaker Gap - .014-.016".
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Counterclockwise viewed from above.

①Automatic Advance - COTF-12127-B

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0		550	0		1100
¾-1¾		700	1½-3½		1400
3¼-4¼		900	6½-8½		1800
5½-6½		1150	11-13		2300
8½-10		1600	17-20		3200
9¼-10¾		1800	18½-21½		3600

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0		400	0		800
½-1½		500	1-3		1000
5½-6½		900	11-13		1800
8½-9½		1250	17-19		2500
10¾-12¼		2000	21½-24½		4000

① - Set test stand at 0° and 300 RPM.
② - Set test stand at 0° and 250 RPM.
Vacuum Spark Control (292MD): Integral type.

③Vacuum Advance - COTF-12127-B

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
0-1	0-2	5
3¾-6¾	7½-13½	10
5½-8½	11-17	13

③ - Set test stand at 0°, 0" of Hg, and 1000 RPM.

IGNITION TIMING

Engine	Std. Ignition Setting
223 All Trans.	6° BTDC
262	2° BTDC
292 All Trans.	8° BTDC

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

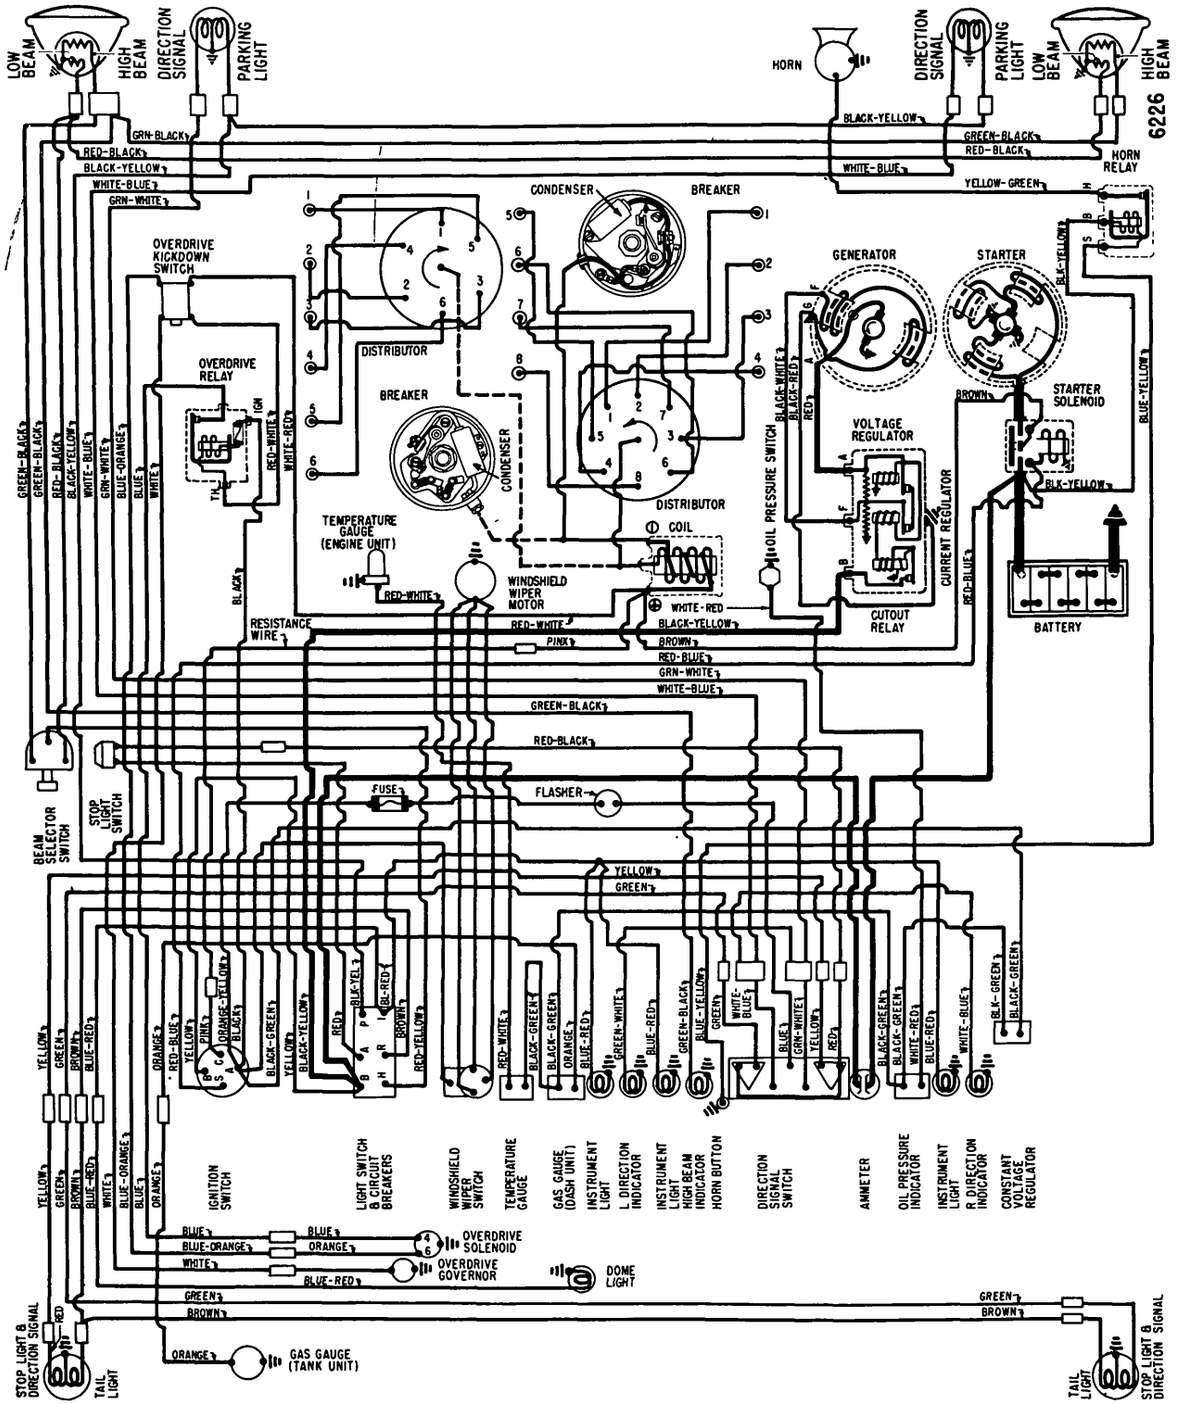
►*TIMING RANGE NOTE:* Under special conditions, timing may be advanced 5° over recommended setting or retarded from normal setting to 2° BTDC.

►*TIMING SETTING CAUTION:* Set timing with engine idling and distributor vacuum line disconnected. Check advance operation by accelerating engine after vacuum line connected

Timing Mark (223) - Vibration damper marked by lines TDC (Long Mark) & 3°, 5°, 7°, 9° BTDC (Short Marks). Align pointer on chain case cover with correct mark (or space between marks) on pointer.

Timing Mark (262) - Vibration damper marked by lines TDC (Long Mark) & 2°, 4°, 6°, 8°, 10° BTDC (Short Marks). Align pointer on chain case cover with correct mark on pointer.

Timing Mark (292) - Notch or pin in crankshaft pulley and timing pointer on chain case cover. Pointer marked "0", "3", "6", "10". Align pulley notch or pin with correct mark on pointer.



CARBURETOR

►*CARBURETOR APPLICATION: Holley Model 1904 or 1908 single barrel carburetor used on all 6 Cyl.; Holley 2-Barrel carburetor used on all 292MD; Holley 4-Barrel carburetor used on all 292HD.*

THROTTLE LINKAGE ADJUSTMENT (6 Cyl. Cruise-O-Matic): Adjust engine idle speed to 475-525 RPM in Drive and make anti-stall dashpot adjustment (see below). With engine stopped and carburetor on hot idle, remove lock from clevis pin on upper end of throttle control rod and loosen clevis locknut. Remove clevis and pull throttle control rod upward so throttle lever will be held against internal stop in transmission. Turn throttle rod clevis until pin enters hole in lever and **lengthen throttle rod 3 turns.** Connect throttle control rod, tighten locknut, install clevis lock. Measure accelerator pedal height from point where linkage connects to pedal to floor mat. Distance should be 3¾" (Except P Series). On P Series, measure distance from center of hole in cross shaft (for accelerator rod) to a line parallel to bottom line of bracket. Distance should be 1 7/8". To adjust, turn threaded adjusting sleeve on accelerator pedal adjusting link. Adjust pedal detent so it barely contacts pedal at full throttle. Make final adjustment by pressure method (see below).

THROTTLE LINKAGE ADJUSTMENT (V8 Cruise-O-Matic): Adjust idle speed to 475-525 RPM in Drive and make anti-stall dashpot adjustment (see below). Disconnect throttle control rod and carburetor connecting rod from cross shaft assembly. Insert a ¼" gauge pin through gauge holes. Hold connecting rod to normal operation position so throttle lever is solidly against idle adjusting screw. Adjust connecting rod length to fit freely into accelerator assembly lever, then turn adjusting sleeve **one full turn counterclockwise to lengthen rod.** Remove gauge pin and connect rod. Check alignment or gauge pin holes, and set throttle to hot idle position. Gauge pin must enter freely. Readjust connecting rod as necessary. Remove gauge pin, pull upward on throttle control rod, so transmission lever is against its internal stop. Rotate adjusting sleeve so rod fits freely into accelerator lever assembly. Lengthen throttle control rod (turn adjusting

CONTINUED ON NEXT PAGE

FORD TRUCK (PARCEL DELIVERY) WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

sleeve counterclockwise) three turns for approximate setting. Connect control rod to accelerator assembly lever. Adjust pedal height to 3¾" measured from floor mat to point where linkage connects to pedal (except P Series), so center of hole in cross shaft lever (for pedal rod) is 9/16" above horizontal (P Series). To adjust height, turn sleeve on accelerator pedal connecting rod. Adjust pedal detent so it just contacts pedal at full throttle. Make a final adjustment of throttle linkage by pressure method (see below).

Pressure Method Final Adjustment: With carburetor or accelerator pedal linkage adjusted and transmission at normal operating temperature, apply parking brake. Stop engine, and remove threaded cap from pressure linkage tube (in engine compartment) and connect pressure gauge to tube using Adapter T60L-7000-B so pressure gauge can be read from driver's seat. Connect a tachometer to engine. Note gauge reading at 1000 RPM. If pressure below 80 lbs., lengthen throttle rod by rotating sleeve. If pressure is over 85 lbs., shorten rod. Tighten locknut to hold rod adjustment.

Anti-Stall Dashpot Adjustment: After engine idle speed has been adjusted to specifications, loosen dashpot locknut. Hold throttle in hot idle position, bottom dashpot plunger. Distance from plunger to throttle shaft lever should be .060-.090". Adjust by turning dashpot or dashpot adjusting nut.

HOLLEY MODELS 1904 & 1908

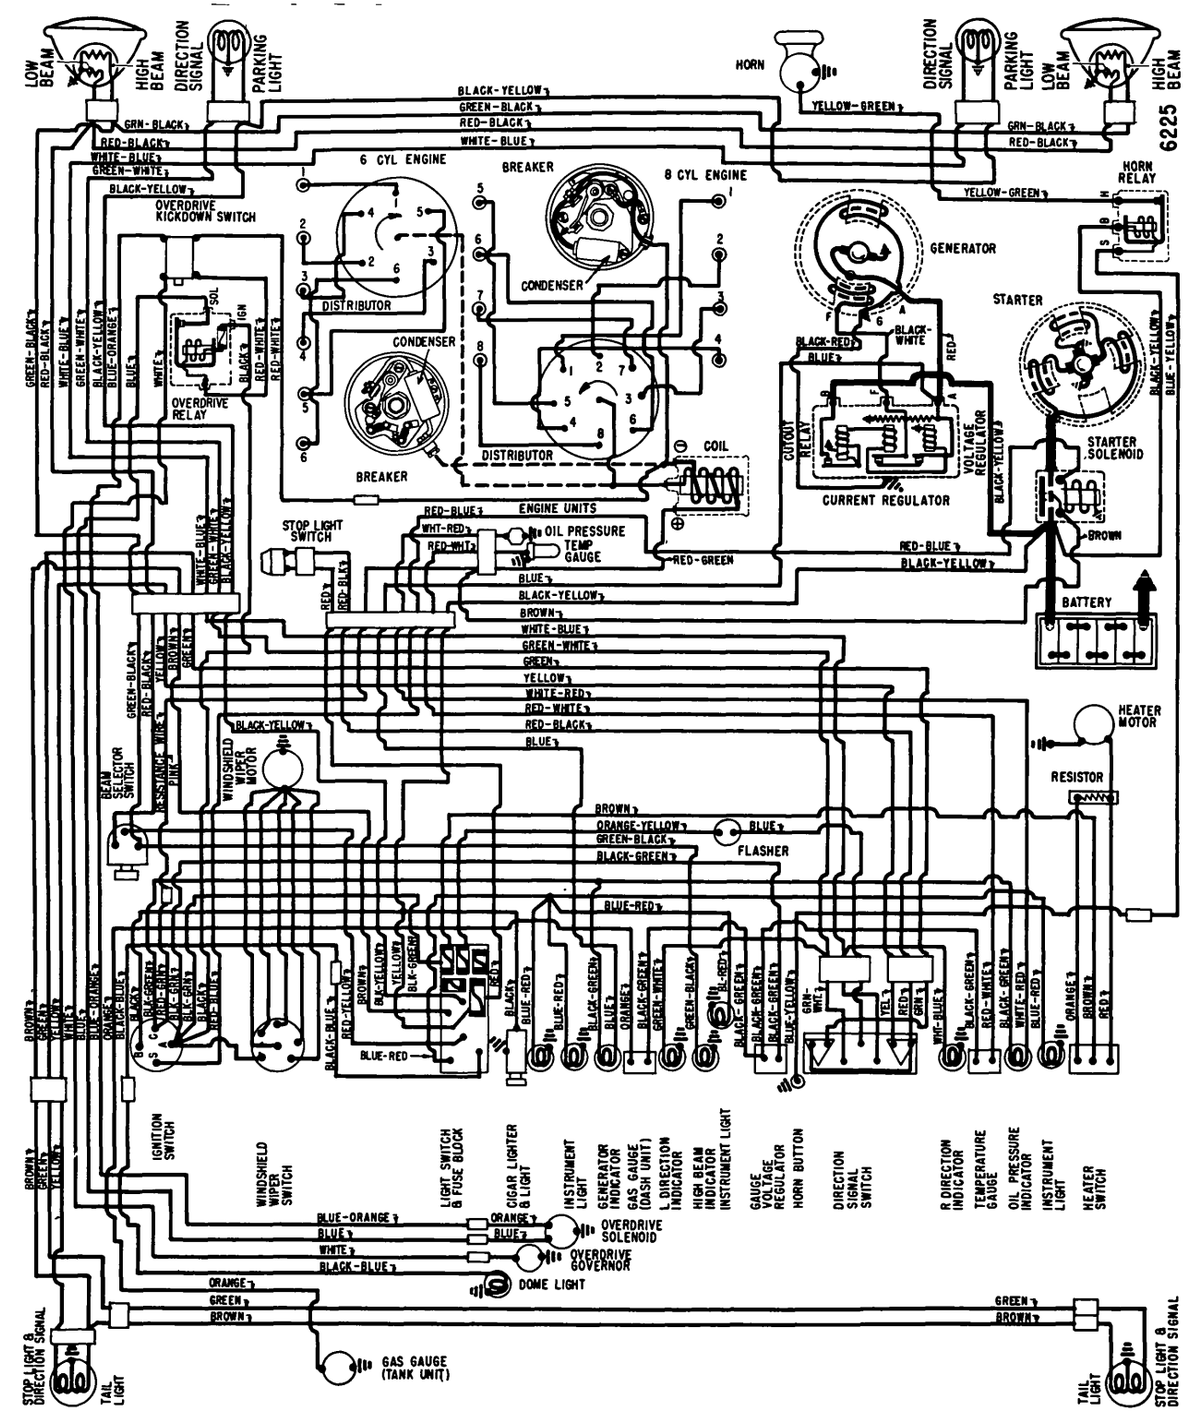
Engine & Series ①	② Carburetor No.
223 (Except P Series) Synchro-mesh Std.	C2TE-9510-E
223 (Except P Series) Synchro-mesh CCV	C2TE-9510-F
223 (Except P Series) Auto. Trans. Std.	C2TE-9510-H
223 (Except P Series) Auto. Trans. CCV	C2TE-9510-J
223 (P Series) Synchro-mesh	C2TE-9510-G
223 (P Series) Auto. Trans.	C2TE-9510-K
223 (P Series)	C2TE-9510-T
223 (P-100)	C2TE-9510-C
262 All Series	C2TE-9510-L

① - **Std.** - Without Closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.
② - Stamped on fuel inlet boss or main body.

Idle Setting - Initial setting 1-1½ turns open. Turn mixture screw in until engine runs roughly (lean mixture) then back out screw until engine rolls (rich mixture). Turn screw in until engine runs smoothly. Favor a rich mixture.

Idle Speed - 223 & 262 - 500-550 RPM (Synchro-mesh), 475-525 RPM in "D" (Auto. Trans.).

Fuel Level - 11/16"±1/32" (Except C2TE-9510-L), 3/4"±1/32"(C2TE-9510-L) below power valve diaphragm cover mounting surface. Use Gauge T52L-9550-AEE.



Accelerating Pump - Inner hole for average or hot weather operation, outer hole for cold weather operation.

Fast Idle: No adjustment, will be correct when hot or slow idle correctly set.

Throttle Linkage Adjustment: See *CARBURETOR above.*

292MD All Trans. With Hand Throttle	④C2TE-9510-R

HOLLEY 4-BARREL CARBURETORS

Engine & Transmission ②	②Carburetor No.
292HD All Trans. (Std.)	C1TE-9510-AM
292HD All Trans. (CCV)	C1TE-9510-A

① - **Std.** - Without Closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.
② - Number stamped on choke plate flange.
③ - Part No. C2TZ-9510-D. ④ - Part No. C2TZ-9510-E.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

Idle Setting - *NOTE - Idle mixture adjusting needles used only on secondary side (one on each side of Fuel Metering Block).* Initial setting 1-1½ turns open. Turn mixture needles until engine runs roughly (lean mixture), then back needles out until engine begins to roll (rich mixture). Turn needles in until engine runs smoothly. Favor a rich mixture.

Idle Speed - **292MD** - 500-550 RPM (Synchro-mesh), 475-525 RPM (Auto. Trans. in "D"). **292HD** - 525-575 RPM (Synchro-mesh), 475-525 RPM (Auto. Trans. in "D").

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Holley 2 & 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: As follows:

Engine	Ford Pump No.
223	B8A-9350-E
262	C1TE-9350-A or C2TZ-9350-A
292 MD	B9TE-9350-A
292 HD	B8T-9350-B

Fuel Pump Pressure - 3.5-6.5 (292 HD) 3.3-5.5 lbs. at 500 RPM. (All Others).

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) type with Gauge Voltage Regulator as follows:

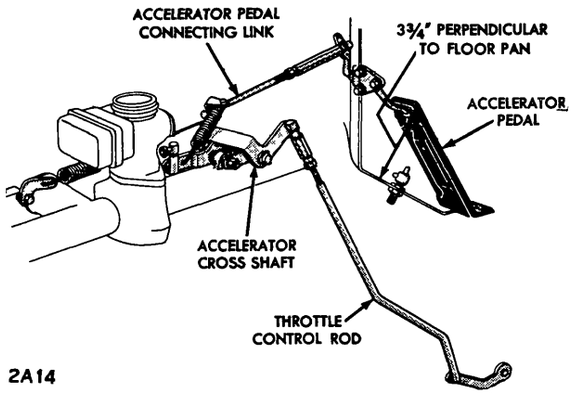
Series & Body Type	Ford Regulator No.
F & B Series (Cowl, No Windshield)	B7A-10804-B
F & B Series (Others)	B9MF-10804-A
P Series	B7J-10804-A
C Series	COMF-10804-A

Dash Unit - As follows:

Series & Body Type	Ford Motor Co. No.
F & B Series (Cowl, No windshield)	C1TF-9280-A
F & B Series (Others)	C1TF-9280-C
P Series	B7J-9280-A
C Series	C1TF-9280-B

Tank Unit - As follows:

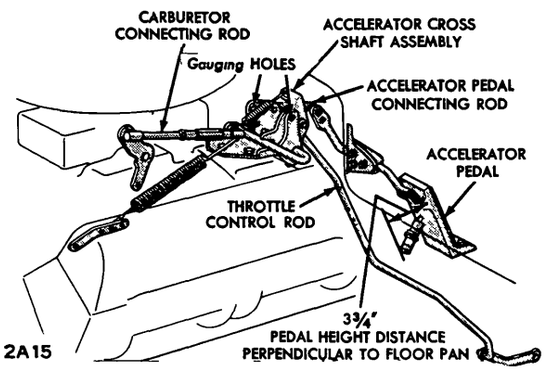
Series & Body Style	Ford Motor Co. No.
F & B Series ①②	C1TF-9275-C
F-100,250,350; All P Series③④	B8C-9275-A
F-350③; F-500, 600; B-500, 600⑤	B8T-9275-A
C Series ⑤⑥	B8T-9275-A
P-350,400,500; F-500,600; B-500,600⑥	B8T-9275-A



① - Conventional Closed Cab & Pickups.
② - 18 gallon "In cab" tank. ③ - Without cab.
④ - 17 gal. tank mounted inside frame.
⑤ - 18 gallon side mounted tank. ⑥ - 30 gal. tank.

Fuel Filter: Disposable or replaceable element type in fuel inlet line, or magnetic type in fuel Pump bowl, depending on truck model. Clean filter (except disposable type) every 8,000 miles (On Highway), 4,000 miles (Off Highway). Replace disposable type every 12,000 miles. Replace element type every 12,000 miles (Off Highway), 24,000 miles (On Highway).

Air Cleaner: Oil bath type. Clean at 4000 miles or 1000 miles in dusty areas (On Highway), at 500 mile intervals (Off Highway).



ELECTRICAL

FORD 6 CYL. PARCEL DELIVERY AUTO. TRANS. THROTTLE LINKAGE

2A17

FORD V8 PARCEL DELIVERY AUTO. TRANS. THROTTLE LINKAGE

Se INDEXES on Pgs. 4 to 9 for compl t CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

ENGINE REMOVAL: *See "Engine" in Ford Motor Co. Special Data.*

OIL PAN REMOVAL (6 Cyl.): Drain crankcase and remove oil level dipstick. Remove flywheel housing inspection cover. Remove oil pan retaining screws and remove oil pan.

OIL PAN REMOVAL (V8): Drain crankcase and remove dipstick. Remove converter housing dust cover (Auto. Trans. Trucks). On C Series, position No. 1 piston at TDC. On all trucks, disconnect oil inlet tube from oil pump and remove "O" ring seal from tube. Remove oil pan retaining screws and remove oil pan.

6 CYL. ENGINES

223" 6 CYLINDER ENGINE

►*See 1962 Ford Galaxie 6 & Mercury Monterey 6 Passenger Car Pages.* Engine is similar to that used in 1962 Passenger Cars, and all car engine data applies to truck *except the following:*

Connecting Rod: Clearance - .0008-.0028". Wear limit .0035".
Side play - .005-.011". Wear limit .014".
Main Bearing: Clearance - .0009-.0033". Wear limit .0038".
Camshaft Lobe Lift: .273" All lobes.
Tappet Clearance: .019" Hot or Cold, all valves.

Valve Spring Specifications
(Free Length 2.09")

Valve	Spring Pressure	Length
Closed	① 71-79 lbs.	1.78"
Open	② 161-177 lbs.	1.39"

① - Wear limit 64 lbs. at 1.780".
② - Wear Limit 145 lbs. at 1.390".

262" 6 CYLINDER ENGINE

This 262" 6 Cylinder Engine is similar in design to 223" 6 Cylinder Engine. The camshaft is driven directly by a gear in mesh with crankshaft gear instead of by a timing chain. The exhaust valves are "free turning" type, with cap eliminated. *NOTE - All 223" Ford Galaxie 6 & Mercury 6 engine data on Car Model Pages apply to this 262" engine except as follows:*

Pistons: Clearance - .0032-.005".
Rings (Compression): Width - .0774-.0781".
Connecting Rod: Sideplay - .005-.011". Wear limit .014".
Main Bearings: Clearance - .0009-.0034".
Camshaft Setting: Mesh marked tooth of crankshaft gear with marked notch in camshaft gear, with marks in line with shaft centers.
Lobe Lift - .273". All lobes.
►*VALVE SEAT NOTE:* Valve inserts used in exhaust valve seats only.
Valve: Head Diam. - Exhaust 1.505-1.515".
Stem to Guide Clearance - Exhaust .0025-.0042".

Valve Spring Specifications
(Free Length 1.96")

Valve	Spring Pressure	Length
Closed	③ 71-79 lbs.	1.78"
Open	④ 161-177 lbs.	1.39"

③ - Wear limit 64 lbs. at 1.78".
④ - Wear limit 145 lbs. at 1.39".
Tappet Clearance: .019" Hot or Cold. All Valves.

V8 ENGINES

►*SEE 1962 FORD GALAXIE V8 & MERCURY MONTEREY V8 PAGES AND NOTE THE FOLLOWING EXCEPTIONS:*

PISTON RINGS:	Width	End Gap	Side Clearance
Compr. (1)	.0774-.0781"	.010-.025"	.0019-.0036"
Compr. (2)	.0774-.0781"	.010-.025"	.0019-.0036"
Oil (3)		.015-.062"	①

① - Snug - Side sealing-type ring.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Ford Motor Co. Special Data.*
Crankcase Capacity: 5 qts. (223 & 292), 6 qts. (262) for refill. Add 1 qt. with filter change.
Normal Oil Pressure: 25-55 lbs. at 2000 RPM.
Pressure Regulator Valve - In pump body, not adjustable.
Oil Pressure Indicator: (F Series) - Indicator light on instrument panel controlled by Engine Oil Pressure Switch, Ford No. B6A-9278-B.
(B,C & P Series) - King-Seeley Electric "CV" (Constant Voltage) type with gauge voltage regulator. *See "Gasoline Gauge" under CARB. EQUIPMENT above for Gauge Voltage Regulator application.*
Dash Unit - Ford No. C1TF-9273-A (B Series), No. C1TF-9273-B (C Series), No. B7J-9273-A (P Series).
Engin Unit - Ford No. B7T-9278-A (B,C & P Series). On right side of engine above starter (6 Cyl.), at rear of oil filter (V8).
Oil Pump: Rotor Type, mounted in crankcase (6 Cyl.), outside of crankcase on left side (V8).
Pump Overhaul - *See "Oiling System" in Ford Motor Co. Special Data.*
Oil Filter: Full-flow, disposable element type. Replace element every 4,000 miles.
Reinstallation - *NOTE - Be sure two elongated holes in anti-drain back diaphragm are in the "UP" position,* Install new gasket, place assembly in position, insert center bolt into adapter finger tight. Rotate assembly in each direction to seat gasket evenly and torque bolt to 20-25 ft. lbs. DO NOT OVER TORQUE BOLT.
Crankcase Ventilation: Conventional - Filter in oil filler (inlet) and outlet pipe at rear of engine. Clean system every 4000 miles (On Highway) 500 miles (Off Highway), or sooner under severe operating conditions.
Positive - Road draft tube replaced by an adapter, tubing, and hose routed to ventilation valve installed in intake manifold or in spacer between carburetor and intake manifold. Service system each 8000 miles (4000 miles or every three months in Stop and Go Service). Check valve operation before performing a "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: Depends on vehicle - Variable. Add 1 qt. for heater.
Pressure Valve: 7 lb. radiator filler cap Ford No. OL-8100-A.
Thermostat: 160°F. Ford No. COAZ-8575-A, 178°F. No. COAZ-9575-B.
Water Pump: Packless, sealed ball bearing type. *See "Cooling System" in Ford Motor Co. Special Data.*
Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type with a gauge voltage regulator. *See "Gasoline Gauge" under CARB. EQUIPMENT above for Gauge Voltage Regulator applications.*
Dash Unit - Ford No. B7J-10883-A (Parcel Delivery), No. C1TF-10883-A or C (Others).
Engine Unit - Ford No. B7A-10884-A.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*NOTE:* The following data covers the Aluminum V8 (215 cu. ins.), Cast Iron V6 (198 cu. ins.) and the Cast Iron V8 (401 cu. ins.). *R f r nc will b mad to Displacement.*

TIGHTENING SPECIFICATIONS

198" & 215" ENGINES

	Ft. Lbs.
Cylinder Head	65-70
Rocker Arm Bracket	25-30 (V8), 30-35 (V6)
Rocker Arm Cover	3-5
Intake Manifold	25-30
Carb. to Intake Manifold	12-15
Water Outlet to Intake Manifold	20-25
Exhaust Manifold	10-15
Oil Pan	6-15
Engine Front Cover	20-25
Oil Pump Cover	10-15
Fuel Pump to Front Cover	20-25
Water Pump to Front Cover	6-8
Main Bearing Caps (Exc. Rear)	50-55 (V8) 100-125 (V6)
Main Bearing Cap (Rear)	65-70(V8) 100-110(V6)
Connecting Rods	30-35

401" ENGINE

Cylinder Head	65-75
Intake Manifold	25-30
Exhaust Manifold	10-15
Oil Pan	6-15
Main Bearing Caps	100-110
Flywheel	50-60
Harmonic Balancer	200-220
Con Rod Caps	40-45
Rocker Arm Support Brackets	30-35
Rocker Arm Cover	3-5
Valve Lifter Cover	3-5
Water Manifold	25-30

ALUMINUM ENGINE SERVICE CAUTIONS

SERVICE PRECAUTIONS: *NOTE* - Extreme caution must be observed when working on aluminum engines, to prevent damage by scratching, nicking, or scoring. Note the following:

1) Do not drop or slide machined surfaces on bench or floor.

2) Do not use gasket cement (Except as indicated under Cylinder Head Installation).

3) Lubricate bolts and screws entering any aluminum part. *See "Bolt Thread Lubrication Note" below.*

4) Tighten bolts and nuts to the specified torque. DO NOT overtighten. Torque values are for clean lubricated threads.

►*BOLT THREAD LUBRICATION NOTE:* Use "Buick Special Thread Lubricant".

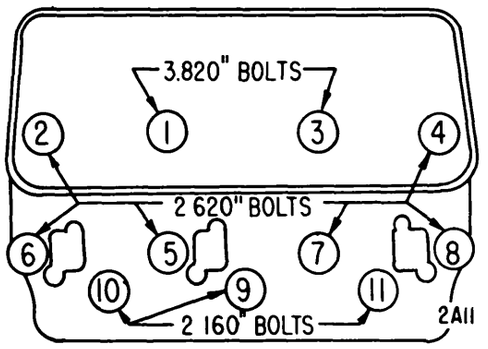
DAMAGED OR WORN THREAD REPAIR (ALUMINUM BLOCK): "Heli-Coils" are available locally for repairing damaged or worn threads in aluminum. The repair consists of drilling out worn or damaged threads tapping hole with special "Heli-Coil" tap, and installing a "Heli-Coil" insert in tapped hole. This brings hole back to original threaded size. See following table for inserts and tools required.

"Heli-Coil" Thread Inserts

Thread Size	Insert Part No.	Drill Size	Special Tap Part No.	Inserting Tool No.
1/4"-20	1185-4	266"	4 CPB	528-4N
5/16"-18	1185-5	332"	5 CPB	528-5N
3/8-16	1185-6	397"	6 CPB	528-6N
7/16"-14	1185-7	453"	7 CPB	528-7N
1/2"-13	1185-8	516"	8 CPB	528-8N
Spark Plug				
14 MM Short	512		137-11	542
14 MM Long	513		137-11	542

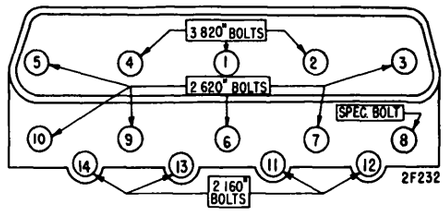
ENGINE MOUNTINGS

401" ENGINE



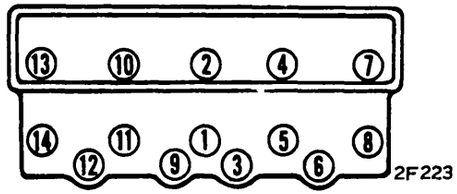
►*ENGINE MOUNTING NOTE:* When properly aligned, engine and transmission should rest in normal position without any strain on the rubber mounting pads. Engine alignment is determined by transmission support location. Before loosening or removing support, mark support and frame at each end to insure reinstallation in original position with exact number and location of shims used originally.

ENGINE MOUNTINGS: Adjustment - Disconnect exhaust pipe from exhaust manifold and loosen four engine mount-to-frame bolts. With support shims in place, support in original position (fore and aft), and transmission support-to-frame bolts tight, raise engine to allow mounts to normalize, then lower engine and tighten mount-to-frame bolts. Reassemble exhaust system making certain system is free of binding and that there is no interference between exhaust pipes and chassis members.



CYLINDER HEAD & MANIFOLD

198" & 215" ENGINES



CYLINDER HEAD & GASKET INSTALLATION: Install new cylinder head gasket over dowels on block. *CAUTION - DO NOT USE sealing compound of any kind.* Install cylinder head, then coat threads of cylinder head bolts with Buick Perfect Seal. Install and tighten bolts a little at a time about three times around in sequence indicated in diagram (diagram also shows locations of different size bolts). Tighten bolts in same sequence to specifications. DO NOT OVERTIGHTEN.

198" ENGINE CYLINDER HEAD DIAGRAM

215" ENGINE CYLINDER HEAD DIAGRAM

401" ENGINE CYLINDER HEAD DIAGRAM

401" ENGINE

CYLINDER HEAD & GASKET: When handling the thin crimped steel gasket, use care not to damage lacquered surface coat or kink sealing rings stamped in gasket. *(CAUTION* - Do not coat lacquered surface of gasket with any sealing material and DO NOT RE-USE THE OLD GASKET as stamped sealing rings are flattened in a used gasket). Right and left cylinder heads are identical except that the water inlet port is open at front end and is plugged at rear end as installed on engine. After installation of cylinder head, tighten bolts a little at a time, three times around in sequence shown in diagram, then in same sequence to specifications. After engine brought to operating temperature, recheck head bolts to specifications.

►*CYLINDER HEAD REMOVAL NOTE:* All of the cylinder head bolts and pushrods cannot be removed with head in place. When removing head, pull pushrods part way out and tape in place. These same pushrods must be in head before head installation.

PISTON PINS

198" & 215" ENGINES

►*PRESS-FIT PISTON PIN REMOVAL & INSTALLATION: CAUTION - Special tools must be used to avoid damage to piston assembly parts.*

Pin Removal: Place Support J-8754-1 in press with full radial face up and install spring in support. Place piston, pin and rod in press with Driver J-8355-3 inserted in pin. Press out piston pin.

Pin Installation: Place Pilot J-8754-2 and spring in Support J-8754-1 and position Support so Pilot J-8754-2 is located in piston pin bore, then place in arbor press. Coat pin and connecting rod lightly with graphite lubricant and place Driver J-8355-3 in pin and press pin into piston and connecting rod until pin bottoms against Pilot J-8754-2.

401" ENGINE

PRESS-FIT PISTON PIN REMOVAL & INSTALLATION: *CAUTION - Special tools must be used to avoid damage to piston assembly parts.*

Pin Removal: Place piston pin Support Tool J-6047-17

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in press with radial face up. Place piston assembly on Support and press out pin with Drive Pin Tool J-6047-4. *NOTE* - Guide Pin Tool J-6047-16 used for installation.

Pin Installation: 1) Place piston Support Tool J-6047-18 in base plate of press with piston Support full radial face upward.

2) Place rod in piston with spurt notch on same side as valve depressions in piston dome. Lubriplate pin and enter into boss, forcing rod against opposite boss.

3) Place small end of Drive Pin Tool J-6047-4 in top end of pin and place assembly in press.

4) Be sure all parts are aligned correctly, then force pin through rod and piston bosses until Guide Pin Tool J-6047-18 stops downward travel.

5) Remove assembly and rotate piston on pin to check for proper fit between piston and pin.

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT REAR OIL SEAL: Braided fabric seals pressed into grooves in crankcase and rear bearing cap at rear of oil collecting groove. Neoprene seals are placed in sides of bearing cap. Crankshaft must be removed to replace braided seal in crankcase.

ALL SERIES

Installation - Place new seal in groove in cap and force down with hammer handle or smooth stick until seal projects above groove not more than 1/16". Cut ends of seal flush with surface of cap. Replace seal in crankcase in same manner. *CAUTION - Engine must be operated at slow speed after new braided seal installed.* Neoprene seals are slightly longer than grooves in bearing cap. Seals must **not** be cut to length. Lubricate seals and install in bearing cap with upper ends protruding approximately 1/16". After cap is installed, force seals up into cap with blunt instrument to provide seal at parting line between cap and case.

ENGINE FRONT COVER

198" & 215" ENGINES

TIMING CHAIN COVER: Removal - 1) Drain cooling system, disconnect hoses and remove radiator. Remove fan, pulley and belts.

2) Remove crankshaft pulley and reinforcement, and harmonic balancer.

3) On Pwr. Steering Cars, remove steering pump bracket bolts at timing cover and loosen or remove other bolts so that pump may be moved out of way.

4) Remove fuel pump and generator (not the generator brackets).

5) Remove distributor cap and pull spark plug wires off rocker arm cover brackets. Swing cap and wires out of way and disconnect distributor primary wire. Remove distributor.

6) When timing chain and sprockets are not to be disturbed, note position of distributor rotor for reinstallation in same position.

7) Loosen and slide thermostat bypass front hose clamp rearward. Remove timing cover to engine block bolts and two oil pan to timing cover bolts. Remove cover assembly and gasket.

FRONT OIL SEAL: Removal & Installation - Use a punch to drive out old seal and shedder from front toward rear of cover. To install, coil new packing around opening so ends are at top. Drive in shedder with punch. Stake shedder in place in at least three places. Use hammer handle or other smooth object to size packing until balancer hub can be inserted through opening.

401" ENGINE

TIMING CHAIN COVER: Removal - Drain cooling system, remove radiator core, shroud, fan belt, fan and pulley, vibration dampener. Remove all bolts attaching timing chain cover and water pump manifold to upper and lower crankcase and cylinder heads. *NOTE* - DO NOT REMOVE water pump from chain cover. Remove cover and manifold carefully, making sure not to damage lower crankcase gasket.

FRONT OIL SEAL: Installation - After removing braided fabric packing with a screwdriver and tapping pressed steel shedder out of timing chain cover, work the new packing into the shedder, then drive the shedder into recess in cover with Installer J-5250-1. Push Packing Expander J-5250-2 through seal to expand packing into place and size the opening for the crankshaft. Apply a light coat of vaseline to packing.

FLYWHEEL

ALL SERIES

FLYWHEEL REPLACEMENT: Flywheel or Ring Gear must be replaced as an assembly (gear is welded in place and not furnished separately).

Installation of Flywheel: Make certain that flywheel and crankshaft are clean and free from burrs which might cause run-out (remove burrs with a mill file). Install flywheel and tighten bolts evenly to specifications. Mount Dial Indicator so stem of indicator bears against float surface of flywheel at inner side of bolt holes. Hold crankshaft end thrust in one direction and turn flywheel to check runout. Runout should not exceed .015". When runout exceeds .015", tap high side of flywheel with mallet. If not corrected, remove flywheel and check for burrs between flywheel and face of crankshaft flange. If not corrected by removing burrs, check runout of flange.

Engine Vibration: When engine vibration is introduced by installation of the flywheel, proceed as for "Engine Unbalance" below.

Misaligned Flywheel: Loosen one flywheel attaching bolt and check contact between flywheel legs and converter pump cover. A .010" feeler should slip between flywheel and cover with slight drag. Pry leg away when too much contact exists, or insert ¼" diameter rod on each side of bolt and tighten bolt to spring leg to increase contact. Recheck other legs, to obtain equal contact.

ENGINE BALANCING

►*IF VIBRATION NOTED AFTER INSTALLATION OF CRANKSHAFT, FLYWHEEL, OR OTHER ROTATING PARTS, CORRECT THIS UNBALANCED CONDITION AS FOLLOWS:*

Critical Speed of Vibration - Determine speed at which vibration is most evident (use tachometer) and operate engine at this speed to check results from the following corrective procedures.

►*CAUTION:* Procedure below will correct minor unbalance caused by replacement of individually balanced parts. Extreme vibration caused by parts abnormally out of balance, or different in weight from corresponding parts, should be corrected by replacement of these parts.

1) Remove bell housing cover and install one balance weight (.060" thick) under head of two converter pump cover bolts, and tighten bolts to 25-30 ft. lbs. *(CAUTION - Do not place a weight at a flywheel-to-converter driving bolt as these bolts are not long enough for addition of weights).*

2) Run engine at critical speed and carefully compare vibration with that obtained without the weight, then stop engine. Mark location of balance weight on converter pump, remove weight and tighten bolt to 25-30 ft. lbs .Install the weight at other converter pump cover bolts and compare vibration produced at critical speed

3) At the point where balance weight produced greatest improvement in vibration. Install weights of proper thickness to eliminate objectionable vibration. Balance weights are furnished in the following thicknesses:

Balance Weight Part Nos.

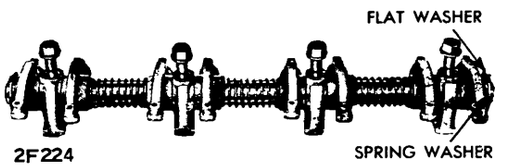
Thickness	Part No.
.009"	1178106
.018"	1178107
.0345"	1178108
.060"	1178109
.120"	1178110

NOTE: When factory balancing of converter pump is changed to balance on engine, the pump cannot be used with any other engine.

VALVE SYSTEM

ROCKER ARMS

198" & 215" ENGINES



ROCKER ARM ASSEMBLY: Removal - Pull spark plug wires from brackets on rocker arm covers and swing wires and retainer out of way. On right side, remove vent pipe, then remove rocker arm cover and gasket. Remove four rocker arm shaft to cylinder head bolts and remove rocker arm and shaft assembly. *NOTE - Vent pipe oil baffle is mounted under rear bolts on right rocker arm and shaft assembly.*

Disassembly - Remove cotter pin, plain washer and spring washer from each end of shaft. Remove bracket bolts and slide rocker arm, springs and brackets off shaft.

Reassembly - Assemble springs, rocker arms and brackets as shown in diagram. *NOTE - Two types of rocker arms are used, and valve ends of rocker arms slant away from brackets.* Install spring washer, flat washer and cotter pin on each end of shaft in the order named. Install bolts with plain washers through brackets and shaft so notch in one end of shaft is up and at the front (right hand shaft), up and at the rear (left hand shaft).

NOTE - Vent pipe oil baffle is mounted under rear bolts on right rocker arm and shaft assembly.

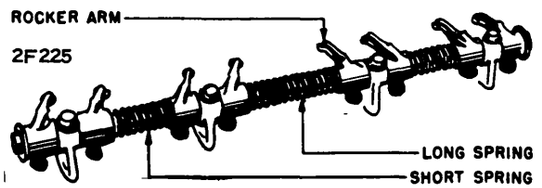
CONTINUED ON NEXT PAGE

198" & 215" ENGINES ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

401" ENGINE

ROCKER ARM ASSEMBLY: One assembly mounted on each cylinder head (see illustration).



Disassembly: Remove cotter pin, flat washer, and spring washer from each end of shaft. Pull mounting bolts out of support brackets and slide rocker arms, springs and brackets off shaft.

Reassembly: See illustration for location of parts. Install longer spring at center of shaft and install rocker arms with offset (slant) toward center of shaft (two types of rocker arms used - see table below for proper location of each type). Turn shaft so that notch in one end of shaft is upward or toward top of bracket and install bolt through bracket and shaft to maintain this position (*CAUTION* - Notch must be upward to place rocker shaft oil holes in proper relationship to rocker arms).

Rocker Arms

Part No.	Location
1173808	4 Right Front & 4 Left Rear
1173809	4 Left Front & 4 Right Rear

Installation: Make certain that notch in one end of rocker arm shaft is upward, position assembly on head with dowels engaging blind holes in brackets, tighten all bracket bolts evenly to 30-35 ft. lbs.

401" ENGINE ROCKER ARM ASSEMBLY

HYDRAULIC LIFTERS

198" & 215" ENGINES

Removal: *CAUTION - Use air and clean cloths to remove all dirt from cylinder heads and adjacent parts.*

1) Drain cooling system, remove air cleaner and silencer, disconnect all pipes and hoses from carburetor. Remove coil and disconnect temperature wire at switch.

2) Disconnect accelerator and transmission linkage and throttle return spring. Slide front bypass hose clamp rearward and disconnect upper radiator hose at outlet.

3) Disconnect heater hose at thermostat control valve inlet (push hose down to drain intake manifold).

4) Remove twelve intake manifold-to-cylinder head bolts and remove intake manifold and carburetor assembly (slide rearward to disconnect bypass hose from water pump).

5) Remove intake manifold gasket (sound absorber). Remove intake manifold gasket clamps and gasket and remove rubber gasket seal.

6) Remove rocker arm covers, and rocker arm and shaft assemblies. Remove pushrods and valve lifters. *NOTE - Keep lifters separated (in order) so they will be returned to original positions in engine.*

401" ENGINES

Removal: Remove air cleaner, disconnect all pipes from carburetor and intake manifold. Disconnect wires from accelerator vacuum switch and remove throttle return spring. Remove coil and equalizer shaft bracket from intake manifold and move them out of way. Remove intake manifold and carburetor as an assembly. Thoroughly clean cylinder heads, rocker arm covers and adjacent areas to prevent dirt entering engine. Remove rocker arm cover and rocker arm assemblies, remove pushrods. Remove valve lifter cover, lift out individual valve lifters and place them in numbered compartments of a holding fixture to insure re-installation in original position in engine.

ALL SERIES

Disassembly: Use a pushrod to hold down the pushrod seat in lifter while removing plunger retainer from body with Retainer Remover J-5238. Remove pushrod seat and plunger from lifter body. Body bore above plunger may be caked with carbon and varnish. In this case, place lifter in large end of Tool J-4160 (Special), J-4160-A (Std.) with plunger inward. While holding lifter with thumb, rap open end of remover against a block of wood with just enough force to jar plunger from body.

►*IMPORTANT NOTE:* Disassemble one lifter at a time to avoid interchanging parts. Be careful not to score or nick lifter parts.

Cleaning and Inspection: Wash all parts in a suitable carbon solvent and remove all trace of carbon and varnish. Inspect plunger and lifter body for scoring or other damage that would prevent free movement. Inspect lower end of lifter body for nicks or identations. If any exist, replace complete lifter assembly. Dry lifter parts with air, then install plunger in lifter body without other parts and check for free movement. Plunger should drop of own weight into body bore.

Reassembly: *NOTE - Current type of ball retainers eliminate need for check of ball travel unless retainer is badly worn or damaged.* It is recommended that all parts be rinsed in clean kerosene and then assembled without drying (this will eliminate all lint and dust adhering to parts). Hold plunger in vertical position with feed hole up, install check ball, ball retainer, spring, and body over plunger. Install pushrod seat and plunger retainer in end of body, use handle of Tool J-5238 to depress parts until retainer engages groove in body. Test lifter for leakdown rate, see below. Protect lifter assembly by wrapping it in clean paper until ready to test or install in engine.

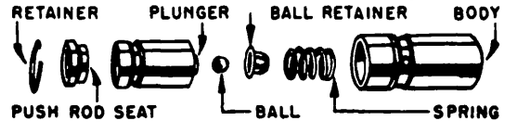
Leakdown Rate - 1) Clean cup of Test Fixture J-5095 and fill it to ½" of top with "Hydraulic Lifter Test Fluid" (Kent-Moore No. J-5268).

2) Remove rubber washer (used for larger lifters) and install Gauge Sleeve J 5180-5 in cup and install Buick V8 Gauge Rod Nose J 5180-15 in ram.

3) Swing arm out of way, raise ram and place lifter (top side up) in Sleeve J-5180-5. *NOTE* - Lifter must be completely covered by fluid during test.

4) Lower ram to rest in lifter pushrod seat, then lower weight arm to rest on roller of ram.

5) Operate lifter plunger, through full travel to force all air out of lifter, until considerable resistance is built up in lifter and a definite grab point is felt at top of stroke when indicator pointer is at bottom of scale.



6) Finally operate lifter plunger approximately 10 additional strokes to be sure all air is out of lifter. *NOTE* - When one stroke (of last ten) has noticeable weak resistance, replace check ball and repeat above procedure.

7) Remove weight arm to allow lifter plunger to come up to its retainer, then lower arm to rest on ram roller. As pointer starts moving upward, start rotating fluid cup by turning handle one revolution every two seconds.

8) Use stop watch to check time required for pointer to move from lower to upper mark on scale (Marked Buick V8).

9) Leakdown rate (time between marks) must be between 12 and 40 seconds for satisfactory lifter operation.

►*LIFTER REPLACEMENT CAUTION:* A doubtful lifter should be checked 3-4 times before deciding to replace it.

HYDRAULIC VALVE LIFTER (ALL) 2F226

OILING SYSTEM

ENGINE LUBRICATION

198" & 215" ENGINES

ENGINE LUBRICATION: Force feed type with oil supplied under pressure to crankshaft, connecting rod and camshaft bearings and to valve lifters. Oil is supplied under controlled pressure to rocker arm bearings and pushrods. All other moving parts are lubricated by gravity flow or splash. See *Engine Oil Flow Diagram.*

OPERATION: Gear type oil pump located in timing chain cover, draws oil through screen and pipe assembly (or over top of screen if clogged) and a drilled passage in crankcase connecting to drilled passage in timing chain cover. All oil is discharged from pump to cover assembly. Spring loaded relief valve (in cover) limits oil pressure to a maximum of 33 lbs. per square inch. A bypass valve (in cover) opens when filter becomes clogged (4½-5 lbs. pressure difference between filter inlet and outlet) to bypass unfiltered oil directly to oil galleries in engine. Oil from filter (mounted on oil pump cover) supplies oil through oil pump cover and drilled passages in crankcase to two main oil galleries that run full length of the crankcase.

Crankshaft & Camshaft - Both crankshaft and camshaft are supplied oil through drilled passages in crankcase, from right main oil gallery.

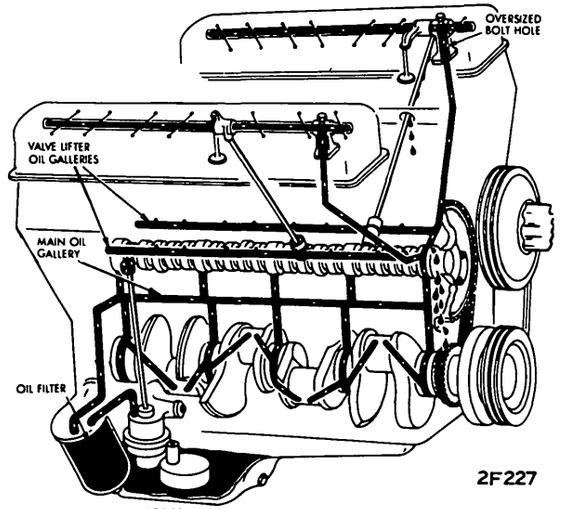
Connecting Rod & Pistons - Main bearings supply oil through drilled passages in crankshaft to connecting rod bearings. Pistons and cylinder walls are lubricated by oil forced through small notch in connecting rod bearing parting surface that registers with hole in crankshaft every revolution. Piston pins are lubricated by splash.

Timing Chain & Sprockets - Drilled holes in camshaft connect front camshaft bearing to key slot in front of camshaft. Oil flows from camshaft journal into keyslot over woodruff key in space between key and camshaft sprocket and fuel pump eccentric. A relief

CONTINUED ON NEXT PAGE

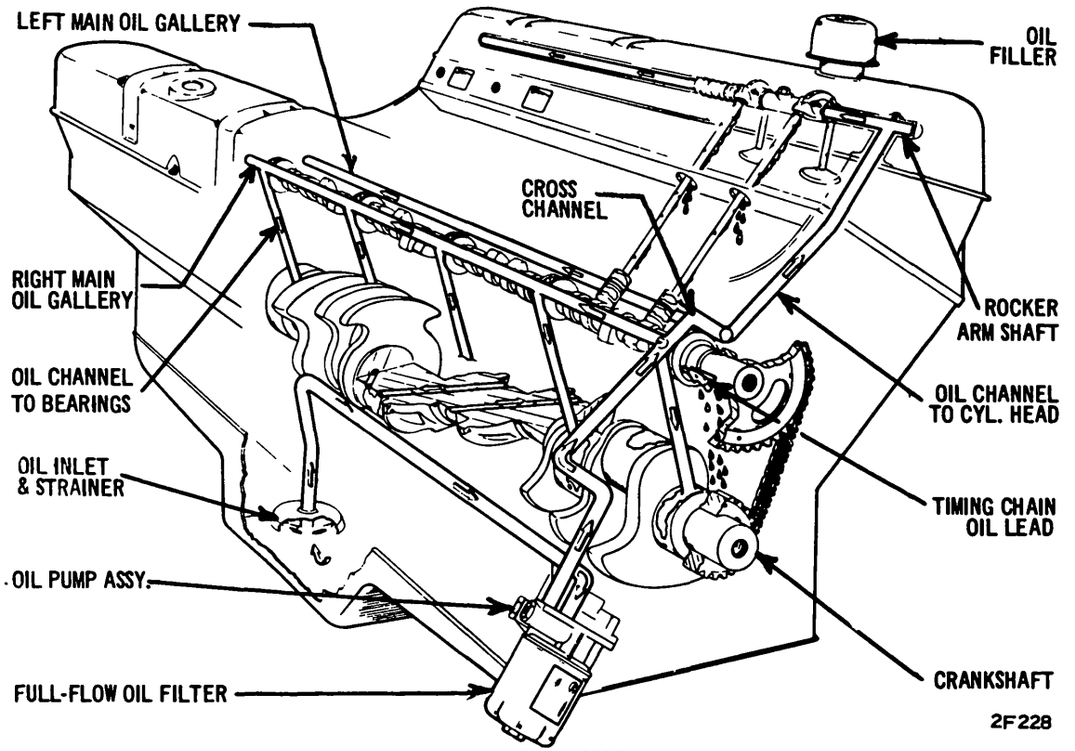
CONTINUED FROM PRECEDING PAGE

in forward end of fuel pump eccentric allows oil to escape between eccentric and camshaft distributor gear. Oil strikes distributor gear once each camshaft revolution, supplying lubrication to timing chain and sprockets.



Hydraulic Lifters - Full pressure lubrication is supplied hydraulic lifters from cutouts in lifter bores in main oil galleries.

Rocker Arms, Valves and Pushrods - These items receive oil from main oil galleries through drilled holes in front of cylinder block and head, leading up from forward end of corresponding main oil gallery. Hole in head ends beneath front rocker arm shaft bracket. A notch cast in base of bracket allows oil to flow up inside bracket (between bracket and bolt) to hollow rocker arm shaft (plugged at both ends). Each rocker arm receives oil through hole in underside of shaft. Grooves in arm provide lubrication to bearing surfaces. Oil is metered to pushrod seat and valve stem through holes drilled in rocker arm. Excess oil returns to oil pan through passages in cylinder head and block.



401" ENGINE

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to crankshaft, connecting rods, and camshaft bearings, and under controlled volume to valve lifters, rocker arm bearings and pushrods. All other moving parts are lubricated by gravity flow or splash. *See "Engine Oil Flow" diagram.*

OPERATION: Gear type oil pump at lower side of crankcase (at rear end) draws oil from crankcase sump through screen (or over top of screen if clogged) and delivers it through oil passages in pump body and crankcase to full flow filter. By-pass ball type valve in filter base opens to by-pass filter element when clogged or when difference in oil pressure between inlet and outlet ports is 4½-5½ lbs. Oil from filter passes into main oil gallery (full length of crankcase below camshaft) and through drilled passages in crankcase at full pressure to all crankshaft and camshaft bearings, where it is distributed to all moving parts of engine.

401" ENGINE OILING SYSTEM

215" ENGINE OILING SYSTEM (198" ENGINE SIMILAR)

Crankshaft, Connecting Rods & Pistons - Holes drilled in crankshaft carry oil from main bearings to connecting rod bearings. Pistons and cylinder walls are lubricated by oil forced through squirt hole in parting surface of connecting rod that registers with hole in crankshaft at each revolution of crankshaft. Pistons are lubricated by splash.

Camshaft, Sprockets, Lifters - Oil from front camshaft bearing, flows down front face of crankcase to drop on sprocket that transfers it to chain. Oil holes in crankcase and camshaft front bearing align with groove in camshaft bearing journal which meters flow of oil from main gallery to valve lifter oil galleries in each bank of cylinders. The full length of cylinder bank oil gallery cuts into lower sides of all valve lifter guide holes to supply low pressure oil to each lifter.

Rocker Arms, Valves & Pushrods - These items receive low pressure oil from valve lifter gallery through connecting passages drilled in front end of cylinder block and head. Oil passage in cylinder head ends in a counterbored recess surrounding front rocker arm shaft bracket bolt. Oversize bolt hole in bracket permits oil to flow into hollow rocker arm shaft (plugged at each end). Holes in rocker arm shaft allow oil to flow to each rocker arm. Oil is metered to pushrod ball seat and to valve stem through drilled holes in rocker arm. Excess oil drains off and returns to oil pan through pushrod opening in cylinder head and block.

OIL PUMP

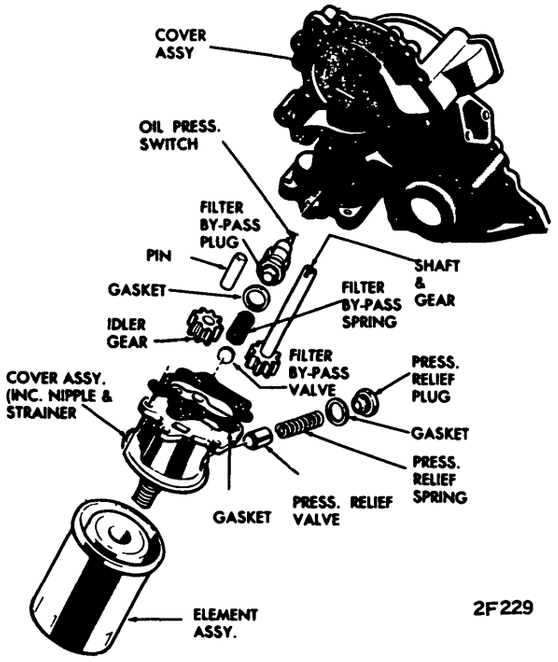
198" & 215" ENGINES

►*OIL PUMP COVER SPACER INSTALLATION CAUTION (Police Cars):* Spacer must be installed between oil pump cover gasket and spacer gasket and the cover must be installed with switch away from alternator.

OIL PUMP: Removal & Disassembly - Remove oil filter and disconnect pressure switch wire at bypass valve cap. Remove oil pump cover assembly-to-timing chain cover screws, then remove cover assembly and slide out oil pump gears. Remove oil pressure relief valve cap, spring and valve. Remove oil filter bypass valve cap, spring and valve.

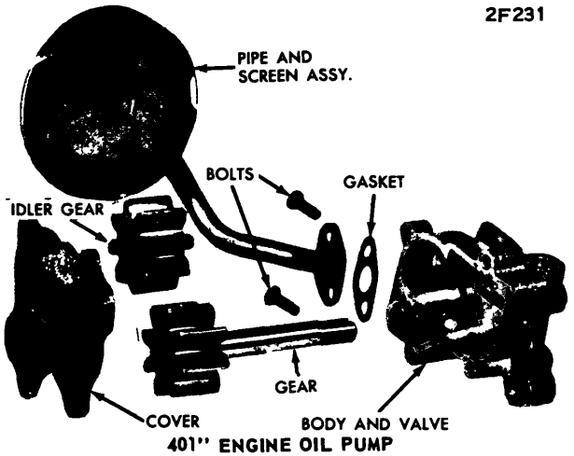
Inspection - Wash all parts thoroughly and inspect all parts for wear or scoring. Replace any relief valve spring that shows side wear or is questionable. Clean screen staked in bore. Valve should be an easy slip fit in bore. Check bypass valve for cracks, nicks or warping. Valve should be flat and the face free of nicks or scratches.

Assembly & Installation - Reverse removal and disassembly procedure and note the following: Lubricate relief valve before installation and tighten relief valve and bypass valve caps to 30-35 ft. lbs. *NOTE - Relief valve cap has no hole tapped for pressure switch.* Place straightedge across gears. Clearance between straightedge and gasket surface of timing chain cover should be .0018-.0058". If less, remove gears and check



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



chain cover for wear. If satisfactory, remove gears, fill gear pocket full of petrolatum jelly and force gears into cavity. *CAUTION - This is important as pump will not prime itself with air in cavity.* Install gasket and tighten cover-to-timing chain cover screws alternately and evenly to 10-15 ft. lbs. Install filter and connect switch wire.

401" ENGINE

OIL PUMP: Removal & Disassembly - Remove oil pan, then remove oil pump. Remove screen and screen

198" & 215" ENGINES OIL PUMP

401" ENGINE OIL PUMP

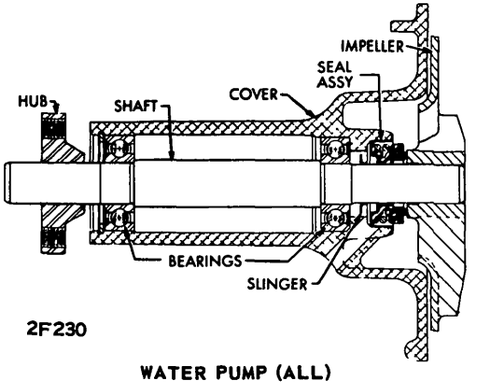
housing, then remove gasket, pipe, and cover from pump body. Remove gears. Remove hex cap, spring and ball valve from pump body.

Cleaning & Inspection - Clean all parts in solvent and blow dry with air. Check for wear on side of spring and that it has not collapsed. Check ball for wear and that it seats properly. Inspect body, cover, gears and shaft for wear or scoring. Replace all worn or damaged parts.

Reassembly - Install gear and shaft and idler assembly in pump body with chamfered end of idler gear teeth inward away from cover. Use straightedge across pump body to check clearance of gears and cover. Clearance should not be more than .005" or less than .0005". Lubricate and assembly parts to pump body by reversing removal procedure. When completely reassembled, pump shaft should turn freely and have slight endplay (.0005-.005").

Installation - Install pump with new gasket, tightening screws while turning shaft back and forth through gear lash. *NOTE* - If pump shaft tends to bind as bolts are tightened, rap body lightly with plastic mallet to free shaft. Shaft must be free of bind when bolts are tight.

COOLING SYSTEM



ALL SERIES

WATER PUMP: *NOTE* - Water pump cover is die cast aluminum in which pump bearings are shrunk fit. The cover, shaft, bearings, and hub are not serviceable. Seal and impeller are only serviceable parts.

Disassembly - Pull impeller from pump shaft (avoid end thrust on bearings). Remove carbon washer, rubber bellows and spring from brake sleeve. When necessary to replace sleeve, use drift through vent hole in pump body. *NOTE* - DO NOT use solvent to clean parts as it will destroy bearing lubricant.

Reassembly - Press new brass seal sleeve into body using thick walled tube. When old sleeve not removed, separate new seal sleeve from seal bellows by soaking it in hot water to soften cement. Install bellows and spring in sleeve with notches in washer engaging driving dents of sleeve. Coat face of washer and impeller hub with rust preventative and press impeller on shaft until rear face is flush with end of shaft. *CAUTION - Avoid any thrust on shaft bearings.*

Installation - Clean gasket surfaces and use new gasket. Bolts with lockwashers must be tightened uniformly.

WATER PUMP (ALL)

►*JACKING & HOISTING CAUTION: Before jacking, hoisting or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

Series	Series Designation
LeSabre	4400
Invicta	4600
Electra "225"	4800

ENGINE & SERIAL NUMBER: Stamped on plate attached to body at left front hinge pillar and observed through a cut-out in left hinge cover; and also stamped on top surface of crankcase forward of valve lifter cover on left side. Number (example below) includes identification data.

① ② ③ ④
4 1 1 00 1001

① - Series. 4 4400. 6 4600. 8 4800.
② - Year Model. 1 1962.
③ - Assembly Plant. 1 Flint. 2 South Gate. 3 Linden. 4 Kansas City. 5 Wilmington. 6 Atlanta. 8 Arlington.
④ - Beginning vehicle number at each assembly plant.

Engin Production Cd Number: Stamped on same surface as Engine & Serial Number, but on right side. When viewed from front of engine, number is upside down. Number is **not** used for licensing.

►*ENGINE PRODUCTION CODE NUMBER IDENTIFYING MARKS:* Used as follows:

21 - Std. engine, 2-Bbl. Carb., 10.25-1 Compr. Ratio.
L21 - Regular Gas Option engine, 2-Bbl. Carb., 9.0-1 Compr. Ratio.
41 - Std. engine, 4-Bbl. Carb., 10.25-1 Compr. Ratio.
L41 - Low Compr. Ratio Export engine, 4-Bbl. Carb., 8.75-1 Compr. Ratio.

TUNE-UP

►*ENGINE OPERATION IN LOW OCTANE AREAS (For ign Travel): See Note under Engine Specifications for recommended changes.*

COMPRESSION PRESSURE: 160 lbs. minimum (8.75-1 & 9.0-1 ratios), 180 lbs. minimum (10.25-1 ratio) at cranking speed of 160 RPM. Cylinders must be equal within 15 lbs.

VACUUM READING: 14" minimum at 525 RPM.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: Automatic thermostatic type located in right exhaust manifold. Valve must operate freely (lubricate shaft every 1000 miles). Check thermostat at 70°F (room temperature). There should be 180° wrap on spring.

CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-2-7-8-4-5-6-3.
Cylinders - RIGHT BANK 1-3-5-7. LEFT BANK 2-4-6-8.

SPARK PLUG GAP: .035".
Spark Plugs - AC No. 44S (Std.), No. 42COM (Colder) No. 45S (Hotter). 14 mm. Torque to 25-30 ft. lbs.

COIL: Delco-Remy No. 1115100
Ignition Current - 1.7 amps. idling, 3.7 amps. stopped at 12.6 volts.
Resistor - Resistance wire (1.80±.05 ohms) connected in circuit from coil to IGN.1 terminal of ignition switch. Bypassed during cranking by lead from IGN.2 terminal of switch to coil.

►*IGNITION CIRCUIT NOTE: When ignition switch is in "Lock" position, coil resistance wire is grounded.*

DISTRIBUTOR: Delco-Remy No. 1110993 (10.25-1 ratio). No. 1110999 (9.0-1 & 8.75-1 ratios).
Condenser - Delco-Remy. **Capacity** - .18-.23 mfd.
Breaker Gap - Gap (.016") will be correct when cam angle correctly set.
Cam Angle - 29-31°. Set at 30° (will give .016" point opening).
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance - 1110993 & 999

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	450	0-4	900
3-5	950	6-10	1900
6-8	1425	12-16	2850
9-11	1900	18-22	3800

Vacuum Spark Control: Delco-Remy No. 1116163 (1110993 Distr.), No. 1116164 (1110999 Distr.).

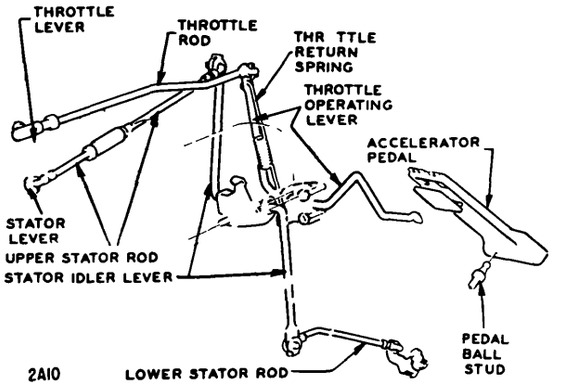
Vacuum Advance - 1116163

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	8-10
8	16	16.25-18

Vacuum Advance - 1116164

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6.5-8.5
9-10.5	18-21	12-14

IGNITION TIMING



Setting - 12° BTDC at 400 RPM.
Timing Mark - Timing indicator on chain case cover marked "O" (TDC), "5" (5° BTDC), and "12" (12° BTDC). Align correct mark with yellow paint filled groove on harmonic balancer.

CARBURETOR

►*CARBURETOR APPLICATION: Carter and Rochester carburetors used as follows:*

Series & Compr. Ratio	Carburetor Type
4400 Std. (10.25-1)	Rochester 2GC
4400 Reg. Gas (9.0-1)	Rochester 2GC
4400 Power Pack (10.25-1)	Carter AFB or Rochester 4GC
4600 & 4800 (10.25-1)	Carter AFB or Rochester 4GC
All Series Export (8.75-1)	Carter AFB or Rochester 4GC

THROTTLE LINKAGE ADJUSTMENT: Make sure stator linkage is properly adjusted (see below), then proceed as follows: Disconnect carburetor throttle rod from throttle operating lever. Hold accelerator pedal firmly against floor mat and throttle in wide open position. Now hold throttle rod at hole in lever. **Rod must be 1/16" short of entering hole in lever.** Readjust rod as necessary. Connect rod to lever and again check for wide open throttle with accelerator against floor mat. Check and adjust choke unloader if necessary. Check for smooth operation of linkage. Desired wide open

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

throttle position should be when accelerator pedal strikes floor mat rather than stop on throttle lever striking hard against boss on throttle body.

Stator Linkage Adjustment: Move upper end of stator idler lever forward and hold against pressure of stator valve spring. Move throttle lever to wide open throttle position. Throttle lever on carburetor should contact stator lever just as throttle reaches wide open position. If clearance exists between throttle lever and stator lever, shorten upper stator rod as necessary by rotating turnbuckle. If wide open throttle causes stator idler lever upper end to bend farther forward, lengthen upper stator rod as necessary by rotating turnbuckle. Tighten turnbuckle locknut and check operation.

Anti-Stall Dashpot Adjustment: With engine at normal operating temperature, open throttle to clear fast idle cam, then rotate cam to extreme fast idle position and let throttle close against cam. Adjust dashpot so it just touches throttle lever. *This is a preliminary setting only. Now proceed as follows:* Place transmission in "Drive" with brakes applied, then jab accelerator pedal and release quickly. If engine stalls, move dashpot toward throttle lever. If too much time required for throttle to come to fully closed position, move dashpot away from throttle lever.

ROCHESTER 2GC 2-BARREL

Rochester 2GC. Two-Barrel, downdraft type as follows:

Model	Rochester No.
4400 Std., No. CCV Ⓒ	7020046
4400 Air Cond. No. CCV Ⓒ	7020047
4400 Std. CCV Ⓒ	7020048
4400 Air Cond., CCV Ⓒ	7020049
4400 Replacement	7016201

Ⓒ - Closed Crankcase Ventilation.

►*HESITATION CORRECTION & CARBURETOR PRODUCTION CHANGE (4400 WITH 2GC CARBURETOR):* Hesitation during moderate acceleration after engine thoroughly warmed up can be corrected by installing new Power Piston (Carburetors stamped "B" on metal tag have this new piston installed in production). *See "Rochester 2GC Carburetors" in Carburetion Section.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1-4-6-7, LEFT barrel feeds 2-3-5-8.*

Idle Setting - Initial setting 1½ turns out. Turn screw out for richer mixture.

Idle Speed - Initial setting 1 turn in. Adjust screw for idle speed of 525 RPM (575 RPM on Air Cond. Cars) with transmission in "N" (Neutral) or "P" (Park).

Float Level - 23/32" (Gauge BT-214) from air horn gasket to lower (sharp) edge of float seam at outer end of float with air horn inverted. To adjust, bend float arm at rear.

Float Drop - 1 29/32" (Gauge BT-184) from air horn gasket to bottom of float with air horn upright and float hanging freely. To adjust, bend float tang.

Accelerating Pump - Install connector rod in center hole of throttle lever.

Fast Idle: No adjustment (will be correct when hot or slow idle correctly set).

Automatic Choke Setting: At index.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 2GC 2-Barrel Carburetors" in Carburetion Section.*

CARTER AFB 4-BARREL

Carter AFB No. 3297S. Four-Barrel downdraft type.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 1-4-6-7, LEFT barrels feed 2-3-5-8.*

►*IDLE COMPENSATOR CAUTION:* Idle compensator (thermostatically controlled idle air bypass) must be in closed position when making idle setting and idle speed adjustments. Remove air cleaner and use pencil or suitable tool inserted in throttle bore to hold valve closed.

Idle Setting - Initial setting ¾ turn open. Adjust both screws (primary side only) alike. Turn screws out for richer mixture.

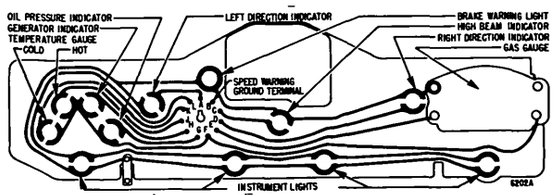
Idle Speed - Initial setting ¾ turn in. Adjust screw for idle speed of 525 RPM (575 RPM on Air Cond. Cars) with transmission in "N" (Neutral) or "P" (Park).

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

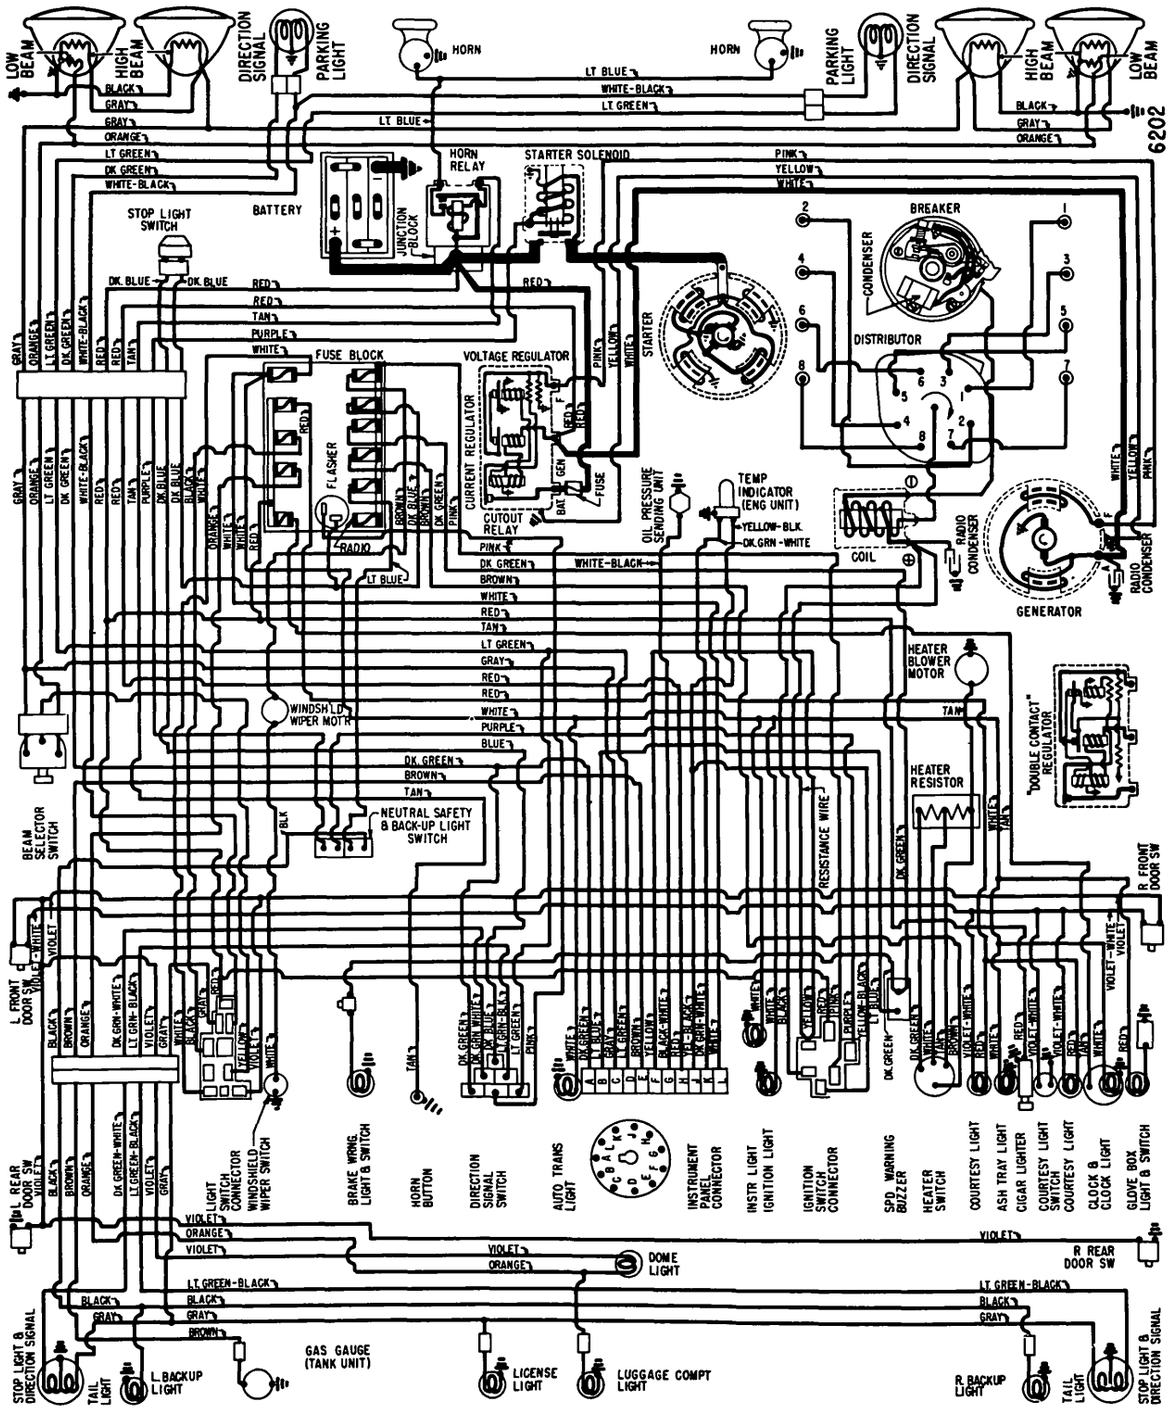
ROCHESTER 4GC 4-BARREL

Rochester 4GC. Four-Barrel downdraft type as follows:



Model	Rochester No.
Standard No. CCV℄	7020040
Standard CCV℄	7020041
Replacement	7016200

℄ - Closed Crankcase Ventilation.



►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 1-4-6-7, LEFT barrels feed 2-3-5-8.*

►*IDLE COMPENSATOR CAUTION:* Idle compensator

CONTINUED ON NEXT PAGE

BUICK PRINTED CIRCUIT

CONTINUED FROM PRECEDING PAGE

(thermostatically controlled idle air bypass) must be in closed position when making idle setting and idle speed adjustments. Remove air cleaner and use pencil or suitable tool inserted in throttle bore to hold valve closed.

Idl Setting - Initial setting 1½ turns open. Adjust both screws (primary side only) alike. Turn screws out for richer mixture.

Idl Speed - Initial setting 1 turn in. Adjust screw for idle speed of 525 RPM (575 RPM on Air Cond. Cars) with transmission in "N" (Neutral) or "P" (Park).

Throttle Linkag Adjustment: *See CARBURETOR above.*

►*OTHER DATA: S "Rochester 4GC 4-Barrel Carbur tors" in Carbur tion S ction.*

CARB. EQUIPMENT

Fu l Pump: Mechanical.
Pr ssur - 4¾-6½ lbs. at idle speed at carburetor inlet.
Fu l Filt r: Glass bowl type in carburetor inlet line. Replace filter element every 12,000 miles.
Air Clean r: Oil wetted plastic foam (Polyurethane) type. Clean and reoil every 8000 miles or sooner under severe operating conditions.
►*PLASTIC ELEMENT CLEANING CAUTION:* Remove element carefully from wire mesh support and wash in solvent. Squeeze element (do not wring) to remove all solvent and reoil with 10W-30 engine oil.

BATTERY

D lc N . 562 (Wet), No. 563 (Dry). 12-volt, 11 plate, 70 ampere hour capacity (20 hour rate).
Battery Gr und - Negative, to left front corner of engine block.
Engin Gr und - From rear of each cylinder head to dash.

STARTER

D lco-R my N . 1107221. Armature - Delco-Remy.
Driv - Overrunning clutch (solenoid pinion shift).
R tati n - Counterclockwise at commutator end.
Brush Spring T nsi n - 35 ozs. minimum.

P rformance Data

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	3800-6200	10.6	70-105
	Lock	2.0	320-360

Ⓒ - Includes solenoid.

Starting Switch: Delco-Remy Solenoid No. 1114272 controlled by combination Ignition & Starter Switch (Key starting) No. 1116588.

N utral Saf ty & Back-up Light Switch (Auto. Trans.): Buick No. 1178138. Mounted on steering column under instrument panel. Connected in starter control circuit so that starter operates only when selector lever is in "N" or "P" position. *To adjust, see "Buick Twin Turbine Dynaflow" in Transmission Section.*

GENERATOR

►*CHARGING CIRCUIT FUSE CAUTION: Batt ry charging circuit prot cted by a 40 ampere, white porcelain covered, (Std. Regulator), 50 ampere, brown procelain covered, (Air Cond. Regulator) fuse clipped to "BAT" t rminal of g n rat r r gulat r. Ch ck for blown fus wh n diagnosing batt ry, g n rator, r r gulat r failur .*

D lc -R my N . 1102302 (L ss Air C nd.), 1102215 (Early Air Cond.). *NOTE - Delcotron Alternator used on late production Air Cond. Cars. See ALTERNATOR below.*

Performance Data - Cold (70°F)

Generator	Amperes	Volts	RPM
1102302	35	14.0	2730
1102215	45	14.0	2600

Field Current - 1.48-1.62 amps. (1102302), 2.66-2.86 amps. (1102215) at 12 volts and 80°F.
Brush Spring Tension - 28 ozs.
Rotation - Counterclockwise at commutator end.
Belt Adjustment: Tension Gauge J-7316 should read "70" on Std. cars, "90" on Air Cond. cars.

GENERATOR REGULATOR

Delco-Remy No. 1119242,277,299 (Std.); No. 1119659 (Air Cond.) - *NOTE - Regulator No. 1119659 is "Double Contact" type.*
►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

Cutout Relay

Cuts In - 11.8-13.5 volts (1119242,277,299), 11.8-13.0 volts (1119659).
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting (1119242,277,299) - 13.8-14.7 volts at 125°F ambient temperature.
Setting (1119659) - 13.8-14.6 volts at 125°F ambient temperature operating on upper contacts. .1-.3 volt lower operating on lower contacts.
Contact Gap (1119659) - .016".
Air Gap - .075" (1119242,277,299), .067" (1119659) with armature pressed down to point where contacts just touch.

Current Regulator

Setting (1119242,277,299) - 31.0-35.5 amps. at 125°F.
Setting (1119659) - 42.5-47.0 amps. at 125°F.
Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-Remy Single Contact Regulators" or "Delco-Remy Double Contact Regulators" in Electrical Section.*

ALTERNATOR

Delco-Remy Delcotron No. 1100633 (Late Air Cond. Cars), No. 1117070 (Police Cars).

►*DELCOTRON MOUNTING BRACKET PRODUCTION CHANGE & BREAKAGE CORRECTION:* When replacing first type bracket (with brace attached to Delcotron rear mounting bolt), install later type bracket, No. 1356686 and brace No. 1356688 *(CAUTION - These parts must be used together).* Later bracket has two tapped holes for brace attachment and is installed on later production cars.

R tation - Clockwise at drive end.
Rat d Output (Hot) - 52 amps. (1100633), 60 amps. (1117070).

Performance Data - Cold (70°F)

Alternator	Amperes	Volts	RPM
1100633	5	14.0	1100
	52	14.0	6500
1117070	58	14.0	2500

Field Current - 6-6.6 amps. (1117070), 1.9-2.3 amps. (1100633) at 12 volts and 80°F.
Belt Adjustment: Tension Gauge J-7316 should read 80.
►*OTHER DATA: See "Delco-Remy Delcotron Alternators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy No. 1119506 (1100633 Gen.), No. 9000554 (1117070 Gen.). *NOTE - Regulator No. 1119506 has double contacts for Voltage Regulation.*

REGULATOR 1119506: Two-unit type containing a Double Contact Voltage Regulator and a Field Relay.

Voltage Regulator

Setting - 13.5-14.4 volts at 125°F ambient temperature operating on upper contacts. .1-.3 volt lower operating on lower contacts.
Air Gap - .060" with lower contacts just touching.
Contact Gap - .014" with lower contacts just touching.

Field Relay

Closing Voltage - 2.3-3.7 volts.
Air Gap - .015" with contacts just touching.
Contact Gap - .030".
►*OTHER DATA: See "Delco-Remy Double Contact Alternator Regulators" in Electrical Section.*

REGULATOR 9000554: Contains an Indicator Light Relay, Transistorized Voltage Regulator, with separate Field Relay, Delco-Remy No. 1116895.

Indicator Light Relay

Setting - Points should close 2 volts lower than voltage regulator setting (below).
Air Gap - .075" with armature pressed down to point where contacts just close.

Voltage Regulator

Setting - 13.0-13.6 volts, adjust to 13.4 volts at 125°F.
Air Gap - .075" with armature pressed down to point where contacts just touch.

Field Relay

Closing Voltage - 7.0-9.0 volts.
Sealing Voltage - 11 volts maximum.
Air Gap - .010" with contacts just touching.
Contact Gap - .015-.025".
►*OTHER DATA: See "Delco-Remy Transistorized Alt rnator Regulators ("A" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

►*INSTRUMENT CLUSTER ASSEMBLY NOTE:* It is necessary to remove Instrument Cluster Assembly to replace printed circuit and fuel gauge. Light bulb sockets are accessible by lowering either right or left lower plate and are removed by turning bulb socket counterclockwise.

Instrument Cluster Assembly: Removal - 1) Remove Instrument panel screws (4 along front edge) and position mirror in its rearmost position.
2) Lift up cover and pull it toward rear of car to remove it, then disconnect clock wiring connectors

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

3) Lower left control plate and disconnect printed circuit plug. *CAUTION* - Use care to prevent damaging pins on printed circuit.

4) Remove knob and nut from end of speedometer reset shaft and unplug parking brake warning light socket (if used) from panel.

5) Remove three screws securing cluster to instrument panel and lift cluster up to disconnect speedometer cable and remove assembly.

►*PRINTED CIRCUIT REMOVAL CAUTION:* Safety Buzzer ground wire (if used) must be disconnected from pin on underside of printed circuit before removing printed circuit.

Installation - Reverse removal procedure aligning projection on disconnect plug with keyway when assembling plug on connector pins and be sure that ground clip is installed correctly.

Speedometer Removal: Speedometer can be removed from cluster assembly after assembly removed.

"Guide-Matic" Headlight Control: *See Electrical Section.*

Lighting Switch Removal: Disconnect battery ground cable. Remove light switch and vent control plate to instrument panel screws and pull plate out from instrument panel. Unplug multiple connector and pull switch out to last notch, then depress latch button on top of switch as you draw rod and knob assembly out of switch. *CAUTION - DO NOT depress latch button prior to pulling on knob and rod.* Remove switch escutcheon with wrench J-8563, then remove nut with wide blade screwdriver. Remove switch plate.

CIRCUIT BREAKERS: 15 Ampere - Headlights, High Beam Indicator, Parking Lights. In headlight switch.

Special - Cigar lighter. On back of lighter.

FUSES: *All fuses located in fuse block under left side of instrument panel.*

30 Ampere - Heater & Air Cond. Blowers & Compressor Clutch.

25 Ampere - Windshield wiper and washer.

20 Ampere - Dome & Trunk Lights, and Rear Cigar Lighter.

10 Ampere - Back-up Lights.

10 Ampere - Turn Signals & Indicator, and Stop Lights.

10 Ampere - Tail & License Lights, and Instrument Panel Lights and Rheostat feed.

7.5 Ampere - Radio (Wonder Bar).

5 Ampere - Courtesy & Glove Box Lights.

5 Ampere - Speed Warning Buzzer, Parking Brake Warning Light.

4 Ampere - Automatic Headlight Dimmer. *NOTE* - This fuse located under left front kick pad near amplifier.

3 Ampere - Instrument Panel Lights.

2.5 Ampere - Radio (Except Wonder Bar).

2 Ampere - Clock.

ENGINE

ENGINE SPECIFICATIONS: Own. 90° V8, valve-in-head. 401" engine of same design used previously.

Bore	Stroke	Displacement	Rated HP
4.1875"	3.640"	401 cu. ins.	56.11

Series & Engine	Compr. Ratio	Developed HP
4400 Std. (2-Bbl.)	10.25-1	280 at 4400 RPM
4400 Reg. Gas (2-Bbl.)	9.0-1	265 at 4400 RPM
4400 Power Pack (4-Bbl.)	10.25-1	325 at 4400 RPM
4600 & 4800 All	10.25-1	325 at 4400 RPM
All Series Export	8.75-1	315 at 4400 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

►*ENGINE OPERATION IN LOW OCTANE AREAS (Foreign Travel):* Minimum fuel octane rating for satisfactory performance is 93 Research Method, 84 Motor Method. If satisfactory fuel cannot be secured for 8.75-1 & 9.0-1 ratio engines, install a .045" thick cylinder head gasket. To lower compression ratio of 10.25-1 ratio engines, install lower compression ratio piston and pin assembly, Part No. 1388539.

ENGINE MOUNTINGS: *See "Engine Mountings" in Buick Special Data.*

CYLINDER HEAD & GASKET: Cylinder heads are interchangeable between engines. All engines use a .015" cylinder head gasket and lower compression ratio used with Regular Gas Option, is obtained by use of lower dome height pistons. *See "Engine Operation in Low Octane Areas (Foreign Travel)" above.*

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Buick Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Buick Special Data.*

PISTONS

Aluminum alloy, cam ground - transverse slot, divorced skirt.

Clearance - .001-.0016" (Top of skirt). Measure at right angle to piston pin ¼" below top of skirt.

Removal - Pistons and rods removed from above.

Replacement Pistons: Furnished Std. and .001", .005", .010", .020" & .030" Oversize. *NOTE - Pistons furnished only with fitted pins.*

Installing Pistons: Install pistons and rods with valve depressions in head of piston on same side as oil spurt notch in lower end of rod. *See Rod Installation.*

PISTON PIN

Pin is press fit in connecting rod.

Diameter - .9994-.9997". **Length** - 3.520".

Clearance in Piston - .0001". Finger push fit.

Clearance in Rod - .0007-.0015". Press fit.

Piston Pin Removal & Installation: *See "Piston Pins" in Buick Special Data. CAUTION - Pistons may be damaged if special procedure and tools not used.*

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.077-.078"	.015-.025"	.003-.005"
Oil (3)	.181-.187"	.015-.035"	.0035-.0095"

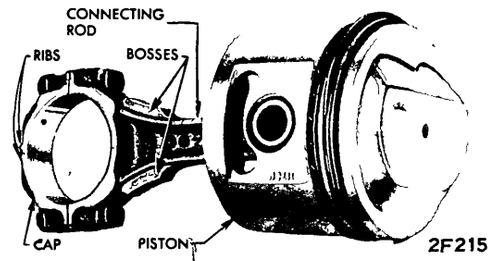
►*COMPRESSION RING INSTALLATION NOTE:* Install rings with identification mark upwards. Top ring must be installed with inner bevel to top of piston. Second ring must be installed with inner bevel to bottom of piston.

Replacement Rings: Std. & .010", .020", .030" Oversize.

CONNECTING ROD

Length - 6.220" (center-to-center).

Crankpin Journal Diameter - 2.249-2.250". Out-of-round limit .0015".



Bearings - Steel backed M400 Aluminum, full precision type. Both halves interchangeable.

Clearance - .0002-.0023". Wear limit .003".

Side play - .005-.012" (Two rods).

Replacement Bearings: Standard and .001", .002", .020" and .021" Undersize.

Installing Rods: Install piston and rod assembly in engine with spurt notch in lower end of rod and valve depressions in pistons on the high side of cylinder bore. This will bring all spurt notches and valve depressions in piston toward camshaft. Rib on edge of rod cap should be on same side as conical boss on web of rod and both marks should face toward adjacent connecting rod on same crankpin.

PISTON & ROD ASSEMBLY

CRANKSHAFT

►*CRANKSHAFT & FLYWHEEL UNBALANCE OR VIBRATION (After replacement of parts - Synchro-mesh & Dynaflow Cars):* *See "Engine Balancing" in Buick Special Data.*

Journal Diameter - 2.498-2.499". Five bearings. Out-of-round limit .0015".

Bearings - Durex 100A (Rear Main), M400 Aluminum (All others), full precision type. Both halves interchangeable.

►*BEARING NOTE:* Bearing upper halves can be rotated out and in by using Tool KMO-734 in oil hole.

Clearance - .0005-.0021".

Replacement Bearings: Furnished Std. and .001", .002". .003" Undersize.

End Thrust: Taken by No. 3 main bearing.

Endplay - .004-.008".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Buick Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Buick Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Buick Special Data.*

FLYWHEEL REPLACEMENT: *See "Flywheel" in Buick Special Data.*

CAMSHAFT

►*1962 CAMSHAFT & VALVE SPRING PRODUCTION CHANGE & CAUTION:* On cars beginning Engine Production Code No. 4I-28962, new camshaft, Part No. 1351515, and new outer valve springs, Part No. 1352424; were installed to improve engine performance. Early camshafts have 1 groove in land just forward of No. 3 bearing journal, and later camshafts have 2 grooves. *DO NOT use early type valve springs with later type camshaft because of lifter pump-up at high speeds. However, later type valve springs can be used with either camshaft.*

Journal Diameters - (1) 1.785-1.786", (2) 1.755-1.756", (3) 1.725-1.726", (4) 1.695-1.696", (5) 1.665-1.666".

Bearings - Steel-backed babbitt lined bushings.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*BEARING REPLACEMENT NOTE:* Camshaft bearings must be line reamed after being pressed into block. **Clearance** - .0005-.0035". Service limit .0015-.004".

End Thrust: Taken by hub of camshaft sprocket. Distributor and oil pump drive force camshaft to rear at all times.

Timing Chain: Link belt. **Width** - .864", **Pitch** - .500". **Length** - 26" or 52 links.

Camshaft Setting: "O" marks on camshaft and crankshaft sprockets in line with straightedge across shaft centers.

Engine Front Cover: *See "Engine Front Cover" in Buick Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Buick Special Data.*

VALVES

►*1962 OUTER VALVE SPRING & CAMSHAFT PRODUCTION CHANGE & CAUTION: See CAMSHAFT above.*

Tappet Clearance: Zero lash, hydraulic lifters.

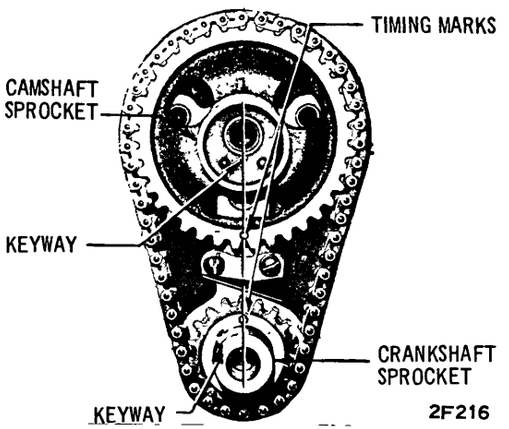
Valve	Head Diam.	Stem Diam.	Length
Intake	1.875"	①	4.785"
Exhaust	1.500"	②	4.785"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.439"	③
Exhaust	45°	.441"	④

① - Top .373"; Bottom .3715".
② - Top .372"; Bottom .3705".
③ - Top .001-.003"; Bottom .002-.004".
④ - Top .0015-.0035"; Bottom .0025-.0045".

Valve Seat Width - 3/64-5/64" (1/16" average).

►*VALVE GRINDING CAUTION:* Normal height of valve stem above rocker arm gasket surface is 1.540". When valve facing or seat grinding raises valve stem height more than .050" above normal, grind off end of valve stem or replace valve.



Valve Springs: Inner and outer springs used on all valves. Install with closed coils against cylinder head.

Valve	Inner Spring Lbs. Press.	Inner Spring Length	Outer Spring Lbs. Press.	Outer Spring Length
Closed	23-28	1.69"	39.5-44.5	1.60"
Open	73-79	1.25"	93-99	1.16"

Valve Guides: Drive old guides out from combustion chamber side using Driver J-269. Install new guides from top of head using Valve Guide Aligner J-5240-2 over guide hole and installer J-5240-1 to drive guide down until installer shoulder contacts top of aligner which will position guide correctly in head. Finish ream guides with Valve Guide Reamer J-129-3..

Hydraulic Valve Lifters: Barrel type.
Diameter - .8425". **Clearance in Block** - .0015-.003".
Lifter Overhaul & Testing - *See "Valve System" in Buick Special Data.*

Rocker Arm Assembly: *See "Valve System" in Buick Special Data.*

VALVE TIMING MARKS

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 28° BTDC. Close 87° ALDC.
Exhaust Valves - Open 76° BLDC. Close 46° ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Buick Special Data.*

Crankcase Capacity: 4 qts. refill, 5 qts. dry engine. Add 1 qt. for filter change.

Normal Oil Pressure; 40 lbs. at 1600 RPM.
Pressure Regulator Valve - In oil pump body. Not adjustalbe.

Oil Pressure Indicator: Oil pressure warning light on instrument panel and oil pressure switch in oil gallery at right rear of engine. Lights when oil pressure below a safe level.
Engine Unit - AC No. 1508753.

Oil Pump: Spur-gear type oil pump mounted at rear end of crankcase and driven by distributor drive shaft.
Oil Pump Removal & Overhaul - *See "Oiling System" in Buick Special Data.*

Oil Filter: AC full flow type, mounted on right rear of engine. Replace every 4000 miles or sooner if needed. *NOTE* - Ball check in filter base bypasses oil directly to engine when pressure differential between inlet and outlet ports reaches 4½-5½ lbs.

►*EXHAUST CROSSOVER PIPE INTERFERENCE WITH FILTER REMOVAL (EARLY CARS):* If clearance insufficient for filter removal, loosen exhaust system and crossover pipe at exhaust manifolds and move pipe rearward. If clearance still insufficient, install new crossover pipe. *CAUTION - Do not bend or hammer* pipe to provide more clearance.

Filter Element Replacement - AC No. PF-7.

►*OIL FILTER INSTALLATION CAUTION:* DO NOT use a wrench to tighten filter. Tighten (by hand only) until gasket contacts seal face, then tighten additional 2/3 turn. DO NOT OVERTIGHTEN.

Crankcase Ventilation: Standard Cars - Air enters through two ventilating type filter caps at top of each rocker arm cover. Air is drawn out through metal gauze filled filter located at rear end of valve lifter cover and ventilator pipe extending down from lifter cover.
Positive Crankcase Ventilation Cars - Same as for standard cars except that ventilator pipe is removed and a vent tube adapter, valve assembly and hose is connected to intake manifold adapter. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Temperature Controlled Fan Clutch (AC Cars): Air Cond. cars equipped with 20" fan have a torque sensitive fan clutch. Flow of silicone (governing fan speed) controlled by temperature sensitive coil. When air through radiator is 80°F or below, fan speed is 800-1200 RPM. At higher temperatures speed of fan into a maximum of 2100 RPM.
Fan Clutch Adjustment - Normal position is in center slot of tab. For hotter fan cut-in, place spring end in right hand slot (facing engine). For colder fan cut-in place spring end in left hand slot (facing engine). To reposition spring, bend retaining tab just enough to move spring.

Water Capacity: 17 qts. Add 1½ qts. for heater.

Pressure Valve: Radiator filler cap. 15 lb. type. *NOTE* - Use of lower test filler cap will cause engine to heat with loss of coolant.

Thermostat: Poppet type, located in water manifold above pump. Opens at 167-172°F.

Water Pump: Packless sealed ball bearing type with aluminum housing. *NOTE - Shaft seal and impeller only replaceable parts. See "Cooling System" in Buick Special Data.*
Pump Removal - Drain cooling system. loosen belts, and remove fan blade, spacer, and pulleys from water pump hub on pump shaft. Remove belts. Disconnect hose from pump inlet and heater hose from nipple. Remove bolts, then remove pump assembly and gasket from timing chain cover.

Temperature Indicator: Two light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and goes out when engine temperature reaches 110°F. RED light remains off during normal engine operation but comes on when engine temperature reaches 245°F. *NOTE* - Red light circuit is connected to Oil Pressure sender line through a vacuum switch so that the light will come on when ignition switch is turned on (this checks bulb and circuit each time engine is started). As soon as engine starts and manifold vacuum builds up, vacuum switch opens this circuit and red light will go out.
Engine Unit - AC No. 1998746.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*STARTING CAR BY PUSHING NOTE (AUTOMATIC TRANSMISSION CARS):* Because of transmission design, car cannot be started by pushing.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

Series	Series Designation
Standard	4000
Deluxe	4100
Skylark	4300

ENGINE & SERIAL NUMBER: Stamped on plate attached to body at left front hinge pillar; and also stamped on identification pad on engine crankcase just forward of right cylinder head. Number (example below) includes identification data.

①②③ ④
1 1 1 001001

① - Series. 0 4000 (V8), 1 4100 (V8), 3 4300 (V8), A 4000 (V6), B 4100 (V6). *NOTE* - Some early V6 4000 series may have a 0.

② - Year Model. 1 1962.

③ - Assembly Plant. 1 Flint. 2 South Gate. 3 Linden. 4 Kansas City. 5 Wilmington. 6 Atlanta. 8 Arlington.

④ - Beginning vehicle number at each assembly plant.

Engine Production Code Number: V6 - Stamped on front of crankcase below left cylinder head gasket. Number is **not** used for licensing.

V8 - Stamped along side of Engine & Serial Number (see above), but is upside down when viewed from front of engine. Number is **not** used for licensing.

►*ENGINE PRODUCTION CODE NUMBER IDENTIFYING MARKS.* Used as follows:

6I - Prefix for V6 engine.

I - Prefix for Std. V8 engine (9.0-1 compr. ratio & 2-Bbl. carb.).

HI - Prefix for Power Pack V8 engine (10.25-1 compr. ratio & 4-Bbl. carb.).

LI - Prefix for Export V8 engine (7.6-1 compr. ratio & 2-Bbl. carb.).

TUNE-UP

►*ENGINE OPERATION IN LOW OCTANE AREAS (Foreign Travel): See Notes under V6 & V8 Engine Specifications for recommended changes.*

COMPRESSION PRESSURE: 160 lbs. minimum (Except V8 Power Pack), 175 lbs. minimum (V8 Power Pack) at cranking speed. Cylinders must be equal within 15 lbs.

VACUUM READING: 14" minimum at 525 RPM.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: V6 - Automatic thermostatic type located in right exhaust manifold. Valve must operate freely (lubricate shaft every 1000 miles). Check thermostat at 70°F (room temperature). There should be 180° wrap on spring.

V8 - None used. Intake manifold is heated by engine coolant.

CRANKCASE VENTILATION VALVE: Service at 8000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. See *"Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

►*V6 IGNITION NOTE:* Firing Intervals are 90° & 150°. Cam angle (dwell) is 30° and same for all cylinders (point open interval varies).

FIRING ORDER (V6): 1-6-5-4-3-2.

Cylinders - RIGHT BANK 2-4-6, LEFT BANK 1-3-5.

FIRING ORDER (V8): 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs - AC No. 44S (V6), No. 45FFS (V8 Std.), No. 44FFS (V8 Power Pack), 14 mm. Torque to 25-35 ft. lbs. (V6), 15-20 ft. lbs. lubricated (V8).

COIL: Delco-Remy No. 1115137 (V6), No. 1115136 (V8 Std.), No. 1115161 (V8 Power Pack).

Ignition Current - 1.7 amps. idling, 3.7 amps. stopped at 12.6 volts.

Resistor - Resistance wire (1.80±.05 ohms) connected in circuit from coil to IGN 1 terminal of ignition switch. Bypassed during cranking by lead from IGN 2 terminal of ignition switch to coil.

►*IGNITION CIRCUIT NOTE: When ignition switch is in "Lock" position, coil resistance wire is grounded.*

DISTRIBUTOR: Delco-Remy No. 1110286 (V6), No. 1110977 (V8). External adjustment "Window" type.

Condenser - Delco-Remy. **Capacity** - .18-.23 mfd.

Breaker Gap - Gap (.016") will be correct when cam angle correctly set.

Cam Angle - 29-31°. Set at 30° (will give .016" point opening).

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Clockwise viewed from above.

Automatic Advance - 1110286

Degrees Distr.	RPM	Degrees Eng.	RPM
.5-2.5	525	1-5	1050
6-8	875	12-16	1750
9.5-11.5	1400	19-23	2800
13-15	1950	26-30	3900

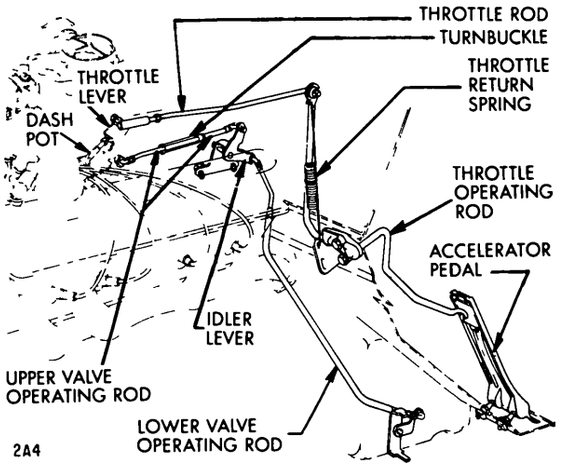
Automatic Advance - 1110977

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	525	0-4	1050
6.5-8.5	1050	13-17	2100
12-14	1850	24-28	3700

Vacuum Spark Control: Delco-Remy No. 1116182.

Vacuum Advance - 1116182

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
8	16	14.50-15.75



►*V6 DISTRIBUTOR INSTALLATION CAUTION:* Centerline of rotor must be aligned with notch on distributor housing. Install distributor with rotor in position to fire No. 1 cylinder (distributor cap towers are numbered and No. 1 terminal is first tower beyond window in direction of rotation).

IGNITION TIMING

Ignition Timing Specifications

Engine	At 1050 RPM	At 400 RPM
All (Except V8 Power Pack)	7½° BTDC	5° BTDC
V8 Power Pack	10 BTDC	7½° BTDC

►*TIMING SETTING NOTE:* Set timing with distributor vacuum line disconnected. Preferred method of setting. timing is with engine at **exactly** 1050 RPM. After timing set, reset engine idle speed. If impossible to use preferred method, set timing at 400 RPM so there is no centrifugal advance (second method is less accurate than preferred method).

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

Timing Mark - Timing indicator on chain case cover marked "O" (TDC), "5" (5° BTDC), "10" (10° BTDC). Align correct mark with yellow paint filled groove on harmonic balancer.

CARBURETOR

►*CARBURETOR APPLICATION: On Rochester 2GC 2-Barrel used on all engines except V8 Power Pack. One Rochester 4GC 4-Barrel used on V8 Power Pack.*

THROTTLE LINKAGE ADJUSTMENT (AUTO. TRANS.): Move throttle lever to wide open position and make sure carburetor-to-transmission linkage does not prevent throttle from opening completely. *NOTE - If throttle does not open completely, adjust carburetor-to-transmission linkage (see below).* Disconnect rear end of throttle rod from throttle operating lever, then with accelerator pedal pressed firmly against floor mat, hold throttle in wide open position and hold rear end of throttle rod at hole in throttle operating lever. **Rod end must be approximately 1/16" short of entering hole in lever.** Adjust rod length as necessary, then connect rod to lever and secure with cotter pin. With accelerator pedal pressed to floor mat, recheck throttle for wide open position. Hold choke valve closed and move throttle lever to wide open position to check adjustment of choke unloader. *NOTE - Throttle should be wide open just as accelerator pedal strikes floor mat, rather than stop on throttle lever striking hard against boss on throttle body.*

Carburetor-To-Transmission Linkage - With throttle held in wide open position, check adjustment by pushing transmission linkage idler lever fully forward (through detent). *CAUTION - Transmission linkage should have all play (slack) just taken out, but should not be adjusted so short that stop in transmission prevents carburetor from reaching wide open position.* If carburetor

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

will not reach wide open position, lengthen rod as required by rotating turnbuckle. If there is any play in linkage, shorten rod as required. *CAUTION - Never driv car with transmission linkage misadjusted or disconnected as lin pr ssur will be too low and burned out clutch s will result.*

Anti-Stall Dashp t Adjustment (All Cars): Open throttle to clear fast idle, then rotate cam to extreme fast idle position, and allow throttle to close against fast idle cam. Adjust dashpot until it just touches throttle lever. *NOTE - This is a preliminary setting only.* With transmission in "D" (Auto. Trans.), Neutral (Synchro-mesh) and brakes firmly applied, jab accelerator pedal and release rapidly. Note engine operation as throttle closes. If engine stalls from too rapid closing of throttle, move dashpot towards throttle lever until its action prevents engine stalling. If excessive time is required for throttle to reach fully closed position, move dashpot away from throttle lever. If proper control cannot be obtained by adjustment, replace dashpot.

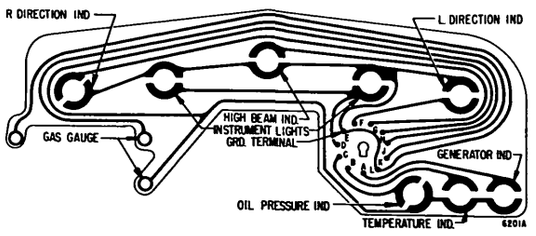
►*ANTI-STALL DASHPOT (SYNCHRO-MESH TRANS. CARS) PRODUCTION CHANGE NOTE:* Beginning approximately May 15, 1962 all cars with synchro-mesh transmissions (3 & 4-Speed) assembled without carburetor dashpots.

ROCHESTER 2GC 2-BARREL

R chester 2GC. Used as follows:

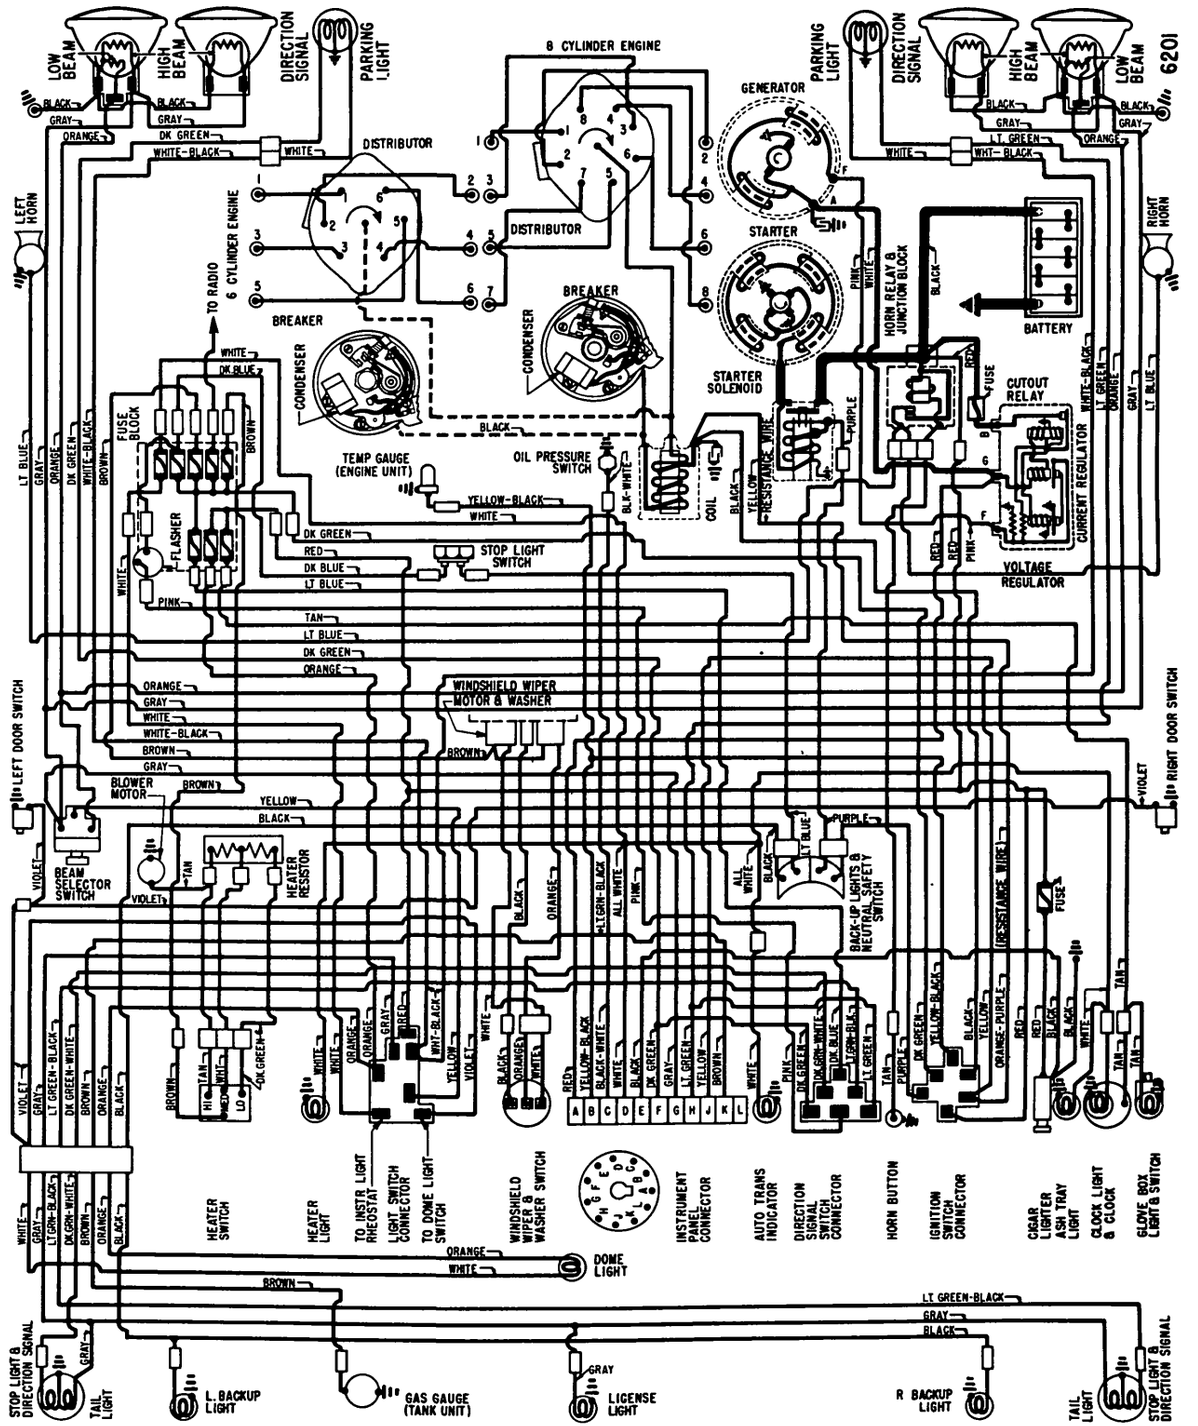
Engin Ⓒ	Rochester No.
V6 Synchro-mesh (Std.)	7020141
V6 Synchro-mesh (CCV)	7020143
V6 Auto. Trans. (Std.)	7020140
V6 Auto. Trans. (CCV)	7020142
V8 Synchro-mesh	7019093 or 7020147
V8 Auto. Trans.	7019090 or 7020146

Ⓒ - **Std.** - Without Closed Crankcase Ventilation.
CCV - With Closed Crankcase Ventilation.



►*MANIFOLD FUEL DISTRIBUTION (V6): Carburetor RIGHT barr l f eds right bank cylinders, LEFT barrel feeds l ft bank cylind rs.*

►*MANIFOLD FUEL DISTRIBUTION (V8): Carburetor RIGHT barrel f ds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*



Idl Setting - Initial setting 1 turn out. Turn screw out for richer mixture.

Idl Sp d - Initial setting 1 turn in. Adjust screw for idle speed as follows: **V6** - 575 RPM (Std. & Air Cond.). **V8** - 525 RPM (Std.), 575 RPM (Air Cond.). *Automatic transmission must be in "N" (Neutral) or "P" (Park).*

CONTINUED ON NEXT PAGE

BUICK SPECIAL PRINTED CIRCUIT

CONTINUED FROM PRECEDING PAGE

Float Level - With air horn assembly inverted, position float level gauge BT-188 over float so gauge rests against pump side of power piston shaft with outer gauge leg in line with center of float. Float level should be 1 17/64". To adjust, bend float arms.

Float Drop - Hold air horn assembly upright and measure distance from gasket to bottom of float pontoon at outer end. Distance should be 1 29/32". To adjust, bend tang on float arm.

Accelerating Pump - Install connector rod in outer hole of throttle lever.

Fast Idle: No adjustment (will be correct when hot or slow idle correctly set).

Automatic Choke Setting: 1 notch rich (V6), at Index (V8).

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 2GC 2-Barrel Carburetors" in Carburetion Section.*

ROCHESTER 4GC 4-BARREL

Rochester 4GC No. 7020045 (Synchro-mesh), No. 7020043 (Auto. Trans.).

►*HESITATION ON ACCELERATION CORRECTION:* If carburetor accelerator pump system not defective, trouble may be due to incorrect pump stroke adjustment. Correct pump rod setting depends on average daytime temperature as indicated:

Temperature	Pump Rod Position
Below 0°F	Inner Hole (Long Stroke)
0° to 60°F	Center Hole
Above 60°F	Outer Hole (Short Stroke)

►*IDLE COMPENSATOR CAUTION:* Idle compensator (thermostatically controlled idle air bypass) must be in closed position when making idle setting and idle speed adjustments. Remove air cleaner and use pencil or other suitable tool inserted in throttle bore to hold valve closed.

Idle Setting - 1½ turns open. Adjust both screws (primary side only) alike.

Idle Speed - 525 RPM (575 RPM on Air Cond. Cars) with selector lever in Neutral or Park Position.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 4GC Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC type.

Pressure - 4½-5¾ lbs. at pump outlet.

Fuel Filter: (V6 Engine) - Sintered bronze filter at carburetor inlet. To clean, soak in solvent, blow dry with air. Replace if necessary.

V8 Engine - Glass bowl located in line between pump and carburetor. Can be visually inspected.

►*FUEL BOWL FILTER NOTE:* To clean, remove and soak bowl in cleaning solvent to loosen any deposits. Replace element (AC type GF-124) every 12,000 miles or sooner if contamination has entered fuel system.

Air Cleaner: Oil-wetted plastic foam type. Clean and recoil every 8000 miles or sooner if needed.

►*AIR CLEANER INSTALLATION CAUTION:* No locating tabs used. Install air cleaner on carburetor and securely tighten wing nut **by hand.** The word "FRONT" must be located on the forward center line of engine.

►*PLASTIC ELEMENT CLEANING CAUTION:* Remove element carefully from mesh support and wash in nonflammable solvent. Kerosene or Oleum Spirts may be used if fire hazard precautions are observed. Squeeze element (do not wring out) to remove all solvent and recoil with 10W-30 engine oil. Element should not drip oil.

BATTERY

Delco No. 454 (Wet), No. 455 (Dry). 12 volt, 9 plate, 40 ampere hour capacity (20 hour rate).

Battery Ground - Negative, to right front corner of engine block.

Engine Ground - From rear of right cylinder head to dash.

STARTER

Delco-Remy No. 1108303.

Armature - Delco-Remy No 1935829.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs min.

Performance Data

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

Ⓒ - Includes solenoid.

Starting Switch: Delco-Remy Solenoid No. 1114266, mounted on starter and controlled by combination Ignition & Starter Switch Delco-Remy No. 1116621.

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1347209 (without Back-up Lights), No. 1349888 (with Back-up Lights) mounted on steering column under cowl. Connected in starter control circuit so that starter operates only when selector lever is in "N" or "P" position.

Adjustment - *See "Buick Special Automatic Transmission" in Transmission Section.*

GENERATOR

►*CHARGING CIRCUIT FUSE CAUTION: Battery charging circuit protected by a 40 ampere fuse clipped to "BAT" terminal of generator regulator. Check for blown fuse when diagnosing battery, generator, or regulator failure.*

Delco-Remy No. 1102310 (V6), No. 1102307 (V8).

Performance Data - Cold (70°F)

Amperes	Volts	RPM
35	14.0	2730

Field Current - 1.48-1.62 amps. at 12 volts and 80°F.

Brush Spring Tension - 28 ozs.

Rotation - Counterclockwise at commutator end.

Belt Adjustment: Tension reading on Gauge J-7316 should be 60 lbs. (Less AC and Pwr. Strg.), 72 lbs. (With AC), 80 lbs. (Power Strg.).

GENERATOR REGULATOR

Delco-Remy No. 1119277 & 299.

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

►*NOTE: Specifications below are "Normal" settings.*

Cut out Relay

Cuts In - 11.8-13.5 volts.

Contact Gap - .020".

Air Gap - .020" with contacts just closed

Voltage Regulator

Setting - 13.8-14.7 volts at 125°F ambient temperature.

Air Gap - .075" with armature pressed down to point where contacts just touch.

Current Regulator

Setting - 31.0-35.5 amps. at 125°F.

Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-Remy (Single Contact) Regulators" in Electrical Section.*

ALTERNATOR

Delco-Remy No. 1117070. Three-phase type with internal rectifiers.

Ⓒ Performance Data - Cold (70°F)

Amperes	Volts	RPM
58	14.0	2500

Ⓒ - Rated output hot 60 amps.

Current Output At Idle Speed - 25 amps. (approx.) at 525 Engine RPM.

Field Current - 6-6.6 amps. at 12 volts and 80°F.

Brush Spring Tension - 13 ozs.

Rotation - Clockwise at drive end.

Belt Adjustment: Tension Gauge J-7316 should read 80.

►*OTHER DATA: See "Delco-Remy Delcotron Alternators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy No. 9000554 (Indicator Light Relay & Transistorized Voltage Regulator) with separate Field Relay, Delco-Remy No. 1116895.

Indicator Light Relay

Setting - Points should close 2 volts lower than voltage regulator setting.

Air Gap - .075" with armature pressed down to point where contacts just touch.

Voltage Regulator

Setting - 13.0-13.6 volts, adjust to 13.4 volts at 125°F.

Air Gap - .075" with armature pressed down to point where contacts just touch.

Field Relay

Closing Voltage - 7.0-9.0 volts.

Sealing Voltage - 11 volts maximum.

Air Gap - .010" with contacts just touching.

Contact Gap - .015-.025".

►*OTHER DATA: See "Delco-Remy Transistorized Alternator Regulators ("A" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

►*INSTRUMENT CLUSTER ASSEMBLY NOTE:* This assembly is made of plastic and contains speedometer, indicator lights, fuel gauge, light switch, wiper & washer switch, ignition & starter switch and lighter. It is necessary to remove instrument cluster to remove printed circuit which is a part of speedometer housing. Light bulbs are accessible without removing cluster by turning sockets counterclockwise. An external ground is used for lights, switches and lighter *CAUTION* - Disconnect battery ground cable at battery before removing any instrument panel unit or wiring.

Instrument Cluster Assembly: Removal - 1) Install two

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

pieces of cloth tape 1" wide x 4" long (double thickness) over lower flange of instrument panel to prevent damage to harness.

2) Remove cluster hood, then remove two nuts from under panel that retain cluster at each side. Remove two lower edge of cluster to instrument panel tie bar screws.

3) Disconnect wiring harness connectors from headlight switch, windshield wiper switch, ignition switch and lighter. Disconnect speedometer cable and printed circuit plug.

4) Remove cluster by pulling rearward and upward.

Installati n - Reverse removal procedure being careful to line up disconnect plug with keyway in printed circuit when assembling plug on connector pins.

Sp d meter R m val: Remove Instrument Cluster Assembly, see above, then remove speedometer from cluster.

Lighting Switch Rem val: Disconnect battery ground cable, unplug multiple connector from switch. Pull switch out to last notch and depress loaded latch button on left side of switch while pulling rod and knob assembly out of switch. Remove switch escutcheon with wrench J-8563 and remove switch from instrument panel.

CIRCUIT BREAKERS: 15 Ampere - Headlights and Front Parking Lights. Integral with headlight switch.
Special - Cigar lighter. On back of lighter.

FUSES: *'All fus s located in fuse block under left side of instrument pan l.*
25 Amper - Windshield wiper and washer.
20 Amper - Heater and Air Conditioning Systems.
10 Amper - Direction Signals & Stop Lights.
9 Ampere - Back-up Lights.
9 Amp r - Tail, License, Dome, Instrument Panel Lights, and Instrument Panel Light Rheostat feed.
3 Amp r - Instrument Panel Lights & Rheostat.
2.5 Amp r - Radio.
2 Amper - Clock & Glove Box Light.

V6 ENGINES

ENGINE SPECIFICATIONS: Own. 90°V6, valve-in-head. Engine block is cast iron type.

B r	Strok	Displacement
3.625"	3.200"	198 cu. ins.

C mpressi n Rati	Rated HP	Developed HP
8.8-1	31.54	135 at 4600 RPM

Compr ssion & Vacuum R ading - *See TUNE-UP.*

►*ENGINE OPERATION IN LOW OCTANE AREAS (For ign Trav l):* Minimum fuel octane rating (research method) for satisfactory operation is 93.

OIL PAN REMOVAL: Drain oil and remove steering idler arm bracket-to-crossmember attaching bolts, then remove lower flywheel housing. Remove oil pan bolts and lower pan enough to remove oil pump pipe and screen-to-cylinder block bolts. Rotate crankshaft for maximum clearance of forward end of oil pan. Move front of pan to right and lower pan through opening between crossmember and steering intermediate shaft.

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Buick Sp cial Data.*

TIGHTENING TORQUES: *S "Tight ning Sp cifications" in Buick Sp cial Data.*

PISTONS

Aluminum alloy, full skirt, cam ground, tin plated. Three rings used.

Removal - Pistons and rods removed from above.

Fitting New Pistons: Clearance .0005-.0011". Use accurate micrometer and measure at right angle to piston pin ¼" below oil ring groove. Measure cylinder bore approximately 1½-2" below top of bore at right angle to pin. Block and piston must be at nearly the same temperature.

Installing Pistons: Assemble rod in piston so identification notch in piston head is to front of engine. *See Rod Installation.*

Replacement Pistons: Furnished Std. & .010" Oversize.

PISTON PIN

Pin is pressed fit in connecting rod.

Diameter - .8747-.8750". **Length** - 2.960".

Clearance in Piston - .0001". Easy finger push fit at 70°F.

Clearance in Rod - .0007-.0015". Press fit.

Piston Pin Removal & Installation: *See "Piston Pins" in Buick Special Data. NOTE - Pistons may be damaged if special procedure and tools not used.*

Replacement Pins: Furnished in Std. size only.

PISTON RINGS

Compression rings are cast iron lubrited type. Oil ring consists of two uncoated steel rails separated by a spacer and backed by a hump type spring steel expander.

Ring	Width	End Gap	Side Clearance
Compr.(1& 2)	.077-.078"	.010-.020"	.003-.005"
Oil (3)	.180-.186"	.015-.035"	.0035-.0095"

►*COMPRESSION RING INSTALLATION NOTE:* Install rings with inner groove or bevel downward.

Replacement Rings: Furnished Std. size only.

CONNECTING ROD

Length - 5.860" (center-to-center).

Crankpin Journal Diameter - 2.000".

Bearings - Steel backed Durex 100A. Precision type.

Clearance - .0002-.0022".

Sideplay - .006-.014" (Total both rods).

Replacement Bearings: Furnished std., .001", .002", .010", .020" & .021" Undersize.

Installing Rods: Install piston and rod assembly in engine so all spurt notches in lower ends of rods are upward, and all notches in piston heads are to front of engine. Rib on edge of rod cap should be on same side as conical boss on web of rod and both marks should face toward adjacent connecting rod on same crankpin.

CRANKSHAFT

Journal Diameter: 2.2992". Out-of-round limit .003".

Clearance - .0005-.0021". Wear limit .003".

End Thrust: Taken by No. 2 (front intermediate) main bearing.

Endplay - .004-.008".

Replacement Bearings: Furnished Std., .001", .002", .003" & .010" Undersize.

►*MAIN BEARING CAP IDENTIFICATION CAUTION:* *See V8 Engine below.*

Crankshaft R ar Main Bearing Oil S al: *S "Crankshaft & Main B arings" in Buick Sp cial Data.*

Engin Front Cov r Removal: *Se "Engin Front Cov r" in Buick Special Data.*

Crankshaft Fr nt Oil S al: *Se "Engin Fr nt Cov r" in Buick Sp cial Data.*

FLYWHEEL REPLACEMENT: *S "Flywhe l" in Buick Special Data.*

CAMSHAFT

Journal Diameters - (1) 1.755-1.756", (2) 1.725-1.726", (3) 1.695-1.696", (4) 1.665-1.666".

Bearings - Steel backed babbitt. *NOTE* - Bearings must be line reamed after installation.

Clearance - .0005-.0035". Wear limit .0015-.004".

Endplay - .004-.008".

Timing Chain: Link belt. **Width** - .875". **Pitch** - .375". **Length** - 54 links.

Camshaft Setting: "O" marks on camshaft and crankshaft sprockets adjacent and in line across shaft centers.

Engine Front Cover: *See "Engine Front Cover" in Buick Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Buick Special Data.*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters.

Valve	Head Diameter	Stem Diameter	Length
Intake	1.500"	①	4.605"
Exhaust	1.3125"	②	4.605"

Valve	Seat Angle	Lift	Stem Clearanc
Intake	45°	.385"	③
Exhaust	45°	.385"	④

① - Top .3412"; Bottom .3407".
② - Top .3407"; Bottom .3402".
③ - Top .0005-.0025"; Bottom .001-.003".
④ - Top .001-.003"; Bottom .0015-.0035".

Valve Seat Width - 1/16". Wear limit 5/64".

►*VALVE GRINDING CAUTION:* Normal height of valve stem above valve spring seat surface is 1.825". When valve facing or seat grinding raises valve stem height more than .050" above normal, grind off end of valve stem or replace valve.

Valve Springs: Single springs used on all valves. Install springs with closed coils against cylinder head.

Valve Spring Specifications

Valve	Spring Pressure	Length
Closed	64 lbs.	1.640"
Open	168 lbs.	1.260"

Valve Guides: Non-replaceable (integral with head). If valve stem has excessive clearance in its guide, ream guide .005" oversize (use Reamer Tool J-9556) and replace valve using a .005" oversize valve.

Hydraulic Valve Lifters: Barrel type.

Diameter - .8422-.8427".

Clearance in Block - .0015-.003".

Lifter Overhaul & Testing - *See "Valve System" in Buick Special Data.*

Rocker Arm Assembly: *See "Valve System" in Buick Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 18° BTDC. Close 82° ALDC.
Exhaust Valves - Open 62° BLDC. Close 38° ATDC.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

V8 ENGINES

ENGINE SPECIFICATIONS: Own. 90° V8, valve-in-head. Aluminum block with cast iron cylinder liners of same design used previously.

Bore	Stroke	Displacement	Rated HP
3.50"	2.80"	215 cu. ins.	39.2

Engine	Compr. Ratio	Developed HP
Standard	9.0-1	155 at 4600 RPM
Power Pack	10.25-1	185 at 4800 RPM
Export	7.6-1	145 at 4600 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

►*ENGINE OPERATION IN LOW OCTANE AREAS (Foreign Travel):* Minimum fuel rating for satisfactory performance is as follows:

9.0-1 Compr. Ratio - 93 (Research), 83 (Motor).
10.25-1 Compr. Ratio - 99 (Research), 84 (Motor).
7.6-1 Compr. Ratio - 83 (Research), 74 (Motor).

►*ALUMINUM ENGINE SERVICE CAUTION:* This aluminum engine requires special gasket and bolt lubricants, special torques and special handling precautions. *See "Aluminum Engine Service Cautions" in Buick Special Data.*

OIL PAN REMOVAL: Drain oil and remove steering idler arm bracket-to-crossmember attaching bolts, then remove lower flywheel housing. Remove oil pan bolts and lower pan enough to remove oil pump pipe and screen-to-cylinder block bolts. Rotate crankshaft for maximum clearance of forward end of oil pan. Move front of pan to right and lower pan through opening between crossmember and steering intermediate shaft.

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Buick Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Buick Special Data.*

PISTONS

Aluminum alloy, cam ground, transverse slot, divorced skirt.

Clearance - .001-.0015" measured as follows: **On piston,** ¼" below oil ring groove at right angles to piston pin. **In bore,** at right angles to crankshaft 1½" from top of cylinder bore. Piston and bore should be at same temperature.

Removal - Pistons and rods removed from above.

Replacement Pistons: Furnished Std. & .010" Oversize.

Installing Pistons: Pistons may be installed on rods in either direction. Piston pins are not offset and pistons are concentric. *See Rod Installation.*

PISTON PIN

Pin is pressed fit on connecting rod.

Diameter - .8747-.8750". **Length** - 2.870".
Clearance in Piston - .0001" select. At 70°F.
Clearance in Rod - .0007-.0015". Press fit.

Piston Pin Removal & Installation: *See "Piston Pins" in Buick Special Data. CAUTION - Pistons may be damaged if special procedure and tools not used.*

Replacement Pins: Furnished in Std. size only.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.077-.078"	.010-.020"	.003-.005"
Oil (3)	.181-.187"	.015-.035"	.0035-.0095"

►*COMPRESSION RING INSTALLATION NOTE: Install both rings with identification mark up.*

Replacement Rings: Furnished standard size only.

CONNECTING ROD

Length - 5.660" (Center to Center).
Crankpin Journal Diameter - 2.000".
Bearings - Steel backed Durex 100A. Precision type.
Clearance - .0002-.0022".
Side Play - .006-.014" (Total both rods).

Replacement Bearings: Furnished Std., .001", .002", .010", .020", .021" Undersize.

Installing Rods: Install piston and rod assembly in engine with boss on rod and cap **forward** (right hand cylinders), **rearward** (left hand cylinders) with oil spurt hole upward.

CRANKSHAFT

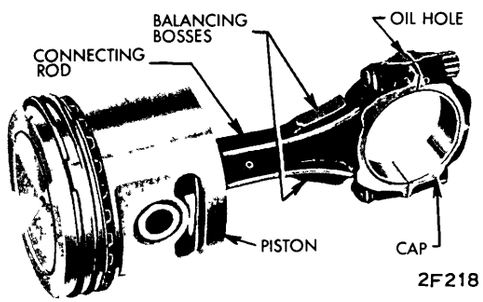
►*MAIN BEARING CAP IDENTIFICATION NOTE & INSTALLATION CAUTION:* No. 2 & 3 main bearing caps for both V6 and V8 engines are stamped with identifying numbers and must be installed in correct locations. V8 engine caps are identified by the numbers to the right of arrow on cap. V6 engine caps are identified by the numbers to the left of the arrow. Numbers are listed below.

Main Bearing Cap Identifying Numbers

Engine	No. 2 Cap	No. 3 Cap
V6	2-6 ↑ 3-8	3-6 ↑ 2-8
V8	3-6 ↑ 2-8	2-6 ↑ 3-8

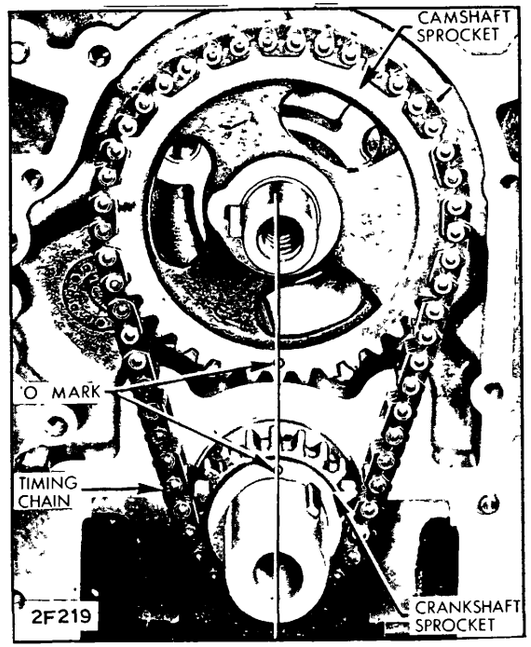
Crankshaft Journal Diameter - 2.2992". Five bearings.

Bearings - Steel backed Durex 100A. Precision type. Bearing halves are not alike and not interchangeable in cap and crankcase. Front two and rear two assemblies are identical, center bearing flanged for end thrust control. *CAUTION - Ends extend slightly beyond parting surface to fit tightly and not turn. DO NOT FILE FLUSH WITH PARTING SURFACE.*



Clearance - .0005-.0021".

Replacement Bearings: Furnished Std., .001", .002", .003", .010" Undersize.



End Thrust: Taken by center No. 3 main bearing.
Endplay - .004-.008".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Buick Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Buick Special Data.*

PISTON & ROD ASSEMBLY

VALVE TIMING MARKS

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Buick Special Data.*

FLYWHEEL REPLACEMENT: *See "Flywheel" in Buick Special Data.*

CAMSHAFT

Journal Diameters - 1) 1.785-1.786". 2) 1.755-1.756". 3) 1.725-1.726". 4) 1.695-1.696". 5) 1.665-1.666".

Bearings - Steel backed babbitt. *NOTE* - Bearings must be line reamed after installation.

Clearance - .0005-.0035". Wear limit .0015-.004".

Endplay - .004-.008".

Timing Chain: Link belt. **Width** - .875". **Pitch** - .375". **Length** - 54 links.

Camshaft Setting: "O" marks on camshaft and crankshaft sprockets adjacent and in line across shaft centers.

Engine Front Cover: *See "Engine Front Cover" in Buick Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Buick Special Data.*

VALVES

Tappet Clearance: *None in service (hydraulic).*

Valve	Head Diam.	Stem Diam.	Length
Intake	1.500"	①	4.605"
Exhaust	1.3125"	③	4.605"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.383"	②
Exhaust	45°	.383"	④

① - .3412" (top), .3407" (bottom).
② - .0005-.0025" (top), .0015-.0035" (bottom).
③ - .3407" (top), .3397" (bottom).
④ - .001-.003" (top), .002-.004" (bottom).

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Valve Seat Width - 1/16-5/64" (all valves)

►*VALVE SEAT NOTE* - *Seats are "Sintered Iron" shrunk fit at time of assembly and are not replaceable*

►*VALVE GRINDING CAUTION* Normal height of valve stem above valve spring seat surface is 1.825". Grind off stem or replace valve when stem is raised more than .050" above normal

Valve Springs: Single valve spring used (no inner spring or damper). Install with closed coil end toward cylinder head

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Closed	64	1.640"
Open	168	1.260"

Valve Guides: Drive out old guide from combustion chamber side with Tool J-267. Lubricate and install new guide with Tool J-8813. Tool will bottom when guide properly installed. *NOTE* - Service guides are .001" larger outside diameter for good fit in aluminum head. Ream valve guides to correct size after installation with Reamer J-8814.

Hydraulic Valve Lifters: Barrel type.

Diameter - .8422-.8427" **Clearance in Block** - .0015-.003"

Lifter Overhaul & Testing - *See "Valve System" in Buick Special Data*

Rocker Arm Assembly: *See "Valve System" in Buick Special Data*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above

Valve Timing Specifications

Intake Valves - Open 29° BTDC, Close 71° ATDC

Exhaust Valves - Open 67° BLDC, Close 33° ATDC

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM See "Engine Lubrication" under OILING SYSTEM in Buick Special Data*

Crankcase Capacity: 4 qts. (refill), 5 qts. (dry). Add 1 qt. with filter change.

Normal Oil Pressure: 33 lbs. at 2400 RPM

Pressure Regulator Valve - In oil pump cover. *NOTE* - Regulator relief valve cap not drilled for pressure indicator switch. Switch located in bypass valve cap.

Oil Pressure Indicator: Oil pressure indicator light in Instrument Cluster controlled by oil pressure switch in cap of oil bypass valve in oil pump cover. Lights when ignition turned on and goes out when oil pressure reaches a safe level.

Engine Unit - AC No. 1194214

Oil Pump: Spur gear type, mounted in engine front cover and driven by distributor drive shaft.

Oil Pump Overhaul - *See "Oiling System" in Buick Special Data*

Oil Filter: AC full-flow type, mounted on oil pump cover at right front of engine. Replace element every 4,000 miles. *NOTE* - Bypass valve in oil pump cover bypasses oil directly to engine when pressure differential between inlet and outlet ports reaches 4½-5½ lbs.

Replacement Filter Element - AC No. PF-7

►*OIL FILTER INSTALLATION CAUTION* DO NOT use a wrench to tighten filter. Tighten by hand until gasket contacts sealing face, then tighten an additional 2/3 turn. This supersedes previous instructions.

Crankcase Ventilation: Standard Cars - Air is drawn in through a ventilation cap in left rocker arm cover and drawn out through right rocker arm cover vent pipe, past a baffle that prevents oil being exhausted through vent pipe. Vent pipe extends down from lifter cover.

Positive Crankcase Ventilation Cars - Same as above, except that right rocker arm vent is connected by hose directly to plate located between carburetor and intake manifold. A spring loaded check valve is used to restrict ventilation system flow whenever intake manifold vacuum is high. *See "Closed Crankcase Ventilation Systems" in Carburetion Section*

ENGINE COOLING SYSTEM

Water Capacity: 12 qts. (V8), 10½ qts. (V6). Add 1½ qts. for heater.

Pressure Valve: 15 lbs. radiator filler cap.

NOTE - Use of lower test filler cap will cause engine to heat with eventual loss of coolant.

Thermostat: Pellet type, located in forward (outlet) end of intake manifold. Opens at 167-172°F.

Water Pump: Packless sealed ball bearing type with aluminum housing. *NOTE* - Shaft seal and impeller are the only replaceable parts. *See "Cooling System" in Buick Special Data.*

Pump Removal - 1) Drain cooling system, loosen belts and remove fan blade and pulleys from hub on water pump shaft and remove belts.

2) Disconnect hose from water pump inlet and heater hose from nipple. Remove water pump-to-timing chain cover bolts and remove pump.

Temperature Indicator: Temperature indicator light in Instrument Cluster controlled by water temperature switch in intake manifold. Bulb will light when starter switch turned on (grounded circuit) to test bulb, and when water temperature reaches 248°F (indicating cooling system not functioning properly).

Engine Unit - AC No. 1993582

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

ENGINE

ENGINE REMOVAL (WITH TRANSMISSION): *CAUTION - Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.* Proceed as follows:

1) Drain cooling system, crankcase and transmission. Remove hood top panel, disconnect battery and wires from generator. Remove upper and lower radiator hoses and remove radiator core. Remove fan and vibration dampener and loosen distributor.

2) Disconnect power steering pump to valve body hoses at pump and install caps on fittings to prevent oil leakage. Disconnect refrigerant lines, see Caution above. Disconnect all heater hoses at water pump, power brake vacuum line at intake manifold. Remove carburetor air cleaner, disconnect carburetor linkage and fittings and remove carburetor.

3) Remove transmission linkage slush deflector and disconnect throttle valve levers and speedometer cable at transmission. Disconnect flexible fuel line at steel fuel line and engine to cowl ground straps, primary wire at coil, oil pressure and cooling system temperature switch wires. Remove coil and disconnect wire to procelain resistor.

4) Remove two center-bearing-support to frame bolts (Nuts are tack welded and should remain fastened to support), "U"-bolts and locks at rear axle pinion, slide propeller shaft and front yoke off transmission mainshaft and through frame tunnel section. DO NOT nick yoke. Remove intermediate support.

5) Remove wires from starter and disconnect exhaust pipe at exhaust manifolds. Disconnect front motor support screws at frame idler arm support screws from frame and lower idler arm and steering connecting link.

6) Install rope or chain around intake manifold, attach hoist and take weight off engine supports. Disconnect and remove rear engine support bracket from frame and extension housing. Lift engine with transmission out.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD REMOVAL: There are six lengths of cylinder head screws used. Carefully note length and position of each cylinder head screw for correct reinstallation.

CYLINDER HEAD INSTALLATION: Use a Torque Wrench and tighten cylinder head capscrews starting from the center row of bolts and working outward and toward each end.

Cylinder Head Gasket - Install with side stamped "Top" UP.

Tightening Torque - See Tightening (Torque Wrench) Specifications.

ORIGINAL BORE & PISTONS

ORIGINAL PRODUCTION ENGINE BORE & PISTON SIZES: Piston and cylinder bore size indicated by a letter ("A" through "M" less "F", "G" & "I") in steps of .0002". Letter stamped on top face of block either to right or left of each cylinder bore. Sizes range from 4.0000-4.0002" to 4.0018-4.0020" (Cylinder Size), 3.9990-3.9992" to 4.008-4.0010" (Piston Size). *NOTE* - A cylinder with letters "AA" stamped on block would have a diameter of 4.0010-4.0102" and a piston diameter of 4.018-4.011".

PISTONS

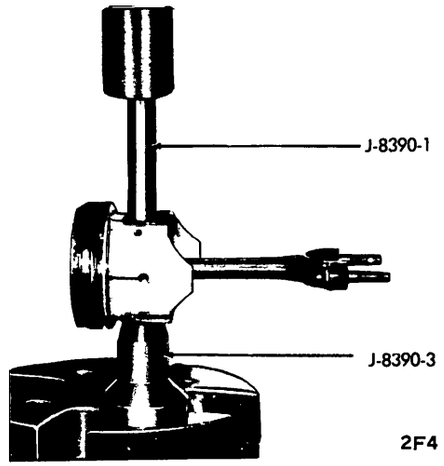
FITTING NEW PISTONS: Pistons should be measured for size 1/8" below upper cross slot and 1/8" to either side of vertical slot. Cylinders should be measured 1 1/4" from top, crosswise to cylinder block.

PISTON PINS

PISTON PIN REMOVAL: Place Piston Pin Support J-8390-3 on arbor press and place piston assembly on support with "REAR" marked **upward.** Insert pilot end of Remover J-8390-1 into piston pin and press pin out of piston and connecting rod. *NOTE* - Keep pins in order for reinstallation.

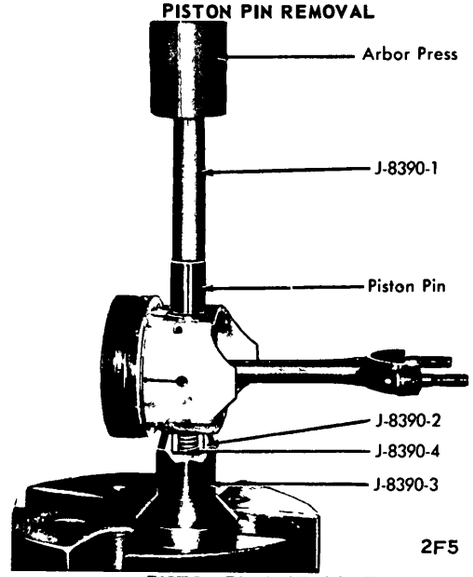
PISTON PIN INSTALLATION: Lubricate piston pins and piston pin holes in piston with engine oil. Place Support J-8390-3 on press with Spring J-8390-4 and Spacer J-8390-2 in position on Support. Place connecting rod on its respective piston so that when assembly is installed in engine, side of piston marked "Rear" is toward rear of engine and number on lower end of rod is down. Nos. 1,3,5,7 (Left bank), 2,4,6,8 (Right bank). Place assembly on Support and place pin in position. Place Pin Remover & Installer J-8390-1 on piston pin and press pin in until it bottoms on spacer in Support.

VALVE SYSTEM



ROCKER ARMS

ROCKER ARM ASSEMBLY: Remove rocker arm covers. Remove secondary wiring and distributor cap as an assembly. Remove four cylinder head cap screws which hold rocker arm assembly to cylinder head and remove rocker arm assembly.



Disassembly & Reassembly: See illustration for correct order of parts. Parts can be removed from shaft by removing cotter pin at end.

Installation: Install rocker arm assembly in position on cylinder head with notches on each end of rocker shaft pointing downward and toward center of engine, and rocker arm brackets with larger machined surface next to head. Install four cylinder head screws and tighten to specifications. Install rocker arm covers and secondary wiring with distributor cap assembly. Tighten cover screws to specifications.

CONTINUED FROM PRECEDING PAGE

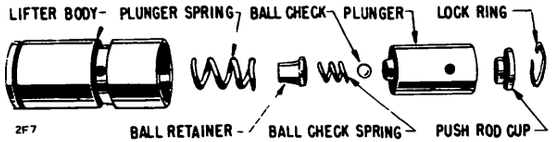
HYDRAULIC LIFTERS

VALVE LIFTERS: Hydraulic, Barrel Type. Consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet or body (See illustration). Oil is introduced to this unit from main oil gallery through hole in side of lifter plunger and body.

Testing Lock Down Rate (On Engine): *NOTE - Procedure below requires use of Lifter Leak Down Rate Tester J-3074 which is designed for this purpose.* 1) On Air Cond. Cars, remove rear bracket and loosen generator. Remove resistor wire from porcelain resistor at coil. Remove distributor cap, coil, and rocker arm covers. Set timing at "C" mark and observe position of distributor rotor. Check each lifter as outlined in the following table:

With rotor at No. 1 firing position (pointing toward rear of engine), check each lifter as shown below.

No. 1 Int. & Exh.	No. 2 Int. & Ex.	No. 3 Exhaust
No. 4 Exhaust	No. 5 Intake	No. 7 Intake
No. 8 Int. & Exh.		



Rotate crankshaft one complete turn and with rotor at No. 6 firing position (pointing toward front of engine) check:

No. 3 Intake	No. 4 Intake	No. 5 Exhaust
No. 6 Int. & Exh.	No. 7 Exhaust	

2) Insert feeler gauge of tool between valve stem and rocker arm, at the same time compress the tool "pop-out" spring against the valve spring retainer. *NOTE* - Tool should be installed as quickly as possible to avoid any unnecessary leak down of lifter. Note the interval of time during which tool is held in place by valve spring pressure. It will be found through this test that noisy lifter or lifters will have the shortest leak down time.

Removal - Pushrod holes in cylinder block enlarged to permit removal of valve lifters without removing intake manifold. Remove rocker arm assembly and pushrods, then remove lifters with mechanical finger or magnet attached to long rod.

Disassembly: Press down on center of valve lifter pushrod cup, and with pointed tool remove lock wire from groove. Invert lifter and slide out pushrod cup, plunger, ball, snap spring, ball retainer and spring. *NOTE* - If plunger is stuck in body, place lifter, pushrod end down, in Valve Plunger Remover Tool J-4160. Holding tool firmly in hand with thumb over lifter body, strike tool sharply on block of wood until plunger falls out of body.

HYDRAULIC VALVE LIFTER

Cleaning & Inspection: Wash all parts in a suitable carbon solvent and remove all trace of carbon and varnish. Inspect plunger and lifter body for scoring or other damage that would prevent free movement. Inspect lower end of lifter body for nicks or indentations. If any exist replace complete lifter assembly. Dry lifter parts with air, then install plunger in lifter body without other parts and check for free movement. Plunger should drop of own weight into body bore.

Reassembly: Place ball on its seat in lower end of plunger while holding plunger upside down. Place small spring on ball. Position ball retainer over ball and end of plunger. Move retainer up and down to be sure spring is in working order. Place spring over ball retainer. Lower lifter body over plunger assembly on an angle to seat spring. If necessary probe with a small wire through oil hole to allow assembly to be seated. Turn assembly right side up and fill plunger with clean engine oil. Jiggle ball with a small piece of wire until oil drains out of plunger into body and trapped air is released from body. Refill plunger with oil and place pushrod cup on plunger. Position lock wire over cup. Using Valve Lifter Lock Wire Installer J-2730, press lock wire into groove.

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT REMOVAL (Engine in Car): Place stands under car at all four wheels. Remove timing chain and sprockets. Remove transmission and flywheel flex plate. Remove steering gear idler arm from right frame side bar and lower steering linkage to floor. Remove oil pan, oil pan baffle and oil pump. Remove spark plugs, disconnect connecting rods and push piston assemblies up into cylinder bores. Remove front and rear main bearing caps support crankshaft at front and rear and remove three remaining bearing caps. Lower crankshaft.

REAR MAIN BEARING OIL SEAL: Raise car on stands and remove oil pan, oil baffle and oil pump. Remove rear main bearing cap and discard seal. Remove and discard upper seal from cylinder block. *NOTE* - Grooves in bearing cap and cylinder block must be clean, dry and free from burrs. Upper and lower seal are identical.

Upper Half Installation - Start seal in groove in block and rotate seal into position. Press firmly on both ends so it protrudes evenly on each side.

Lower Half Installation - Install lower half in cap with lip facing forward and one end of seal over ridge and flush with split line. Hold this end from slipping and push seal into position with pressure on other end. Seal must be pressed down firmly and protrude uniformly on each side. *NOTE - DO NOT apply pressure on lip.* Coat surface of cap and block with .010" thick film of rubber cement but do not get cement on seal lip or bearing surface. Lubricate lip of seal with thin film of engine oil.

►*REAR MAIN BEARING INSTALLATION CAUTION:* For proper alignment of thrust surfaces of rear main bearing proceed as follows: Install upper and lower inserts in block and bearing cap. With rear oil seal in place and mating surfaces clean, install bearing cap and tighten screws to 1-2 ft. lbs. torque. Using a plastic hammer, drive crankshaft forward, then rearward, then forward again (*CAUTION* - Pound on counterweights, not on connecting rods). Tighten bolts evenly to specifications. Check to make sure crankshaft is not binding.

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove Air Conditioner Condenser, *see "Air Conditioning" in Miscellaneous Section.* Remove radiator, timing chain and sprockets and remove valve lifters. Remove fuel pump and fuel pump pushrod. Slide camshaft forward carefully out of engine. *CAUTION* - DO NOT scratch camshaft bearings with camshaft lobes.

Camshaft Bushing Removal & Installation: Use Bearing Remover & Installer Tool J-3063 to pull old bushings out. Install new bushings with same tool and see that oil holes in bushing line up with oil holes in block (check oil leads with piece of wire after tool removed).

Camshaft Installation: Lower camshaft into position between radiator grille and engine and guide it carefully into cylinder block. Be sure distributor is timed correctly when inserting camshaft. Reverse removal procedure.

OILING SYSTEM
ENGINE LUBRICATION

ENGINE LUBRICATION: Force feed type of lubrication with oil supplied under pressure to crankshaft, connecting rod, and camshaft bearings, valve lifters, rocker arm bearings and metered to upper rocker arms for pushrod surface and valve lubrication. Oil is supplied from rear main bearing for lubrication of oil pump drive shaft. All other moving parts of engine are lubricated by gravity flow or splash. See "Engine Oil Flow" diagram.

OPERATION: Gear type oil pump mounted on rear main bearing cap (driven by distributor drive shaft) draws oil through a screened intake floating on oil in crankcase and delivers it through full flow oil filter and to vertical oil header which feeds rear main bearing. This header delivers oil to an intersecting Right Longitudinal Header and through a connecting header, to the Left Longitudinal Header. Upper end of vertical header is plugged. Rear end of right longitudinal header supplies oil through cylinder block and head to right rocker arm shaft, left longitudinal header supplies oil at front end through cylinder block to left rocker arm shaft. Oil from cylinder heads drains back directly to crankcase through left front and both rear holes in each cylinder head. The hole in front end of right cylinder head drains oil back through head and matching hole in block to engine front cover for lubrication of timing chain and sprockets. A drilled hole at rear of valve lifter compartment returns lifter compartment excess oil to crankcase.

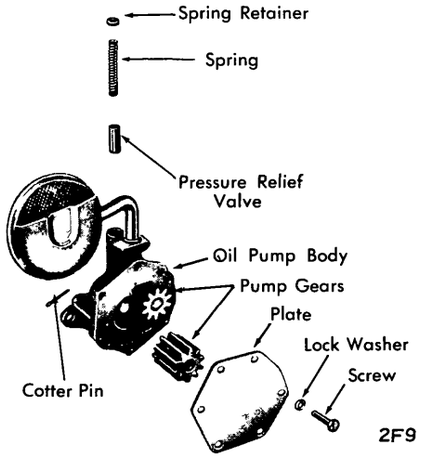
Crankshaft, Connecting Rods & Pistons - Vertical header at rear main bearing supplies oil to rear main bearing. The right longitudinal header supplies oil to the front and center main bearings. The left longitudinal header supplies oil to the two intermediate main bearings. Drilled passages in crankshaft supply oil from main bearing journal to connecting rod journal for connecting rod bearing lubrication. Oil is forced out groove in connecting rod bearing cap against cylinder walls for piston lubrication. Piston pins receive oil through drilled passage in piston.

Camshaft, Sprockets and Lifters - Rear camshaft bearing is supplied oil from the connecting header. All other camshaft bearings receive oil from drilled passages in block from respective main bearing. Oil pressure switch is screwed into upper end of connecting header. Drain back hole in front end of right cylinder head returns surplus oil to engine front cover for tim-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ing chain and sprocket lubrication. Each longitudinal header supplies oil through drilled passages in block to its respective bank of valve lifters.



Rocker Arms, Valves & Pushrods - Oil is supplied to rocker arm shaft on right bank from rear end of right longitudinal header through a vertical branch in cylinder block and head. The left rocker arm shaft is supplied through a vertical branch in cylinder block and head at front end of left longitudinal header. Rocker arm shafts are plugged at each end. One hole in bottom of rocker arm shaft intersects a 45° groove and supplies oil evenly under loaded area of each rocker arm. The other hole is mismatched with an angular passage in the arm and meters oil to the pushrod end of the arm for lubrication of the pushrod surface in the arm. From this point oil flows down to the opposite end of the arm for valve tip lubrication.

OIL FILTER: Full Flow Type - Mounted on pad on right rear side of crankcase. Oil inlet (from pump) and outlet (to engine oiling system) channels are located in mounting pad and filter mounting bracket.

OIL PUMP

OIL PUMP REMOVAL: Remove oil pan, oil pan baffle and two nuts holding oil pump to rear main bearing cap and remove oil pump assembly. *NOTE* - Pump drive shaft is now loose and should be removed.

Disassembly: Remove cotter pin securing oil pressure regulator valve spring and spring retainer in body and remove valve and spring. *NOTE - Do not lose retainer when removing cotter pin.* Unlock and remove six cover plate-to-housing screws and remove plate. Slide idler gear off idler shaft in pump and press collar off drive shaft. Slide pump drive gear out of pump body.

OIL PUMP ASSEMBLY

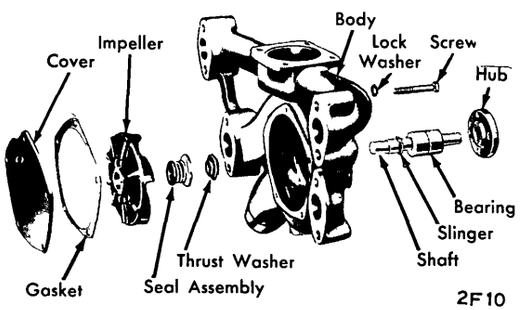
Inspection: Inspect strainer screen for dirt and clean thoroughly. Inspect oil pressure regulator valve for nicks and burrs. Check free length of regulator valve spring. Inspect drive gear and idler gear for nicks and burrs.

Oil Pump Specifications - Backlash between drive gears - .008-.012". Clearance drive shaft to pump body - .0010-.0025". Wear limit .005". Endplay in pump gears - .001-.004". Wear limit .006".

Spring Free Length - 2 21/32". **Spring Pressure** - 5 1/4-5 3/4 lbs. at 1 7/16".

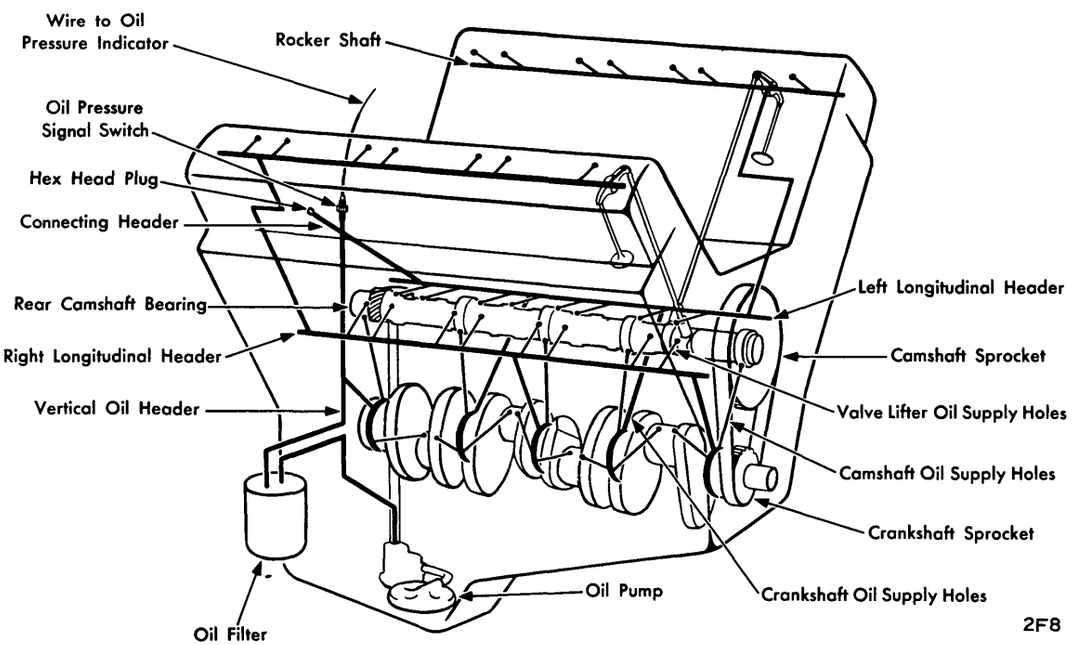
Assembly: Install oil pump drive gear in oil pump body. Press collar on end of drive shaft and slide idler gear into pump body, meshing gear with drive gear. Install oil pump cover plate and secure screws with new locks. Slide regulator valve, spring and retainer into pump body and install cotter pin.

Installation: Install oil pump drive shaft. Place pump assembly on studs so drive shaft does not bind against block and install two nuts and lockwashers and tighten to specifications.



COOLING SYSTEM

WATER PUMP REMOVAL: Non-Air Conditioned Cars - Remove air cleaner, drain cooling system, and disconnect all hoses from water pump. Remove steering pump and generator belts. Disconnect throttle return spring, disconnect steering pump bracket and move pump and bracket to one side (do not disconnect hoses). Remove water pump attaching screws and remove water pump and fan.



Air Conditioned Cars - Remove air cleaner, drain cooling system and disconnect all hoses from water pump. Remove all belts. Move power steering pump and bracket to one side (do not disconnect hoses). Remove fan, fan clutch, and fan pulley. Remove water pump-to-cylinder block screws which also hold Freon compressor front mounting bracket to water pump flanges. Remove compressor front mounting bracket-to-cylinder head screw. Remove compressor front mounting bracket brace-to-water pump screw. Remove water pump attaching screws and remove pump.

Disassembly: Remove thermostat housing, thermostat, fan blade assembly, cover plate and gasket. Use Impeller Puller No. J-3211 to remove impeller. Remove seal assembly and washer from body. Press shaft out through front of pump body. Discard shaft.

CONTINUED ON NEXT PAGE

WATER PUMP ASSEMBLY

CADILLAC ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING PAGE

Inspection: Check impeller blades for improper clearance or excessive wear and check spring loaded seal for wear or cracks. Check shaft bearing for roughness or excessive endplay. To refinish seal surface, place Seal Seat Refinisher Fixture J-8759 in vise and place water pump housing face down on fixture. Install pilot in fixture and use flat side of fine valve grinding stone (large enough to cover surface of casting). Use short grinding intervals and follow with refinish grinding stone. *NOTE* - If grinding increases distance from gasket surface to seal surface to more than 1 7/32", replace housing.

Reassembly: Place pump on Holding Fixture J-6855-1 so that center shaft of fixture does not line up with hole in water pump housing. Install new shaft Assembly with Tool J-3249. *NOTE - DO NOT install shaft without installer J-3249 as shaft bearings will be damaged.* Turn pump over and install thrust washer and seal assembly over driving lugs of shaft space slinger. Washer should slide freely. Use arbor press to install impeller on shaft assembly, until outer face of impeller vanes is .005-.010" below back face of water pump. Position fixture on pump so center shaft touches end of pump shaft assembly. Align hub on shaft and press it on until flush with top of shaft. Hub should be positioned on shaft as follows:

On Non-Air Cond. Cars, with assembly in same position, place .080" Hub Spacer J-3249-2 on bottom of Hub Installer J-3249 then position both on hub and shaft and press until tool bottoms on shaft. **On Air Cond. Cars,** same as above except without .080" Hub Spacer J-3249-2. Rotate shaft to check for hub runout. Use gasket cement when installing cover and tighten screws to 15 ft. lbs. Rotate shaft to be sure impeller has clearance. Install pulley and fan assembly and tighten screws to 20 ft. lbs. Install thermostat in pump body, coat housing and flange with cement and tighten screws to 12 ft. lbs.

Installation: Reverse removal procedure. Run engine and check for leaks.

►*JACKING & HOISTING (ALL MODELS): Before jacking, hoisting, towing or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

►*STARTING CAR BY PUSHING: Car CANNOT be started by pushing because of transmission design.*

►*PARKING BRAKE VACUUM RELEASE CAUTION: Before working on engine with engine running and car in gear, disconnect vacuum supply hose from right hand connector of vacuum switch on neutral safety switch and tape switch opening closed.*

MODEL IDENTIFICATION

ENGINE SERIAL NUMBER: Stamped on lower left hand side of cylinder block between two welch plugs just above edge of oil pan, and on top of frame on left hand side member just behind radiator. *NOTE* - Number (example below) includes identification data as follows:

① ② ③
62 L 000001

① - Year model - 1962.
② - Body Code - *See Series Designation Table below.*
③ - Beginning Engine Serial Number.

Series Designation

Series	Body Style	Body Code
60	6039 Sedans, Sixty Special	M
62	6229 Sedan Six Window	K
62	6239 Sedan Four Window	N
62	6247 Coupe	G
62	6267 Convertible	F
62	6289 Sedan, Four Window	A
62	6329 Sedan DeVille, Six Window	L
62	6339 Sedan DeVille, Four Window	B
62	6347 Coupe DeVille	J
62	6367 Eldorado Biarritz	E
62	6389 Sedan Short Deck	D
75	6723 Sedan, Nine Pass.	R
75	6733 Limousine, Nine Pass.	S
CC	6890 Commercial Chassis	Z

Engine Unit Number: Stamped on bell housing portion of crankcase behind left hand cylinder block directly above cast rib. *NOTE* - "L.C" after unit number indicates low compression engine. Mark * following unit number indicates .010" oversize bore and pistons.

Body Style	Engine Unit Prefix
6039; 6229, 47, 67, 89; 6329, 39, 47, 67, 89 (Less AC)	26X
6039; 6229, 47, 67, 89; 6329, 39, 47, 67, 89 (With AC)	26K
6723, 33; 6890 (Less AC)	27X
6723, 33; 6890 (With AC)	27K

TUNE-UP

►*FLUTTERING OR WARBLING NOISE CORRECTION (Cars with Carter Carburetors):* This noise noted with engine idling and transmission in Drive or Neutral and can be eliminated by pumping brakes (causing large vacuum flow into brake unit). Caused by vibration of metal web of carburetor-to-intake manifold steel shim. Correct by installing new type shim, Part No. 1480387 (shim redesigned to prevent this vibration).

COMPRESSION PRESSURE: 165-185 lbs. (Cranking Speed), 212-230 lbs. (1000 RPM) with throttle wide open. Maximum variation between highest and lowest cylinders should be less than 20 lbs.

VALVE TAPPET CLEARANCE: None. Hydraulic lifters.

MANIFOLD HEAT CONTROL: Automatic thermostatic type, located between left exhaust manifold and pipe. Valve controls flow of exhaust gases from left cylinder head through ribbed passages in intake manifold with a branch passage that warms carburetor in region of primary throttle valves and idle ports.

CRANKCASE VENTILATION VALVE: Service at every engine oil change, and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs - AC No. 44. 14 mm. Torque to 25 ft. lbs.

COIL: Delco-Remy 1115134 (Service Replacement).

Ignition Current - 1.25 amperes with engine running.

Resistor - Resistance type wire (primary circuit) from switch to coil. Resistance wire by-passed by feed from starter solenoid during engine cranking period.

►*IGNITION COIL NOTE:* Identified by Brown Bakelite Insulator. DO NOT use these higher inductance coils and 1.35 ohm ignition feed harness on 1959 and earlier cars.

DISTRIBUTOR: Delco-Remy 1110988 (Early), 1111014 (Later). "Window" type.

►*DISTRIBUTOR PRODUCTION CHANGE:* Distributor No. 1111014 used in production beginning Engine No. 066509 with new centrifugal advance specifications. Vacuum Advance Specifications remain the same as for Distributor 1110988. *See Specifications below.*

Condenser - Delco-Remy 1932004. **Capacity** .18-.23 mfd.

Contact Point Set - Delco-Remy 1931988.

Breaker Gap - Breaker gap will be correct (.016") when cam angle correctly set.

Cam Angle - 28-32°. Set to 30°.

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance - 1110988

Degrees Distr.	RPM	Degrees Eng.	RPM
0-1½	400	0-3	800
2½-4	600	5-8	1200
5-7	1400	10-14	2800
7-9	2000	14-18	4000

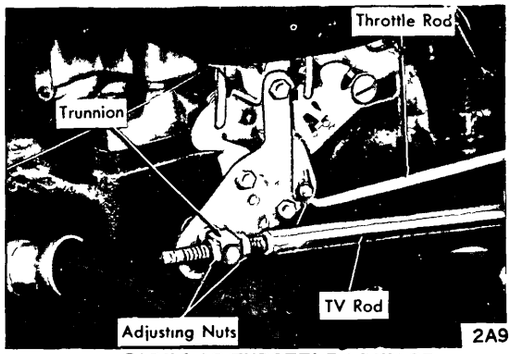
Automatic Advance - 1111014

Degrees Distr.	RPM	Degrees Eng.	RPM
0-1.5	400	0-3	800
2.25-3.75	600	4.5-7.5	1200
4.5-6.0	800	9-12	1600
6.25-8.0	1200	12.5-16.0	2400
7.75-9.75	1600	15.5-19.5	3200
8.0-10.0	2000	16.0-20.0	4000

Vacuum Spark Control: Delco-Remy 1116192.

Vacuum Advance - 1110988, 1111014

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	8-10
10½-12	21-24	13.25-15.25



IGNITION TIMING

Setting - 5° BTDC.

►*SETTING NOTE:* When fuel of 100 octane rating or better is not available, retard setting toward "C" mark to eliminate detonation.

Timing - Disconnect vacuum line at distributor (tape pipe). Adjust timing with engine idling at 480 RPM.

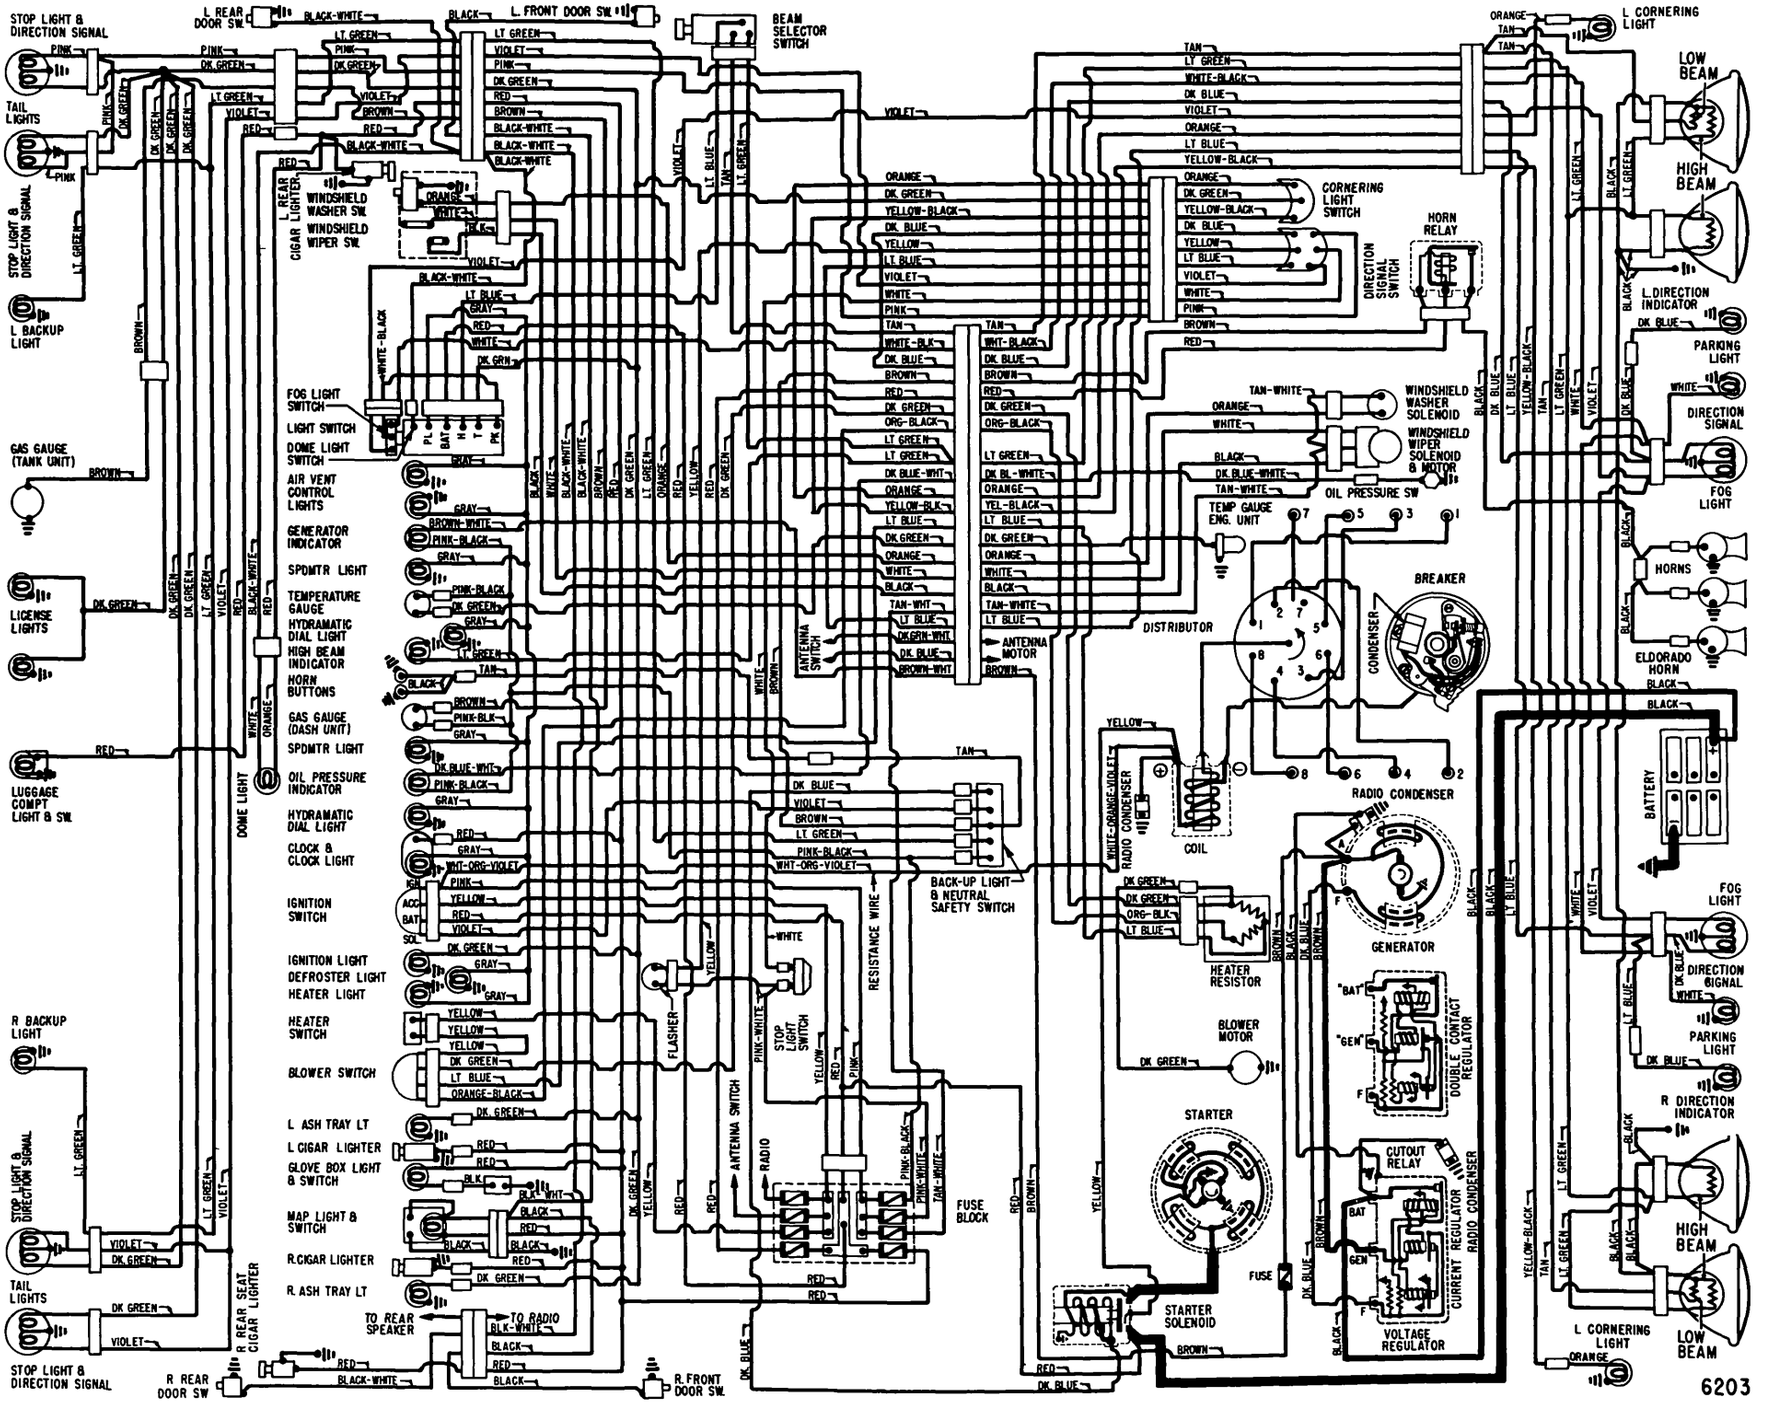
Timing Marks - Timing indicator on chain case cover and harmonic balancer marked "C", "5" and "10". "5" & "10" are degrees ahead of "C" mark (TDC).

CADILLAC THROTTLE LINKAGE ADJUSTMENT POINTS

CARBURETOR

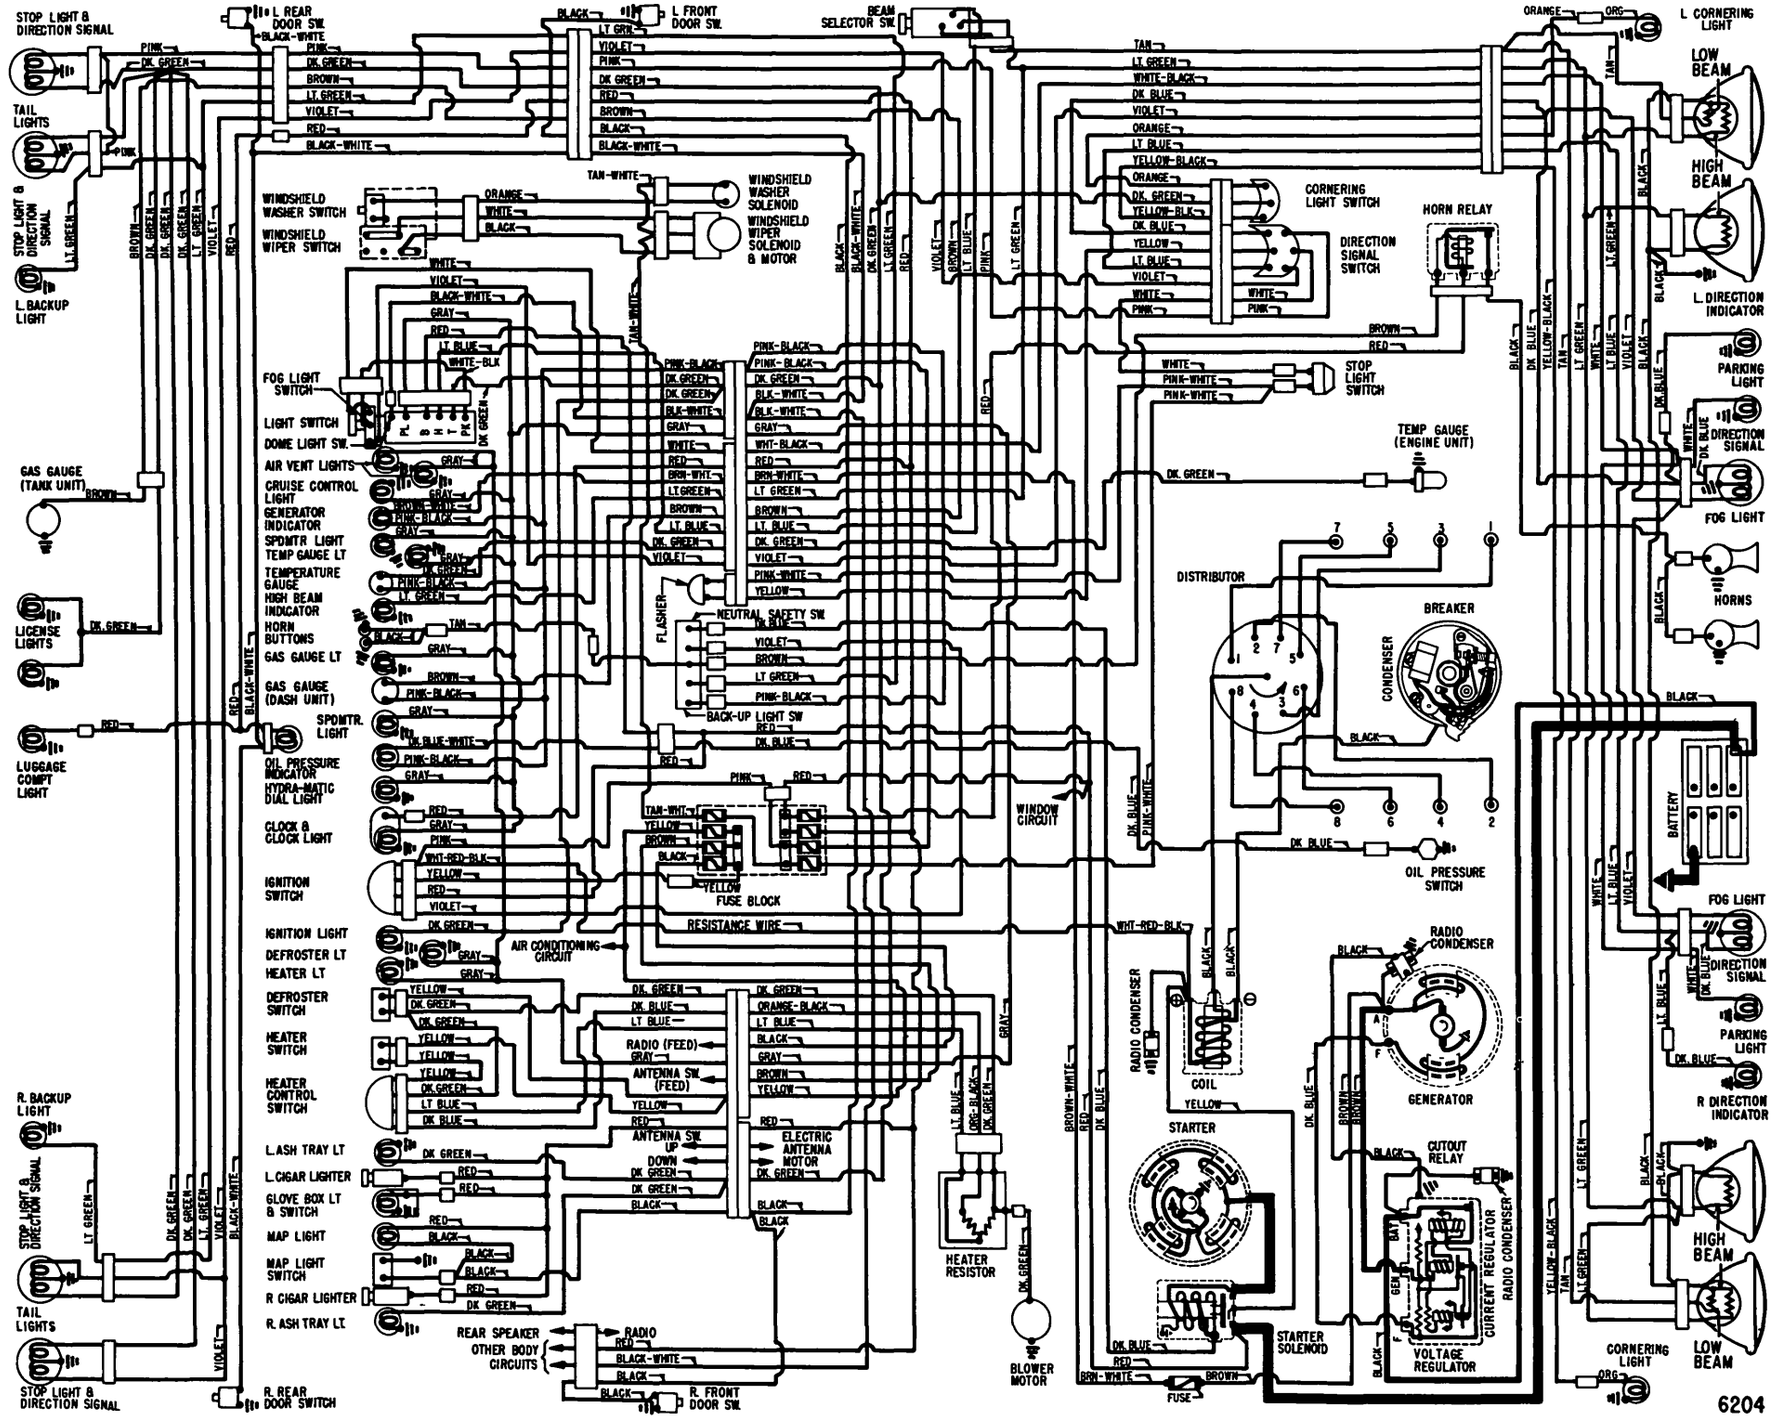
►*CARBURETOR APPLICATION: Carter and Rochester 4-Barrel carburetors used.*

►*CARTER CARBURETOR PRODUCTION CHANGE & IMPROVED LOW SPEED OPERATION & RESTARTING CHANGE:* New choke baffle which improves low traffic speed operation in cold weather and delays choke closing during brief engine shut-downs used in production beginning with Engine No. 083297 (approx.). *For installation of this choke baffle in earlier carburetors, see "Carter AFB 4-Barrel Carburetors" in in Carburetion Section.*



Idle Speed-Up Control Adjustment (Cars With Air Conditioning): With engine at normal operating temperature and slow idle adjustment completed, turn air conditioner "ON" and place transmission selector lever in "N" position. Adjust engine idle speed to 900-950 RPM by loosening locknut on diaphragm shaft and turning nut to obtain specified RPM. Tighten locknut.

Throttle Return Check Adjustment: Allow engine to idle and make sure that throttle check plunger is not in contact with throttle relay lever. Open throttle wide momentarily to allow engine manifold vacuum to drop and throttle check plunger to come out. Let throttle snap shut and observe delay caused by throttle check. If engine races, throttle check plunger is too long. If engine stalls, plunger is too short. Adjust plunger screw as necessary for correct operation. *NOTE* - Clearance between throttle check plunger and relay should be approximately .190" with engine running.



THROTTLE LINKAGE ADJUSTMENT: Remove clip from carburetor throttle rod trunnion and remove trunnion from relay bracket lever (at front of dash). Place a ¼" drill shank through gauging hole in relay lever and dash relay bracket. With engine running, set throttle lever to hot idle position (Air Conditioner turned "OFF"). Adjust carburetor throttle rod trunnion to allow free entry into dash relay lever and install trunnion and spring clip. Push end of throttle valve rod (rod from carburetor to transmission throttle lever) toward rear of car to position transmission throttle lever against its stop. Bring front jam nut on throttle valve rod against trunnion until all slack is taken up. **Then tighten nut 3 full turns.** Tighten rear jam nut. If 4-3 downshift cannot be obtained, check carburetor

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CADILLAC 60 & 62 SERIES WIRING DIAGRAM

CADILLAC 75 & CC SERIES WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

for wide open throttle and choke unloader with accelerator pedal fully depressed.

Accelerator Pedal Height Adjustment - Remove cotter pin from trunnion on inner side of accelerator pedal arm and remove trunnion from arm. Adjust trunnion up or down as required to obtain wide open throttle with pedal fully depressed. Assemble linkage, and install slush deflector.

ROCHESTER 4GC 4-BARREL

Rochester 4GC No. 7019030 (Std.), 7019031 (Air Cond.).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

►*IDLE ADJUSTMENT NOTE: See "Parking Brake Vacuum Release Caution" above.* Hose must be disconnected and vacuum fitting taped.

►*IDLE SPEED ADJUSTMENT NOTE:* Idle Air Bypass screw on throttle body used to adjust idle speed. Throttle valves are normally closed at slow idle.

Idle Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Rochester 4GC 4-Barrel Carburetors" in Carburetion Section.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 4GC 4-Barrel Carburetors" in Carburetion Section.*

CARTER AFB 4-BARREL

Carter AFB No. 3351S (Std.), 3352S (Air Cond.).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed 2-3-5-8, LEFT barrels feed 1-4-6-7.*

►*IDLE ADJUSTMENT NOTE: See "Parking Brake Vacuum Release Caution" above.* Disconnecting hose at this location eliminates vacuum leakage at neutral switch while making idle mixture adjustment.

►*IDLE SPEED ADJUSTMENT NOTE:* Idle Air Bypass screw on throttle body used to adjust idle speed. Throttle valves are normally closed at slow idle.

Idle Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC No. 713. Fuel only.
Pressure - 5¼-6½ lbs. at idling.

Fuel Line Filter: Located in line between fuel pump and carburetor. *NOTE* - Air Conditioned cars have special filter and orificed passages for returning fuel vapors to fuel tank.

Gasoline Gauge: AC electric type.
Dash Unit - AC No. 5643643 (Exc. Comm. Chassis), 5643115 (Comm. Chassis).
Tank Unit - AC. Used as follows:

Model	Std. Car	Air Cond. Car
All (Exc. Comm.)	5642342	5642343
Comm. Chassis	5642565	

Air Cleaner: Replaceable oil-wetted Polyurethane Foam element type. Replace element every 30,000 miles.

►*CAUTION:* Element should NOT be washed, oiled, tapped, or blown out with compressed air.

Cruise Control: Automatic speed control and warning device. *See "Speed Controls" in Carburetion Section.*

BATTERY

Delco No. 562. 12 volt, 11 plate, 70 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Engine to dash.

STARTER

Delco-Remy 1107799. Armature 1950563.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. min.

Performance Data

Torque	RPM	Volts	① Amperes
0 ft. lbs.	3600-5100	10.0	65
	Lock	3.5	300

① - Includes solenoid.

Starting Switch: Delco-Remy Solenoid Switch No. 1119910 mounted on starter and controlled by Ignition & Starter Switch Delco-Remy No. 1116618 (Ser. 75 & CC), No. 1116619 (Others).

Neutral Safety Switch: Combination Neutral Safety & Back-up Light Switch Delco-Remy No. 1993560, mounted on steering column.
Adjustment - *See "Dual-Coupling Hydra-Matic Drive" in Transmission Section.*

GENERATOR

Delco-Remy. Used as follows:

Series	Generator	Armature
All (Exc. 75,CC) Std.	1102315	1946719
All (Exc. 75,CC) Air Cond.	1102318	1939837
75, CC Std.	1102318	1939837

Performance Data

Generator	Amperes	Volts	RPM
1102315	35	14.0	2730
1102318	45	14.0	2520

Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 28 ozs.
Field Current - 1.48-1.62 amps. (1102315), 2.66-2.86 amps. (1102318) at 12 volts and 80°F.

Belt Adjustment: Adjust belt tension to 60 lbs. (used belt), 90 lbs. (new belt). *NOTE* - Use variable reading strand tension type gauge on belt midway between pulleys.

REGULATOR

Delco-Remy 1119002 or 1119168 (1102315 Gen.), 1119601 (1102318 Gen.). *NOTE - Regulator 1119601 is "Double Contact" type.*

►*NOTE: Specifications below are "Normal" Settings.*

Cutout Relay

Cuts In - 11.8-13.5 volts (1119002 & 1119168), 11.8-13.0 volts (1119601).
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting - 1119002 & 1119168) - 13.8-14.7 volts at ambient temperature of 125°F.
Setting (1119601) - 13.8-14.6 volts at 125°F ambient temperature when operating on upper contacts. .1-.3 volts lower when operating on lower contacts.
Contact Gap (1119601) - .016".
Air Gap - .075" (1119002 & 1119168), .067" (1119601) with armature pressed down to point where contacts just touch.

Current Regulator

Setting (1119002) - 32-37 amps. at 125°F.
Setting (1119601) - 42.5-47.0 amps. at 125°F.
Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-Remy 6 & 12 Volt Single Contact Regulators" and "Delco-Remy 1119600 Series Double Contact Regulators" in Electrical Section.*

MISC. ELECTRICAL

►*DIRECTION SIGNAL SWITCH CHANGE (To ensure switch turn-off after Right Turn completed):* New switch cam, Part No. 1479866, with new cam lobe contour used in production beginning Engine No. 075000 (approx.). If switch does not cancel after right turn completed on earlier cars, remove steering wheel and install new type cam. *For steering wheel removal, see "Saginaw Rotary Valve Power Steering" in Steering Section.*

Instrument Panel, Bezel & Cluster Removal (Ser. 60,62):
1) Disconnect battery and remove five screws retaining upper panel cover to lower panel. Raise upper panel enough to disconnect Map Light and Guide-Matic Phototube Unit 3-way connectors. Pull cover rearward to disengage hooks at front of cover from retainers on cowl and remove cover.
2) Instrument Panel Bezel - Remove instrument panel cover, see above. Remove radio manual selector and volume control knobs, springs, and speaker and tone control rings. Use Wrench J-6968 to remove selector control shaft nut. Disconnect one 6-way wire connector and one single connector from headlamp switch and fog lamp three-way connector. Disconnect light bulb socket and feed wire connector from clock. Remove bezel retaining nuts from left side of bezel and remove screw and nut from right side near clock. Remove screw holding bezel to cowl brace.
3) Instrument Cluster - Remove Instrument Panel Cover & Bezel, *see above.* Disconnect gauge wires from fuel and temperature gauges, speedometer cable at speedometer head and remove cluster bulb sockets. Disconnect odometer reset cable from lower flange of instrument panel, then remove cluster screws and cluster.
4) Fuel & Temperature Gauge - Remove upper panel cover (see above) and disconnect wires from gauge. Remove gauge-to-cluster retaining screws and remove gauge.
5) Speedometer - Remove instrument cluster, then remove eight back plate to cluster casting screws and remove back plate with speedometer head. Remove speedometer head from back plate.

Instrument Panel Cover & Cluster Removal (Series 75 & Comm.): Disconnect the battery and remove lower steering column cover and Hydra-Matic indicator pointer, Remove panel cover-to-lower instrument panel screws. Raise front edge of cover and insert wood block. *NOTE - Above procedure provides access to components.* Disconnect two harness connectors at firewall, headlight feed connector, ignition switch connector, shift indicator light, speedometer cable, and trip mileage cable. Disconnect Guide-Matic and Cruise Control. Unhook panel cover hooks from cowl retainers and remove cover.

Instrument Cluster - After cluster and panel assembly removed (see above), separate cluster from panel after marking bulbs and cluster for reassembly.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Fuel & Temperature Gaug - After cluster and panel assembly removed (see above), disconnect wires and remove gauges from cluster. If removed with cluster installed in car, raise panel cover (see above), loosen cluster harness from retaining clip for access, disconnect wires and remove gauge.

Speedometer - Separate speedometer from cluster after cluster and panel assembly have been removed (see above).

St p Light Switch Location: Mounted on flange protruding from brake pedal support bracket below instrument panel. **Adjustment** - Loosen switch mounting nut and adjust switch position so stop lights are on when brake pedal depressed ½".

CIRCUIT BREAKERS: 20 Ampere. On Headlight switch. Protects Head, Ash Tray, Fog, Instrument, Parking & Cornering lights.

40 Ampere. Horn (with Power Seats and Windows).

FUSES: In Fuse panel unless otherwise specified.

25 Ampere. Body feed (Cigar Lighters, Cloak, Courtesy lights, Glove Box, Map, and Trunk compartment lights).

25 Ampere. Windshield Wipers.

14 Ampere. Turn Signals and Stop Lights.

7½ Ampere. Radio.

9 Ampere. Indicators and Back-Up Lights.

25 Ampere. Air Cond. & Heater.

6 Ampere. Generator Tell-Tale. In right dust shield.

6 Ampere. Cruise Control. Cruise Control Brake Signal.

4 Ampere. Guide-Matic. At Amplifier Unit.

25 Ampere. Horn (without Power Seats & Windows).

ENGINE

ENGINE SPECIFICATIONS: Own. V8, valve-in-head.

Bore	Stroke	Displacement
4"	3 7/8"	390 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
10.5-1©	51.2	325 at 4800 RPM

© - 8.75-1 Export.

Compression Pressure - *See TUNE-UP.*

►*OVERSIZE CYLINDER BORE CAUTION:* Engines with mark * following Engine Unit No. have .010" oversize cylinder bore and pistons.

►*CYLINDER HEAD PRODUCTION CHANGE & VALVE GRINDING CAUTION:* New head, identified by code letter "Z" adjacent to center exhaust port, used in production after Engine No. 027755. This head has machining changes to prevent valve deposits and to increase valve spring pressures. *When valves ground on this cylinder head, shims must not be used under valve springs. See VALVE data below.*

ENGINE REMOVAL: *See "Engine" in Cadillac Special Data.*

OIL PAN REMOVAL: Disconnect battery ground strap and drain oil. Remove starter and heat control valve (swing exhaust pipe away). Lower idler arm support from frame side bar and remove oil pan-to-cylinder block screws and nuts and remove oil pan.

CYLINDER HEAD & MANIFOLDS: *See "Cylinder Head & Manifolds" in Cadillac Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Cadillac Special Data.*

PISTONS

►*ORIGINAL CYLINDER BORE CAUTION:* Engines with mark * preceding Engine Unit No. (on left rear of crankcase) have .010" oversize pistons and cylinder bore. Standard cylinder bore size 4.000-4.0020".

Original Bore & Pist ns - *See "Original B re& Pistons" in Cadillac Special Data.*

Pistons - Pistons have trough in head to provide fuel turbulance and clearance for valves at high speed.

Clearance - .0008-.0012". Measure piston with micrometer placed 1/8" below cross slot and 1/8" to either side of vertical slot, with piston at 70°F. Subtract .0001" for every 6° above 70°F.

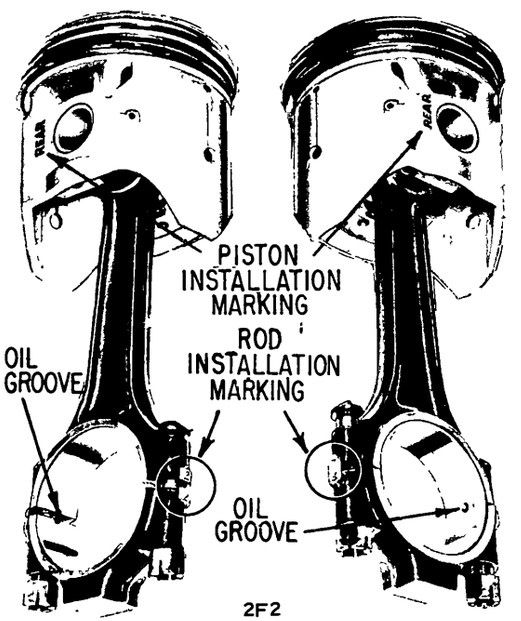
Removal - Piston and rod assemblies removed from above. Install connecting rod Guide Studs J-3224 on connecting rod bolts to guide rod out through bore without nicking or damaging it.

Fitting New Pistons: Use micrometer or feeler gauge *See "Pistons" in Cadillac Special Data.*

Replacement Pistons: Standard (3 sizes Code K,L,M) and .010" (3 sizes Code KK, LL, MM), .020" & .030" Oversize with rings and pins.

Installing Pistons: Install in cylinder with piston pin boss marked "Rear" toward rear of engine. *See "Connecting Rods" (below) for installation on rods.*

PISTON PIN



Pins are selective fit in pistons and not available separately. When high mileage wear sufficient to cause tapping or knock, replace piston and pin assembly.

Diameter - .9994-.9997". Length - 3 3/32".

Pin Fit in Piston - .00005-.0001" clearance at 70°F. Not fitted in field (replace piston & pin assembly).

Pin Fit in Rod - *(NOTE* - Special tools required). *See "Piston Pins" in Cadillac Special Data.*

Replacement Pins: Furnished with new pistons only.

RIGHT BANK LEFT BANK

CADILLAC PISTON & ROD ASSY

PISTON RINGS

Piston rings are 2-in-1 chrome set with side sealing type oil ring.

Ring	Width	End Gap	Sid Cl aranc
Compr. 1&2	5/64"	.013-.029"	.0022-.0035"
Oil	3/16"	.013-.029"	©

© - Three-piece type, side sealing.

Replacement Rings: Standard, .020" and .030" Oversize.

Installing Rings: Chamfered inner edge of both compression rings must be installed toward top of piston.

CONNECTING ROD

Length - 6.5" (center-to-center).

Crankpin Journal Diamet r - 2.2488-2.2493".

Out-of-Round Limits - .00025" maximum.

Bearings - Moraine 400. Bearing shell is steel backed aluminum. Bearing halves are interchangeable. No shims.

Clearance - .0005-.0020" (Service limit .0035").

Replacement Bearings: Furnished in standard size only.

Installing Rods: Install piston and rod in cylinder bore with REAR on piston toward rear of engine and numbers on lower end of rod down. Numbers 1, 3, 5, 7 are in left bank; 2, 4, 6, 8 are in right bank.

CRANKSHAFT

Journal Diameter - 2.625"

Out-of-Round Limits - 00025"

Bearings - Rear, Moraine Durex 100A. All other bearings are Moraine 400 Aluminum

Clearance - .0008-.0025". Wear limit .0045".

Replacement Bearings: Furnished in standard size only.

►*REAR MAIN BEARING ALIGNMENT NOTE:* For thrust bearing surface alignment *see "Crankshaft & Main Bearings" in Cadillac Special Data.*

End Thrust: Taken by flanged rear main bearing.

Endplay - .001-.007". Wear limit .010".

Crankshaft Removal: *See "Crankshaft & Main Bearings" in Cadillac Special Data.*

Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Cadillac Special Data.*

CAMSHAFT

►*CAUTION:* Handle shaft with care to avoid damage

Removal, Alignment & Installati n - S *"Camshaft & Bearings" in Cadillac Special Data.*

Bearings - Steel backed babbitt bushings.

Clearance - .001-.0022" (service limit .004" max.).

Bearing Out-of-Round Limit - .002" max.

Timing Chain: Link-Belt side guide type. **Width** - 11/16", **Pitch** .500", **Length** 23" or 46 links.

Camshaft Setting: Both sprockets marked "0". Mesh chain with sprockets turned so that marks adjacent and in line with straightedge across shaft.

VALVES

Tappet Clearance: None in service, hydraulic.

Valve	Head Diam.	St m Diam.	L ngth
Intake	1.875"	.3415-.3425"	4.717-4.688"
Exhaust	1.500"	.3415-.3420"	4.727-4.694"

Valve	Seat Angle	Lift	Stem Cl arance
Intake	©45°	45"	②.0005-.0025"
Exhaust	©45°	45"	②.0010-.0025"

© - Valve face angle 44°.

② - New valves and guides. Wear limit .005" max.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*NEW VALVE SEAT CAUTION: DO NOT lap or grind so that seat width is more than 1/64" (due to difference of 1° between valve seat and valve which is designed to provide "hairline" contact.*

►*VALVE GRINDING & SPRING HEIGHT CAUTION:* When valves ground on engines before Engine No. 027755, shims should be installed on cylinder head under valve springs to compensate for metal removed from valve and head and restore valve spring pressures. These shims furnished in Kit No. 3632098. *DO NOT use shims on engines after No. 027755. See Cylinder Head Production Change above.*

Valve Seat Recommendations - 3/64-1/16" (moderate speed or city driving), 1/16-3/32" (high speed driving). Cut seat so that distance from outer edge to edge of flange on valve head is no more than 1/32".

Valve Stem Oil Seal: Rubber "O" ring seal installed in lower groove on valve stem below valve keeper.

Valve Stem Oil Seal Check & Installation - Place 1" diameter suction cup on valve spring retainer. Cup will not stick to retainer when pumped up and down if seal leaks. To install new seal without removing valve, proceed as follows: Remove spark plug at affected cylinder, insert Valve Holder J-3213-1 in plug port to hold valve up and seated. Reinstall nearest rocker arm bolt and position Valve Spring Compressor J-5892-1 under bolt head and depress valve spring. Remove valve lock and seal. Release spring tension to replace spring.

Valve Guides: Pressed in cylinder head from combustion chamber side with longest chamfer end pointing toward rocker arm side of head. Use Remover Tool J-3062 to drive out old guide (toward top of head) and installer Tool J-3066 to drive new guide in (tool serves as stop for driver).

Valve Springs: Free length 2.25" approximately.

Valve Spring Specifications

	Pressure	Length
Valve Closed	60-65 lbs.	1.946"
Valve Open	155-165 lbs.	1.496"

►*SPRING INSTALLATION CAUTION:* Lower end of valve spring must be seated in cylinder head.

Valve Lifters: Hydraulic.

►*HYDRAULIC LIFTER PRODUCTION CHANGE:* Lifter with fused carbide foot used in production beginning Engine No. 048100. Improved lifter does not have joint line on body but is interchangeable with previous type (same part number).

See "Valve System" in Cadillac Special Data.

Valve Lifter Removal - *See "Valve System" in Cadillac Special Data.*

Rocker Arm Assembly: *See "Valve System" in Cadillac Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: Specifications are "Without Ramp".*

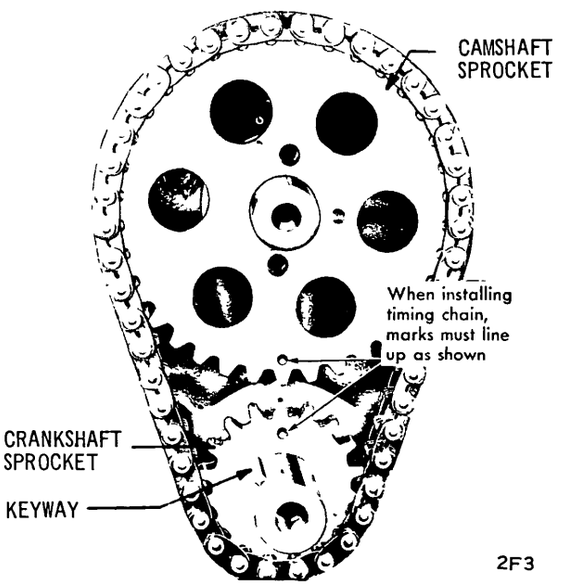
Valve Timing Specifications

Intake Valves - Open 39° ℄BTDC. Close 105° ALDC.
Exhaust Valves - Open 85° ℄BLDC. Close 59° ATDC.
℄ - At .001" lift.

Valve Timing Check - Not practical to check in field. Manufacturer recommends removing timing chain cover and checking timing gears.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Cadillac Special Data.*



Crankcase Capacity: 4 qts. refill, 6 qts. with filter change.

Normal Oil Pressure: 30-35 lbs. min. at 30 MPH. 15 lbs. at idling speed.

Pressure Regulator Valve - On oil pump. Not adjustable.

Oil Pressure Indicator - Light on instrument panel controlled by pressure switch AC No. 1508767 mounted on engine.

Oil Pump: Helical gear, mounted on rear main bearing cap.

CADILLAC VALVE TIMING MARKS

Oil Pump Removal & Overhaul - *See "Oiling System" in Cadillac Special Data.*

Oil Filter: Full flow type, with throw-away type filter element, located on right rear side of engine block near starter. Replace filter element at 6,000 miles and then each six months or 4,000 miles thereafter.

►*OIL FILTER INSTALLATION CAUTION:* Screw new filter element onto stud by hand until gasket touches filter base, then tighten element additional 2/3 turn. DO NOT OVERTIGHTEN.

Crankcase Ventilation: Standard Cars - Air intake in oil filler cap (oil wetted type) with road draft tube from rear of valve rocker cover extending down below engine at right rear corner. Clean and re-oil breather cap at every engine oil change.

Positive Crankcase Ventilation Cars - Air intake in oil filler cap with road draft tube replaced by a hose from rear of valve rocker cover to ventilation valve mounted between carburetor and intake manifold to provide complete recirculation of engine gases. *CAUTION - On this system, filler cap air intake must be serviced at recommended interval (whenever oil filter changed - see Std. Cars above) to insure proper operation of system and to prevent other engine or carburetion troubles. Also, ventilation valve must be serviced at this time. See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Four blade fan (Std.), seven blade fan with shroud and thermostatically controlled clutch (Air Cond. Cars).

Water Capacity: 18½ qts. (All) less heater; 19¼ qts. (Exc. Ser. 75); 20¾ qts. (Ser. 75) with heater.

Pressure Valve - 13½-16½ lb. radiator filler cap.

Pressure Valve: AC No. RC-15, 13½-16½ lb. Radiator filler cap. Bayonet type with safety catch. Rotate to left against stop to relieve pressure before removing cap.

Thermostat: Dole type. Cadillac No. 3136531 (165°F), No. 3150205 (175°F). In water outlet at top of pump body.

Temperature Controlled Fan Clutch (Air Cond. Cars): When temperature around thermostatically controlled clutch is above 155°F, or outside temperature is higher than 90°F, clutch is coupled, permitting maximum fan speed of 3500 RPM. When underhood temperature is below 120°F or outside air temperature is below 70°F, clutch will uncouple, limiting maximum fan speed to 2100 RPM. Unit is serviced as an assembly only.

Water Pump: Packless type, with sealed ball bearings.

Removal & Overhaul - *See "Cooling System" in Cadillac Special Data.*

Temperature Gauge: AC Electric type.

Dash Unit - AC No. 1513993 (Series 75 & CC), No. 1514468 (Others).

Engine Unit - AC No. 1513130.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

	Ft. Lbs.

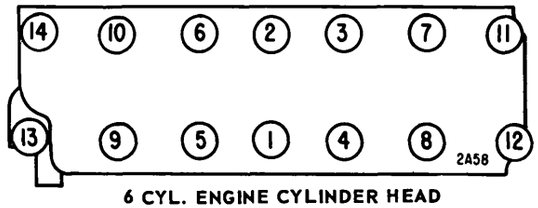
ENGINE

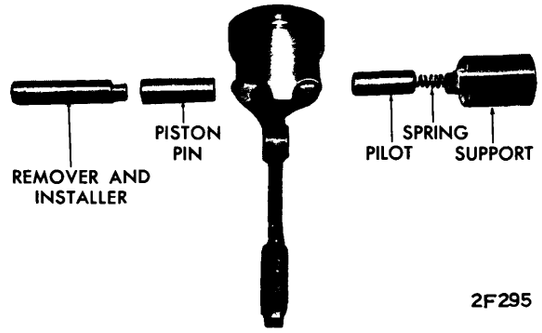


ENGINE REMOVAL: Raise car and place on jackstand. Drain cooling system and crankcase. Remove hood, disconnect radiator and heater hoses at engine. Disconnect battery. Remove radiator and shroud assembly (4 Cyl.), radiator (6 Cyl.). Remove air cleaner, disconnect all accessible wires. Disconnect fuel line at fuel pump and disconnect accelerator control linkage at firewall. On 4 Cyl., disconnect hand choke linkage. On all cars, disconnect exhaust pipe from manifold. Disconnect clutch cross shaft bracket at frame and disconnect clutch pushrod, spring and pedal linkage. On Auto. Trans. Cars, remove transmission oil filler tube and plug opening. On all cars, remove rocker arm cover and road draft tube. Install engine lifting tool in two cylinder head bolt holes. Attach to hoist and secure engine. Remove drive shaft by removing universal joint U-bolts. Plug end of transmission extension housing. Disconnect steering linkage idler arm bracket from right side rail and lower linkage for clearance. Remove engine rear mounting bolts. Disconnect speedometer cable and transmission control rod linkage lower ends. Loosen engine front mounting bolts and raise engine slightly and remove front engine mounting bolts, nuts, washers. Remove transmission crossmember and free transmission rear mounting. *CAUTION - Unless sufficient weight has been taken off crossmember, the transmission extension or crossmember may suddenly swing downward.* Remove engine and transmission as a unit from vehicle.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION & REMOVAL: Removal - Drain cooling system, remove air cleaner, and disconnect all lines and hoses from carburetor. Remove intake and exhaust manifolds and carburetor as an assembly. Remove retaining clip from water outlet and disconnect wiring harness from rocker arm cover. Disconnect radiator hose and battery ground strap from cylinder head. Remove spark plugs. Remove coil on 6 Cyl. On all cars, remove rocker arm cover. Back off rocker arm adjusting nuts and pivot rocker arms to clear pushrods, then remove pushrods. Remove cylinder head.

4 CYL. ENGINE CYLINDER HEAD



6 CYL. ENGINE CYLINDER HEAD

Installation - Reverse removal procedure. Coat cylinder head bolts with sealing compound and tighten to specifications in sequence shown in diagram.

PISTON PINS

PISTON PINS: Removal - Install pilot of Piston Pin Removing & Installing Tool J-6994 on piston pin. Install piston and rod assembly on support and place assembly in an arbor press. Press pin out of connecting rod.

Installation - Lubricate piston pin holes in pistons and connecting rods. Position rod in piston so that flange or heavy side of rod at the bearing end will be towards front of piston (cast depression in top of piston head). Install pin on installer and pilot spring and pilot in support. Install piston and rod on support (indexing pilot through piston and rod). Using an arbor press, start pin into piston and press on installer until pin pilot bottoms. Check piston pin for freedom of movement in piston bore.

PISTON PIN ASSEMBLY

CRANKSHAFT & MAIN BEARINGS

MAIN BEARING REPLACEMENT (With Engine in Car): Remove oil pan, spark plugs, cap on main bearing, and remove bearing from shell. Install main bearing shell removing and installing tool in crankshaft oil hole. *NOTE - If such tool not available, a cotter pin may be bent and used.* Rotate crankshaft clockwise to roll upper bearing shell out of engine. Oil new bearing shell and insert plain (unnotched) end of shell between crankshaft and indented or notched side. Rotate bearing into place. Install new bearing shell in bearing cap. Check bearing clearance. Install oil pan and spark plugs.

REAR MAIN BEARING OIL SEAL: Can be replaced without removing crankshaft. *NOTE - Always replace upper and lower seal as a unit.* Drain crankcase and remove oil pan. Remove oil seal from groove, prying from bottom (small screwdriver). Clean crankshaft surface and install well lubricated seal in bearing cap groove (keep oil off of parting line surface) and gradually push until seal is rolled into place (use a hammer handle). To replace upper half of seal, use a small hammer and brass pin punch to tap one end of seal until it protrudes enough to be removed with pliers. Install bearing cap and torque to specifications.

CRANKSHAFT PULLEY

4 CYLINDER ENGINE

CRANKSHAFT PULLEY: Pulley is bolted on flanged hub by three bolts (two 3/8", one 5/16") to ensure correct location of timing mark on pulley rim.

Removal - Drain radiator, disconnect hoses, remove radiator core and shroud as an assembly. Remove fan belt. Remove pulley. Install puller tool, No. J-6978, on hub using two 3/8" x 2" and one 5/16" x 2" bolts, remove hub. Do not use key in crankshaft.

Installation - Coat seal contact area on hub with engine oil, position hub on crankshaft with key aligned with keyway, use Tool J-5590 to drive hub on shaft until it bottoms against crankshaft gear *(NOTE - Crankshaft extends through hub and tool must be used to ensure seating hub properly on shaft).* Install pulley and tighten mounting bolts securely.

HARMONIC BALANCER

6 CYLINDER ENGINES

HARMONIC BALANCER: Balancer consists of an inertia weight pressed on a hub and procedure below must be used when removing and installing balancer to prevent inertia weight shifting on hub.

Removal - Drain radiator, disconnect radiator hoses, remove radiator core, remove fan belt. Install puller tool, No. J-6978, using bolts in tapped holes in face of balancer, remove balancer.

Installation - Coat seal contact area of balancer hub with engine oil, assemble special balancer installer tool, No. J-8792, on balancer *(see TOOL J-8792 NOTE below)*, position balancer on crankshaft with key aligned with keyway and drive balancer on shaft until it bottoms against crankshaft gear, remove tool.

TOOL J-8792 NOTE - This tool also used on V8 engines (different set-up) and must be assembled exactly as follows for use on 6 Cyl. Engines: Thread Driver into Clamp on deep finger side of clamp (side marked V8), insert pilot in end of driver on opposite side of clamp with smaller end in toward clamp, secure pilot with machine screw. Install tool assembly on balancer with shallow fingers of clamp engaging pulley rim on balancer.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ENGINE FRONT COVER

FRONT OIL SEAL INSTALLATION: Remove crankshaft pulley (4 Cyl.), harmonic balancer (6 Cyl.). *See Crankshaft Pulley and Harmonic Balancer above.* Drain oil and remove oil pan. Remove timing gear cover and gasket. Pry oil seal out of cover from front with a large screwdriver. Install new seal with lip (open side of seal) toward inside of cover and drive or press seal into place with Tool J-0995 (with cover removed) or Tool J-8340 (with cover in place).

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL & INSTALLATION: Drain crankcase and radiator. Remove radiator and grille. Remove rocker arm cover and rocker arm shaft assembly. Remove coil and valve side cover, pushrods, and lifters. When removing distributor, note position of rotor. Remove vibration dampener (6 Cyl. - See above), or crankshaft pulley (4 Cyl.). On all engines remove oil pan and engine front cover (see above). Remove camshaft thrust plate screws and remove camshaft and gear. *CAUTION - Support shaft carefully to prevent bearing damag .*

Installati n: Reverse removal procedure and note the following: When installing a replacement camshaft, one 16 oz. can of "E.O.S" (Engine Oil Supplement Part No. 3755788) should be added to crankcase and, if practical, at the same time pour 2 or 3 ounces directly on the newly installed camshaft. Molybdenum disulphide ("Molykote" or equivalent) should be applied to the foot of each valve lifter. Drain out the engine oil containing "E.O.S." after engine has been driven its normal oil change period.

CAMSHAFT LOBE LIFT CHECK: Remove valve rocker covers and gaskets, remove rocker arms and balls. Attach Tool J-8520 to stud, then position clamp and indicator with ball socket adapter of Tool J-8520 to pushrod. *NOTE - Pushrod must be in lifter socket.* Rotate crankshaft slowly in direction of rotation until lifter is on heel of cam lobe. At this point, pushrod will be at lowest position. Set dial indicator to zero, then rotate crankshaft slowly, or attach an auxiliary starter switch and "bump" engine over, until pushrod is in fully raised position. *NOTE - Ground primary wire on coil when cranking ngin .* Total lift on dial indicator should be .1914". To check reading for accuracy, continue to rotate engine until dial indicator reads zero.

CAMSHAFT BEARING REPLACEMENT: Removal - With camshaft and flywheel removed, drive out expansion plug from rear cam bearing by driving from inside. Position bearing pilot in inner bearing. Install nut on puller screw far enough so puller screw can be threaded into pilot while nut extends out front of block. Install remover section onto puller screw, then install screw through cam bore and thread it into pilot. Using two wrenches, hold screw shaft and turn puller nut to remove bearing. On 6 Cyl. Eng., repeat operation on other inner bearing from rear of engine. Drive out front and rear bearings from outside to inside of block.

Installati n - Inner bearings should be installed first. Install inner bearing on pilot and position to rear of inner bearing bore and install screw shaft (with remover adapter on it) through block from front of engine into pilot. Align oil hole on bearing with oil hole from oil gallery. Snug puller nut against adapter. Using two wrenches, hold screw shaft and turn puller nut to pull bearing into place. *NOTE* - Oil hole on top side of bearing shell cannot be seen during installation, so first align bearing shell oil hole with oil hole in bore and mark opposite side of bearing and block at bore to easily index oil hole during installation. On 6 Cyl. engines, repeat operation from rear of engine to install inner bearing. Install new No. 1 bearing on pilot with drive handle attached. Align oil hole on bearing with oil hole from oil gallery and drive bearing in from front of engine. *CAUTION - The front bearing must be driven approximately 1/8" behind front of cylinder block to uncover oil hole to timing gear oil nozzle.* Repeat above procedures to drive rear bearing into position from rear of block. *NOTE* - Rear bearing installed position is flush with inner edge of rear cam bearing bore in block. Install new expansion plug at rear bearing.

VALVE SYSTEM

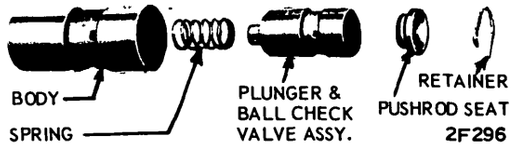
VALVE STEM OIL SEALS

VALVE STEM OIL SEAL INSTALLATION: Place valve in the port and place valve spring and cap in position. Place spring and rotator on valve. Then using Tool J-8062 compress the spring and install the oil seal and valve keys. See that the seal is flat (not twisted) in the lower valve stem groove and that the keys seat properly in upper valve stem groove. Install all valve stem seals in same manner.

VALVE GUIDES

VALVE GUIDE REAMING FOR OVERSIZE VALVE STEMS: Valves with oversize stems are furnished for inlet and exhaust valves in .003", .015" and .030". Use 3/8" diameter reamer sizes from Reamer Tool Set J-7049. J-7049-7 (Std.), J-7049-4 (.003"), J-7049-5 (.015"), & J-7049-6 (.030"). Ream to next oversize.

ROCKER ARMS



ROCKER ARM STUD REPLACEMENT: Damage rocker arm studs may be replaced with Std. size studs. Loose studs should be replaced with .003" or .013" Oversize studs after reaming rocker arm stud holes with Tool J-5715 (.003") or J-6036 (.013"). Remove old stud by placing Tool J-5802 over stud, installing nut and flat washer and removing stud by turning nut. Ream hole for oversize, if necessary, then coat press-fit area of stud with hypoid axle lubricant. Install new stud using Tool J-6880. Tool should bottom on head.

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTERS: Barrel type consisting ing of plunger and valve assembly operating within a cylinder formed by valve lifter body (see illustration). Oil is introduced to this unit through oil gallery in block.

Removal: Remove rocker arm assemblies, pushrod cover, pushrods and valve lifters. *NOTE* - Keep valve lifters and pushrods in order so they may be reinstalled in original positions.

Disassembly: Use Tool J-4274 and hold plunger down and remove plunger and pushrod seat retainer with a small screwdriver blade. Remove pushrod seat, plunger,

HYDRAULIC VALVE LIFTER

ballcheck valve assembly, and plunger lifter spring. Clean all parts in solvent and inspect each part for nicks or burrs and wear. Replace lifter assembly if any part damaged or has excessive wear.

Reassembly: Drop lifter spring into body. Install plunger and ball check valve assembly into body, using care to align feed holes in body and plunger . Fill lifter with SAE 10 oil, insert end of Tool J-4274 into plunger, and press down solidly. Insert Pin (Part of Tool J-4274) through oil feed holes to hold plunger against spring tension and remove other part of tool. Fill lifter with SAE 10 oil and install pushrod seat and spring retainer. Remove tool pin.

OILING SYSTEM
ENGINE LUBRICATION

DESCRIPTION: Positive pressure lubrication is provided to all main, camshaft and connecting rod bearings and to all valve lifters and rocker arms. The main oil gallery at right side of block distributes all lubrication.

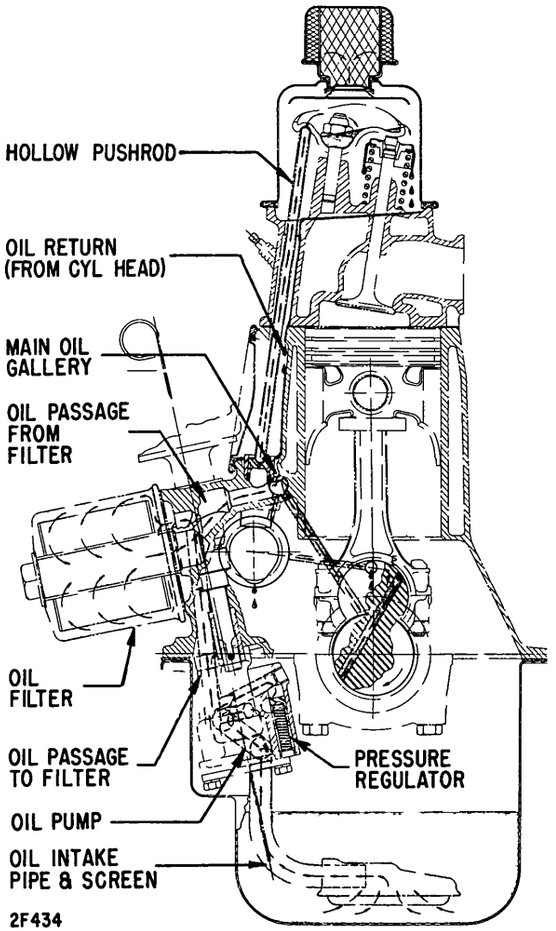
OPERATION: Gear type oil pump flange mounted to cylinder block (at right side) and driven by distributor drive shaft draws oil from oil pan through a floating screen and delivers it through an opening in mounting flange to cylinder block, then into the full flow oil filter. The oil pump cover is equipped with a pressure regulator valve. Bypass valve located in filter base. Oil flows from filter to main oil gallery and is then distributed as follows:

Crankshaft & Camshaft Bearings - Each main and camshaft bearing is fed oil by a passage extending through crankcase webs from main oil gallery.

Connecting Rods & Pistons - Oil is delivered from each main bearing to adjacent connecting rod bearing through drilled passages in crankshaft. A hole in connecting rod sprays oil onto cylinder walls for piston and pin lubrication, when holes in rod and journal index. Oil hole in rod is towards camshaft side of engine.

Valve Lifters - Main oil gallery intersects lifter bores and lifters are supplied with oil directly from gallery. Lifter has metering valve directly below hole in pushrod seat to permit oil to pass into hollow pushrod.

Rocker Arms & Valve Stems - Oil passes up through hollow pushrods to a hole in upper end of pushrods that matches hole in rocker arm. Oil sprayed from this hole and across rocker arm lubricates valve stem tip. Oil in rocker arm chamber drains down through pushrod holes to valve lifter chamber, then returns to crankcase through drain holes.



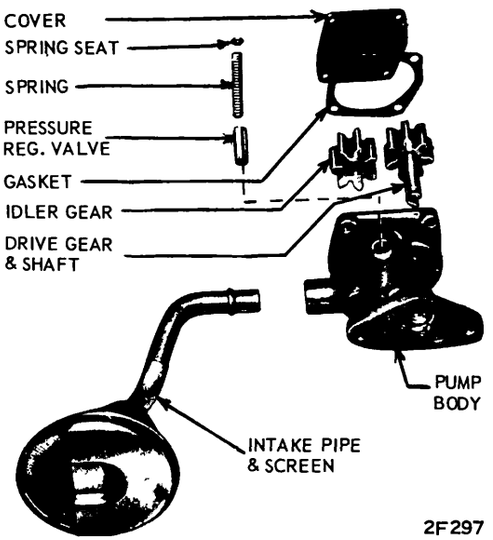
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Timing Gears - Lubricated by oil flow from nozzle pressed in front face of block above crankshaft gear. Oil is fed to nozzle through cross-passage from front camshaft bearing.

Distributor Drive Gear - Lubricated by oil drainage from valve lifter compartment (drain hole directs oil onto gears).

OIL FILTER: Full-flow type mounted on right side of engine. Bypass valve located in filter base. Receives oil from passage in crankcase and delivers it to main oil gallery. Replace filter cartridge every 4000 miles.



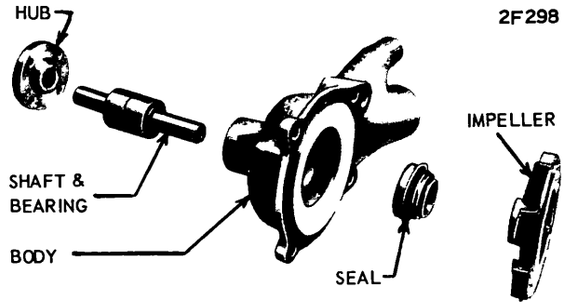
ENGINE OILING SYSTEM

OIL PUMP

OIL PUMP: Removal & Disassembly - Drain oil and remove oil pan, *see Car page*. Remove mounting bolts and remove pump and screen assembly. Remove 4 cover screws, cover, gasket, idler gear and drive gear and shaft. Remove pressure regulator valve and valve parts. If necessary, pull out oil pump suction pipe and screen. *NOTE* - DO NOT disturb oil pickup pipe on screen (pipe is located at assembly).

Inspection - Wash all parts in cleaning solvent and dry with compressed air. Replace pump assembly if any of the following conditions are found: 1) Pump body cracks or excessive wear. 2) Excessive wear or damage to gears. 3) Excessive shaft looseness in housing. 4) Excessive wear on inside of cover that would permit oil to leak past gears. 5) Damaged pickup screen or relief grommet or oil in air chamber. 6) Poor pressure regulator valve fit in cover.

Reassembly & Installation - Install drive gear and shaft in pump body, install idler gear with smooth face toward pump cover. Install suction pipe and screen assembly on cover, then install cover on pump body with new gasket, tighten cover screws to specifications. Check to see that shaft turns freely with cover tightened. Install all pressure regulator valve parts in order. Align slot in pump drive shaft with tongue on end of distributor shaft and mount pump on lower face of cylinder block (*CAUTION - Do not use a gasket on pump mounting flange*). Pump mounting flange should fit freely over end of distributor shaft lower bushing. Tighten pump mounting screws to specifications.



ENGINE OIL PUMP

COOLING SYSTEM

WATER PUMP

WATER PUMP REMOVAL: Drain radiator and remove water inlet hose from pump. Remove fan belt. On heater equipped cars, remove hose from pump housing. On all models, remove water pump attaching bolts, then remove pump. *CAUTION - Pull pump straight out of cylinder block to avoid damage to impeller and shaft.*

Disassembly - Remove fan and pulley. Support fan hub in an arbor press and press pump shaft out of hub. Then support pump in an arbor press and press shaft and impeller assembly out rear of pump, applying pressure on outer race of shaft bearing (use a 7/8" deep socket or a piece of tubing 1 1/8" O.D.). *CAUTION - Do not press on shaft or bearings will be damaged.* Use Tool J-5855 and a 1/2" x 2" pin in an arbor press to press shaft out of impeller (support impeller on seal surface). Discard old seal.

ENGINE WATER PUMP

Reassembly - Install pump shaft and bearing assembly into pump body bearing bore, applying pressure to outer race until it is flush with front of pump body. *CAUTION - Apply pressure to outer race only.* Lightly coat O.D. of new seal with sealing compound and press into place. Using Tool J-5590, apply pressure to seal outer flange. Seal should bottom with outer flange against body of pump. Press on fan hub and check fan hub location. Measure from pump body gasket surface to outer or front side of hub, using Tool J-9583 (installed in pump mounting hole - end of tool should contact bed plate on press ±.005"). Support pump on front or hub end of shaft and press on impeller. Press to obtain .010-.035" clearance between impeller vanes and pump body. Install pump cover and gasket (with a light coat of gasket sealer) and tighten screws diagonally. Install pump pulley and fan on pump hub and tighten securely. Install pump assembly on cylinder block and tighten bolts securely. Use a new pump-to-block gasket. Install hoses and fill radiator.

IGNITION NOTES

DISTRIBUTOR DRIVE SHAFT LOWER BUSHING: This bushing pressed in cylinder block (with or without washer at upper end of bushing bore) and serves as lower bearing for distributor shaft. Replace bushing (and washer, if used) when shaft-to-bushing clearance exceeds .0035".

Removal: Use Tool J-9534 and slide hammer to remove old bushing from lower face of cylinder block. If washer found in bushing recess in block, drive old washer out with a drift.

Installation: If washer used, drive new washer up in place in block with Tool J-9535. Position new bushing on Tool J-9535 (use driver-bolt in driver handle) and drive bushing up into position in block until tool bottoms against block, remove tool from bushing. *NOTE* - Bushing may slightly seize installer arbor during installation. If this occurs, remove tool by using slide hammer in driver bolt hole of driver handle (will not damage bushing).

►*JACKING & HOISTING CAUTION: B f r jacking, hoisting, r wo king und r car, s "Jacking & Hoisting Pr cauti ns" in Susp nsion & Wh el Alignm nt S cti n.*

►*PUSH-STARTING DELCOTRON EQUIPPED CARS:* Turn off all electrical loads except ignition to insure ample closing voltage for the field relay coil. Once engine started, electrical loads may be added.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar. Number (example below) includes identification data.

① ② ③ ④
2 0211 F 100001

① - Model Year. 2 1962.
② - Body Style (preceded by "O"). *See below.*
③ - Assembly Plant. *S b low.*
④ - Beginning vehicle number at each assembly plant.

Body Styl Designation
Ch vy II 100 Standard

4 Cyl. Powerglide	EG
6 Cyl. Synchro-mesh	H
6 Cyl. Synchro-mesh & Heavy Duty Clutch	HB
6 Cyl. Powerglide	HF

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. at cranking speed with throttle wide open. Maximum variation between highest and lowest cylinders 20 lbs.

VACUUM READING: 17-21" at idle speed.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

Hydraulic Lifter Adjustment (Engine Running) - With engine at normal operating temperature and running at idle s peed, back off rocker arm stud adjusting nut until rocker arm starts to clatter against valve stem, then turn nut down until clatter just stops. This is "zero lash" position. Now turn nut an additional ½-turn and wait until engine runs smoothly. Continue to turn nut down in ½-turn increments until nut has been turned down 1 full turn from "zero lash" position. *CAUTION - Make adjustment slowly so lifter will adjust itself and prevent engine damage.*

MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight in exhaust manifold outlet. Valve must operate freely.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

►*4 CYL. ENG. MIS-FIRE OR CUT-OUT: See "Coil Wire Caution" below.*

FIRING ORDER: 4 Cy. - 1-3-4-2. 6 Cyl. - 1-5-3-6-2-4.

SPARK PLUG GAP: .033-.038" - Set at .035".

Spark Plugs - AC No. 46N. 14 mm. Torque to 20-25 ft. lbs.

COIL: Delco-Remy No. 1115165 (4 Cyl.), No. 1115166 (6 Cyl.).

►*4 CYL. ENG. COIL WIRE CAUTION:* Correct length of coil-to-distributor high tension wire is 13". Use of the 6 Cyl. Eng. wire (10") could result in mis-fire or engine "cut-out". Replace wire if not correct length.

Ignition Current - 1.8 amps. idling, 4.0 amps. stopped.

Resistor - Pink resistance wire (1.8 ohms at 80°F) connected in circuit from passenger side of bulkhead connector to a splice near ignition switch. Bypassed during cranking by lead from starter solenoid.

DISTRIBUTOR: Delco-Remy No. 1110268 (4 Cyl.), No. 1110267 (6 Cyl.). Pivoted breaker plate type.

►*CAM ANGLE SETTING CAUTION:* Cam angle must be set with distributor on the engine (Can not be set accurately with distributor on bench since distributor shaft lower bushing is located in engine block).

Condenser - Delco-Remy No. 1928111.
Capacity - .18-.23 mfd.
Contact Point Set - Delco-Remy No. 1954557.

Breaker Gap - .019" (new points), .016" (used points).
Cam Angl - 31-34°.
Br aker Arm Spring Tensi n - 19-23 ozs.
R tation - Clockwise viewed from above.

Automatic Advanc - 1110267

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	375	0-4	750
5-7	700	10-14	1400
12-14	1150	24-28	2300

Automatic Advance - 1110268

Degrees Distr.	RPM	Degrees Eng.	RPM
.5-2.5	400	1-5	800
6-8	750	12-16	1500
9.5-11.5	1300	19-23	2600
13-15	1850	26-30	3700

Vacuum Spark Control: Delco-Remy No. 1116187 or 198.

Vacuum Advance - 1116187 & 198

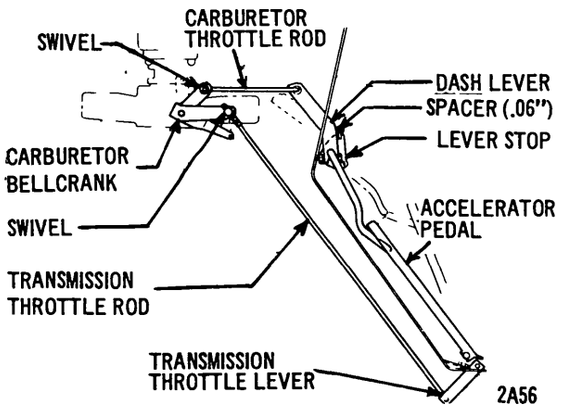
Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5-7
11-13.5	22-27	11.5

Distributor Drive Shaft Lower Bushing: For service information, *see "Ignition Notes" in Chevy II Special Data.*

IGNITION TIMING

Setting - 4 Cyl. - 4° BTDC (Range 4-10° BTDC).
6 Cyl. - 8° BTDC (Range 8-12° BTDC).

►*TIMING SETTING NOTE:* Set timing with engine running at idle speed and vacuum hose disconnected from distributor and taped closed.



Timing Mark - Notch in pulley (4 Cyl.), vibration damper (6 Cyl.), and timing tab on engine front cover marked "O" (TDC) with 2° increment marks indicating advance. Align pulley or damper notch with correct mark on tab.

CARBURETOR

►*CARBURETOR APPLICATION: One Rochester B used on 4 Cyl. Eng., one Rochester BC used on 6 Cyl. Eng. Carter YF optional on all models.*

THROTTLE LINKAGE ADJUSTMENT (POWERGLIDE CARS): Disc nnect carburetor throttle rod at carbu-

CONTINUED ON NEXT PAGE

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

S e INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

retor bellcrank and depress accelerator pedal fully so dash lever is against a .06" (1/16") spacer between dash lever and lever stop. Rotate carburetor bellcrank to wide open throttle position and adjust swivel on carburetor throttle rod so it freely enters hole in bellcrank. With accelerator pedal still depressed, disconnect transmission throttle rod from carburetor bellcrank (bellcrank still in wide open position), push downward on transmission throttle rod to reach full detent in transmission, then adjust swivel on transmission throttle rod so rod freely enters hole in carburetor bellcrank. **Lengthen rod 2 additional turns.** Remove spacer at dash lever.

ROCHESTER B & BC

Engine & Transmission	Carburetor No.
4 Cyl. Synchro-mesh (Early)	B 7020103
4 Cyl. Synchro-mesh (Late)	B 7020115
4 Cyl. Powerglide (Early)	B 7020104
4 Cyl. Powerglide (Late)	B 7020114
6 Cyl. Synchro-mesh	BC 7020105
6 Cyl. Powerglide	BC 7020108

►*BC 7020105 CARBURETOR LOAD-UP DURING WARM-UP CORRECTION & PRODUCTION CHANGE NOTE:* To minimize engine "load-up" after a cold start, change choke setting to INDEX. This change now in production.

►*4 CYL. CARBURETOR PRODUCTION CHANGE NOTE:* Carburetors Nos. 7020114 & 115 have new spring-loaded float needle valve assembly and seat unit that requires special float level adjustment, *see below.* For rework of earlier model carburetors, *see "Rochester B & BC Carburetors" in Carburetion Section.*

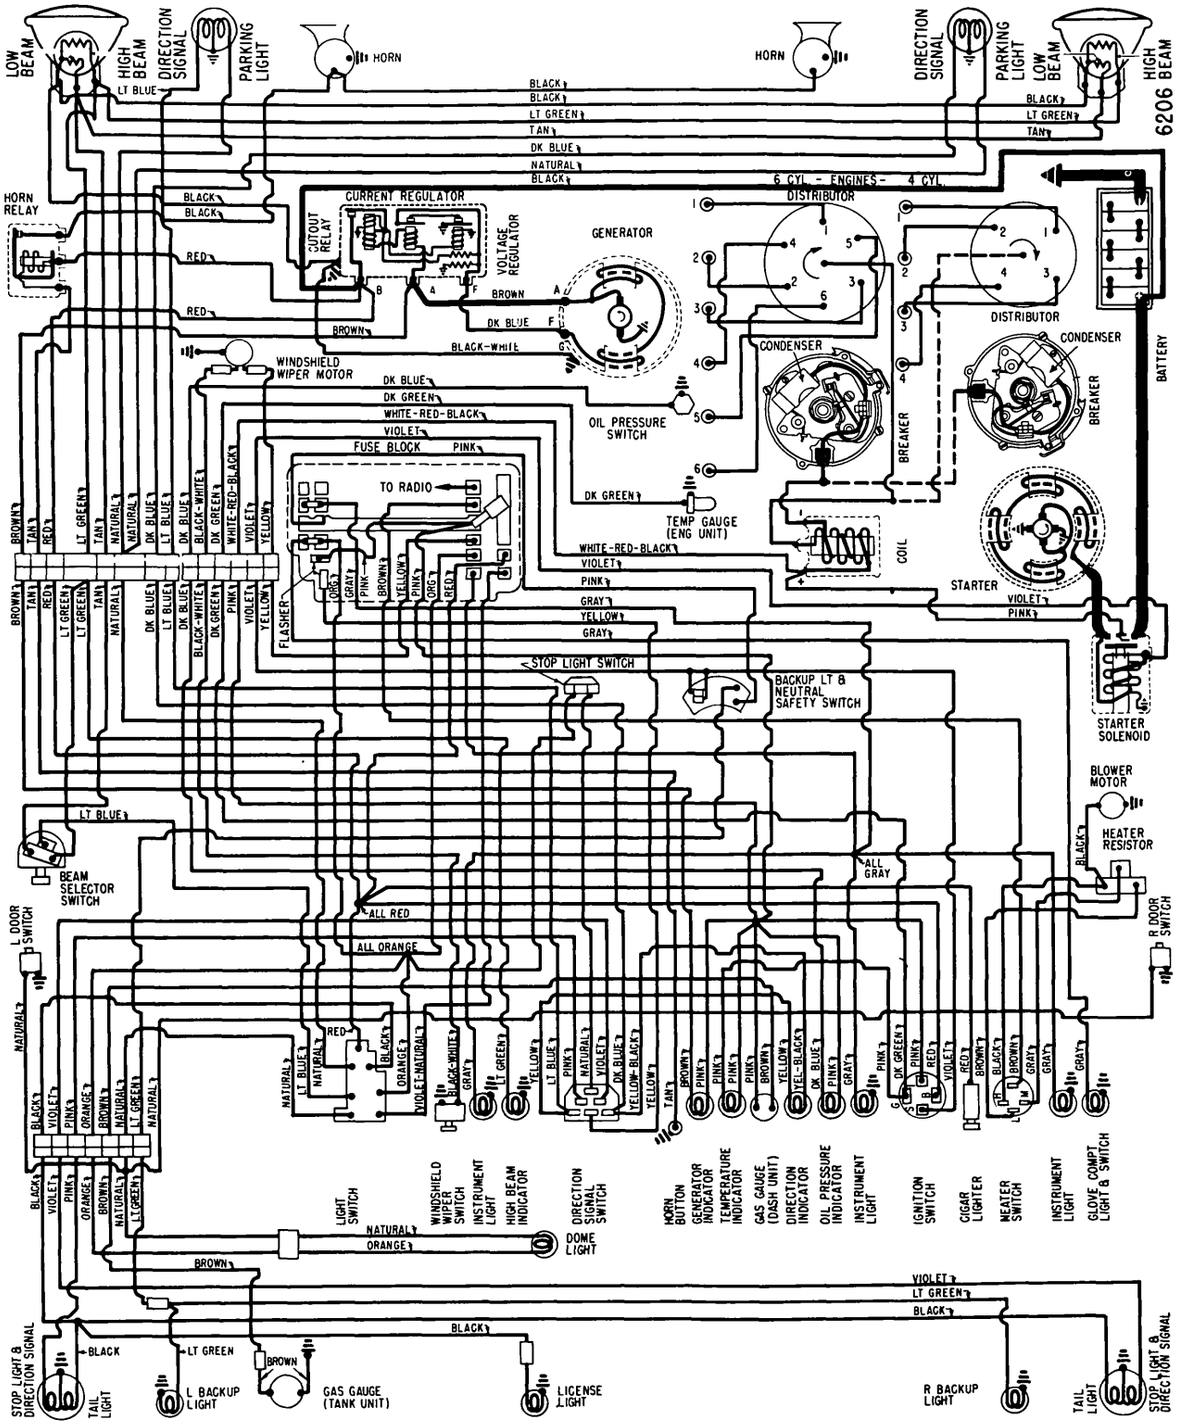
►*ENGINE SURGE CORRECTION:* To correct this condition on B or BC carburetors Nos. 7020103,104,105 or 108, *see "Rochester B & BC Carburetors" in Carburetion Section.*

Idle Speed - 600 RPM (4 Cyl.), 500 RPM (6 Cyl. Synchro-mesh), 600 RPM (6 Cyl. Powerglide in "D" Drive).

Float Level (Solid Float Needle) - 1 9/32" (Gauge M-250) with air horn inverted, gasket in place, and gauge tang inserted in discharge nozzle. Top of each float must just touch gauge and float must be centered between gauge legs. To adjust, bend float tang.

Float Level (Spring-Loaded Needle) - 1 9/32" (Gauge M-250) with air horn inverted, gasket in place and gauge tang inserted in discharge nozzle. While setting float level, a 1/32" shim must be inserted between head of float needle pin and float arm. Float adjustment is performed with float arm resting freely on shim. Bend float arms to adjust.

Float Drop - 1¾" (Gauge BT-93) from gasket surface to bottom of float with air horn upright and float hanging freely. To adjust, bend float tang.



Fast Idle: No Adjustment. Will be correct when hot or slow idle correctly set.

Automatic Choke Setting: At INDEX. Supersedes previous specification for BC 7020105.

Throttl Linkag Adjustment: S e *CARBURETOR above.*

►*OTHER DATA: S "Roch ster B & BC Carburetors" in Carburetion S ction.*

CARB. EQUIPMENT

Fuel Pump: AC No. 3540, stamped 5623540. Mechanical Pressure - 3½-4½ lbs. at 500-1000 RPM.
Gas line Gauge: AC Electric.
Dash Unit - AC No. 5643846.
Tank Unit - AC No. 5642018 (exc. 3-Seat Sta. Wgn.), No. 5642259 (3-Seat Sta. Wgn.).
Air Cleaner: Oil wetted plastic foam (Polyurethane) type. Clean and reoil every 4000 miles or sooner under severe operating conditions.
►*PLASTIC ELEMENT CLEANING CAUTION:* Remove element carefully from wire mesh support and wash in solvent. Squeeze element (do not wring) to remove all solvent and reoil with 10W-30 engine oil.
Fuel Filter: In carburetor inlet. Clean at regular intervals (unnecessary to replace at each tune-up). *CAUTION - When installing, be sure small cone end faces outward.*

BATTERY

Delco No. 454 (Std.) - 12 volt, 9 plate, 42 ampere hour capacity (20 hour rate).
Delco No. 668 (Optl.) - 12 volt, 11 plate, 70 ampere hour capacity (20 hour rate).
Battery Ground - Negative, to cylinder head.
Engine Ground - Rear of cylinder head to firewall.

STARTER

Delco-Remy No. 1107216 & 247 (Synchro-mesh), No. 1107236 & 248 (Powerglide).
Armature - Delco-Remy.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data (All)

Torque	RPM	Volts	① Amperes
0 ft. lbs.	6200-9400	10.6	49-76
	Lock	4.3	270-310

① - Includes Solenoid.

GENERATOR

Delco-Remy No. 1100326 (4 Cyl.), 1102096 (6 Cyl.), 1102273 & 168 (Optional).
Armature - Delco-Remy No. 1928952 (1100326 Gen.), No. 1923535 (1102096 Gen.).

Performance Data - Cold (70°F)

Generator	Amperes	Volts	RPM
1100326	25	14.0	2710
1102096	30	14.0	2240
1102274	35	14.0	2630
1102168	35	14.0	2730

Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 28 ozs.
Field Current - 1.5-1.62 amps. (1100326), 1.48-1.62 amps. (1102168), 1.69-1.79 amps. (1102096 & 274) at 12.0 volts and 80°F.
Belt Adjustment: Belt tension gauge should read 75 lbs. This supersedes previous specifications. Move generator in its mounting bracket to adjust.

GENERATOR REGULATOR

Delco-Remy. Used as follows:

Regulator No.	Generator No.
1119000	1100326
1119001	1102096
1119002	1102274
1119604	1102168

►*REGULATOR NOTE: Delco-Remy Regulator No. 1119604 has double contacts for voltage regulation.*

Cutout Relay
Cuts In - 11.8-13.0 volts (1119604), 11.8-13.5 volts (Others).
Contact Gap - .020".
Air Gap - .020" with contacts just touching.

Voltage Regulator
Setting (Exc. 1119604) - 13.8-14.7 volts at 125°F ambient temperature.
Setting (1119604) - 13.8-14.6 volts at 125°F ambient temperature. .1-.3 volt lower when operating on lower contacts.
Air Gap - .075" (Exc. 1119604), .067" (1119604) with armature pressed down to point where contacts just touch.
Contact Gap (1119604) - .016".

Current Regulator
Setting - 23.0-27.0 (1119000), 27.0-31.0 (1119001), 31.0-35.5 (1119002 & 604) amps. at 125°F ambient temperature.
Air Gap - .075" with armature pressed down to point where contacts just touch.
►*OTHER DATA: See "Delco-Remy 1119000 Series Single Contact Regulators" or "Delco-Remy 1119600 Series Double Contact Regulators" in Electrical Section.*

ALTERNATOR

Model	Delco-Remy Alternator No.
Air Conditioning	1100600 & 613
Optional	1100601
Optional Heavy Duty	1117765

Performance Data - Cold

Alternator	Amperes	RPM
1100600, 613	12	1100
	42	6500
1100601	5	1100
	52	6500
1117765	24	1100
	62	6500

Field Current - 1.9-2.3 amps. (1100600,601 & 613), 3.7-4.4 amps. (1117765) at 12 volts and 80°F.
►*OTHER DATA: See "Delco-Remy Delcotron Alternators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy. Transistorized and conventional types used as follows:

Regulator No.	Type	Alternator No.
1119502	① Conventional (3-Unit)	1100600, 601, 613
9000567 ②	③ Transistorized (2-Unit)	1117765

① - Contains a Voltage Regulator, Field Relay, and Indicator Light Relay.
② - Use with separate Indicator Light Relay, Delco-Remy No. 1115811.
③ - Contains a Voltage Regulator and Field Relay.

Field Relay
Closing Vltag - 6.5-8.5 volts (1119502), 5.0-9.5 volts (9000567).
Contact Gap - .015" (1119502), .027" (9000567).
Air Gap - .015" (1119502), .014" (9000567).

Voltage Regulator
Setting - 13.5-14.4 volts (1119502), 13.2-14.2 volts (9000567) at 125°F ambient temperature operating on upper contacts. .1-.3 volts lower operating on lower contacts.
Air Gap - .067" (1119502), .075" (9000567).

Indicator Light Relay (No. 1119502)
Closing Voltage - 3.8-5.2 volts.
Contact Gap - .010". **Air Gap** - .010".

Indicator Light Relay (No. 1115811)
Closing Voltage - 1.5-9.5 volts.
Contact Gap - .018".
Air Gap - .020" with contacts closed.
►*OTHER DATA: See "Delco-Remy Double Contact Alternator Regulators" or "Delco-Remy Transistorized Alternator Regulators ("B" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

Lighting Switch Removal: Pull control knob out to ON position. Reach under instrument panel and depress switch shaft retainer and remove knob and shaft assembly. Remove retaining ferrule and escutcheon, then remove switch assembly. Disconnect multiple plug connector. *NOTE* - Use screwdriver inserted in side of switch to pry plug from switch.
Stop Light Switch Location: Mechanical type mounted under dash in contact with brake pedal.
Adjustment - Adjust position of switch so that stop light comes on when brake pedal is depressed 5/8" from fully released position.
Instrument Cluster Console & Instruments Removal: Loosen upper mast jacket retaining clamp and slide upward to free mast jacket. Loosen lower mast jacket retaining clamp and drop mast jacket and steering wheel down. Disconnect speedometer cable from speedometer and remove console-to-instrument panel attaching screws. Lean console forward onto mast jacket. Remove individual instrument as required. Remove console as a unit by unsnapping all wire connectors. To install, reverse removal procedure.
Speedometer Cluster Removal: After instrument cluster console removed (see above), remove four back panel-to-bezel attaching screw and separate parts carefully. Remove two screws attaching speedometer head to cluster back panel. To install, reverse removal procedure.
CIRCUIT BREAKERS: 15 Ampere - Headlight & Parking Light circuits. Integral with headlight switch.
FUSES: *Fuses are located in a junction block under dash panel.*
SAE 20 Ampere - Heater & Air Conditioning.
SAE 20 Ampere - Windshield Wiper Motor.
3AG/AGC 15 Ampere - Tail, Stop, Dome lights.
3AG/AGC 10 Ampere - Heater (without Air Conditioning).
3AG/AGC 10 Ampere - Back-Up & Brake Lights.
3AG/AGC 4 Ampere - Radio.
3AG/AGC 3 Amper - Instrument & Clock lights.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

ENGINE

►*OPTIONAL V8 ENGINE NOTE: 283" & 327" V8 engines are available as optional equipment. See "1962 Chevrolet V8 Cars & Corvette" data pages for all data on these engines.*

ENGINE SPECIFICATIONS: Own. 4 Cylinder or 6 Cylinder, overhead valve, cast iron block engine of conventional design. 4 Cyl. Engine has 5 main bearings, 6 Cyl. Engine has 7 main bearings. Rocker arms on all engines are individually mounted on studs installed in cylinder head.

Engine	Bore	Stroke	Displacement
4 Cyl.	3.876"	3.25"	153 cu. ins.
6 Cyl.	3.5635"	3.25"	194 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
4 Cyl.	8.5-1	24.0	90 at 4000 RPM
6 Cyl.	8.5-1	30.5	120 at 4400 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

►*INACCURATE ENGINE OIL LEVEL READING CORRECTION (Early Cars):* Make sure dipstick retaining tube projects 2 5/16" (4 Cyl.), 1 13/16" (6 Cyl.) out of cylinder block.

OIL PAN REMOVAL: Drain crankcase, disconnect battery, and remove starter. Disconnect steering idler arm bracket at right frame side rail and swing steering linkage down for clearance. On 6 Cyl., remove front crossmember (let stabilizer bar hang down while removing crossmember on station wagons). On all cars, remove oil pan attaching bolts and remove oil pan. *NOTE* - When installing oil pan, install screws into timing gear cover last as they are installed at an angle and holes will line up after other pan bolts are installed.

ENGINE REMOVAL: *See "Engine" in Chevy II Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Chevy II Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chevy II Special Data.*

PISTONS

Aluminum alloy, cam ground. Three rings used.

Removal - Pistons and rods removed from above.

Replacement Pistons: Furnished Std. & .001", .020", .030", .040" Oversize.

Fitting New Pistons: Clearance .0006-.0010" at bottom of skirt. Use .0015" x ½" ribbon feeler (part of Tool J-5513). With piston and cylinder clean and dry, insert feeler and inverted piston into cylinder until center of piston pin is flush with top of cylinder block, with feeler 90° from piston pin hole. Pull required to withdraw feeler should be 7-18 lbs.

Installing Pist ns: Assemble piston to connecting rod so cast depression in piston head will be to front of engine. *S Rod Installation.*

PISTON PIN

Diamet r - .9270-.9273". **L ngth** - 2.990-3.010".

Clearanc In Piston: .00015-.00025". Pin should support its own weight in either pin boss when coated with light engine oil and at 60°F. *Higher or lower temper- will give false interpretations.*

Clearance In Rod: Press fit.

Piston Pin Removal & Installation: Special procedure and tools used. *See "Piston Pins" in Chevy II Special Data.*

Replacement Pins: Furnished with new pistons only. Replace piston and pin as a unit.

PISTON RINGS

Compression rings are cast alloy iron with upper ring chrome plated. Oil has two chrome plated steel rails and an expander spacer.

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0775-.0780"	.010-.020"	.0020-.0035"
Compr.(2)	.0770-.0780"	.010-.020"	.0020-.0035"
Oil (3)	.184-.188"	.015-.055"	Snug

►*COMPRESSION RING INSTALLATION NOTE:* Install all rings with mark "GM" to top of piston. Inner bevel must be to top of upper ring, to bottom of lower ring.

Replacement Rings: Service type rings furnished Std. & .020", .030", .040" Oversize.

CONNECTING ROD

Length - 5.700"(center-to-center).

Crankpin Journal Diameter: 1.999-2.000". Out-of-round and taper limit .001".

Clearance - .0007-.0027".

Sideplay - .008-.014".

Installing Rods: Install pistons and rods in engine so cast depressions in piston head are to front of engine and oil hole in connecting rod is to camshaft side of engine.

Replacement Bearings: Std. & .001", .002", .010", .020" Undersize.

CRANKSHAFT

NOTE - 4 Cyl. Eng. has 5 main bearings, 6 Cyl. Eng. has 7 main bearings.

Journal Diameter: 2.2978-2.2988". Out-of-round and taper limit .001".

Clearance - .0008-.0034".

End Thrust: Taken by rear main bearing.

Endplay - .002-.006".

Replacement Bearings: Std. & .002", .010", .020", .030" Undersize.

Bearing Installation: Not necessary to remove engine. *See "Crankshaft & Main Bearings" in Chevy II Special Data.*

Crankshaft & Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chevy II Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Ch vy II Special Data.*

Vibrati n Damp n r (6 Cyl. Only): *S e "Vibration Dampner" in Ch vy II Special Data.*

CAMSHAFT

J urnal Diameter - 1.8682-1.8692". Out-of-round limit .001".

Bearings - Steel backed babbitt lined bushings.

Replacement Bearings: "Precision Type" (do not require reaming).

►*CAMSHAFT BEARING INSTALLATION CAUTION:* Outside diameter of bearings varies according to bearing number and engine listed below. Be sure bearings are installed in proper locations. No. 1 bearing must be installed to depth of 1/8" below front face of cylinder block.

Camshaft Bearing Outside Diamet r

Bearing No.	Outsid Diameter
6 Cyl. No. 1 & 4; 4 Cyl. No. 3	2.009-2.011"
6 Cyl. No. 2 & 3; 4 Cyl. No. 1 & 2	1.999-2.001"

End Thrust: Taken by thrust plate between camshaft sprocket and camshaft gear.

Endplay - .001-.005".

Camshaft Setting: Timing marks on both gears must be together.

Camshaft Removal & Installati n: *S "Camshaft & Bearings" in Chevy II Sp cial Data.*

Engine Front Cover Oil Seal (Crankshaft Fr nt S al): *See "Engine Front Cover" in Chevy II Sp cial Data.*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters. *For op rating clearance adjustment, s "Tune-Up". F r initial adjustment after overhaul, s b low.*

Initial Valve Lash Adjustment - Use distributor rotor position for determining when lifter is on base circle of cam. With rotor pointing to No. 1 cylinder (points open), turn adjusting screw down until all lash is removed (by checking pushrod sideplay), then turn screw down an additional 1 turn and tighten locknut. Repeat on other valve for that cylinder. Continue to adjust valves for each cylinder using firing order sequence.

Valve	Head Diameter	St m Diameter	L ngth
Intake	1.715-1.725"	3410-.3417"	4.9025-4.9324"
Exhaust	1.495-1.505"	①	4.913-4.933"

Valve	Seat Angle	② Lift	St m Cl aranc
Intake	46°③	.335"	.0010-.0027"
Exhaust	46°③	.335"	④ .0015-.0032"

① - Top .3410-.3417"; Bottom .3400-.3407".
② - Cam Lobe Lift .1914".
③ - Valve Face Angle 45°
④ - At Center.

Valve Rotators - May be used.

Valve Seat Width - 1/32-1/16" Intake; 1/16-3/32" Exhaust.

Valve Springs: Single springs used on all valves. Install with closed coil end toward cylinder head.

Spring Free Length - 2.03" approximately.

Valve Spring Specificati ns

Valve	Spring Pressur	Length
Closed	84-92 lbs. ①	1.660"
Open	163-173 lbs.	1.330"

① - Wear limit 70 lbs. at 1.660".

CONTINUED ON NEXT PAGE

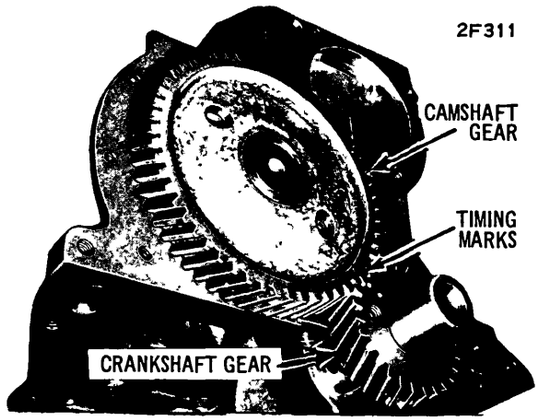
See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Valv Spring Install d Height: Check installed height of valve spring from top of spring seat in cylinder head to top of valve spring shield. If height greater than 1 23/32", install 1/16" shim under spring at spring seat to bring height within limits of 1 21/32-1 23/32". *CAUTION - Installed height must not be less than 1 21/32".*

R ck r Arms: Individually mounted on studs installed in cylinder head.
R ck r Arm Stud R placement - *See "Rocker Arms" in Ch vy II Sp cial Data.*
Valve St m Oil S als (Replacement): *See "Valve System" in Chevy II Special Data.*

Valv Guid s: Integral with cylinder head. *See "Valve System" in Chevy II Special Data.*
Valv Lift rs: Hydraulic on all models. *For overhaul proc dures, see "Valv System" in Chevy II Special Data.*



VALVE TIMING

S e *"Camshaft S tting" under CAMSHAFT above.*

Valv Timing Specifications
Intak Valv s - Open 34° BTDC. Close 86° ALDC.
Exhaust Valv s - Open 68° BLDC. Close 52° ATDC.

ENGINE OILING SYSTEM

►*OIL LEVEL DIPSTICK NOTE (EARLY CARS):* If oil level reading not accurate on these cars, check distance oil dipstick tube projects out of block. This distance should be 2 5/16"(4 Cyl.), 1 13/16"(6 Cyl.). *CAUTION - Dipstick on 4 Cyl. ngin must be pressed firmly in*

VALVE TIMING MARKS

tube so that felt seal contacts top of tube to prevent oil leakage.

►*ENGINE OILING SYST EM: See "Engine Lubrication" under OILING SYSTEM in Chevy II Special Data.*

Crankcase Capacity: 4 Cyl. - 3½ qt. refill 4 qts. with filter change.
6 Cyl. - 4 qts. refill, 5 qts. with filter change.
Normal Oil Pressure - 45 lbs. at 2000 RPM.
Pressure Relief Valve - In oil pump. Not adjustable.
Oil Pressure Indicator - Light on instrument panel controlled by pressure switch AC No. 3815936 located in main oil gallery on lower right side of engine.
Oil Filter: Full flow type for all engines. Replace cartridge every 4000 miles or sooner if needed.
Replacem nt Filter Element - AC PF-11 (6 Cyl.), PF-12 (4 Cyl.).
Oil Pump: Spur gear type. Located in crankcase, driven by distributor gear. No gasket used between pump and mounting flange.
Oil Pump Removal & Overhaul - *See "Oiling System" in Chevy II Special Data.*
Crankcase Ventilation: Standard Cars - Air intake through oil filler breather cap and outlet at crankcase ventilator pipe.

Positive Crankcase Ventilation Cars - Road draft tube replaced by adapter to which is connected a valve and hose which connect to adapter plate between carburetor and intake manifold. Disassemble and clean system every 10,000 miles or sooner if needed. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 8½ qts. (4 Cyl.), 11½ qts. (6 Cyl.), add ½ qt. for heater.
Pressure Valve: 13 lb. radiator filler cap, AC No. 850800.
Thermostat: Poppet pellet type. In intake manifold water outlet. 170°F Part No. 3138868.
Temperature Gauge: AC Electric.
Engine Unit - AC No. 6400092 (stamped AC 238-242M).
Water Pump: Centrifugal, double row ball bearing type. Permanently lubricated.
Overhaul - *See "Cooling System" in Chevy II Special Data.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

	6 Cyl. - Ft. Lbs.	V8

② - Corner bolts. Other screws 6-7½ ft lbs
③ - 60-70 ft. lbs. (283" & 327" Eng.), 95-105 ft. lbs. (409" Eng.).
④ - 30-35 ft. lbs. (283" & 327" Eng.), 35-45 ft. lbs. (409" Eng.).

ENGINE

PASS. CARS

ENGINE REMOVAL: Drain cooling system crankcase and transmission Remove hood radiator (on Auto Trans Cars disconnect and plug cooler lines) Remove battery and all electric equipment wires and remove air cleaner and filter Disconnect fuel and vacuum lines and remove exhaust pipe to manifold bolts Disconnect carburetor control rods at bellcrank clutch control bell crank and transmission rods (overdrive wires and cables) Remove Auto Trans filler tube and plug opening Disconnect speedometer cable propeller shaft (and remove overdrive solenoid) On V8 cars remove road draft tube exhaust crossover pipe and manifold heat control valve Install lifting hooks (Kit J 4536) Disconnect clutch idler shaft bracket raise engine slightly and remove all engine and transmission mounting bolts Remove engine and transmission

CORVETTE

ENGINE REMOVAL: Drain cooling system, drain transmission (or plug drive shaft opening when shaft removed). Disconnect battery cables, remove air cleaner and distributor shield. Disconnect all wiring, ground straps, and pipes at engine connections. On Powerglide cars, disconnect Neutral Safety Switch lead at connector on firewall. Disconnect accelerator linkage and tachometer drive cable at distributor Scribe alignment marks on hood hinges, remove hood. Disconnect radiator tank hoses and upper radiator hose at radiator Remove shroud upper half, remove generator, fan assembly, belt, and water pump pulley, then remove shroud lower half. Disconnect lower radiator hose and remove radiator. Disconnect heater hoses from engine and position hose ends between heater air duct and fender for clearance. On Fuel Injection Cars, remove Fuel Injection unit Remove rocker arm covers. Support vehicle on jack stands. Attach lift fixture to engine (at center head bolt on each bank), and support engine weight with a lift Lift off distributor cap and place it in front of distributor for clearance, cover distributor with clean cloth. Remove engine front mount bolts, disconnect exhaust pipes at manifolds, remove shift lever knob and floor cover. Remove propeller shaft and disconnect speedometer drive cable. Remove right front engine mount frame bracket or fuel pump for clearance. Support transmission weight on jack, take out transmission mount bolts, remove transmission support bracket. Lower transmission while guiding shift lever through floor opening. Lift engine and transmission out of vehicle.

6 CYL. TRUCKS

ENGINE REMOVAL: *NOTE - On Low Cab Forward Models, see "Front Sheet Metal Assembly Removal" below.* On Other Models, drain cooling system, crankcase and transmission Remove hood, radiator hoses, radiator and shroud On All Trucks, disconnect all electric equipment wires Remove coil mounting screws and lay coil and wires out of way Disconnect engine ground strap, fuel line, and remove air cleaner Disconnect control cables from carburetor and oil pressure and vacuum lines Remove exhaust pipe to-manifold bolts, accelerator rod and on ½, ¾ Ton trucks, remove control rods from bellcrank on clutch housing On Auto Trans Trucks, remove transmission throttle linkage rods at transmission On 1-Ton Trucks, remove coolant line clips from dash and frame panels On All Other Models remove floor mat and transmission floor pan cover On 1-Ton Trucks disconnect parking brake pull rod On 1½ & 2-Ton Trucks, disconnect inner and outer levers from parking brake operating lever On 1 1½, 2-Ton Trucks remove transmission cover (with parking brake and gearshift levers) *NOTE Cover opening to keep out dirt* Disconnect speedometer cable, clutch slave cylinder hydraulic line and remove propeller shaft Remove rocker arm assemblies and pushrods Install lifting Tool J 4536-A and raise engine slightly Remove engine mounts and remove engine and transmission

FRONT SHEET METAL ASSEMBLY REMOVAL (Low Cab Forward): Drain radiator and remove radiator hoses On Air Cond trucks remove compressor lines Disconnect air cleaner intake hose at fender skirt (if so equipped) wire connectors at dash and toe panel battery generator and regulator leads Disconnect Power Steering Reservoir hose at pump Remove hood assembly at hinges and remove front bumper Remove fender extension bolts (note number and location of shims for reinstallation) Remove fender upper edge to-plenum and hinge pillar bolts Work from under rear of fender to remove two bolts and spacers at fender extension mounting bracket Remove bolt locking tab, and flat washer from radiator support to crossmember Remove fender skirt mounting bolts and remove bolt, washer spacer and grommet from fender skirt bracket Remove steering joint cover bolts and cover from fender skirt and remove snap in clip from seal to skirt Spread seal from steering column and remove cover Remove sheet metal assembly with radiator battery horn and voltage regulator

ENGINE REMOVAL (Tilt Cab): Engine removal is same as for conventional trucks except for special procedures required by cab design as follows **1)** Drain radiator, disconnect gear shift cable assemblies, and parking brake cable. **2)** Disconnect slave cylinder steel line from flexible hose, then remove accelerator cable rear support and cable ball joint from relay bellcrank. **3)** Separate brake vacuum hose from carburetor, then remove check valve from cab support crossmember. Disconnect fuel inlet line at pump. **4)** Remove surge tank, radiator and heater hoses from engine. Disconnect all wiring, including ground strap, and remove cab release rod guide from side of cab support. **5)** Remove cab-control island support assembly-to-frame and radiator bolts and remove support assembly from truck. **6)** Remove engine mounting bolts, lift engine and transmission up and out of chassis as a unit.

V8 TRUCKS

ENGINE REMOVAL: Drain cooling system crankcase and transmission Remove hood, battery cables and carburetor air cleaner Remove radiator and heater hoses fan blade, spacer, pulley, fan shroud and radiator Remove power brake vacuum line, power steering return line and pump pressure line Remove all electrical equipment lines Disconnect choke and throttle cables Remove accelerator rod from carburetor and dash bellcrank Remove road draft tube and disconnect exhaust pipe at manifolds Remove transmission control rods and disconnect clutch slave cylinder hydraulic line Disconnect and plug oil cooler lines (if so equipped) Disconnect speedometer cable and propeller shaft Remove floor pan and sheet metal, *see "Front Sheet Metal Assembly Removal, Low Cab Forward" above* Remove engine front mount-to-frame crossmember bracket nut and washer, rocker arm covers Install eye bolts (Kit J 4536-A) in head bolt holes Raise engine slightly remove crossmember Remove engine and transmission as a unit

OIL PAN

6 CYL. CARS

OIL PAN REMOVAL (Cars with Powerglide Trans.): Engine must be removed from chassis for pan removal unless cylinder head removed first. With cylinder head off, remove pan as for Synchro-mesh Cars (following).

OIL PAN REMOVAL (All Synchro-mesh Cars & Powerglide Cars with Cyl. Head Removed): Drain crankcase and cooling system, raise and support car and remove radiator and cylinder head. Disconnect battery ground strap at engine, fuel pump inlet line at pump, and accelerator control rod at accelerator control rod lever. Remove overdrive solenoid. Disconnect power brake hose at check valve, and remove oil filter and support bracket assembly. Disconnect exhaust pipe from exhaust manifold, and transmission lower control rods at transmission shifter levers. Disconnect clutch fork pushrod at clutch fork and all clutch controls from engine Loosen transmission mounting bolts and disconnect engine front mounts from engine. Remove hood. Raise engine approximately 3" until valve rocker cover contacts dash upper panel. Remove flywheel underpan extension and remove oil pan. *NOTE* - Rotate crankshaft as necessary for oil pan to clear counterweights.

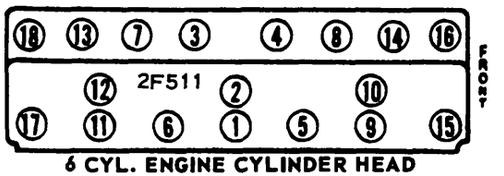
DROPPING OIL PAN (For Limited Work): *NOTE* - Oil pan gaskets, seals and rear main bearing oil seal can be replaced without removing oil pan completely from vehicle as follows: Raise car on hoist drain crankcase, remove rocker arm cover and disconnect exhaust pipe at manifold and the transmission shifter bellcrank

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

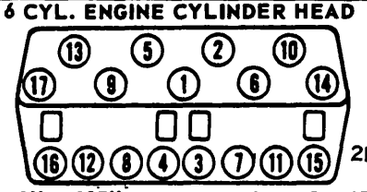
at transmission. Loosen engine rear mount and remove through bolts at engine front mounts. Raise engine front end (use jack under pan or balancer) high enough to place a 2" spacer wood block under each engine front mount. *NOTE - Raise engine slowly to avoid damage to fan and radiator hoses.* Then place blocks under front mounts and remove jack. Remove oil pan screws and lower pan to frame. Move oil pan forward between sway bar and harmonic balancer. This will allow a 4-6" clearance for rear main bearing oil seal replacement. To remove oil pan gaskets and seals, manipulate oil pan to gain access to each piece. To install, reverse removal procedure.

V8 PASS. CARS



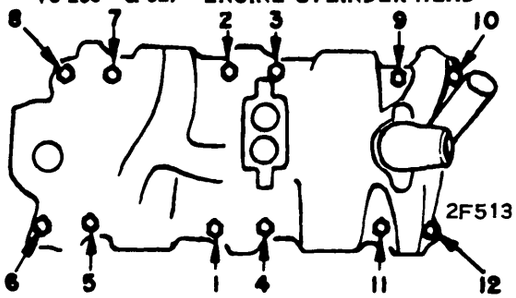
OIL PAN REMOVAL: *NOTE - On Powerglide transmission cars, r mov transmission control lever cross shaft at transmissi n shift r lev r and shaft assembly in addition to f llowing procedur .* Raise car, drain crankcase and radiator. Disconnect radiator hoses at radiator. Disconnect battery ground strap at engine. Disconnect clutch pushrod at pedal control and disconnect intermediate lever and shaft. Remove clutch pedal control intermediate lever and shaft assembly from frame mounting bracket, but leave shaft assembly attached to engine. Remove carburetor fuel feed pipe at fuel pump and remove the fuel pump. Remove accelerator control rod from its lever. On 409" engine, remove oil level gauge tube. Remove power brake vacuum hose at check valve on manifold. On other engines, remove power steering pump at generator and lay on upper control arm (unnecessary to disconnect hoses). On 409" engine, disconnect generator brace and rotate away from engine so power steering pump will clear brake master cylinder. Remove transmission lower control rods at shift levers. Disconnect exhaust pipes from manifolds and lower pipe and muffler assembly. Remove oil filter. Loosen transmission mounting bolts. Remove long bolts from each front engine mount. *NOTE - Turn crankshaft so harmonic balancer keyway slot is at bottom of engine to enabl crankshaft c unt rweights to clear oil pan baffl .* Raise engine at harmonic balancer approximately 2¾" (409" engine), 3" (Other engines) until transmission contacts underbody toe pan. *CAUTION - While raising engine watch clearance at fan blades and shroud.* Remove oil pan bolts and remove pan with a tilting motion.

CYLINDER HEAD & MANIFOLD
ALL ENGINES



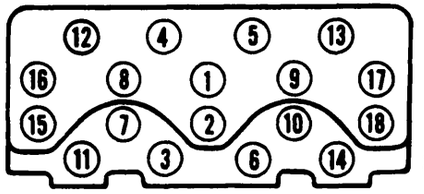
CYLINDER HEAD INSTALLATION (6 CYL. ENGINES): Use torque indicating wrench to tighten cylinder head capscrews in correct sequence as shown in diagram

CYLINDER HEAD INSTALLATION (V8 ENGINES): Coat steel head gasket with a good head gasket paste and install gaskets in position on cylinder block. Install heads over dowels in block. Coat threads of all bolts with Permatex No. 3 (head bolts protrude into water passages). Use a torque indicating wrench and tighten bolts a little at a time to 60-70 ft. lbs. in the sequence shown in diagram.

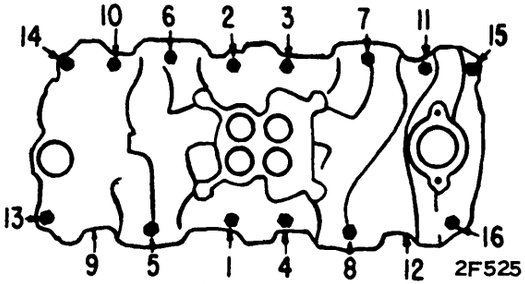


►*CYLINDER HEAD GASKET CAUTION (CORVETTE):* On 340 HP. & 360 HP. engines, TWO cylinder head gaskets are used on each head. DO NOT use gasket cement between the head gaskets.

6 CYL. ENGINE CYLINDER HEAD



V8 283" & 327" ENGINE CYLINDER HEAD



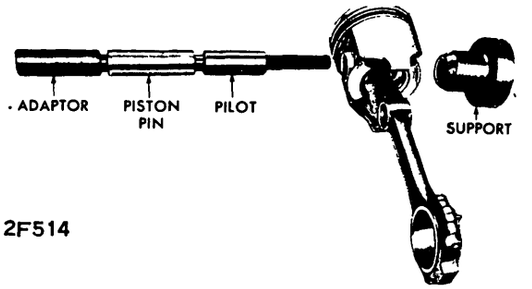
V8 283" & 327" ENGINE INTAKE MANIFOLD

►*409" ENGINE CYLINDER HEAD GASKET CAUTION:* Changes in coolant passages in 1962 engines require the use of 1962 Gasket No. 3814003 **only.** *Use of 1961 gasket will result in water pump seal failure.*

INTAKE MANIFOLD INSTALLATION (V8 ENGINES): Install manifold end gaskets on cylinder block. Coat ends of intake manifold side gaskets around water passages with a good sealing compound and install heads. Tighten bolts a little at a time to 25-35 ft. lbs. torque.

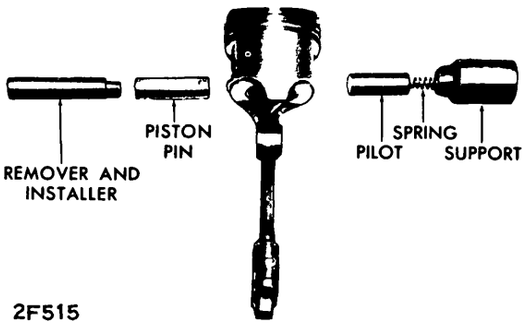
CHEVROLET V8 409" ENGINE CYLINDER HEAD

CHEVROLET V8 409" ENGINE INTAKE MANIFOLD



PISTON PINS
V8 ENGINES

PISTON PINS (283" & 327" Engines): Removal - Install pilot Tool J-9510 on puller screw with pilot through piston and pin. Install tool support over threaded end of puller screw with small end of support against piston. Install nut loosely on puller screw and place assembly in arbor press so that pin can be pressed out through support.



Installation: Lubricate pin holes and position connecting rod in its respective piston so that flange or heavy side of rod at bearing end will be toward **front** of piston (cast depression in head of piston and "F" marks on piston struts) on #1-#3-#5-#7 pistons and rod flange to **rear** of piston on No. 2, No. 4, No. 6, No. 8 pistons. Install piston pin on adapter and pilot on screw. Install puller screw through piston and rod, indexing pilot through piston and rod. Install support over threaded end of puller screw with small diameter toward piston. Install in arbor press and press piston pin in until pilot bottoms in support.

PISTON PINS (409" Engine): Removal - Install pilot of piston pin Tool J-6994-5 on piston pin. Place piston and rod assembly on support and place assembly in arbor press. Press pin out of connecting rod.

CONTINUED ON NEXT PAGE

PISTON PIN DISASSEMBLY

PISTON PIN ASSEMBLY

CONTINUED FROM PRECEDING PAGE

Installation - Lubricate piston pin holes in piston and rod, position rod in respective piston, s flange or heavy side of rod (at bearing end) will be towards front of piston (cast depression in piston head and "F" mark on strut) on No. 1-3-5-7pistons,and rod flange or heavy side of rod, to rear on No. 2-4-6-8 pistons. Place piston pin on installer and pilot spring and pilot in support. Place piston and rod on support indexing pilot through piston and rod. Place support on arbor press, start pin into piston, and press pin into piston until pilot bottoms.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

6 CYLINDER & V8 MAIN BEARING REPLACEMENT:

1) Remove spark plugs and remove engine oil pan. Remove bearing cap and bearing shell.

2) Install main bearing shell removing and installing tool (or use a cotter pin bent as required). Rotate crankshaft in direction of usual rotation and roll upper bearing shell out of engine.

3) Oil new bearing shell and insert plain (un-notched) end of shell between crankshaft and block on the indented or notched side. Rotate bearing into place. Install new bearing shell in bearing cap.

REAR MAIN BEARING OIL SEAL (6 Cyl. Eng.): To replace rear bearing oil seal without removing engine proceed as follows:

1) Drop oil pan, oil pump assembly, rear main bearing cap (discard old seal). Loosen all bearing caps (to allow crankshaft to drop a slight amount). *NOTE* - Pry between crankshaft and block to force crankshaft down as necessary.

2) Use screwdriver or similar tool to force old seal out of upper bearing so it can be removed with a pair of pliers (rotate shaft to aid in removal of seal).

3) Pre-form new upper seal in cap.

4) Insert soft wire (tag wire) through new upper seal 1/4" from end and wrap wire around end of seal to keep seal from spreading. Lubricate entire surface of upper seal with lubricant and reform seal in lower cap.

5) Insert wire through seal opening in crankcase and around crankshaft. Use screwdriver or similar tool to start seal accurately, then pull seal into position (working seal into position with tool and rotating crankshaft as necessary). With seal centered, cut off ends ¼" below bearing edge.

6) Install new lower seal in bearing cap (force it into position with Tool J-5788) and cut ends off flush with surface of bearing cap. Tighten all bearing caps to specifications.

REAR MAIN BEARING OIL SEAL (V8 Eng.): To replace rear main bearing seal without removing engine, first remove oil pan (see above for Pass. Cars, or car model page for Trucks), then proceed as follows:

Cap Seal - Remove bearing cap and pry out old seal with screwdriver. Lubricate new seal (exc. parting surface) and roll seal into place without damaging bead of seal with seal tangs.

Block Seal - Use small drift to start seal out until it can be removed with pliers. Lubricate new seal (exc. parting surface) and gradually push seal in with hammer handle until seal rolls into place. DO NOT cut seal with seal retainer tang.

VIBRATION DAMPENER

6 CYL. ENGINE

VIBRATION DAMPENER (6 CYL ENGINE): Removal - Drain radiator, disconnect hoses. On Automatic Transmission models, remove oil cooler lines. Remove radiator (note number of shims). Remove fan belt. Install Tool J-6978 or J-1287 and remove vibration dampener and pulley assembly.

Installation: Remove puller and install two 3/8"-16 x 1" (16 thread) capscrews in dampener to support wheel portion during installation. Position dampener on crankshaft with key and keyway on alignment and drive dampener on shaft until it bottoms against crankshaft gear. Use a heavy hammer and bar through the grille, taking care that a straight installation is made. Remove the two capscrews previously installed.

V8 ENGINES

HARMONIC BALANCER: Balancer consists of an inertia weight pressed on a hub and procedure below must be used when removing and installing balancer to prevent inertia weight shifting on hub.

Removal: Drain radiator, disconnect radiator hoses, disconnect transmission fluid cooler lines (Auto. Trans. Cars). Remove battery, fan belt, fan, and pulley. Remove radiator and fan shroud. Remove pulley bolts from balancer and remove crankshaft pulley. Install puller tool, No. J-6978, using bolts in tapped holes in face of balancer, remove balancer.

Installation: Coat seal contact area of balancer hub with engine oil, assemble special balancer installer tool, J-8792, (see Tool Note below) on balancer with fingers hooked over balancer rim and tighten threaded driver finger tight *(CAUTION - This is necessary to prevent balancer being pulled apart).* Start balancer on crankshaft with keyway aligned with key in shaft, use soft hammer to drive balancer in place until it bottoms on shoulder on shaft (or spacer installed on shaft on 409" Engines). Remove installer tool and reassemble engine.

►*TOOL J-8792 NOTE:* This tool also used on Chevy II 6 Cyl. Engines (different set-up) and must be assembled exactly as follows for use on V8 engines: Thread driver in clamp on shallow finger side (opposite side from V8 mark on clamp), insert pilot in end of driver on opposite side of clamp with large end in toward clamp, secure pilot with machine screw. Install tool assembly on balancer with deep fingers of clamp engaging balancer rim.

►*HARMONIC BALANCER INSTALLATION CAUTION (CORVETTE 340 & 360 HP ENGINES):* A spacer is installed between balancer hub and crankshaft shoulder for belt alignment. Make certain this spacer is in place when installing balancer. On later engines, a bolt is installed in end of crankshaft and this bolt should be used to pull balancer on shaft (do not drive balancer on).

ENGINE FRONT COVER

ALL ENGINES

FRONT OIL SEAL INSTALLATION: Pry old seal out of front cover. Install new seal so that open end of seal is toward inside of cover and drive it into position with Oil Seal Driver J-995 (6 Cyl.), J-996 (V8). *CAUTION* - Support cover at sealing area while installing seal.

CAMSHAFT & BEARINGS

CAMSHAFT LOBE LIFT (All Eng.): Remove rocker arm shaft and support assembly (6 Cyl.), rocker arms and balls (V8). On 6 Cyl. Eng., install 3/8"-24-16 Stud Adapter from Tool J-8520 in rocker shaft support hole. On all engines, attach Tool J-8520 to adapter or stud and adjust dial indicator to seal in pushrod cup. *NOTE - Be sure pushrod is seated in lifter socket.* Rotate crankshaft slowly (clockwise) until lifter is on heel of cam lobe (pushrod will be in its lowest position). Set dial indicator to Zero and slowly "BUMP" engine over until pushrod is in **FULLY** raised position. Compare total lift on dial indicator with Specifications in "CAMSHAFT-WEAR LIMIT" table below. *NOTE - Continue to rotate engine until indicator reads Zero for accuracy check on dial indicator.*

Camshaft Lobe Lift & Wear Limit

	Intake Lift		Exhaust Lift	
Engine	① New	② Worn	① New	② Worn
235" Pass	.222"	.217"	.222"	.217"
235" Trk.	.210"	.203"	.225"	.218"
261" Trk.	.274"	.269"	.280"	.273"
283" ③⑤	.222"	.217"	.222"	.217"
283" ④⑤	.266"	.261"	.266"	.261"
283" ⑥	.263"	.258"	.267"	.262"
327" ⑤	.266"		.266"	
409" ⑥	.2813"		.2649"	

① - Plus or Minus .002". ② - Plus .003", Minus .002".
③ - Pass. Cars with 2-Bbl. Carb.
④ - Pass. Cars (Exc. 2-Bbl. Carb.), Corvette & Trucks.
⑤ - With Hyd. Lifters. ⑥ - With Mech. Lifters.

6 CYL. ENGINES

CAMSHAFT REMOVAL & INSTALLATION: Drain crankcase and radiator. Remove radiator and grille. Remove rocker arm cover and rocker arm shaft assembly. Remove coil and valve side cover, pushrods and lifters. Remove vibration damper (see above). Remove oil pan and engine front cover (see above). Remove camshaft thrust plate screws and remove camshaft and gear. *CAUTION - Support shaft carefully to prevent bearing damage,*

Installation: Reverse removal procedure. Note new camshaft installation caution under V8 below.

6 CYLINDER CAMSHAFT BEARING REPLACEMENT: Use Bearing Remover & Replacer J-6356. Install No. 1 and No. 2 bearings first, then rear two bearings. *(CAUTION* - Align holes in bearings with oil holes in block before pulling into place). Install plug flush to 1/32" deep from clutch housing face of case.

V8 ENGINES

CAMSHAFT REMOVAL & INSTALLATION: 1) Drain radiator, remove outlet and inlet hoses. On Auto. Trans. models, remove oil cooler lines from radiator and plug lines and fittings. Remove attaching bolts and lift radiator straight up to remove.

2) Remove air cleaner, disconnect throttle rod at carburetor (On Auto. Trans. models, disconnect lower transmission throttle lever rod). Disconnect fuel, vacuum, and choke lines at carburetor coil primary wires, and coil to distributor secondary wires. Remove distributor.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

3) On overdrive models, disconnect kickdown switch wires at switch

4) Remove spark plugs, water and heater hoses, and temperature indicator unit from intake manifold Remove intake manifold

5) Remove fan belt, exhaust manifold to exhaust crossover pipe stud nuts and lower crossover pipe Remove exhaust manifold heat control valve from right exhaust manifold

6) Disconnect generator wires, remove exhaust manifolds, choke heat tube and remove rocker arm covers

7) Loosen rocker arm nuts, pivot rocker arms and remove pushrods and valve lifters *NOTE* - Pushrod seats on solid lifters should remain with lifters

8) Remove fuel pump lines at fuel pump, pump mounting bolts, fuel pump, fuel pump pushrod adapter bolts adapter and pushrod

9) Remove bumper, grille-to-fender tie bar screws, grille-to-fender screw and screw and bolt at front end of grille From under fender, remove grille bracket to fender filler panel screw and fender and filler panel to grille screw

10) Remove grille filler panel-to-grille clips, hood lock plate-to-grille support assembly, and fender tie bar bolts

11) From under fender, remove tie bar-to-fender skirt bolts and front bolts at tie bar, then loosen rear bolt at each side Rack tie bar backward to clear top of grille Lift grille assembly to clear tabs at fillerpanel, unplug electrical connections and remove grille

12) Remove vibration dampener (see *"Vibration Dampner R moval"*), timing chain cover, timing chain and sprocket Install two bolts, 5/16"-18 x 4", in camshaft bolt holes and remove camshaft *NOTE* - All camshaft bearings are the same diameter Use care to avoid damage to bearings

Installati n: Reverse removal procedure. **When installing n w camshaft,** add one 16 oz. can of E.O.S. (Engine Oil Supplement Part No. 3755785) to crankcase and, if possible, pour 2 or 3 ozs. of E.O.S. directly on shaft. In addition (particularly on Hi-Perf. Engines), apply molybdenum disulphide (Molykote or equivalent) on foot of each valve lifter. Drain crankcase containing oil with E.O.S. additive at end of 1,000 miles (409" Engine), at normal oil change period (Other Engines).

V8 CAMSHAFT BEARING REPLACEMENT: Use Bearing Remover & Replacer J-6356. Remove bearing nearest center of block first, then No. 2 and No. 4 bearings, and finally front and rear bearings (with this sequence minimum number of turns are required to locate Remover & Replacer for removal of next bearing). When installing, install No. 1 or front bearing first. This bearing will act as guide for tool and center the No. 2 and No. 3 bearings being pulled into place. *(CAUTION–*Use care when installing rear bearing due to smaller size of oil pressure holes in rear bearing. When installing end plug, install flush to 1/32" deep to maintain level surface on rear of cylinder block).

TIMING GEARS

6 CYL. ENGINES

REPLACEMENT TIMING GEARS: Fibre type camshaft gear and steel crankshaft gear used on passenger cars. Aluminum camshaft gear and steel crankshaft gear used on trucks.

TIMING GEAR INSTALLATION: Gears are press fit on crankshaft and camshaft and must be removed and installed as follows

Crankshaft Gear–To remove gear, attach Puller J-8105 to the gear and turn handle When installing gear, make certain that two woodruff keys are in the crankshaft, then drive gear on shaft until it bottoms against shoulder

Camshaft Gear–To remove gear, install Gear Remover J-971 on shaft in back of gear (remover consists of support sleeve), place camshaft assembly in arbor press *(CAUTION–*Thrust plate must be positioned so that it will not be damaged by woodruff key in shaft as shaft pressed out), press shaft out of gear. To install gear, place shaft in arbor press (support shaft securely directly back of front bearing journal), install gear spacer ring and thrust plate over end of shaft, and install woodruff key in shaft keyway. Install camshaft gear and press it on shaft until it bottoms against the gear spacer ring. End clearance of thrust plate should be 001 005" Install the camshaft assembly in engine block, being careful not to damage bearings or cams. With crankshaft installed turn camshaft and crankshaft so that valve timing marks on gear teeth will line up, then push camshaft into position. Install camshaft thrust plate-to-block screws and tighten securely. Camshaft and crankshaft gear runout should not exceed .004" for camshaft and .003" for crankshaft. Backlash between timing gear teeth should not be less than .004" nor more than .006". *CAUTION–*Press on hub only when installing camshaft gear.

TIMING CHAIN

V8 ENGINE

TIMING CHAIN: Removal–Remove vibration dampener, timing chain cover, and oil slinger Rotate engine until timing marks on sprockets are in alignment and adjacent Remove three camshaft sprocket screws and remove camshaft sprocket and chain together

Installation Install chain on camshaft sprocket Hold sprocket vertical with chain hanging below, and line up 'O' timing marks on both sprockets so they are adjacent and in line with a straight edge across shaft centers Align dowel in camshaft with dowel hole in sprocket and install sprocket on camshaft Draw camshaft sprocket onto shaft using the three mounting bolts Tighten to 15-20 ft lbs *CAUTION–Do not attempt to drive sprocket onto shaft as welch plug at rear of engine can be dislodged.*

VALVE SYSTEM

VALVE STEM OIL SEALS
6 CYL. ENGINES

VALVE STEM OIL SEAL INSTALLATION: Seal consists of synthetic rubber ring installed in second groove of valve stem directly under valve locks on all valves. When assembling valves, install seal as follows Install valve spring and spring retainer on valve stem, compress spring until lower groove on valve stem is exposed, install seal in this groove *(CAUTION* - Seal must seat flat in groove and not be twisted). Install valve locks in upper groove in valve stem, relieve spring tension, check to see that seal is properly retained in spring retainer and that locks are engaged.

V8 ENGINES

VALVE STEM OIL SEAL INSTALLATION: Seal consists of "O" ring installed in second groove of valve stem directly under valve locks on all valves and cup shaped metal shield placed over outer end of valve spring under valve cap Install valve spring and damper, with close coiled end against cylinder head and place shield over spring On trucks place rotator in position (if used) Install cap compress spring and install seal in lower groove on stem *NOTE* - Be sure seal is flat and not twisted in groove Install valve locks and release spring tension

VALVE GUIDES
6 CYL. ENGINES

VALVE GUIDE INSTALLATION: Press old guide from cylinder head with an arbor press and Tool J-5600. Press new guides (short guides for exhaust, long guides for intake)into head with Tool J-5599 until top of guide is 15/16" (exhaust), 1" (intake) above head *NOTE - When using Tool J-5599, use a 1/16" shim under tool for intake guides When using Tool J-5734, use a 1/16" shim under tool for exhaust guides* Finish ream all guides with 343" hand reamer, Tool J-4822

ROCKER ARMS

►*ROCKER ARM COVER INSTALLATION CAUTION (CORVETTE)·* Covers are marked "O" on inboard side and must be installed with marks toward center of engine for rocker arm clearance. Engine ground straps are attached by rocker cover screws and must be installed when covers installed.

6 CYL. ENGINES

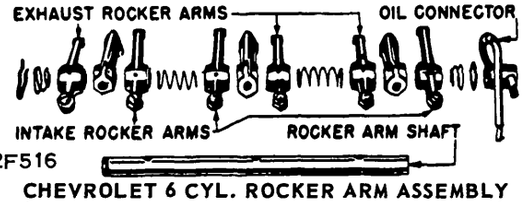
ROCKER ARMS (6 CYL. ENGINES): Diamond bored and "granodized" (no bushings) and fit directly on rocker arm shafts Different rocker arms used as follows and must be installed as indicated

Rocker Arm Identification

Type	Cylinder No.	©Casting No.	Part N .
L H Intake	2-4-6	3764485	3764489
L H Exhaust	1-3-5	3764487	3764481
R H Intake .	1-3-5	3764486	3764490
R H Exhaust	2-4-6	3764488	3764482

©- Last two digits (85, 87, etc) of this number stamped on rocker arm

Installation Assemble rocker arms as indicated in illustration with open end of shaft toward center, and baffle in rear shaft open end in vertical position



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

V8 ENGINES

ROCKER ARM STUD REPLACEMENT (V8 ENGINES): Replacement studs furnished .003" & .013" Oversize. **Removal** - Remove old stud by placing Spacer J-5802 over stud, adding flat washer and nut and turning nut down to pull stud from head.

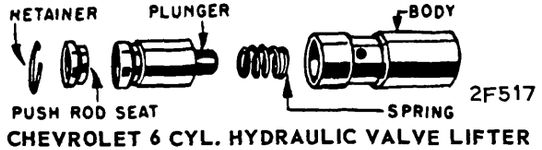
Installation - Ream stud hole for correct oversize stud using Reamer J-5715 for .003", J-6036 for .013" oversize. Coat press-fit part of stud with hypoid lubricant and use Tool J-6880 to install stud in head. Tool should bottom on head.

CHEVROLET 6 CYL. ROCKER ARM ASSEMBLY
(REAR ASSY. SHOWN - FRONT ASSY. SIMILAR)

PUSHROD IDENTIFICATION & INSTALLATION: On 409" Pass. engines, the exhaust pushrod is longer than the inlet pushrod and the pushrods have different color markings. All pushrods with a color stripe on one end **must** have that end contacting rocker arm. *See Valve Data below.*

Pushrod No. & Identification

Engine	Part No.	Valve	Paint Stripe
235", 261"	3836260	All	None
283"	3837152	All	None
327" ①	3817616	All	None
327" ②	3796234	All	Blue
409" Pass.	3795627	Intake	Black
	3795629	Exhaust	Blue



① - 250 & 300 HP Pass. & Corvette.
② - Truck; 340 & 360 HP Corvette.

HYDRAULIC LIFTERS
6 CYL. ENGINES

HYDRAULIC VALVE LIFTERS: Barrel type consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet or body (see illustration) Oil is introduced to this unit through oil gallery in block

Removal: Remove rocker arm assemblies pushrod cover pushrods and valve lifters *NOTE* - Keep valve lifters and pushrods in order so they may be returned to original positions

Disassembly: Use Tool J-4274 and hold plunger down and remove plunger and pushrod seat retainer with a small screwdriver blade. Remove pushrod seat, plunger, ballcheck valve assembly, and plunger lifter spring. Clean all parts in solvent and inspect each part for nicks or burrs and wear. Replace lifter assembly if any part damaged or has excessive wear.

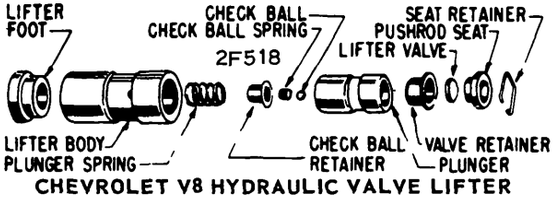
CHEVROLET 6 CYL. HYDRAULIC VALVE LIFTER

R assembly: Drop lifter spring into body. Install plunger and ball check valve assembly into body, using care to align feed holes in body and plunger. Fill lifter with SAE 10 oil, insert end of Tool J-4274 into plunger, and press down solidly. Insert pin (part of J-4274) through oil feed holes to hold plunger against spring tension and remove other part of tool. Fill lifter with SAE 10 oil and install pushrod seat and spring retainer. Remove tool pin.

V8 ENGINES

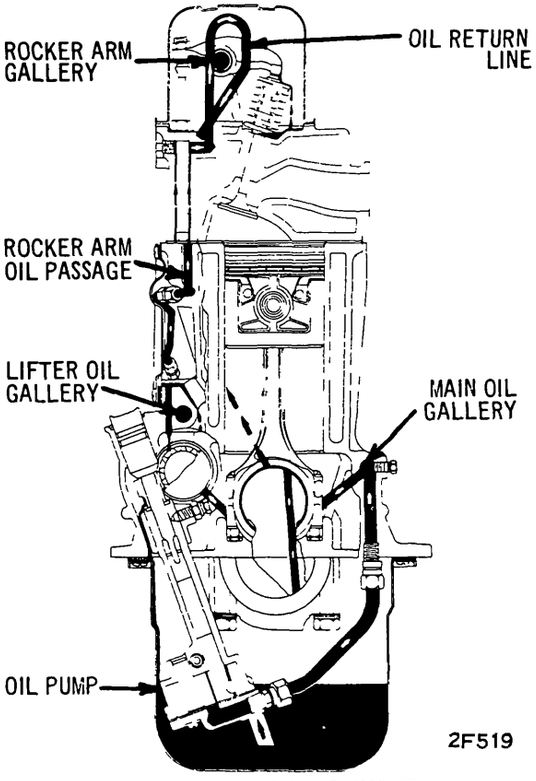
HYDRAULIC VALVE LIFTERS: Barrel type consisting of lifter body pushrod seat inertia valve check ball ball retainer pushrod seat retainer plunger and plunger spring Oil is supplied under pressure from main oil gallery line

Removal: Remove rocker arm covers intake manifold back off rocker arm nuts until arms may be pivoted away to remove pushrods Remove hydraulic lifters.



Disassembly: Hold plunger down with pushrod, then remove pushrod seat retainer, pushrod seat, inertia valve assembly, plunger and spring from lifter body Pull check valve ball retainer from plunger and remove ball and spring Clean all parts in solvent and inspect them carefully for wear or damage Replace lifter if damaged parts are found

Reassembly: Place check ball on small hole in bottom of plunger, check ball spring in ball retainer and place retainer over ball so spring rests on ball Squeeze retainer and press into position in plunger Place plunger spring over ball retainer and slide lifter body over spring and plunger Install pushrod seat and inertia valve assembly in open end of plunger, push plunger into body and install retainer Compress plunger to open holes and fill with SAE 10 oil Work plunger up and down and again refill



V8 ENGINES

LIFTER ADJUSTMENT: Engine Stopped - With No 1 cylinder at TDC firing position, adjust Exhaust Valves 1-3-4-8 and Intake Valves 1-2-5-7 as follows: Back off rocker arm stud adjusting nut until there is play in valve pushrod, then tighten nut until pushrod-to-rocker arm clearance is just removed. Then tighten nut an additional 1 turn. This procedure will place hydraulic lifter plunger in the center of its travel. No further adjustment is required. *NOTE - To identify lifters, see above.* Crank engine one complete revolution so No. 6 cylinder is at TDC firing position and adjust Exhaust Valves 2-5-6-7 and Intake Valves 3-4-6-8 in the same manner.

Engine Running - With engine at idle speed, back off rocker arm stud adjusting nuts one at a time until rocker arm starts to clatter. Then turn nut down until clatter just stops. Turn nut an additional 1 turn.

CHEVROLET V8 HYDRAULIC VALVE LIFTER

6 CYL. ENGINE OILING SYSTEM

OILING SYSTEM
235" & 261" ENGINE

ENGINE LUBRICATION: Force feed type with oil supplied under pressure to all crankshaft, connecting rod and camshaft bearings, lifters and rocker arms. Restricted oil pressure supplied to valve stems and pushrod sockets and timing gears All other parts oiled by spray or mist from engine crankcase

OPERATION: Gear type oil pump, mounted on crankcase (at right side) and driven by distributor drive shaft, draws oil from oil pan through a floating oil screen and delivers it by pipe to fitting on lower end of passage, leading to a horizontal oil gallery at left side of crankcase. Pressure regulator valve located in oil pump body. Oil is distributed from main oil gallery as follows:

Crankshaft & Camshaft Bearings - An oil channel from main oil gallery through each crankcase web delivers oil to each crankshaft main bearing A similar channel in opposite side of each web delivers oil from each crankshaft bearing to each camshaft bearing

Connecting Rod Bearings - Crankshaft is drilled so that each connecting rod bearing is lubricated through passages from adjacent main bearing Main bearings provide continuous flow of oil to connecting rod bearings.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Pistons & Pins - Oil spray is thrown on cylinder walls from an oil hole on left side of connecting rod when this hole registers with hole or passage in connecting rod journal.

Timing Chain & Sprockets - Oil from front camshaft bearing passes through a milled slot in rear surface of front engine plate and is directed by a nozzle at timing gears.

Lifter Oil Gallery - A horizontal lifter oil gallery, located directly above camshaft, receives oil from rear camshaft bearing (early cars) from both front and rear camshaft bearings (later cars). This gallery lubricates both mechanical and hydraulic valve lifters.

Rocker Arms, Pushrods, and Valve Stems - Oil is delivered to the horizontal lifter gallery by the front and rear camshaft bearings. A vertical oil gallery from center of lifter gallery, with an 11/32" orifice restriction, delivers oil to a matching passage in cylinder head to fitting on cylinder head. Oil is delivered from fitting on cylinder head through a pipe to a connector between hollow rocker arm shafts, then to return passage in cylinder head and block to crankcase. Oil passes through holes in hollow rocker arm shafts to rocker arms where bleeder holes supply oil for valve stem and push-rod socket lubrication.

OIL FILTER: 235" Eng. - Optional partial flow type mounted on engine bracket.

261" Eng. - A full flow type filter mounted on the intake manifold. Receives oil directly from passage in crankcase leading to main oil gallery and delivers it to main oil gallery. *NOTE* - When filter removed, connect inlet and outlet openings in crankcase with pipe and DO NOT plug openings at any time.

283 & 327" ENGINES

DESCRIPTION: Positive pressure lubrication is provided to all main, camshaft and connecting rod bearings and to all valve lifters and rocker arms. Three horizontal oil galleries are located in "V" at center of engine and distribute oil under pressure to all parts of engine.

OPERATION: Gear type oil pump mounted on rear main bearing cap draws oil from engine oil pan sump through a meshed screen intake (with bypass valve at center of screen) and delivers it through rear main bearing cap to a vertical passage leading to main oil gallery. On 1956 and later engines, this vertical oil passage is rerouted through a full flow filter mounting pad at left side of crankcase. Bypass valve is located between filter and mounting pad. Oil distribution from main oil gallery is as follows:

Crankshaft & Camshaft Bearings - An oil passage from vertical oil passage supplies oil to rear main bearing. Oil passages from main oil gallery supply oil to each camshaft bearing and to all except the rear main bearing.

Connecting Rods & Pistons - Oil is delivered from each main bearing to adjacent connecting rod bearing through drilled passages in crankshaft. A hole in connecting rod sprays oil onto cylinder walls, for piston and piston pin lubrication, when hole in rod matches hole in connecting rod journal.

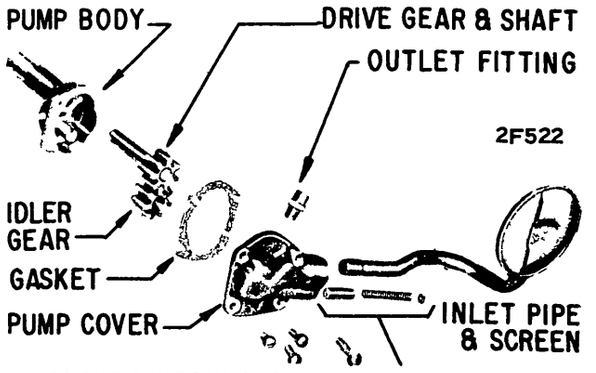
Valve Lifters - Oil passage from rear camshaft bearing supplies oil to lifter oil galleries. Both mechanical and hydraulic valve lifters intersect the gallery. A recess in mechanical lifter permits oil to pass into lower end of pushrod. A larger passage in rear camshaft bearing permits more oil pressure for lubrication of hydraulic lifters. Hydraulic lifters contain an inertia valve which opens permitting oil to pass to hollow pushrods.

Rocker Arms & Valve Stems - Oil passes up through hollow pushrods to a hole in upper end that matches hole in rocker arm. Oil sprayed out this hole and across rocker arm lubricates valve stem tip.

OIL FILTER: Full flow type mounted on left side of crankcase. Receives oil direct from oil passage from oil pump and delivers it back to vertical oil passage. Bypass valve located between filter and mounting pad.

409" ENGINE

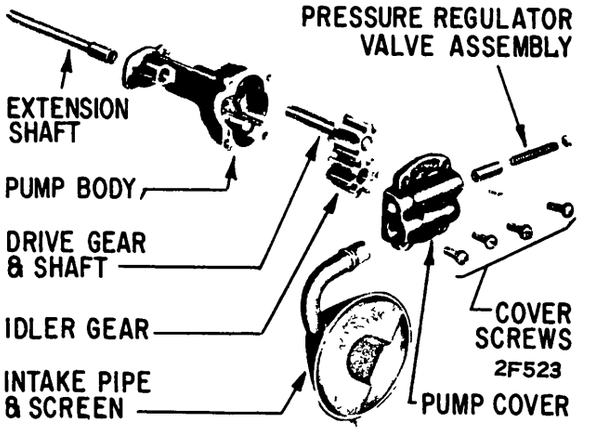
DESCRIPTION: 409" engine lubrication system is the same as for 283" & 327" V8 Engines except for the following: The oil pump delivers oil through passage in rear main bearing cap to a filter mounting pad at left side of engine. A passage from filter pad leads to a horizontal main oil gallery running full length of engine. Oil from this main gallery is delivered through diagonal passages to vertical passages leading up to camshaft and down to crankshaft bearings.



OIL FILTER: Full flow type mounted in recess on left lower side of crankcase with bypass valve located in recess. Receives oil through direct passage in bearing cap and crankcase and delivers it through passage to main oil gallery.

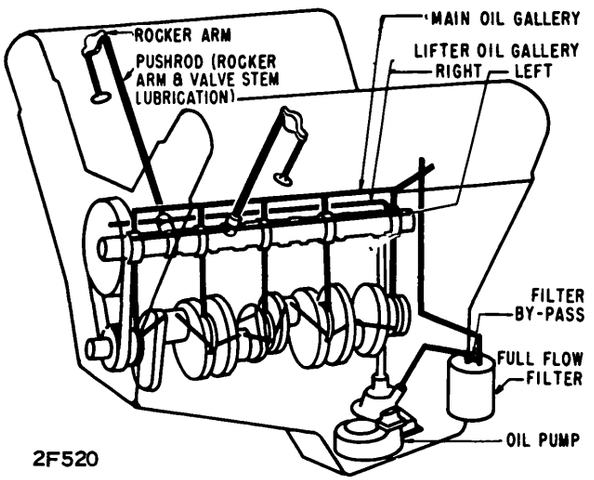
OIL PUMP

6 CYL. ENGINES

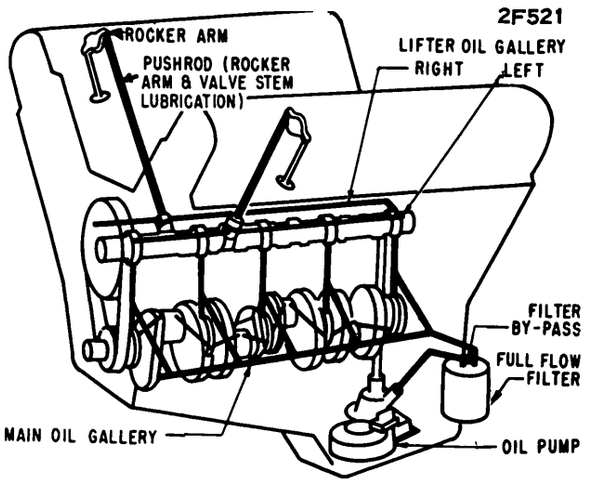


6 CYL. OIL PUMP (Removal & Disassembly): Drain oil, remove oil pan and disconnect oil pump-to-block oil line. Remove oil pump retaining sleeve lock screw and remove oil pump and oil pump-to-block oil line. Remove pressure oil line from pump and remove pump cover attaching screws, cover, gasket, idler gear and drive

CONTINUED ON NEXT PAGE



PRESSURE REGULATOR VALVE ASSY



6 CYL. ENGINE OIL PUMP

CHEVROLET V8 OIL PUMP

348" & 409" ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING PAGE

gear and shaft. Remove regulator valve pin and valve parts. Remove intake pipe and fixed screen as an assembly. Wash all parts in solvent and inspect pump body for cracks or excessive wear. Check shaft for looseness in housing and gear and cover for wear.

Assembly: Install drive gear and shaft in body. Install idler gear with smooth side toward cover. Install cover and new gasket. Tighten screws securely and check to see that shaft turns freely. Install regulator valve plunger, spring, retainer and pin. Install oil line to pump body loosely.

Installation: Install pump in block and align oil lines and install retaining sleeve lock screw and tighten securely. *(CAUTION*–Make sure tapered end of lock screw draws down into hole in oil pump body. Tighten oil pump-to-block oil line and pump-to-screen oil line connector nuts securely. Replace intake pipe and screen.

V8 ENGINE

V8 OIL PUMP (Removal & Disassembly): Drain oil, remove oil pan and pump to rear bearing cap bolt. Remove pump, extension shaft and collar. Disconnect pump shaft from extension, remove pump shaft, pump cover, idler gear, drive gear and shaft. If screen or pipe need replacing, hold cover (in soft jawed vise) and pull out pipe. Wash all parts in solvent and inspect all parts for cracks, burrs or excessive wear.

Reassembly: Assemble drive gear and shaft in body, install idler gear (with smooth side to cover). Install pickup screen and pipe on cover (if removed) but DO NOT twist or collapse suction tube. Install cover and tighten screws to 6-9 ft. lbs. (shaft must turn freely). Assemble collar end of extension shaft assembly over pump drive shaft, align tang with slot in pump drive shaft. Assemble pump and extension shaft to rear bearing cap. Align slot in extension shaft, install rear bearing cap bolt and tighten to specifications. *NOTE* - Bottom edge of screen must be parallel to oil pan rails.

COOLING SYSTEM

WATER PUMP

ALL ENGINES

WATER PUMP (All Eng.): Removal - Drain radiator, remove water inlet hose and heater hose from pump housing. Remove water pump to cylinder block bolts and remove pump from engine. *NOTE* - On 6 Cyl. engine, pull pump straight out of block to avoid damage to impeller and shaft.

►*DISASSEMBLY CAUTION: Fan hub position has been changed to provide radiator clearance and former hub setting gauges cannot be used on 1962 pumps (use former gauges to position hub when installing 1962 pump on 1961 or earlier model). Mark position of hub on shaft before disassembling pump to insure replacing hub in correct position when reassembling pump.*

Disassembly: On V8 pumps, remove back plate and gasket. On all models, support hub in press and press shaft out of hub (use 1/2" x 2" pin). Support pump in press (use blocks under pump body) and press shaft and impeller out of pump body. *(CAUTION* - Apply pressure to outer race of bearing only). Place Tool J-5855 in press, support impeller on seal surface, press shaft out of impeller (use 1/2" x 2" pin). Discard old seal.

Reassembly: 1) Install shaft and bearing assembly in pump body from front side (235", 261", 283", 327" Eng.), from rear side (348" & 409" Eng.), until bearing is flush with front of pump body. *CAUTION - Apply pressure on outer race of bearing only.*

2) Coat outer diameter of seal with sealing compound and press on outer flange with Tool J-5590 until seal bottoms with outer flange against pump body.

3) Press hub on shaft to correspond with mark on shaft made at time of disassembly.

4) Support pump on hub and install impeller. *NOTE - Clearance between vanes and pump body should be .010-.035". Bend feeler gauge to check 348" & 409".* Install cover and gasket, tightening screws diagonally. Install pulley and fan.

Installation - Reverse removal procedure using new gasket between pump and cylinder block. Adjust fan belt tension.

►*FLUID FAN NOTE:* Thermo-modulated fan is standard equipment on 327" & 409" Pass. engines and optional on all other model Pass. Engines. Silicone fluid in clutch assembly limits maximum fan speed to 3500 RPM. Temperature sensing modulating device limits fan speed to 1600 RPM until modulating device reaches 120°F, then fan speed increases to 3500 RPM as temperature increases to 150°F at thermostat.

►*JACKING & HOISTING CAUTION Before jacking, hoisting or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section*

TUNE-UP

COMPRESSION PRESSURE: 130 lbs minimum at cranking speed and throttle wide open 15 lbs maximum variation between cylinders

VACUUM READING: 17-20" steady, at idling speed

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters With engine at operating temperature and idling, loosen locknut and back off adjusting screw (one at a time) until rocker arm clatters, then turn adjusting screw down until clatter stops, plus 1½ turns, then tighten locknut *For Initial Valve Adjustment see VALVES below*

MANIFOLD HEAT CONTROL: Thermostatic type Check for free operation Should require ½ turn from unhooked to hooked position Replace a distorted spring

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition or carburetion troubles *See "Closed Crankcase Ventilation Systems" in Carburetion Section*

IGNITION

FIRING ORDER: 1-5-3-6-2-4

SPARK PLUG GAP: 035"

Spark Plugs - AC-46 (Std), AC-44 (colder) 14 mm Torque to 25 ft lbs

COIL: Delco-Remy No. 1115165.

Ignition Current - 1 8 amps idling, 4 0 amps stopped

Resistor - Resistance type cable (1 8 ohms) used in harness between bulkhead disconnect plug and starter solenoid bypass terminal (in coil primary circuit for regular operation) Bypassed during cranking when coil energized directly from starter solenoid bypass terminal

DISTRIBUTOR: Delco-Remy No. 1112403.

Condenser - Delco-Remy **Capacity** 18-23 mfd

Contact Point Set - Delco-Remy No 1847643

Breaker Gap - 016"

Cam Angle - 28-35° with 016" gap

►*BREAKER GAP CAUTION* Manufacturer recommends final check with feeler gauge or dial indicator if dwell meter used to set points

Breaker Arm Spring Tension - 19-23 ozs

Rotation - Clockwise viewed from above

Automatic Advance

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	375	0-4	750
4-6	700	8-12	1400
9-11	1350	18-22	2700
12-14	1750	24-28	3500

Octane Selector: Adjustment on distributor provides 10° spark advance or retard from center "0" position

Vacuum Spark Control: Delco-Remy No 1116089, 140 or 143

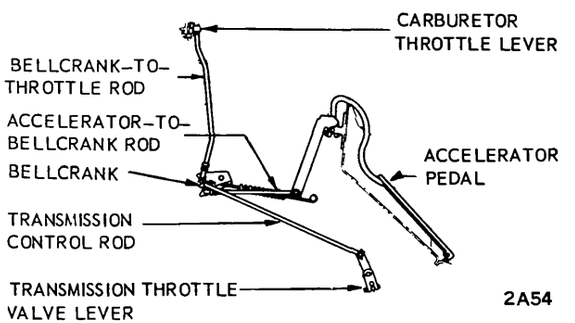
Vacuum Advance - 1116089

Distr Degrees	Eng Degrees	Vacuum (" of Hg)
Start	0	4-6
7 5	15	7 5-10

Vacuum Advance - 1116140 & 143

Distr Degrees	Eng Degrees	Vacuum (" of Hg)
Start	0	4-6
11	22	15-16

IGNITION TIMING



Setting - 5° BTDC at idle speed with vacuum line disconnected Allowable range 0°-8° BTDC

Timing Mark - First short vertical line on flywheel, clockwise from steel ball (TDC) insert This line should align with pointer in inspection hole in right front face of housing with octane selector set on "O"

CARBURETOR

►*CARBURETOR APPLICATION Rochester BC single barrel carburetor used on all models.*

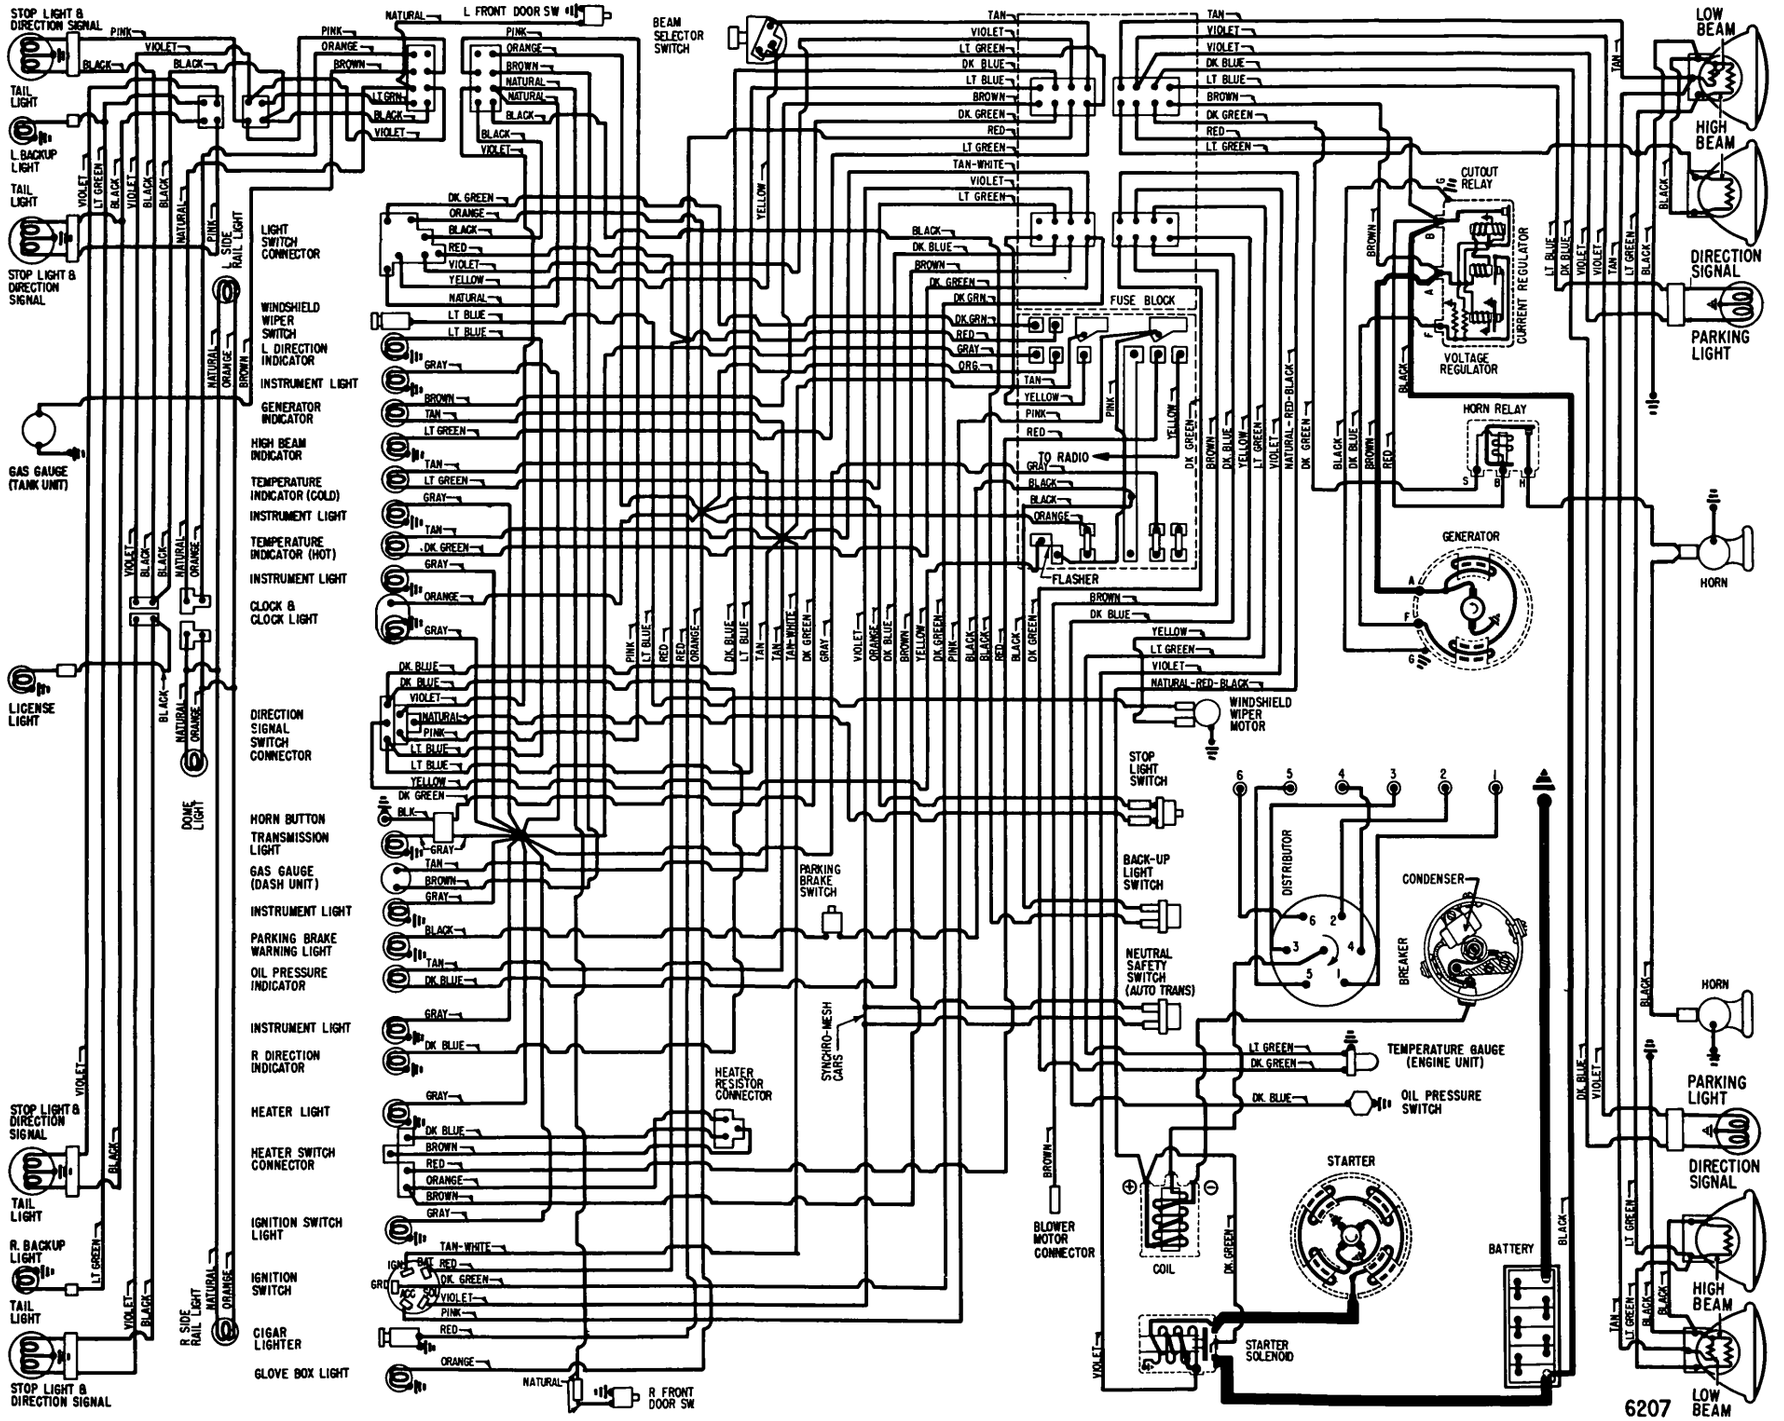
THROTTLE LINKAGE ADJUSTMENT (POWERGLIDE CARS): 1) Disconnect control rod from throttle lever at transmission cover Remove lower bolt at rear of transmission side cover Rotate throttle valve control outer lever counterclockwise to open throttle position 2) Hold lever in this position and with throttle valve outer lever gauge J-5906 set at 7 09", measure distance from left side cover lower rear bolt to hole in throttle lever If pins of gauge will enter holes, adjustment is correct If necessary to adjust, loosen lever-to-clamp adjusting screw and adjust lever on throttle shaft as necessary Reconnect throttle rod

POWERGLIDE TRANSMISSION THROTTLE LINKAGE

3) Disconnect bellcrank-to-transmission throttle lever rod at throttle valve lever Disconnect accelerator-to-bellcrank rod at bellcrank

4) Force bellcrank-to-transmission throttle lever rod forward against its stop in transmission (open throttle position) and adjust bellcrank-to-carburetor throttle rod for free entry of swivel pin in throttle valve lever, with carburetor throttle valve in wide open position

5) With carburetor throttle valve held in wide open position and accelerator fully depressed, adjust accelerator-to-bellcrank rod for free entry of swivel pin into hole in bellcrank



ROCHESTER BC

Rochester BC single barrel carburetor used as follows

Model	Carburetor No.
Synchro-mesh (Std)	7020003
Powerglide (Std)	7020000
Synchro-mesh (Economy)	7020107
Powerglide (Economy)	7020106
Velocity Governor	7020005

Idle Setting - 1½ turns open. 2½ turns open after engine temperature normal.
Idle Speed - 500 RPM (Synchro-mesh), 475 RPM (Powerglide in Drive).
Float Level - 1 9/32" (Gauge M-250). With air horn inverted and gasket in place, position gauge M-250 over floats with tang inserted in discharge nozzle. Bend float arms as necessary so that top of each float just touches gauge and float is centered between gauge legs.
Float Drop - Bend float tang as necessary to obtain a distance of 1¾" from gasket surface to bottom of float, with air horn upright and float hanging free.

Automatic Choke Setting: Set on Index (7020105), 1 Notch Lean (7020003), 1 Notch Rich (7020107), 2 Notches Rich (7020000 & 7020106). *NOTE* - Settings for 7020105 & 7020003 supersede previous specifications.

Fast Idle: With fast idle adjusting screw on second step and against high step of fast idle cam, Gauge BT-99 (.076") should just slide between lower edge of choke valve and carburetor bore. To adjust, bend connector rod.
Throttle Linkage Adjustment: See *CARBURETOR above.*
►*OTHER DATA: See "Rochester BC Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC Diaphragm type. Fuel only.
Replacement Fuel Pump - AC 4434.
Pressure - 3½-4½ lbs. at 450-1000 RPM.
Gas line Gauge: AC Electric type.

Dash Unit - AC No. 5643416.
Tank Unit - AC No. 5641248 (Except Station Wagon), No. 5642510 (Station Wagon).
Air Cleaner: Oil-wetted polyurethane element air cleaner Standard. Oil bath type Optional. Clean oil wetted polyurethane element every 4000 miles or sooner under adverse driving conditions.
►*POLYURETHANE ELEMENT CLEANING CAUTION:* Wash element in kerosene or mineral spirits (not acetone or similar solvents) and squeeze out excess solvent. DO NOT WRING. Reoil with engine oil then squeeze out excess oil. Replace air cleaner-to-air horn gasket. Be sure filter element is not folded or creased so as to cause an imperfect seal.

Fuel Filter: In fuel inlet line at carburetor. Clean with solvent and compressed air. Replace every 15,000 miles.
Cruise Control: Automatic Speed Control. *See "Cruise Control" in Carburetion Section.*

ELECTRICAL

►*SEE CHEVROLET V8 PAGES (FOLLOWING) FOR ALL BATTERY, STARTER, GENERATOR, REGULATOR & MISC. ELECTRICAL DATA.*

ENGINE

ENGINE SPECIFICATIONS: Own. 6 cyl. valve-in-head.

Bore	Stroke	Displacement
3 9/16"	3 15/16"	235.5 cu. in.
Compr. Ratio	**Rated HP**	**Developed HP**
8.25-1	30.4	135 at 4000 RPM

Compression & Vacuum Reading - *See TUNE-UP*
ENGINE REMOVAL: *See "Engine" in Chevrolet Special Data.*

OIL PAN REMOVAL: *See "Oil Pan" in Chevrolet Special Data.*
CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Chevrolet Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Chevrolet Special Data.*

PISTONS

Aluminum alloy, cam ground, tin plated, with pin offset 5/64".
Removal - Pistons and rods removed from above.
Clearance - .0005-.0011".
►*STANDARD & .001" PISTON NOTE:* Standard and .001" pistons are furnished in two sizes as follows: **Std.** - Marked **S4** (3.5625-3.5630"), **S5** (3.5630-3.5635"), **.001" Oversize** - Marked **S6** (3.5635-3.5640"), **S7** (3.5640-3.5645").
Fitting New Pistons: Use .0015" x ½" feeler (part of Tool J-5513). With piston and cylinder clean and dry, insert feeler and inverted piston into cylinder to a point where center of piston pin hole is flush with to surface of block (feeler 90° from pin hole). Pull required to withdraw feeler must be 7-18 lbs.
Installing Pistons: Install piston with notch in piston and mark "Front" toward front of engine.
Replacement Pistons: Furnished Std. & .001", .020" .030", .040" Oversize.

PISTON PIN

Locked in rod. No bushing used in piston.
Diameter - .8660-.8665".
Piston Pin Fit in Piston - .00015-.00025" clearance. With both piston and pin at 70°F, and light film of oil on pin, pin should hold own weight in either piston pin boss. It should be possible to install pin in piston with thumb pressure.
Replacement Pins: Furnished Std. & .0015", .003", .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.(1&2)	.0930-.0935"	.010-.020"	.002-.004"
Oil (3)	.184-.188"	ℂ.015-.055"	ℂ.000-.008"

ℂ - On rails. ℂ - Chrome rails and spacer.
Replacement Rings: Furnished Std. & .020", .030", .040" Oversize.
►*RING INSTALLATION CAUTION:* Install compression rings with side marked "GM" upward.

CONNECTING ROD

Length - 6.81" center-to-center.
Crankpin Journal Diameter - 2.311-2.312".
Lower Bearing - Replaceable precision type.
Clearance - .001-.003" (new), .001-.004" (used).
Sideplay - .005-.012".
Replacement Bearings: Std. & .001", .002", .010", .020" Undersize.
Installing Rods: Install rods with piston pin clamp and number on rod lower end toward camshaft.

CRANKSHAFT

Journal Diameters - (1) 2.6835-2.6845", (2) 2.7145-2.7155", (3) 2.7455-2.7465", (4) 2.7765-2.7775".
Clearance - .0008-.0024" (Nos. 1 & 2), .0010-.0026" Nos. 3 & 4).
Bearing - Thin wall babbitt with steel back.
Bearing Adjustment: Precision type. Replace bearings.
End Thrust - Taken by No. 3 (rear intermediate) main bearing.
Endplay - .0035-.0095".
Replacement Bearings: Furnished Std. & .002", .010", .020", .030" Undersize.
Bearing Installation: Can be replaced without removing engine. *See "Crankshaft & Main Bearings" in Chevrolet Special Data.*
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chevrolet Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chevrolet Special Data.*
Vibration Dampener: *See "Vibration Dampener" in Chevrolet Special Data.*

CAMSHAFT

Journal Diameters - (1) 2.1537-2.1547", (2) 2.0912-2.0922", (3) 2.0287-2.0297", (4) 1.9662-1.9672".
►*NOTE:* Journal out-of-round limits .001". Run-out limits .002".
Bearing Type - Steel backed babbitt lined bushings, no reaming required.
Clearance - .0015-.0035".

End Thrust: Controlled by spacer and thrust plate behind camshaft sprocket.
Endplay - .001-.005".

►*CAMSHAFT LOBE LIFT NOTE:* When improper valve operation is indicated, check lift of each lobe. *See "Camshaft & Bearings" in Chevrolet Special Data.*
Timing Gear: Fibre camshaft gear, steel crankshaft gear.
Back Lash - .003-.005".
Replacement Timing Gears & Installation: *See "Timing Gears" in Chevrolet Special Data.*
Camshaft Setting: Timing is correct when timing marks on gears are together.
Camshaft Removal & Replacement: *See "Camshaft & Bearings" in Chevrolet Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chevrolet Special Data.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

VALVES

Tappet Clearance: Zero lash, hydraulic lifters.

Initial Valve Adjustment: Use distributor rotor position for determining when lifter is on base circle of cam. With rotor pointing at No. 1 cylinder (points open) turn adjusting screw down until all lash is removed (check pushrod side play), then turn screw down an additional 1½ turns and tighten locknut. Repeat on other valve for that cylinder. Continue to adjust valves for each cylinder using firing order sequence.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.870-1.880"	.3410-.3417"	6.272-6.282"
Exhaust	1.495-1.505"	Ⓒ	4.913-4.933"

Valve	Seat Angle	Lift	Stem Clearance
Intake	Ⓑ 31°	.3275"	.0010-.0027"
Exhaust	Ⓓ 46°	.3275"	.0016-.0033"

Ⓒ - .3410-.3417" (top), .3400-.3407" (bottom)..001"taper.
Ⓑ - Valve face angle 30°. Ⓓ - Valve face angle 45°.

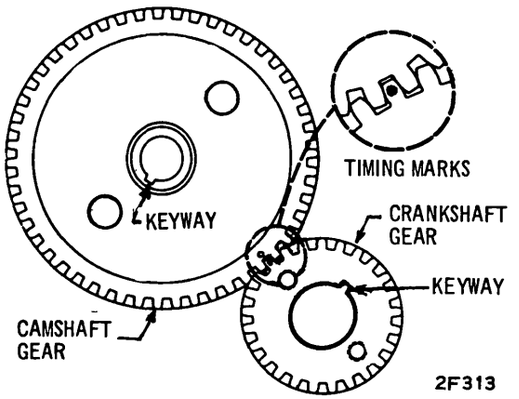
Valve Seat Width - 1/32-1/16" (Intake), 1/16-3/32" (Exhaust).

Valve Stem Oil Seal Installation: *See "Valve System" in Chevrolet Special Data.*

Valve Guides: Precision type, pressed in head.
Valve Guide Installation - *See "Valve System" in Chevrolet Special Data.*

Valve Springs: Install springs with closed coil end down.
Free Length - 2.16".

Spring Specifications



Valve	Pressure	Length
Closed	62-68 lbs.	1.858"
Open	158-168 lbs.	1.528"

►*VALVE SPRING HEIGHT CAUTION:* Check installed height of valve springs. If distance from spring seat in head to top of valve spring exceeds 1 7/8", install shims under spring to bring installed height within limits of 1 51/64-1 7/8".

Valve Lifters: Hydraulic. *See "Valve System" in Chevrolet Special Data.*

Valve Rotators: Used on all valves.

Rocker Arm Assembly: *See "Valve System" in Chevrolet Special Data.*

VALVE TIMING MARKS

►*PUSHROD IDENTIFICATION & INSTALLATION CAUTION:* For Part No. Application, Color Identification & Installation Caution, *see "Rocker Arms" in Chevrolet Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 62° BTDC. Close 94° ALDC.
Exhaust Valves - Open 92°30' BLDC. Close 63°30' ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Chevrolet Special Data.*

Crankcase Capacity: 5 qts., add 1 qt. with filter change.

Normal Oil Pressure: 35 lbs. at 2000 RPM.
Pressure Regulator Valve - In oil pump body. Not adjustable.
Oil Pressure Indicator - Light located on left side of instrument panel, controlled by pressure switch AC No. 1508753 located in main oil gallery on left side of engine. Switch closes when pressure drops to 4-7 lbs.

Oil Pump: Gear type. Located in crankcase, driven by distributor gear.

Oil Pump Overhaul - *See "Oiling System" in Chevrolet Special Data.*

Oil Filter Element: Replacement element AC No. 115. Replace every 4000 miles.

Crankcase Ventilation (Standard): Air intake through breather filter in valve rocker arm cover and outlet through crankcase breather pipe on right side of engine.
Servicing - Clean breather filter in a good solvent every 2,000 miles, then oil mesh with light engine oil.

Crankcase Ventilation (Optional): Positive Type. Two types used as follows: 1) Conventional road draft tube replaced by a crankcase outlet pipe with baffles in upper end. Ventilation valve in upper end of outlet pipe is connected to intake manifold by a hose.
2) Same as Type 1) above with additional fresh air intake from carburetor air cleaner to valve rocker cover. Oil filler breather cap is replaced by solid non-breather type. *Both types are serviced in same manner. See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

►*RADIATOR REMOVAL CAUTION (POWERGLIDE CARS): Transmission oil cooler is part of radiator lower tank and must be TIGHTLY SEALED after removal or during repairs to avoid entrance of foreign material.*

Water Capacity: 17 qts. (Synchro-mesh), 16½ qts. (Powerglide) without heater. Add 1 qt. for heater.

Pressure Valve: Radiator filler cap, AC No. 850800 Type RC-6, 13 lb.

Thermostat: Pellet type. In cylinder head water outlet. 170°F Std., 160°F & 180°F Optional. Use 160°F thermostat with Methanol type anti-freeze.

Temperature Gauge: AC Electric.
Dash Unit - AC No. 1513850.
Engine Unit - AC No. 1993561.

Water Pump: Permanently lubricated, sealed ball bearing type. *See "Cooling System" in Chevrolet Special Data.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*PUSH-STARTING DELCOTRON ALTERNATOR EQUIPPED CARS CAUTION: Turn off all electrical loads except ignition. This insures ample closing voltage for field relay coil.*

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

Series Designation (Exc. Corvette)

Model	Biscayne	Bel Air	Impala
2-Dr. Sedan	1211	1611	
2-Dr. Sport Coupe	1637		1847
Convertible			1867
4-Dr. Sedan	1269	1669	1869
4-Dr. Sport Sedan			1839
Sta. Wgn. (6 Pass.)	1235	1635	1835
Sta. Wgn. (9 Pass.)		1645	1845

Model	Corvette Series Designation
2-Dr. Convertible	867

SERIAL NUMBER: Stamped on plate on left front door hinge pillar post (Exc. Corvette), under hood on upper part of steering column (Corvette). Number (example below) includes identification data.

① ② ③ ④
2 1211 F 100001

① - Model year. 2 1962.
② - Series prefix. *See Series Designation above.*
③ - Assembly plant. F Flint. *See table below.*
④ - Unit number. Continuous at each assembly plant (Pass. & Corvette separate) beginning at 100001.

Assembly Plant Designation

A - Atlanta	J - Janesville	O - Oakland
B - Baltimore	K - Kansas City	S - St. Louis
F - Flint	L - Los Angeles	T - Tarrytown
G - Framingham	N - Norwood	W - Willow Run

ENGINE NUMBER: Stamped on pad at right side of cylinder block behind distributor. Number (example below) includes identification data as indicated.

① ② ③
T 0101 C

① - Engine plant. F - Flint. T - Tonawanda. C - Engines built in Canada.
② - Code number indicates day and month of manufacture. Not individual or continuous number. 0101 is January 1 production date.
③ - Engine type. *See Engine Type table below.*

Engine Type

283" Pass. Car Engine (2-Bbl. Carb.)

Car Model	Transmission Application 3-Speed	Overdrive	Powerglide
Less Air Cond.	C & CB	CD	D
With Air Cond.	CL		DK

327" Pass. Car Engine (4-Bbl. Carb.)

Car Model	Transmission Application 3-Speed	Powerglide
Less Air Cond.	R & RB	S & SB
With Air Cond.	RA	SA

327" Corvette Engine

Carburetion	Transmission Application 3-4-Speed	Powerglide
4-Bbl. (250 HP)	RC	SC
4-Bbl. (300 HP)	RD	SD
4-Bbl. (340 HP, Mech. Lift.)	RE	
Fuel Injection	RF	

409" Pass. Car Engine

Carburetion	HP	Engine Type
One AFB 4-Bbl.	380	QA
Two AFB 4-Bbl.	409	QB

►*409" ENGINE NOTE:* Special cam, mechanical lifters, and 3 & 4-speed transmissions used.

TUNE-UP

COMPRESSION PRESSURE: 140 lbs. (283" Eng.), 160 lbs. (327" Eng.), 150 lbs. (409" Eng.) Minimum at cranking speed with throttle open. Maximum variation between cylinders 15 lbs.

VALVE TAPPET CLEARANCE: Hydraulic Lifters - With engine at operating temperature and idling, loosen locknut and back off adjusting screw (one at a time) until rocker arm clatters, then turn adjusting screw down until clatter stops, plus 1 turn and tighten locknut.

Mechanical Lifters - .008" Intake, .018" Exhaust.

MANIFOLD HEAT CONTROL: Heat control valve and thermostatic coil assembly located between right exhaust manifold and crossover pipe (single exhaust), exhaust pipe (dual exhaust). Assembly not used in Fuel Injection Cars. Make sure valve shaft is free to turn. If sticking, free up with G.M. Manifold Heat Control Solvent or equivalent.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035" (.033-.038").

Spark Plugs - AC 46 (283" Eng.), AC 44 (327" Eng.), AC 43N (409" Eng.). *Corvette plugs listed below.* All *14 mm. Torque to 20-25 ft. lbs.*

Use	Corvette Spark Plug No.	AC Number
City driving only		46
Town & country driving	45 (4-Bbl.), 44 (F.I.)	
Heavy duty and high output		C 43 COM
Extended and extreme high output		C 42-1 COM

COIL: Delco-Remy. Used as follows.

Engine	Delco-Remy No.
283"	1115115
327" (Exc. Corvette)	1115115
327" (Corvette with 4-Bbl. Carb.)	1115091
327" (Corvette with Fuel Injection)	1115107
409"	1115091

Ignition Current - 1.8 amps. idling, 4.0 amps. stopped.
Resistor - Delco-Remy No. 1931385 (Corvette & 409" Eng.). All others use a resistance type cable (1.8 ohms) in harness between bulkhead disconnect plug and starter solenoid bypass terminal (in coil primary circuit for regular operation). Bypassed during cranking when coil energized directly from starter solenoid bypass terminal.

DISTRIBUTOR: Delco-Remy. Used as follows:

Application	Delco-Remy No.
283" Eng.	1110947
327" Eng. (exc. Corvette)	1110987
Corvette (250 & 300 HP)	1110984
Corvette (340 HP)	1110985
Corvette (Fuel Injection)	1110990
409" Eng.	1111006 & 1110919

►*DISTRIBUTOR NOTE: Distributors used as follows:*
1110919, 985, 990 & 1111006 - Double breaker with conventional distributor cap (not window type). Vacuum spark control not used (centrifugal weight advance only).
1110947, 984, 987 - External adjustment "Window" type.
Condenser (Double Breaker Distr.) - Delco-Remy No. 1942284.
Condenser (Window Type Distr.) - Delco-Remy No. 1932004.
Capacity - .18-.25 mfd.
Contact Point Set (Double Breaker Distr.) - Delco-Remy No. 1931988.
Breaker Gap (Window) - Gap (.016") will be correct when cam angle correctly set (see below).
Cam Angle (Window) - 28-32°. Set at 30°. Gives .016" point opening.
Breaker Gap (Double Breaker) - .014-.018" (new points).
Cam Angle (Double Breaker) - Adjust each set of points to 29±1° with other set blocked open with .025" thick insulator. Cam angle for both sets of points operating together should be 34±1°.
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance - 1110947

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	375	0-4	750
5-7	750	10-14	1500
10-12	1450	20-24	2900
13-15	1875	26-30	3750

Automatic Advance (1110984, 85, 87, 90 & 1111006)

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	425	0-4	850
4.5-6.5	800	9-13	1600
8-10	1600	16-20	3200
11-13	2300	22-26	4600

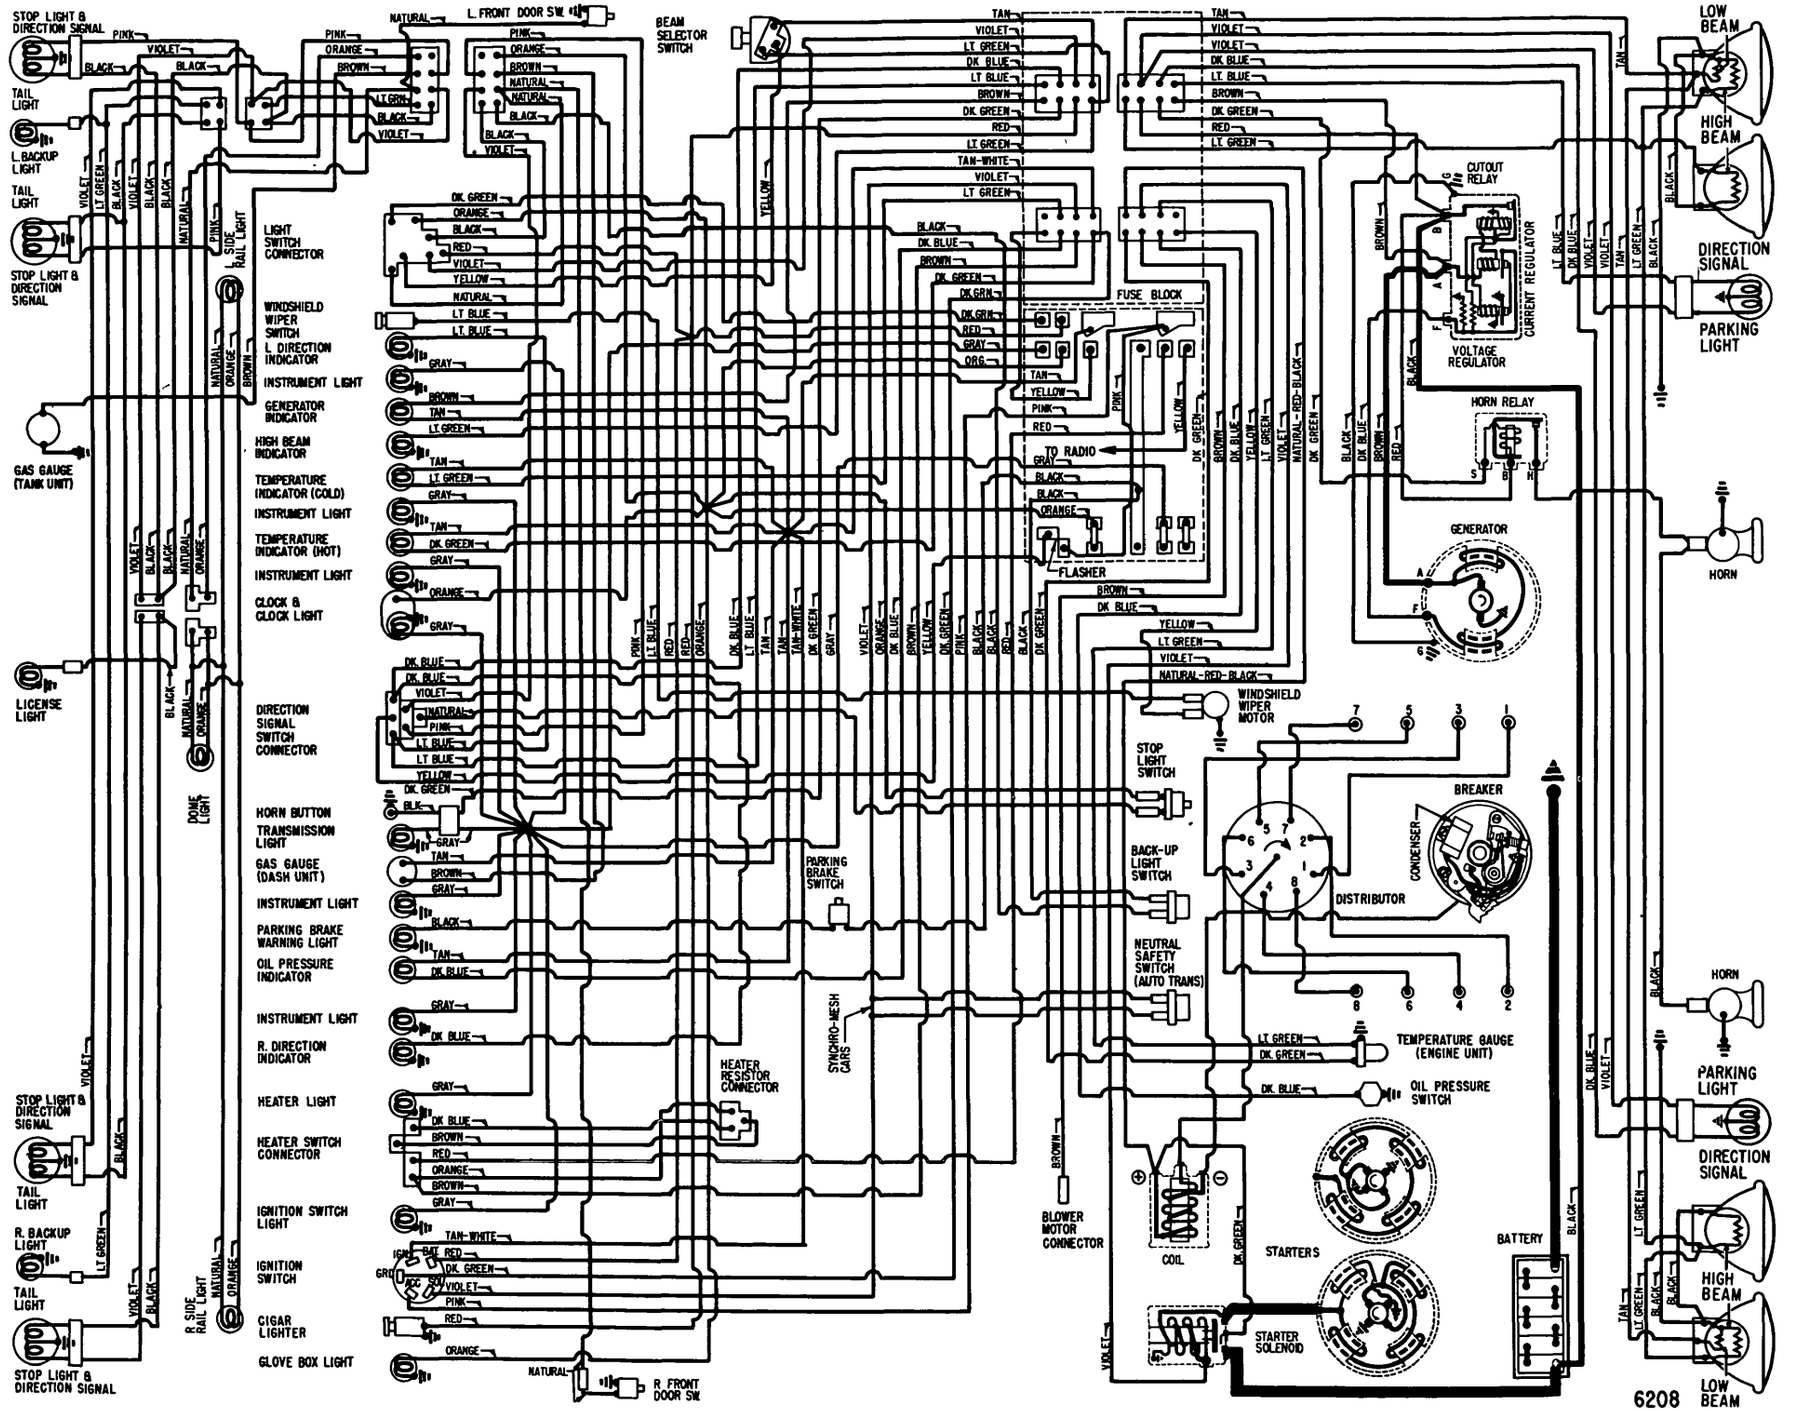
Automatic Advance - 1110919

Degrees	Distr. RPM	Degrees	Eng. RPM
.5-2.5	400	1-5	800
6.5-8.5	775	13-17	1550
9.5-11.5	1600	19-23	3200
13-15	2500	26-30	5000

Vacuum Spark Control: Delco-Remy No. 1116148 or 201.
NOTE - Vacuum unit not used on double breaker type distributors.

Distr. Degrees	Vacuum Advance Eng. Degrees	Vacuum (" of Hg)
Start	0	7-9
8	16	15-16

IGNITION TIMING



Engine	Std. Setting	Range	Idle Spd.
283"	4° BTDC	4-8° BTDC.	① 500 RPM
327" (250 HP)	4° BTDC	4-10° BTDC.	① 500 RPM
327" (300 HP)	8° BTDC	6-12° BTDC.	① 500 RPM
327" (340 & 360 HP)	10° BTDC		650 RPM
409"	12° BTDC		650-700 RPM

① - Synchro-mesh Trans. 475 RPM on Powerglide Cars with selector lever in "Drive".

►*TIMING SETTING CAUTION: Timing must be set with vacuum line disconnected and hollow stud (manifold connection) capped, and engine at idle (see above).*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

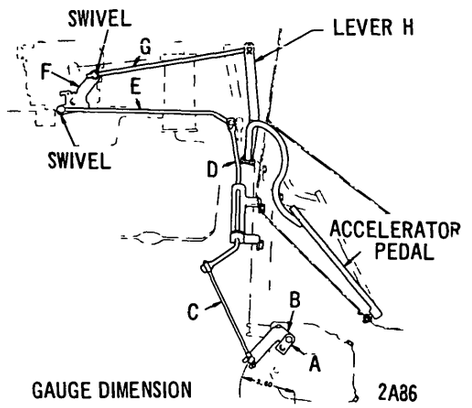
CHEVROLET V8 (EXC. CORVETTE) WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Timing Mark - Mark on vibration damper and timing tab attached to engine front cover. Timing tab marked "A" (Advance), "O" (TDC) and lines at 2° increments with greatest number of lines on advance or BTDC side.

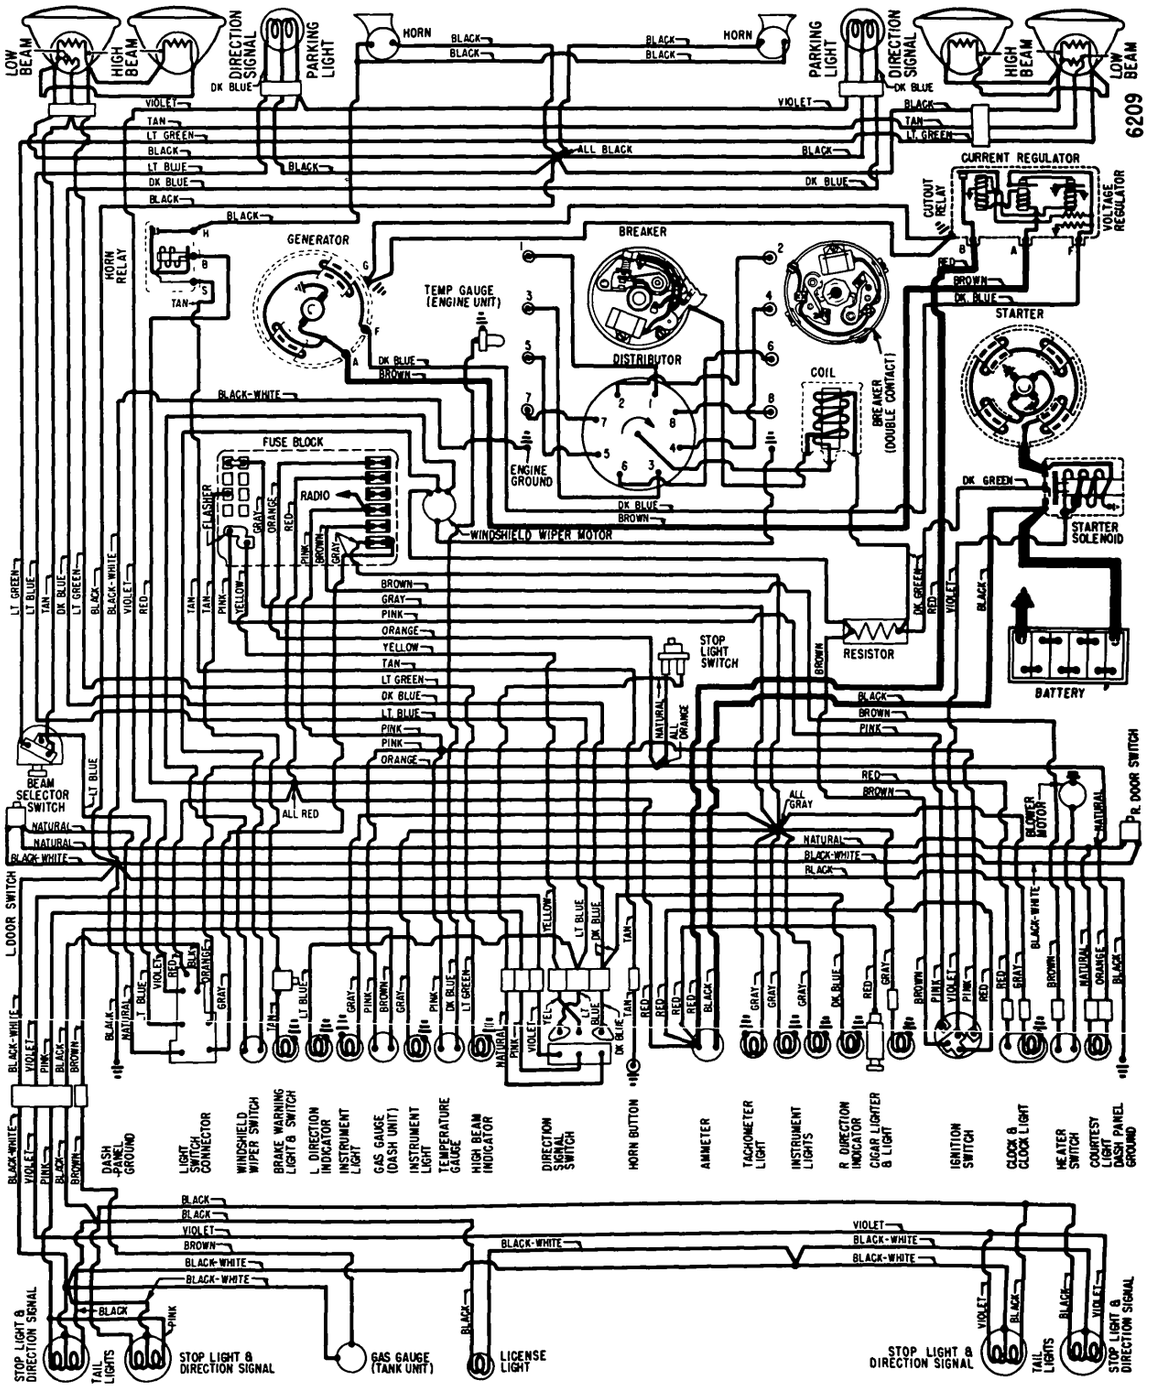
CARBURETOR

Engin	Carburetor Application
283"	Rochester 2GC (one)
327" (250 HP)	① Rochester 4GC or Carter WCFB (one)
327" (300 & 340 HP)	Carter AFB (one)
327" (360 HP)	Rochester Ramjet Fuel Injection
409" (380 HP)	Carter AFB (one)
409" (409 HP)	Carter AFB (two)



① - Rochester 4GC used on some Chev. Pass. Cars with Powerglide.

►*AIR CONDITIONING FAST IDLE CAUTION:* Adjust stop on dash Fast Idle Control Wire to provide 900 RPM engine speed when knob is pulled out. Make sure knob is pushed in when making normal fast idle adjustment and that air conditioning fast idle control linkage d es n t interfere.



THROTTLE LINKAGE ADJUSTMENT (CAST IRON POWERGLIDE): S *illustration.* Loosely assemble lever "B" to clamp "A". Insert Tool J-5906 between transmission left side cover lower front bolt and hole in lever "B". Distance between hole center lines should be 3.60". With gauge in place and holding clamp "A" counterclockwise in full detent position, tighten lever "B" to clamp "A". *R m v gauge, then perform adjustments as outlined in "Aluminum" Powerglide Throttle Linkag Adjustment b low.*

THROTTLE LINKAGE ADJUSTMENT (ALUMINUM POWERGLIDE): S *illustration.* Install rod "C". Thread rod "E" through swivel and install in lever "F". Place lever "F" in wide open position and move cross-shaft assembly "D" forward against transmission internal stop. Adjust swivel on rod "E" until swivel freely enters cross-shaft assembly "D". Fix swivel in cross-shaft. To check adjustment, place linkage in idle position, then return to wide open by rotating lever "F". Push downward on lever "B" and note if rod "E" deflects, or if lever "F" will not reach wide open throttle position (if so, repeat adjustment). Depress ac-

celerator pedal until lever "H" contacts a .125" spacer (Aluminum Powerglide), 1/2" wood block under pedal rod (Cast Iron Powerglide), 1/4-3/8" distance above toe panel with carpet removed (Corvette). On all models rotate lever "F" to wide open position, then adjust swivel in rod "G" for free entry in lever "F" and install rod into lever.

POWERGLIDE (ALUMINUM) THROTTLE LINKAGE
ROCHESTER 2GC 2-BARREL
(283" Engine)

Rochester 2GC No. 7020007 (Synchro-mesh), 7020008 (Powerglide), 7020018 (Air Cond. with Powerglide). Idle Compensator (thermostatically controlled idle air bypass) used on air conditioned cars.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

►*IDLE COMPENSATOR CAUTION:* When making idle setting and idle speed adjustments, Idle Compensator must be in closed position. Depress button on back side of float bowl.

Idle Setting - Initial setting 1½ turns open. Adjust both screws alike. After idle speed set to correct specifications *(see "Idle Speed" below)*, turn both idle mixture screws for smoothest idle with highest vacuum reading and RPM. *NOTE* - Approximate adjustment can be obtained by setting screws lean to moderate rough idle and then backing out ¼ turn.

Idle Speed - 500 RPM (Synchro-mesh), 475 RPM (Powerglide in Drive).

Float Level - 1 23/64" (Gauge BT-152). With air horn inverted and gasket in place, position float level gauge over float, so it rests against pump side of power piston shaft, with outer gauge leg in line with center of float. Bottom of float should just touch gauge. Bend float arm to adjust.

Float Drop - Bend float tang as required to obtain a distance of 1 29/32" (Gauge BT-152) from gasket surface to bottom of float, with air horn upright and float hanging free. Use scale or scribed mark on float and pump gauge.

Automatic Choke Setting: Centered at index (Exc. 7020007), 1 notch lean (7020007).

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA:* See *"Rochester 2GC Carburetors" in Carburetion Section.*

ROCHESTER 4GC 4-BARREL
(327" 250 HP Engine)

Rochester 4GC 7020006 (Powerglide), 7020012 (Early Air Cond.), 7020022 (Late Air Cond.).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

►*IDLE COMPENSATOR CAUTION:* Idle Compensator (thermostatically controlled idle air bypass) used on air conditioned cars and must be in closed position when making idle setting and idle speed adjustments. Remove air cleaner and insert pencil or suitable tool in throttle bore.

Idle Setting - Initial setting 1½ turns open. After idle speed correctly set *(See "Idle Speed" below)*, turn each idle mixture screw for smoothest idle at highest vacuum reading and RPM. *NOTE* - Approximate adjustment can be obtained by setting screws lean to moderate rough idle and then backing out ¼ turn.

Idle Speed - 475 RPM (Powerglide in Drive).

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA:* See *"Rochester 4GC Carburetors" in Carburetion Section.*

CARTER WCFB 4-BARREL
(327" 250 HP Engines)

Carter WCFB 3190S (Powerglide), 3191S (Synchro-mesh). Used on 327" (250 HP) Engines, including Corvette.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

Idle Setting - ½-2 turns open. Turn both screws alike. Turn screws out for richer mixture.

Idle Speed - 500 RPM (Synchro-mesh), 475 RPM (Powerglide). Powerglide Trans. in "Drive".

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA:* See *"Carter WCFB Carburetors" in Carburetion Section.*

CARTER AFB 4-BARREL

Carter AFB 4-Barrel. Used as follows:

Engine	Carter No.
327" (300 & 340 HP) Early Ⓒ	3269S
327" (300 & 340 HP) Late Ⓒ	3310S
409" (380 HP) Early	3270S
409" (380 HP) Late	3345S,SA

Ⓒ - Includes Corvette.

Idle Setting - ½-2 turns open. Turn both screws alike. Turn out for richer mixture.

Idle Speed - (327" 300 HP Engine) - 500 RPM (Synchro-mesh), 475 RPM (Powerglide in Drive).

(327" 340 HP Engine) - 650 RPM.

(409" Engine) - 650-700 RPM.

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA:* See *"Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

CARTER AFB 4-BARREL
(Two Carburetors)

Carter 3361S (Front), 3362S (Rear).

Idle Setting - Turn idle mixture screws ¾ turn open from lightly seated position. Back idle speed screws just off throttle levers and turn in 1½-2 turns.

Idle Speed - 700 RPM.

►*OTHER DATA:* See *"Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

FUEL INJECTION
Rochester Ramjet

Rochester No. 7017355 or 7017360. *NOTE - Only difference between units is in type of fuel filter used. For all data, see "Rochester Fuel Injection" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC Diaphragm type. Fuel only.

Replacement Pump - AC No. 4701 (283" Eng.), No. 4657 (Others).

Pressure - 5½-6½ lbs. at 1,000 RPM.

Gasoline Gauge: AC Electric.

Dash Unit - AC No. 5643416 (Pass.), No. 5643258 (Corvette).

Tank Unit - As follows:

Model	AC No.
Pass. (Exc. Sta. Wgn. & Dual Exh.)	5641248
Pass. Dual Exh. (Exc. Sta. Wgn.)	5641461
Sta. Wgn. (Exc. Dual Exh.)	5642510
Sta. Wgn. Dual Exhaust	5642511
Corvette	5642125

Air Cleaner: 409" Engine & Corvette - Oil wetted polyurethane element type. Clean every 4000 miles (exc. Corvette), 8000 miles (Corvette). See *CLEANING CAUTION below.*

Other Engines - Paper element type Std. Check paper element for restrictions every 5000 miles and replace if necessary.

►*POLYURETHANE ELEMENT CLEANING CAUTION:* Clean element every 4000 miles. Remove and inspect for rips or tears (replace if necessary). Wash element in kerosene or mineral spirits. *NEVER USE a hot degreaser, acetone or similar solvent.* After squeezing out (do not wring), dip element in light engine oil, then gently squeeze out excess oil. Replace air horn-to-air cleaner gasket.

Fuel Filter: In fuel inlet line at carburetor. On fuel injection equipped Corvettes, replace filter every 15,000 miles or sooner if needed. On all other cars, replace paper element at 5,000 mile intervals.

Cruise Control: Automatic speed control. See *"Cruise Control" in Carburetion Section.*

BATTERY

Delco-Remy used as follows:

Engine	Delco No.	Plates	Amp. Hr. Capacity
283" & 235"	458	9	54 (20 hr. rate)
327" & 409"	558	11	61 (20 hr. rate)

Battery Ground - Negative, to engine.

Engine Ground - Engine to cowl.

STARTER

Delco-Remy. Used as follows:

Engine	Delco-Remy No.
6 Cyl.	1107888
283" & Corvette	1107889
327" & 409" (Synchro-mesh)	1107233
327" (Powerglide)	1107242

Drive - Overunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs. minimum (1107888,889), 40 ozs. minimum (1107233,242).

Performance Data - 1107888,889

Torque	RPM	Volts	① Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	3.5	300-360

① - Includes solenoid.

Starting Switch: Delco-Remy Solenoid Switch No. 1119910 mounted on starter and controlled by Ignition Switch Delco-Remy No. 1116610 (Pass.), No. 1116577 (Corvette).

Neutral Safety Switch: Combination neutral safety and back-up light switch, Delco-Remy No. 1998677 (Pass.), No. 1993566 (Corvette), mounted on steering column under instrument panel.

Adjustment - *See "Powerglide Transmission" in Transmission Section.*

GENERATOR

Delco-Remy. Used as follows:

Engine	Generator	Armature
6 Cyl.	1102096	1923535
283"	1102097	1923535
327" Pass. Car	1102097	1923535
327" (250 & 300 HP Corvette)	1102174	1948005
327" (340 & 360 HP Corvette)	1102268	1940161
409"	1102268	1940161
Taxi	1105123	1945122
(Optional)	1105116	1940161

Performance Data

Generator	Amperes	Volts	RPM
1102096, 97	30	14.0	2240
1102174	35	14.0	2630
1102268	35	14.0	2630
1105116	40	14.0	1730
1105123	40	14.0	1930

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.69-1.79 Amps. (1102096,097,174, 268), 2.73-3.0 Amps. (1105116,123) at 12 volts and 80°F.

Belt Adjustment: 75 lbs. (new & used) using strand tension gauge Tool J-7316 midway between generator and water pump pulleys. To adjust, move generator in its mounting bracket.

GENERATOR REGULATOR

Delco-Remy. Used as follows:

Regulator	Generator
1119001E (6 Cyl.)	1102096
1119001E (283" & 327" Pass. Car)	1102097
1119002E (250 & 300 HP Corvette)	1102174
1119002E (340 & 360 HP Corvette)	1102268
1119235 (409" Eng.)	1102268

Cutout Relay

Cuts In - 11.8-13.5 volts.

Contact Gap - .020". **Air Gap** - .020".

Voltage Regulator

Setting - 13.8-14.7 volts at 125°F.

Air Gap - .060" (1119001E & 2E), .075" (1119235).

Current Regulator

Setting - 27.0-31.0 amps. (1119001E), 31.0-35.5 amps. (1119002E, 235).

Air Gap - .075" (contacts just touching).

►*OTHER DATA: See "Delco-Remy Single Contact Regulators" in Electrical Section.*

ALTERNATOR

Delco-Remy "Delcotron". Used as follows:

Model	Alternator No.
Air Conditioning (Std.)	1100600
Air Conditioning (Opt.)	1100613
Heavy Duty	1117765
Optional	1100601

Performance Data

Alternator	Amperes	RPM
1100600, 613	12	1100
	42	6500
1100601	5	1100
	52	6500
1117765	24	1100
	62	6500

Field Current - 1.9-2.3 amps. (1100600, 601 & 613), 4.1-4.5 amps. (1117765) at 12 volts and 80°F.

►*OTHER DATA: See "Delco-Remy Delcotron Alterators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy. Transistorized and conventional types used as follows:

Regulator	Type	Alternator
1119502	① 3-Unit, Conventional	1100600,01,13
9000567 ②	③ 2-Unit, Transistorized	1117765

① - Contains a Voltage Regulator, Field Relay & Indicator Light Relay.

② - Use with separate Indicator Light Relay, Delco-Remy No. 1116811.

③ - Contains a Voltage Regulator and Field Relay.

Field Relay

Closing Voltage - 6.5-8.5 volts (1119502), 5.0-9.5 volts (9000567).

Contact Gap - .015" (1119502), .014" (9000567).

Voltage Regulator

Setting - 13.5-14.3 volts (1119502), 13.3-13.9 volts (9000567) at 125°F ambient temperature operating on upper contacts. .1-.3 volt lower operating on lower contacts.

Contact Gap (1119502) - .016" (upper contacts) with lower contacts just touching.

Air Gap - .067" (1119502), .075" (9000567).

Indicator Light Relay (1119502)

Closing Voltage - 3.8-5.2 volts.

Contact Gap - .010". **Air Gap** - .010".

Indicator Light Relay (No. 1115811)

Closing Voltage - 1.5-9.5 volts.

Contact Gap - .018".

Air Gap - .020" with contacts closed.

►*OTHER DATA: See "Delco-Remy Double Contact Alternator Regulators" or "Delco-Remy Transistorized Alternator Regulators ("B" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

Lighting Switch Removal: Pull handle out to "ON" position. Depress switch shaft retainer (under dash) and remove knob and shaft assembly. Remove retaining ferrule and escutcheon, then remove switch assembly. Disconnect multi-plug connector. *NOTE* - Use screwdriver inserted in side of switch to pry plug from switch.

Stop Light Switch Location: Mechanical type mounted under dash in contact with brake pedal.

Adjustment - Adjust position of switch so that stop light comes on when brake pedal is depressed 5/8" from fully released position.

Instrument Cluster Console Removal: Loosen and slide upwards upper mast jacket retaining clamp to release mast jacket. Loosen lower mast jacket retaining clamp and drop mast jacket and steering wheel down. Disconnect speedometer cable from speedometer. Remove console-to-instrument panel attaching screws and lean console forward onto mast jacket. Remove individual instruments as required or remove console as a unit by unsnapping all wire connectors.

Speedometer Cluster Removal: After Instrument Cluster Console removed (above), unsnap instrument light sockets from speedometer cluster, remove two attaching nuts and remove cluster.

CIRCUIT BREAKER: 30 Ampere - Headlamp circuit. Located in light control switch.

FUSES: Located in junction box beneath dash, except where noted.

20 Ampere - Air Conditioning.

15 Ampere - Spotlight.

10 Ampere - Heater, Back-up Light & Brake Signal Light.

4 Ampere - Radio.

3 Ampere - Instrument panel lights.

9 Ampere - Overdrive. Located in wiring harness on engine side of dash panel, just forward of instrument panel.

ENGINE

►*ENGINE NOTE: 409" Engine & 327" (340 & 360 HP Corvette) Engines use mechanical lifters.*

ENGINE SPECIFICATIONS: Own. V8, valve-in-head, 283", 327" (Including Corvette) and 409" displacement.

Eng.	Bore	Stroke	Rated HP	Displacement
283"	3.875"	3.00"	48	283 cu. ins.
327"	4.000"	3.25"	51.2	327 cu. ins.
409"	4.3125"	3.50"	59.5	409 cu. ins.

Engine	Compr. Ratio	Rated HP
283" Pass. Car	8.5-1	170 at 4200 RPM
327" Pass. & Corv. ①	10.5-1	250 at 4400 RPM
327" Pass. & Corv. ②	10.5-1	300 at 5000 RPM
327" Corvette ③	11.25-1	340 at 6000 RPM
327" Corvette ④	11.25-1	360 at 6000 RPM
409" ⑤	11.0-1	380 at 5800 RPM
409" ⑥	11.0-1	409 at 6000 RPM

① - One WCFB 4-Bbl. Carb. ② - One AFB 4-Bbl. Carb.

③ - One AFB 4-Bbl. Carb. with mechanical lifters.

④ - Fuel Injection (Ramjet) & mechanical lifters.

⑤ - One AFB 4-Bbl. Carb. ⑥ - Two AFB 4-Bbl. Carbs.

Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Chevrolet Special Data.*

OIL PAN REMOVAL: *See "Oil Pan" in Chevrolet Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Chevrolet Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chevrolet Special Data.*

PISTONS

Cast aluminum alloy, autothermic type with piston pin offset .060" toward major thrust side.

Removal - Pistons and rods removed from above.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Clearance - As follows:

Engine	Clearance
283"	①.0006-.0010"
327" (250 & 300 HP)	②.0006-.0010"
327" (340 & 360 HP)	.0030-.0035"
409"	.0035-.0042"

① - Measured 2.44" from top of piston.
② - Measured 2.24" from top of piston.

Fitting Pistons: Use Piston Fitting Scale J-5513 and 8" x ½" x .004" feeler stock (409" & Corvette 340 & 360 HP Engs.), 8" x ½" x .0015" feeler stock (Other engines). With feeler surfaces clean and dry, insert feeler ribbon in cylinder and start inverted piston into bore (feeler adjacent to piston pin boss), keeping feeler ribbon straight in bore. Rotate piston down into cylinder until piston pin is parallel to crankshaft axis and center of pin is flush with top of cylinder bore. With a slow, steady pull on scale, reading should be 7-17 lbs. (409" Eng.), 11-18 lbs. (Corvette 340 & 360 HP Engs.), 4-6 lbs. (Other Engs.).

Replacement Pistons: (Exc. Corvette Fuel Inj. & 409" Eng.) - Furnished Std. & .001", .020", .030", .040" Oversize with fitted pins.

Corvette Fuel Inj. & 409" Eng. - Furnished Std. & .001", .030" Oversize with fitted pins.

►*STANDARD & .001" OVERSIZE PISTON NOTE:* These pistons furnished in TWO sizes and marked as follows:

Engine	Type	Mark	Size
283"	Std.	S4	3.8750-3.8755"
		S5	3.8755-3.8760"
	.001" OS	S6	3.8760-3.8765"
		S7	3.8765-3.8770"
327"	Std.	S4	4.0000-4.0005"
		S5	4.0005-4.0010"
	.001" OS	S6	4.0010-4.0015"
		S7	4.0015-4.0020"
409"	Std.	S4	4.3100-4.3105"
		S5	4.3105-4.3110"
	.001" OS	S6	4.3110-4.3115"
		S7	4.3115-4.3120"

Installing Pistons: Install pistons with cast depression in head and "F" mark cast in side of piston toward front of block. *See Rod Installation.*

PISTON PIN

Pin is press fit in connecting rod.
Diameter - .9270-.9273" (283" & 327" Engs.), .9895-.9898" (409" Eng.).
Length - 2.990-3.010" (283" & 327" Engs.), 3.250-3.270" (409" Eng.).
Pin Fit in Piston - .00015-.00025". With piston and pin at 60°F, and light film of oil on pin, pin should support own weight in either pin boss.
Pin Fit in Connecting Rod - Press fit in rod. Special procedure used for removal & installation, see *"Piston Pins" in Chevrolet Special Data.*
Replacement Pins: Furnished in assembly with new pistons. Replace with new piston and fitted pin assembly.

PISTON RINGS

Compression rings are cast alloy iron, with chrome plated upper and wear resistant coating lower. Oil ring is 3-piece type with chrome plate O.D. rails and stainless steel spacer.

283" Engine

Ring	Width	End Gap
Compr. (1 & 2)	.0775-.0780"	.013-.023"
Oil (3)	.184-.188"	.015-.055"

327" Engine

Ring	Width	End Gap
Compr. (1 & 2)	①.0770-.0775"	.013-.023"
Oil (3)	②.187-.189"	.015-.055"

① - On Corvette, upper ring .0775-.0780".
② - On Corvette, .184-.189".

409" Engine

Ring	Width	End Gap
Compr. (1 & 2)	.0770-.0780"	.015-.025"
Oil (3)	.1839-.1879"	.015-.065"

Replacement Rings: Service type rings furnished as follows:
Corvette (With Fuel Inj.) & 409" Eng. - Rings furnished Std. and .030" Oversize.
Other Engines - Rings furnished Std. & .020", .030", .040" Oversize.
Installing Rings: Install compression rings with mark "GM" upwards.

CONNECTING ROD

Length - 5.699-5.701" (283" & 327"), 6.009-6.011" (409") center-to-center.
Weight - 20.32 ozs. (283" & 327"), 27.53 ozs. (409").
Crankpin Journal Diameter - 1.999-2.000" (283" & 327"), 2.1993-2.1998" (409").
Lower Bearing - Replaceable precision type.
Clearance - .0008-.0028" (vertical on all models). On Corvette the horizontal clearance is .0017-.0038".
Sideplay - .008-.014" (283" & 327"), .015-.021" (409").
Replacement Bearings: Std. & .001", .002", .010", .020" Undersize.
Rod Installation: Install rod in piston so that flange or heavy side of rod at bearing end will be toward FRONT of piston (marked by cast depression in head of piston and "F" mark on piston strut) on Nos. 1-3-5-7 pistons, and flange on rod to REAR of piston on Nos. 2-4-6-8 pistons. Install rod and piston assembly in cylinder with cast depression in head and "F" mark on strut toward front of cylinder block. Oil hole in connecting rod will then be toward center of engine.

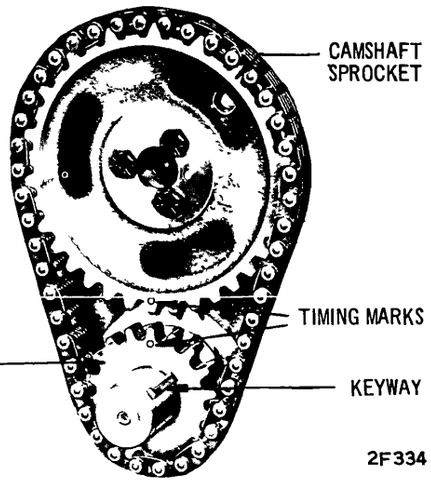
CRANKSHAFT

Journal Diameter - 2.2988" (283" & 327"), 2.4977" (409")
Bearings - Replaceable precision type.
Clearance - .0008-.0034" (283" & 327"), .0006-.0032" (409").
End Thrust - Taken by rear (No. 5) main bearing.
Endplay - .002-.006" (283" & 327"), .006-.010" (409").
Replacement Bearings: Std. & .001", .002", .010", .020" Undersize.
Bearing Installation: Not necessary to remove engine from car. *See "Crankshaft & Main Bearings" in Chevrolet Special Data.*

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chevrolet Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chevrolet Special Data.*
Vibration Damper: *See "Vibration Dampener" in Chevrolet Special Data.*

CAMSHAFT

►*SPECIAL CAMSHAFT NOTE: Special camshaft and mechanical lifters used on Corvette 340 & 360 HP Engines and on 409" Engines.*



►*CAMSHAFT LOBE LIFT NOTE:* When improper valve operation is indicated, check lift of each lobe. *See "Camshaft & Bearings" in Chevrolet Special Data.*

Journal Diameter - (All) 1.8682-1.8692".
Bearings - Steel backed babbitt lined bushings.
Clearance - .0015-.0035".
Replacement Bearings: "Precision" type (do not require reaming). Use Tool J-6098 to remove and install bearings.
Camshaft Setting: Both Sprockets marked "0". Install chain with sprocket marks adjacent and in line with straightedge across shaft centers.
►*CAUTION:* When installing sprocket on camshaft, line up dowel holes in sprocket and shaft. DO NOT DRIVE SPROCKET ON SHAFT, use three mounting bolts and DRAW sprocket in place.
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Chevrolet Special Data.*

Timing Chain: Link belt type. See below for specifications.

Engine	Width	Pitch	Length (Links)
283" & 327"	.875"	.500"	46
409"	.875"	.500"	48

Installation & Removal - *See "Timing Chain" in Chevrolet Special Data.*

VALVE TIMING MARKS

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Chevrolet Special Data.*

VALVES

Tappet Clearance: Mechanical Lifters - .008" Intake, .018" Exhaust.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Hydraulic Lifters - 1 turn down from zero lash. See *"Hydraulic Lifter Ajustment" in Chevrolet Special Data.*

Valve Adjustment (Mechanical Lifters): Turn rocker arm stud nut as required for desired clearance.

Valve Adjustment (Hydraulic Lifters): See *"Hydraulic Lifter Adjustment" in Chevrolet Special Data.*

283" & 327" Engines (Exc. Corvette)

Valve	Head Diam.	Stem Diam.	Length
Intake	① 1.72"	.3410-.3417"	4.902-4.992"
Exhaust	1.495-1.505"	.3410-.3417"	4.913-4.933"
Valve	**② Seat Angl**	**Lift**	**Stem Clearance**
Intake	46°	③ .333"	.0010-.0027"
Exhaust	46°	③ .333"	.0016-.0032"

Corvette

Valve	Head Diam.	Stem Diam.	Length
Intake	④ 1 23/32"	.3410-.3417"	⑤ 4.902-4.922"
Exhaust	1 1/2"	.3410-.3417"	⑥ 4.913-4.933"
Valve	**② Seat Angl**	**Lift**	**Stem Clearance**
Intake	46°	ⓛ .3987"	.0010-.0027"
Exhaust	46°	ⓛ .3987"	.0016-.0033"

409" Engine

Valve	Head Diam.	Stem Diam.	Length
Intake	2.190"	.3715-.3722"	5.095-5.115"
Exhaust	1.715-1.725"	.3710-.3717"	5.105-5.125"
Valve	**② Seat Angl**	**Lift**	**Stem Clearance**
Intake	46°	.4922"	.0010-.0027"
Exhaust	46°	.4735"	.0025-.0042"

ⓛ - 1.94" on 300 HP engines. ② - 45° face angle
③ - .3987" on 327" Engine.
④ - 1 15/16" on 300,340 & 360 HP engines.
⑤ - 4.870-4.889" on 300, 340 & 360 HP engines.
⑥ - 4.891-4.910" on 340 & 360 HP engines.
ⓛ - .39975" on 340 & 360 HP Engs. (measured at valve stem).

Valve Seat Width - 1/32-1/16" Intake, 1/16-3/32" Exhaust (exc. Corvette); 1/16" Intake, 3/32" Exhaust (Corvette).

Valve Rotators - May be used.

Valve Stem Seal Installation: See *"Valve System" in Chevrolet Special Data.*

Valve Guids: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance is excessive. Valves furnished with .003", .015" and .030" Oversize stems. Use reamer Set J-5830 or J-7049.

Valve Springs: .045" x .750" flat wound damper used on 327" (exc. Corvette) & 409" Engines. 5-10 lb. damper used on Corvette engines.

Valve Spring Specifications

283" Engine

Valve	Lbs. Pressure	Length
Closed	84-92	1.660"
Open	163-173	1.330"

327" Engin (Inc. Corvette)

Valve	Lbs. Pressure	Length
Closed	78-86	1.660"
Open	170-180	1.260"

409" Engine

Valve	Lbs. Pressure	Length
Closed	130-138	1.680"
Open	273-285	1.290"

►*VALVE ROCKER COVER ON EARLY 327" (250 & 300 HP) ENGINE INSTALLATION CAUTION:* Due to configuration of valve rocker covers, it is possible to install covers incorrectly. The cover side having the greater vertical wall height, before entering the side-to-top radius, should be installed inboard on cylinder head.

Valve Lifters: Hydraulic lifters standard except on engines with special camshaft. *See "Valve System" in Chevrolet Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.

Rocker Arm Stud Replacement - *See "Valve System" in Chevrolet Special Data.*

►*PUSHROD IDENTIFICATION & INSTALLATION CAUTION:* For Part No. Application, Color Identification & Installation Caution, *see "Rocker Arms" in Chevrolet Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

283" Engine

Intake Valves - Open 18° BTDC. Close 54° ALDC.
Exhaust Valves - Open 52° BLDC. Close 20° ATDC.

327" Engine (Exc. Corvette)

Intake Valves - Open 12°30' BTDC. Close 57°30' ALDC
Exhaust Valves - Open 54°30' BLDC. Close 15°30' ATDC.

Corvette (Hydraulic Lifters)

Intake Valves - Open 32°30' BTDC. Close 87°30' ALDC.
Exhaust Valves - Open 74°30' BLDC. Close 45°30' ATDC.

Corvette (Mechanical Lifters)

Intake Valves - Open 35° BTDC. Close 72° ALDC.
Exhaust Valves - Open 76° BLDC. Close 31° ATDC.

409" Engine

Intake Valves - Open 59°12' BTDC. Close 106°36' ALDC.
Exhaust Valves - Open 86°5' BLDC. Close 26°44' ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Chevrolet Special Data.*

Crankcase Capacity: 4 qts. (Exc. Corvette & 409" Eng.), 5 qts. (Corvette & 409" Eng.). Add 1 qt. with filter change.

Normal Oil Pressure - 45 lbs. at 2000 RPM.

Pressure Relief Valve - In oil pump. Not adjustable.

Oil Pressure Indicator - Light located at left side of instrument panel, controlled by a pressure switch located in main oil gallery adjacent to distributor. Switch closes when pressure drops to 4-7 lbs.

Oil Pressure Gauge (Corvette) - AC No. 1509355.

Oil Filter: Full-flow type. Replace cartridge every 4000 miles or sooner under adverse driving conditions.

Replacement Filter Element - AC No. PF-141.

Oil Pump: Spur gear type. Located in crankcase, driven by distributor drive gear.

Oil Pump Overhaul - *See "Oiling System" in Chevrolet Special Data.*

Crankcase Ventilation: Standard Cars - Air intake through oil filler breather cap and outlet at crankcase ventilator pipe

Positive Crankcase Ventilation Cars - Road draft tube is replaced by an adapter to which is connected the ventilation valve and a hose which runs to an adapter plate between the carburetor and intake manifold. Fresh air is drawn into engine through oil filler breather cap. *To prevent ignition or carburetion troubles and to insure proper operation of system, entire system must be disassembled and cleaned every 10,000 miles or sooner if needed. See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

►*FLUID FAN NOTE:* Viscous Coupling Fan optional on all engines with Air Conditioning.

Water Capacity: 17¼-17¾ qts. (Exc. Corvette & 409" Eng.), 15½ qts. (Corvette), 21 qts. (409" Eng.). On all cars add 1 qt. for heater.

Pressure Valve: Radiator filler cap, used as follows:

Model	AC No.	Pressure	AC Typ
Pass.	850800	13 lbs.	RC-6
Corvette	861753	13 lbs.	RC-21

Thermostat: Poppet pellet type in intake manifold water outlet. 170°F, Part No. 3138868.

Temperature Gauge: AC Electric.

Dash Unit (Pass. Cars) - Two light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and light goes out when temperature reaches 120°F. RED light remains off during normal engine operation, but comes on when engine temperature reaches 240°F. *NOTE* - Red light will come on when ignition key turned to "Start" position (to test bulb and circuit) but should go out when engine started.

Dash Unit (Corvette) - AC No. 1514185.

Engine Unit - AC No. 1993561 (Pass. Cars), No. 1513321 (Corvette).

Water Pump: Packless, sealed ball bearing type.

Overhaul - *See "Cooling System" in Chevrolet Special Data.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*FOR "CORVAIR 95" TRUCKS, SEE CORVAIR DATA PAGES.*

►*JACKING & HOISTING NOTE: B for jacking or hoisting, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

① - **S** Indicates 3/4 Ton Special or 1½ Ton Special, **H** Indicates 2 Ton Heavy Duty (not used on other models).
② - **2** Indicates year 1962.
③ - Series Designation.
④ - Assembly Plant. *See Assembly Plant Table below.*
⑤ - Serial Number Continuous starting with 100001 at each assembly plant.

Assembly Plant Table

A - Atlanta	**J** - Janesville	**O** - Oakland
B - Baltimore	**K** - Kansas City	**S** - St. Louis
F - Flint	**L** - Los Angeles	**T** - Tarrytown
G - Framingham	**N** - Norwood	**W** - Willow Run

ENGINE NUMBER: 6 Cyl. Stamped on right side of block next to distributor.
V8 Eng. Stamped on forward edge of block under right cylinder head.
NOTE - Number (example below) includes identification data as indicated.

① ② ③
F 1210 P

① - Engine Plant. **F** - Flint. **T** - Tonawanda.
② - Code number indicating month (Dec.) and day (10th) of manufacture. This is not an individual or continuous number.
③ - Engine Type. See table below.

Engine Type

J, K, L - 235" (J,JB,JC,JG,JH,JK,K,KA,L indicate clutch and transmission options).
L - 261" (LB,LD,LE,LF,LG,LJ,LK,LM,LU,L,W,LX, LY,LZ, indicate transmission, brake, steering and clutch options).
M - 283" (M,MA,MD,ME indicate transmission options).
U - 327" (U,UA,UB,UD,UE,UF,UG,UH,UJ,UK indicate transmission and brake options).

TUNE-UP

COMPRESSION PRESSURE: 235" & 261" - 130 lbs., 283" 140 lbs., 327" 150 lbs. at cranking speed with throttle open. All cylinders alike within 20 lbs.
VACUUM READING: 17-21", at idling speed.
VALVE TAPPET CLEARANCE: 235" - .006" Intake, .018" Exhaust, hot. 261" - .006" Intake, .020" Exhaust, hot. 283" & 327" - Hydraulic lifters. One turn down from "no-lash".
MANIFOLD HEAT CONTROL: Thermostatic coil spring type located between manifold and exhaust pipe. Valve must operate freely.
CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 6 Cyl. 1-5-3-6-2-4. V8 1-8-4-3-6-5-7-2.
Cylinders (V8) RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".
Spark Plugs - AC 46 (6 Cyl. 235" & 283" V8), AC-42-1 Com. (6 Cyl. 261" & 327" V8).

COIL: Delco-Remy 1115165 (6 Cyl.), 1115115 (V8).
Ignition Current - 1.8 amps. idling, 4.0 amps. stopped.
Resistor - Resistance type cable (1.8 ohms at 80°F) used in harness between bulkhead disconnect plug and starter solenoid bypass terminal (in coil primary circuit for regular operation). Bypassed during cranking when coil energized directly from starter solenoid bypass terminal.

DISTRIBUTOR: Delco-Remy 1112403 (6 Cyl.), 1110947 (283"), 1112765 (327").

Condenser - Delco-Remy No. 1928111 (6 Cyl.), No. 1932004 (V8). **Capacity** - .18-.23 mfd.
Contact Point Set - Delco-Remy 1924571 (6 Cyl. - non-assembled), 1944375 (6 Cyl. - pre-assembled). 1931988 (V8).
Breaker Gap - .016" (6 Cyl. & V8). On V8, gap will be correct when cam angle correctly set.
Cam Angle (6 Cyl.) - 28-35°, **(V8)** 30° ±2°.
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance - 1112403

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		375	0-4		750
4-6		700	8-12		1400

IGNITION TIMING

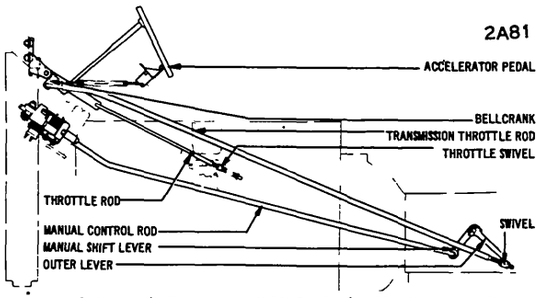
Setting - As follows:

Engine	Ignition Setting
235"	5° BTDC
261"	TDC
283"	①4° BTDC
327"	②8° BTDC

① - With vacuum line disconnected and opening in manifold closed.
② - This supersedes early production setting of 4° BTDC.
Timing Mark (6 Cyl.) - First vertical line on flywheel clockwise from steel ball (235"). Set at steel ball (261"). Line up line or ball with pointer in flywheel housing with Octane selector set at "0".
Timing Mark (V8) - Mark on vibration damper and timing tab attached to engine front cover. Timing tab marked "A" (Advance), "O" (TDC) and lines in 2° graduations with greatest number of lines on advance or BTDC side.

CARBURETOR

Engine	CARBURETOR APPLICATION	Carburetor
6 Cyl. (Exc. Fwd. Contr.)		Rochester B
6 Cyl. (Fwd. Contr.)		Carter BB
V8		Rochester 2G 2-Bbl.



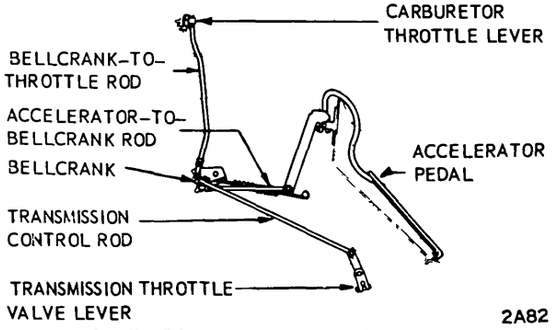
THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC):
Forward Control Models - With engine at normal operating temperature and idle speed set at 400-450 RPM. insert 1/8" diameter pin into gauge pin hole in mounting bracket of accelerator pedal lever. Adjust length of throttle rod so that swivel just enters throttle lever. Remove swivel from outer lever and move lever back against transmission stop. Check distance from hole

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

in outer lever to rear face of transmission with Checking Gauge J-2545-C, bending lever as necessary (Tool J-5260) to allow entry of gauge into hole. *CAUTION D not apply forc against stop at either end of lever travel.* Adjust transmission throttle rod so that swivel at transmission case just enters outer lever, then **shorten** throttle rod **thr and one-half turns** of jam nut.

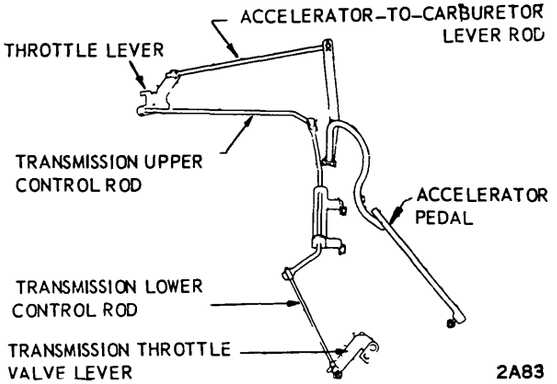


6 CYL. (FORWARD CONTROL) HYDRA-MATIC THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT (POWERGLIDE):

6 Cyl. - 1) Disconnect control rod from throttle lever at transmission cover. Remove lower bolt at rear of transmission side cover. Rotate throttle valve control outer lever counterclockwise to open throttle position.

2) Hold lever in this position and with throttle valve outer lever Gauge J-5906 set at 7.09", measure distance from left side cover lower rear bolt to hole in throttle lever. If pins of gauge will enter holes, adjustment is correct. If necessary to adjust, loosen lever to clamp attaching screw and adjust lever on throttle shaft as necessary. Reconnect throttle rod.



3) Disconnect bellcrank-to-transmission throttle lever rod at throttle valve lever. Disconnect accelerator-to-bellcrank rod at bellcrank.

6 CYL. POWERGLIDE THROTTLE LINKAGE

4) Force bellcrank-to-transmission throttle lever rod forward against its stop in transmission (open throttle position) and adjust bellcrank-to-carburetor throttle rod for free entry of swivel pin in throttle valve lever, with carburetor throttle valve in wide open position.

5) With carburetor throttle valve held in wide open position and accelerator fully depressed, adjust accelerator-to-bellcrank rod for free entry of swivel pin into hole in bellcrank.

V8 POWERGLIDE THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT (POWERGLIDE):

V8 - Remove lower control rod, loosen transmission throttle lever clamp screw. Insert Tool J-5906 between transmission left hand side cover lower front bolt and hole in lever. Distance should be 3.60", as indicated on gauge, from centerline of bolt to hole centerline. With gauge in place and holding lever clamp in full detent position (rotate clockwise), tighten lever to clamp and remove gauge. Install lower control rod. Disconnect upper control rod from throttle lever on carburetor. Adjust upper control rod length for free entry into throttle lever with transmission throttle lever pulled forward against transmission internal stop. Attach throttle rod to carburetor lever. Check adjustment by releasing linkage to its idle position, then hold carburetor throttle lever in wide open position and press downward on transmission outer throttle lever and check for deflection. Readjust upper throttle rod if rod deflects. Place ½" wood block under accelerator pedal rod, depress accelerator against block, and adjust swivel on accelerator-to-carburetor throttle lever rod for free entry into throttle lever when held in wide open position. Readjust length of accelerator rod when detent is not felt before reaching wide open throttle.

ROCHESTER "B" (SINGLE BARREL)

Engine	Rochester Carb. No.
235" (Std.)	7015011
235" (Economy)	7015021
261"	7015013

Idl Setting - 1½-2½ turns open. Turn screw out for richer mixture.

Idl Speed - 475 RPM (Synchro-mesh), 450 RPM (Auto Trans. in "D").

Float Level - 1 9/32" from bottom of each float to cover gasket (do not remove gasket). Use Gauge M-250. With assembly inverted, place gauge with projection inserted in discharge nozzle. Carefully bend float lip vertically so that each float just touches top portion of gauge. Bend float arms to bring them into alignment and to center them in gauge. Tilt assembly 90° on each side and check to see that floats do not touch gauge.

Float Drop - Turn cover right side up so float drops down. Distance from gasket on cover to bottom of each float should be 1¾" on all models. Adjust by bending tang at rear of each float assembly.

►*CAUTION: Both floats must be set alike and must not be twisted out of alignment.*

Accelerating Pump - No seasonal adjustment.

Choke Adjustment: Manual choke used.

Throttle Linkage Adjustment: *See CARBURETOR abov .*

►*OTHER DATA: See "Rochester B & BC Carburetors" in Carburetion Section.*

ROCHESTER 2G (2-BARREL)

Engine	Rochester Carb. No.
283" Std.	7015015
283" Velocity Gov	7013011
327" Std.	7020109

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8. LEFT barrel feeds 1-4-6-7.*

Idle Setting - Initial setting 1½ turns open. After idle speed set to correct specifications (see below), turn both idle mixture screws for smooth idle with highest vacuum reading and RPM.

Idle Speed - 475 RPM (Synchro-mesh), 450 RPM (Auto. Trans, in "D").

Float Level - 1 23/64" (Gauge BT-152) with air horn inverted and gauge placed over float so it rests against pump side of power piston shaft and outer gauge leg in line with center of float. Adjust by bending float arm (Tool BT-69) between pivot and float.

Float Drop - 1 29/32" (Gauge BT-152) from air horn gasket to bottom of float with air horn held upright. To adjust, bend float tang.

Choke Setting: Manual choke used.

Throttle Linkage Adjustment: *See CARBURETOR abov .*

►*OTHER DATA: See "Rochester 2G & 2GC Carburetors" in Carburetion Section.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CARTER BB (UPDRAFT)

Carter (BB) 871SC (Forward Control Models). Single barrel updraft type with manual choke.
Idle Setting - ½-1½ turns open (turn screw out for richer mixture).
Idle Speed - 475 RPM (Synchro-mesh), 450 RPM (Auto. Trans. in "D").

Float Level - Top of float (not seam) 0" to 1/32" below top of bowl with needle valve seated. Use Gauge J-818-13A on top edge of bowl (gasket removed).
Accelerating Pump - Inner hole (in plunger shaft and throttle lever) Summer. Outer hole, Winter.
Throttle Linkage Adjustment: *See CARBURETOR above.*
►*OTHER DATA: See "Carter BB (Updraft) Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC used as follows:

Model	AC No.
6 Cyl. Std.	4434
6 Cyl. Fwd. Contr. & Flat Faced Cowl	4666
V8	4701

Pressure - 3½-4½ lbs. (6 Cyl.), 5½-6½ lbs. (V8) steady at 450-1000 RPM.

Gasoline Gauge: AC Electric.
Dash Unit - As follows:

Model	AC Part No.
Series 10 thru 40 (exc. below)	5643018
Series 10 Fwd. Contr. & All FFC	5643021
Fwd. Contr. (Pin Type Terminals)	5518461

Tank Unit - Various types used. Replace with same type as original equipment.

BATTERY

Delco No. 458. 12 volt, 9 plate, 53 ampere hour capacity (20 hr. rate).
Ground - Negative.
Engine Ground - Engine to frame (6 Cyl.), to dash (V8).

STARTER

Delco-Remy. As follows:

	Starter	Armature
6 Cyl. Std. Trans.	1107888	1932185
Fwd. Contr. Hydra-Matic	1107675, 1107677	1926626
283" V8	1107889	1935829
327" V8	1107233, 1107895	1935829

Drive - Overrunning clutch with solenoid pinion shift.
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 40 ozs. min. (327"), 35 ozs. min. (Others).

Performance Data - 1107888, 889

Torque	RPM	Volts	Amperes
0 ft. lbs.	6200-9400	10.6	49-76
	Lock	4.3	270-310

Torque	RPM	Volts	©Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	3.5	300-360

© - Includes Solenoid.

Starting Switch: Delco-Remy Solenoid No. 1119910 (Synchro-mesh), No. 1119793 (Hydra-Matic), on starter and controlled by Ignition & Starter Switch. Neutral Safety Switch used on Automatic Transmission models (see below).

N utral Saf ty Switch: Delco-Remy 1993520 (Powerglide), 1998677 (Powerglide - with Back-up Light Switch), 1998110 (Hydra-Matic).

Adjustm nt - S "Ch vrolet (Cast Iron) Powerglide" or "Dual-Rang Hydra-Matic" in Transmission Section.

GENERATOR

D lc -R my. Used as follows:

M d l	Generator
All (Exc. Tilt Cab with Pwr. Strg.)	1102096
Tilt Cab with Pwr. Strg.	1102202
Optional	1105116, 123

P rf rmance Data

Generator	Amperes	Volts	RPM
1102096	30	14.0	2240
1102202	35	14.0	2630
1105116	35	14.0	1730
1105123	40	14.0	1930

R tati n - Counterclockwise at commutator end.

Brush Spring T nsi n - 28 ozs.

Fi ld Curr nt - 1.69-1.79 amps. (1102096,202), 2.73-3.0 amps. (1105116,123), at 12.0 volts.

B lt Adjustm nt: (Tensian Gauge) - 90 lbs. new, 75 lbs. used. Approx. 1,000 miles is considered used.

(Withaut T nsi n Gaug) - 1/32" deflection per inch of span between pulleys with 15 lb. push midway between pulleys.

GENERATOR REGULATOR

D lc -Remy. Used as follows:

Regulator	Generator No.
1119001 (30 Amp.)	1102096
1119002 (35 Amp.)	1102202

Cut ut Relay

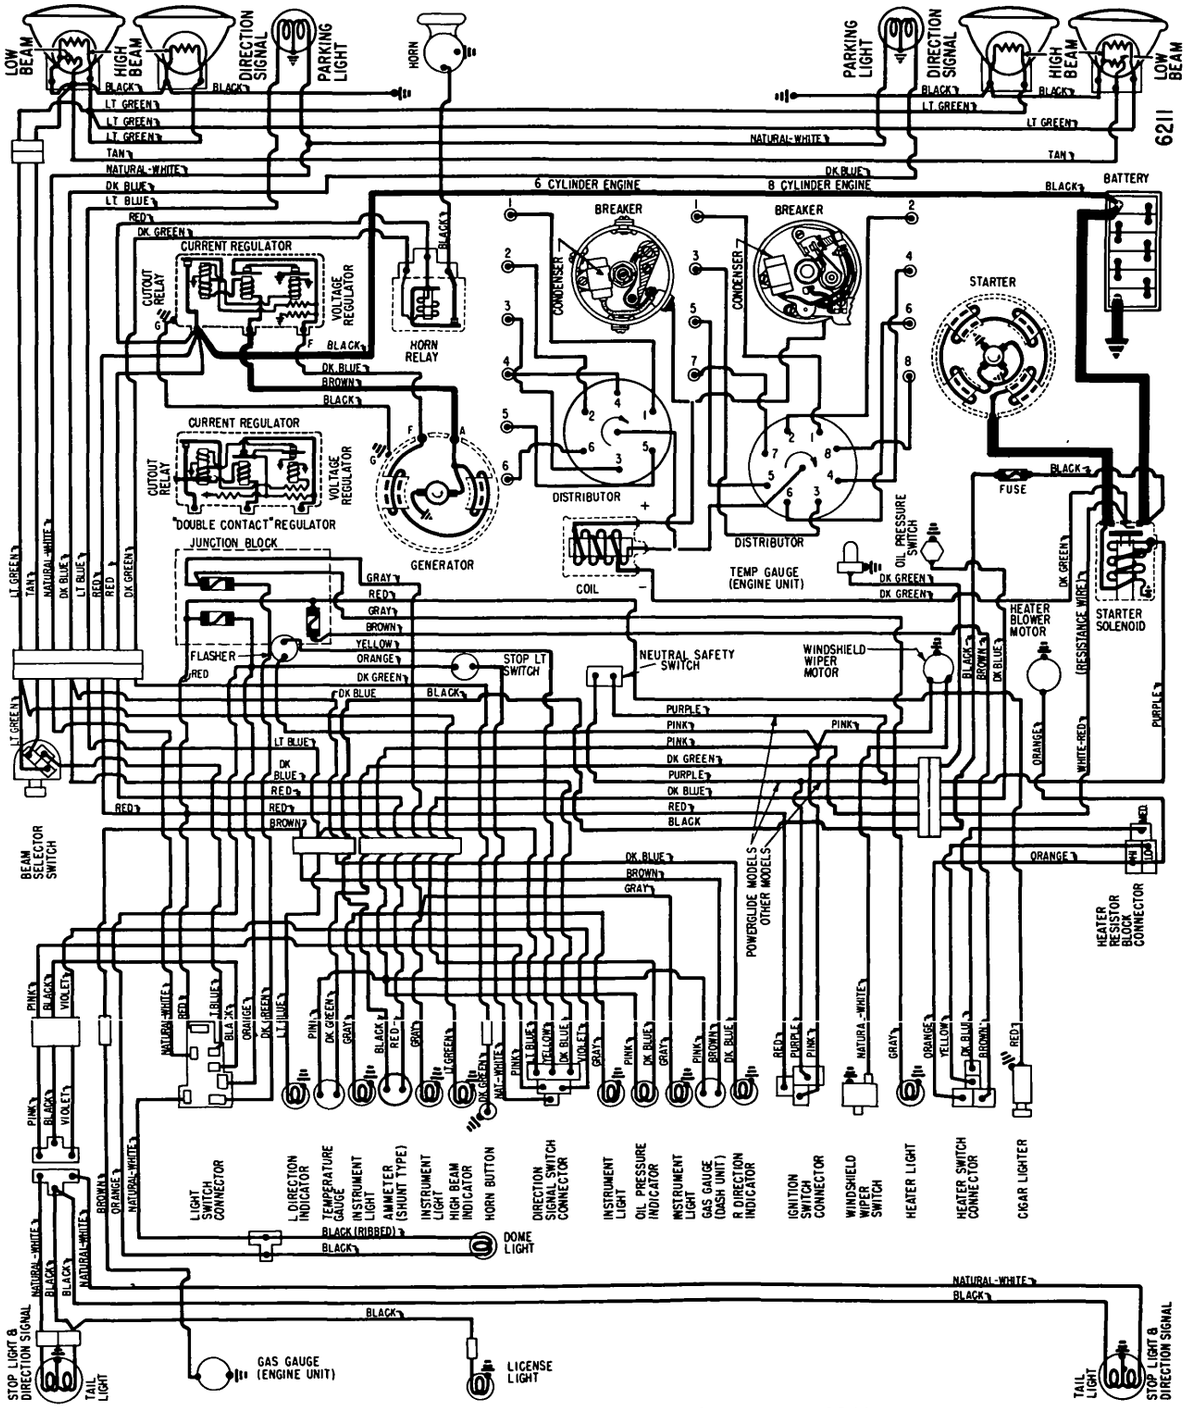
Cuts In - 11.8-13.5 volts.

Contact Gap - .020". **Air Gap** - .020".

V ltage Regulator

S tting - 13.8-14.8 volts at 125°F.

Air Gap - .075".



Current Regulator

Setting - 27-31 amps. (1119001), 31-35.5 amps. (1119002) at 125°F ambient tem perature.

Air Gap - .075" (With contacts just touching).

MISC. ELECTRICAL

Lighting Switch Removal: Remove connector from switch. Depress switch shaft retainer (on top of switch) and remove knob and shaft. Remove retaining ferrule and switch assembly.

Stop Light Switch: Located on underside of dash panel brace. Adjust switch position to make electrical contact with 5/8" brake pedal travel.

Instrument Cluster Removal: Disconnect battery. Disconnect oil pressure line, speedometer cable, and air gauge pipe from instruments. Remove cluster-to-dash retaining screws. Remove cluster from panel, disconnect electrical leads and snap out bulb sockets. Individual instruments may be removed as required.

CIRCUIT BREAKERS: 15 Ampere. Located on light switch, protects Head & Parking lights.

FUSES: Located in fuse block on dash panel, except as noted.

10 Ampere. Back-up light, Heater & Defroster (recirculating type), Parking Brake Alarm.

20 Ampere. Cool Pack Air Conditioning.

15 Ampere. Dome light, Heater & Defroster (Deluxe type), Spot, License, Stop, & Tail lights.

3 Ampere. Instrument lamps.

4 Ampere. Radio.

9 Ampere. Underhood light.

3 Ampere. Ammeter circuit in holder at engine harness bulkhead connector.

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. & V8 Valve-in-Head.

Engine	Bore	Stroke	Displacement
235"	3 9/16"	3 15/16"	235 cu. in.
261"	3 3/4"	3 15/16"	261 cu. un.
283"	3 7/8"	3"	283 cu. in.
327"	4"	3 1/4"	327 cu. in.

Engine	Compr. Ratio	Rated HP	Developed HP
235" Ⓒ	8.25-1	30.4	135 at 4000 RPM
261"	8.0-1	33.7	150 at 4000 RPM
283"	8.5-1	48.0	160 at 4200 RPM
327"	8.0-1	52.1	185 at 4400 RPM

Ⓒ - Both Updraft & Downdraft Carb. Models.

Ⓒ - Rocker arm cover name plates show cubic inch displacement.

Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Chevrolet Special Data.*

OIL PAN REMOVAL: (6 Cyl. Engines) - Raise front of vehicle and place on stands, drain lubricant and remove bolts and screws. *NOTE* - Turn crankshaft as necessary to allow clearance at front crossmember.

OIL PAN REMOVAL: (V8 Engine) - Raise front of vehicle and place on stands. Drain lubricant. Remove bolts and screws and remove oil pan.

CYLINDER HEAD & MANIFOLDS: *See "Cylinder Head & Manifold" in Chevrolet Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Chevrolet Special Data.*

►*327" ENGINE PISTON & RING INSTALLATION CAUTION:* Install compression rings with trademark or identification **UP.** DO NOT use champhered edge on ID as indicator for compression ring installation. Pistons must be installed with notch in piston head **forward** in **left bank** and to **rear** in right bank.

►*PUSHROD IDENTIFICATION & INSTALLATION CAUTION:* For Part No. Application, Color Identification & Installation, *see "Rocker Arms" in Chevrolet Special Data.*

►*VALVE SEAT INSERT NOTE: Exhaust valve seat inserts have been eliminated in 1962 engine cylinder heads.*

►*HYDRAULIC VALVE LIFTER NOTE: New and rebuilt valve lifters should be refilled with engine oil before installation by submerging them in engine oil and working lifter plunger up and down several times.*

►*ROCKER ARM SHAFT SUPPORT NOTE (261" Eng.):* New rocker arm shaft support with a 1/8" horizontal slot located in side of shaft bore towards valves is installed at front and rear positions. New support with new oil connector tube improves durability of valve train.

►*OTHER ENGINE DATA: See Chevrolet Passenger Car Pages and Note the following:*

Valve Timing Specifications

235" Engine

Intake Valves - Open 1° BTDC. Close 39° ALDC.
Exhaust Valves - Open 42° BLDC. Close 9° ATDC.

261" Engine

Intake Valves - Open 11°30' BTDC. Close 52°30' ALDC.
Exhaust Valves - Open 51° BLDC. Close 13° ATDC.
Pistons - Skirt Clearance - (235") .0006-.0010", (261") .0012-.0016",
Piston Pins - Diameter - (261") .927-.9275".
Compression Rings - Gap - (235") .007-.017", (261") .010-.025".
Valves - Length - (235" & 261") 6.364-6.394".
Head Diam. - (235" & 261") 1.875"±.005" (Intake).
Lift - Measured at valve stem. (235") Int. .3104" Exh. .3325" (261") Int. .4051 Exh. .4143".

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Intake Valves	74-82	1.858"
Exhaust Valves	186-198	1.462"

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Chevrolet Special Data.*

Crankcase Capacity: 5 qts. (235",261", & 327"), 4 qts. (283"). Add 1 or 2 qts. for filter change depending on size of filter used.

Normal Oil Pressure - 35 lbs. at 2000 RPM (6 Cyl.), 30 lbs. at 1170-1200 RPM (V8).

Pressure Regulator Valve - In oil pump body, not adjustable.

Oil Pressure Indicator (Exc. Fwd. Contr. & Flat Face Cowl): Indicator light on instrument panel. Controlled by pressure switch Part No. 3815936.

Oil Pressure Gauge (Forward Contr. & Flat Face Cowl Models): AC No. 1508246 (Fwd. Contr. except 102" wheel base), AC No. 1508014 (Ser. 10 Fwd. Control & Flat Face Cowl). Not electric.

Oil Pump: Gear type. Located in crankcase, driven by distributor gear.

►*OIL PUMP SCREEN NOTE:* Oil pickup pipe should be installed so that bottom of pickup screen is parallel with oil pan rails.

Oil Pump Overhaul - *See "Oiling System" in Chevrolet Special Data.*

Oil Filter: Replaceable element type. Replace element at 4000 mile intervals (Ser. 10), at first 1000 miles and at 2000 mile intervals thereafter (Others). Always change filter element when changing crankcase oil.

Replacement Filter Element - (235" 6 Cyl.) AC P-115 (1 qt.), AC P-117 (2 qt.) partial flow. (261", 283" & 327") AC PF-141 full-flow.

Filter Valve Replacement (283" & 327" V8) - Drain crankcase, remove filter and cartridge. Remove oil filter valve bolts, valve and seal. *NOTE - Check valve for cracks, replace if broken.* A 10 lb. valve must be used. Position valve away from engine when installing.

Crankcase Ventilation (Standard): Air intake through oil filler cap, outlet through road draft tube at rear of engine.

Servicing - Clean oil filler cap in solvent and reoil with light engine oil every 2000 miles, or more often if required by operating conditions.

Crankcase Ventilation (Optional): Positive Type (6 Cyl.). Two types used as follows: 1) Conventional road draft tube replaced by a crankcase outlet pipe with baffles in upper end. Ventilation valve at upper end of outlet pipe is connected to intake manifold by a hose.

2) Same as Type 1 above with additional fresh air intake from carburetor air cleaner to valve rocker cover. Oil filler breather cap is replaced by solid non-breather type. *Both types are serviced in same manner. See "Closed Crankcase Ventilating Systems" in Carburetion Section.*

Positive Type (V8) - Road draft tube replaced by an adapter and hose which has control valve at upper end connected to fitting in carburetor base. Valve should be serviced at each tune-up. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: Variable (depends on vehicle and type of cooling system). Add 1 qt. for heater installation.

Pressure Valve - 7 lb. radiator filler cap.

Thermostat: 167-172°F, located in cylinder head water outlet.

Temperature Indicator Gauge: AC electric type.

Dash Unit - AC No. 1513850 (Series 10 thru 40 except Fwd. Contr. & Flat Face Cowl), 1513853 (Series 10 through 40, Series 10 Fwd. Contr. & All Flat Face Cowl), 1513381 (Series 20 & 30 Fwd. Contr.).

Engine Unit - AC No. 1513321 or 6400211.

Water Pump: Packless type with sealed ball bearing.

Pump Removal & Overhaul - *See "Cooling System" in Chevrolet Special Data.*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

►*TIGHTENING CAUTION: Due to use of aluminum crankcas , r ar h using, cylinder heads, and ther parts, bolt and stud torques must be held as close as p ssibl to sp cificati ns in table below to avoid ov rstr ss of bas metal parts and stripped threads.*

	Inch-Lbs.	Ft. Lbs.

POWER TRAIN

POWER TRAIN REMOVAL. *NOTE - Complete assembly (ngin , transmission, and rear axle) must be removed from car as a unit. T s parate transaxle from engine, s "C rvair Transaxl " in Transmission Section.*

PASSENGER CARS

►*TURBOCHARGED ENGINE REMOVAL NOTE:* Engine removal procedure is same as for standard passenger cars after supercharger and carburetor assembly removed Disconnect manifold pressure tube at manifold and thread through front shield as engine is raised or lowered.

1) Remove spare tire (coupe & sedan), engine access cover (station wagon). Remove carburetor air cleaners. Disconnect air heater return air hose. Remove engine-to-body front seal retainer. Disconnect left carburetor return spring and throttle rod at cross shaft. Disconnect main choke cable at firewall.

2) Make the following electrical disconnections: Battery positive terminal cable, generator ground strap and leads to voltage regulator, ignition leads from starter motor harness connector, right and left engine-to-body ground straps, coil and oil and temperature switch wires.

3) Raise car on hoist and remove battery cable and ignition leads from starter solenoid. Remove engine rear grille and skid plate, rear and side seal engine retainers. Disconnect parking brake spring from cross-member. Pull choke cable forward to clear front engine mount. Disconnect accelerator control rods at idler lever and push lever-to-carburetor rod into engine compartment. Disconnect fuel line and speedometer cable. Disconnect air heater flexible hoses from engine. Disconnect gasoline heater fuel line.

4) Remove axle shafts (see Rear Axle Section), and pull universal joints from differential carrier.

5) On Synchro-mesh cars, disconnect shift tube coupling at transmission shifter shaft, then loosen coupling clamp nut and push shift tube coupling into tube until clear of engine front mount. Disconnect clutch return spring and clutch pull rod. Remove clutch cross shaft from front mount. Unfasten clutch cable sheath clamp from engine front mount and drop clutch cable and cross shaft clear of power train. Remove back-up light switch from 4-speed transmission housing (switch is below normal oil level).

6) On Powerglide cars, disconnect transmission shift cable from transmission case. Rotate transmission throttle valve lever fully counterclockwise and remove cable from transmission case. Remove transmission filler tube (use a container to catch oil).

7) Position a hydraulic transmission jack stand under engine assembly, using Tool J-7894 (adapter), and lock tool in place with attached locking knob and additional bolt and nut. Remove cotter pins and castellated nuts from front engine mount (at transmission) and from rear engine mount. *NOTE - If front mounting bracket and shims are removed from transmission, the same amount of shims removed must be replaced. Rear "toe-in" will be affected if shims are changed.* Lower power train gradually and watch for possible interference at rear mount and left rear lower control arm. Remove exhaust pipe and muffler assembly.

TRUCKS

Procedure is same as for Passenger Car Power Train Removal except as noted below.

On Synchro-mesh trucks, disconnect clutch return spring at clutch housing and at pull rod idler lever. Remove clutch cable retainer from engine front mount, then remove pull rod clevis, idler lever and cable clevis. On Powerglide trucks, disconnect transmission oil cooler lines at transmission.

ENGINE SERVICE

►*ENGINE FRONT & REAR IDENTIFICATION: All reference to engine and components is to position installed in car. FRONT of engine is flywheel end toward front of car. REAR of engine is accessory drive end toward rear of car.*

►*CAMSHAFT REPLACEMENT NOTE:* When camshaft being replaced, manufacturer recommends that a 16 oz. can of Engine Oil Supplement, No. 3755788, be added to crankcase (pour 2 or 3 ozs. directly on camshaft if possible). Also, apply molybdenum disulphide ("Molykite" or equivalent) to foot of each valve lifter when camshaft installed (especially important on high performance engines).

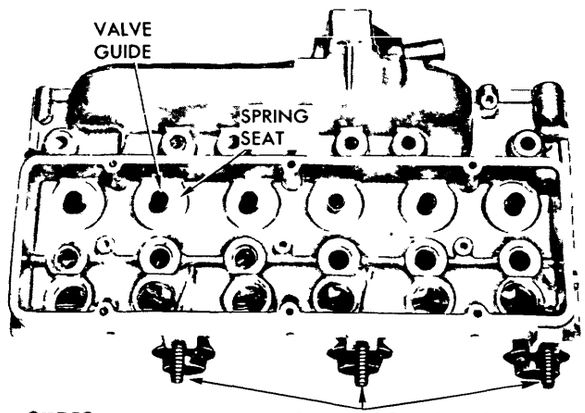
►*ANTI-SEIZE COMPOUND NOTE: Permatex No. 404 Anti-Seize Compound (or equivalent) must be used on threads of all bolts, studs and capscrews entering an aluminum part to prevent thread seizure and damage.*

►*ALUMINUM THREAD REPAIR NOTE: A thread repair kit, Part No. 3780960, is available for repairing stripped or damag d thr ads in aluminum parts.*

►*ALUMINUM PARTS CAUTION: Aluminum c mp n nts of ngin ar r lativ ly soft and asily damag d. Us xtrem care not to nick, scratch or oth rwis distort mating or bearing surfac s.*

CRANKCASE & CYLINDER HEAD STUD REPLACEMENT: Coat stud threads with anti-seize compound (see above) and install into cylinder head or crankcase with special detail of Tool J-8354 to projected length as follows: *NOTE - Measure projected length from shoulder of tool (installed on stud) to surface of crankcase or cylinder head.*

Stud	Projected Length	Tool Detail
Carb. Mounting (Outboard)	4 3/16"	2
Carb. Mounting (Inboard)	1 5/8"	2
Exhaust Manifold	31/32"	3
Cylinder (Long - Upper)	8 9/32"	1
Cylinder (Short - Lower)	7 9/16"	1
Rear Housing Mounting	4 9/16"	3
Distributor Holding	1 1/8"	



►*CYLINDER STUD TORQUE NOTE:* Maximum torque should be 30 ft. lbs., minimum torque 10 ft. lbs. If under 10 ft. lbs., install either .003" or .006" oversize studs as necessary.

EXHAUST MANIFOLD SLEEVE REPLACEMENT: *CAUTION - Remove sleeves from cylinder head only if absolutely necessary.* Remove sleeves by turning gradually with a pipe wrench. **Do not** pry or tap sleeves to remove. To install, coat new sleeves with anti-seize compound (see above). Insert sleeves into dry ice for about 10 minutes and at same time heat cylinder head to 200°F (do not use open flame). Remove sleeves from dry ice and tap into cylinder head bores making sure sleeves are true with bores. *NOTE - Replacem nt sleeves furnished Std., .002", & .010" Oversize.*

EXHAUST MANIFOLD INSTALLATION: Place manifold on sleeve gaskets, tap manifold lightly to insure alignment with gaskets, then firmly seat manifold with a soft hammer. Install manifold clamps and french locks. Torque attaching nuts to 23-27 ft. lbs., then bend tab on locks.

ENGINE MOUNTS: Front Mount Removal - Remove clutch lever control cable cross shaft ball stud at front mount bracket or Powerglide control cable. Support engine and remove insulator-to-bracket nuts. Remove shift rod coupling from transmission shift rod. Lower engine about 2" so front engine bracket clears mount stud.

CONTINUED ON NEXT PAGE

2F532 EXHAUST MANIFOLD STUDS
CORVAIR CYLINDER HEAD

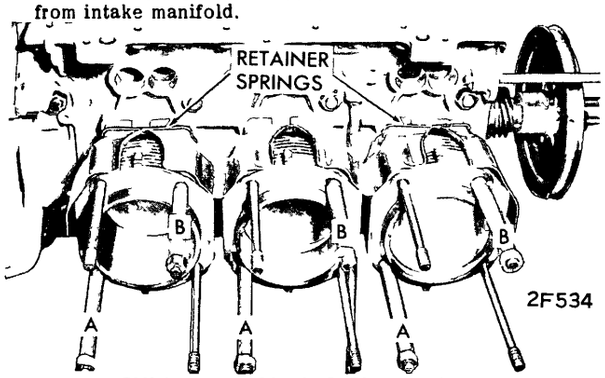
CONTINUED FROM PRECEDING PAGE

Disconnect parking brake cable from mounting bracket. Remove front mount and insulator. *CAUTION - Shims between transmission and mounting bracket control rear wheel toe-in and must be replaced in original positions.*

Rear Mount Removal: Support engine and remove rear center shield. Remove bracket-to-skid plate nuts, lower engine and remove engine-to-bracket mount assembly.

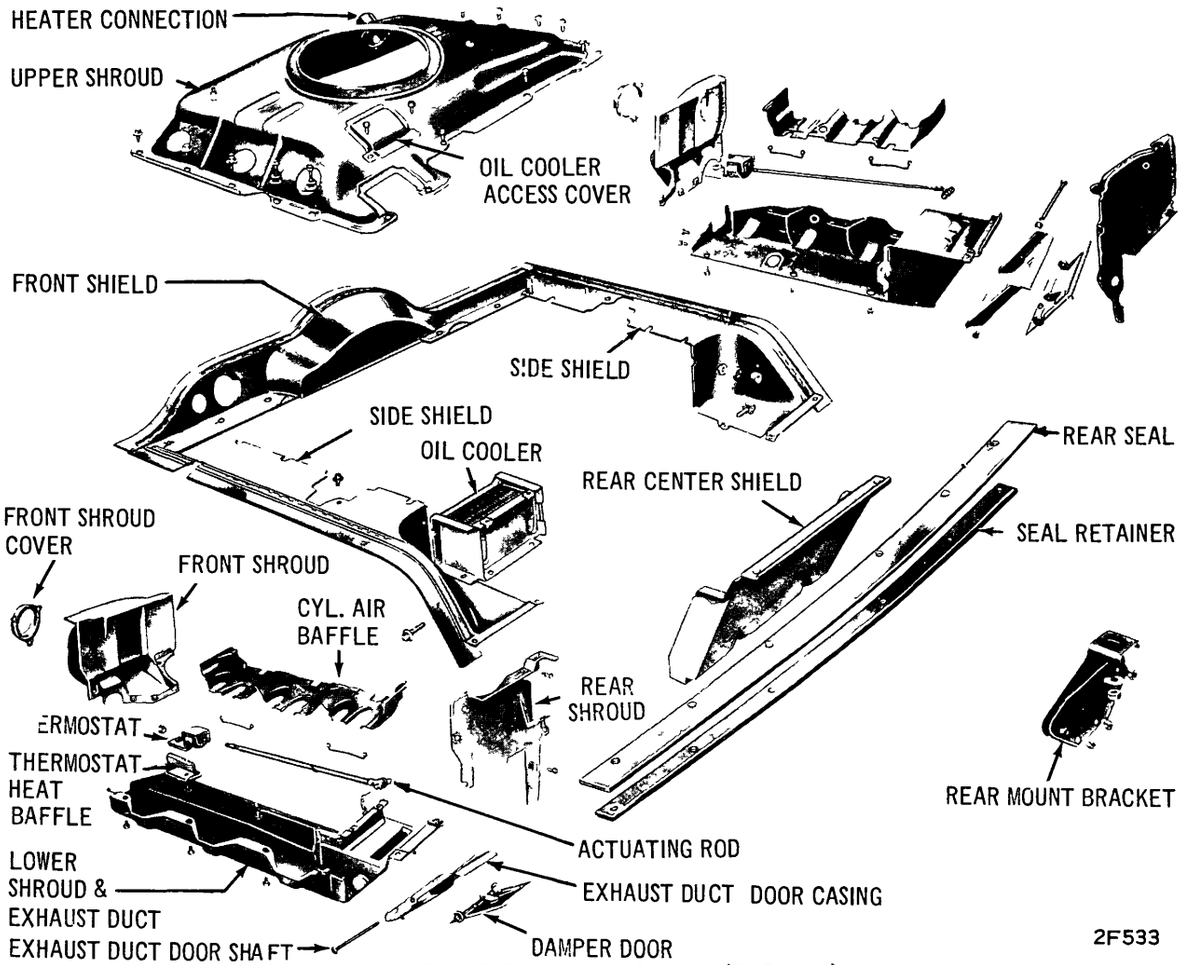
CRANKCASE COVER, BLOWER & BLOWER BEARING REMOVAL: 1) Disconnect battery ground cable, accelerator and fuel lines, then remove oil level gauge and carburetor air cleaners and supports. Remove spare tire. Remove carburetor vacuum balance tube and retaining strap at engine upper shroud assembly and front shield.

2) Remove pulley belt and distributor wire harness, then remove carburetor cross shaft and choke cable assembly from carburetors. Disconnect generator brace and swivel it away from upper shroud. Remove engine upper shroud.



3) Remove four retaining bolts from blower pulley and remove pulley and blower from bearing hub assembly. Remove crankcase cover and blower bearing assembly as a unit. Remove crankcase-to-crankcase vent gasket and crankcase vent.

Blower Bearing Replacement: Use hypoid lubricant on bearing shaft and press bearing on crankcase cover so distance from crankcase cover gasket rail to top surface of large diameter of hub assembly is 4.520-4.530".

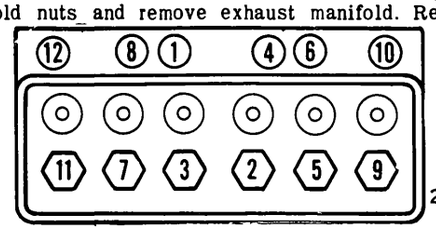


OIL COOLER REMOVAL: Remove all screws retaining cooler to engine shrouds, shields and cylinder head, then remove oil cooler access hole cover and remove long oil cooler mounting bolt. Remove oil cooler.

CYLINDER HEAD: Removal - *NOTE - When removing right hand cylinder head, disconnect coil, oil pressure and cylinder head temperature sending unit wires in addition to following procedure.*

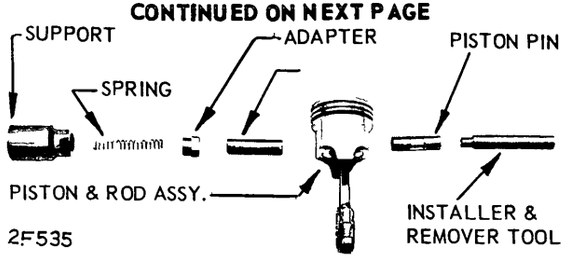
1) Drain crankcase and disconnect battery cables from battery and generator. Disconnect radio ground strap. Remove air cleaner, accelerator return spring and air cleaner support. Disconnect accelerator rod from carburetor and remove cross shaft retainer at shaft support. Disconnect cross shaft support from carburetor. Disconnect fuel line and choke cable from carburetor. Remove carburetor and long (outboard) carburetor mounting stud from manifold. Disconnect vacuum balance tube from intake manifold.

CYLINDER HOLDING FIXTURES



CORVAIR ENGINE SHROUDING (TYPICAL)

2) Disconnect generator mounting bracket and swivel bracket up and away from engine upper shroud. Remove spark plugs. Remove engine side shield. Remove oil cooler.



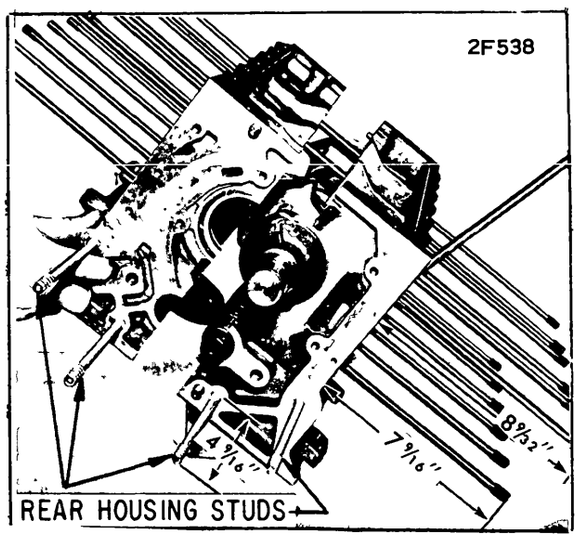
3) Raise car on a hoist and attach Tool J-7894 (adapter) to underside of engine. Remove both engine side seal retainers and rear seal retainers. Remove engine rear center shield and seal assembly. Remove lower engine shroud and exhaust duct, then remove exhaust pipe-to-manifold nuts and remove exhaust manifold. Remove engine rear mounting nut and washer from below body rear mounting bracket.

4) Remove valve rocker cover (catch oil draining from cylinder head), then remove rocker arms, pushrods, rocker arm studs and pushrod guides. Remove "O" rings from cylinder head and from bottom of pushrod drain tubes, then remove drain tubes.

CORVAIR CYLINDER HEAD TIGHTENING SEQUENCE

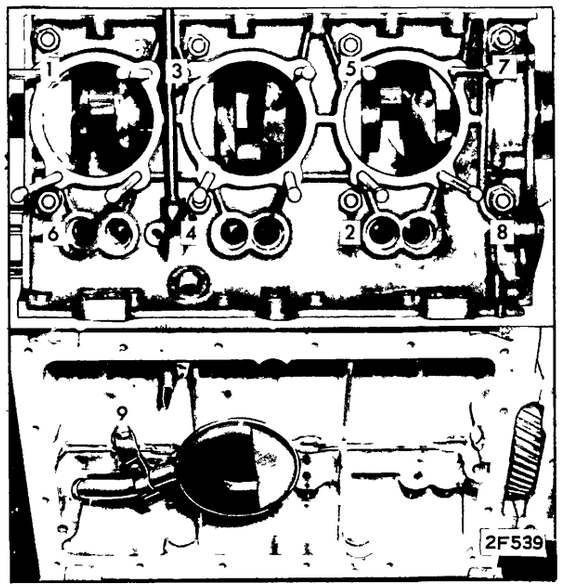
CONTINUED ON NEXT PAGE

CORVAIR PISTON PIN ASSEMBLY



CONTINUED FROM PRECEDING PAGE

5) Remove cylinder head nuts and flat washers, then carefully lower engine assembly approximately 3" to clear cylinder head carburetor flange. Remove cylinder head from crankcase studs.



►*CAUTION: Do not rotate crankshaft with cylinder head removed unless holding fixtures are installed on studs to hold cylinder in place. ½" O.D. steel tubes 4¼" long should be installed one long stud and ½" O.D. steel tubes 3½" long should be installed on one diagonally opposite short stud of each cylinder. See Illustration.*

Installation - To install head, reverse removal procedure and note the following: Use anti-seize compound such as Permatex No. 404 or its equivalent on the threads of all bolts, studs and capscrews entering aluminum parts. Tighten cylinder head retaining nuts and rocker arm stud nuts (rocker arm studs have internal threads at lower end that thread over cylinder head studs and act as cylinder head nuts) to 27-33 ft. lbs. in the sequence shown in diagram. Install pushrods with the .050" side oil hole upward (next to rocker arm). Install rocker arms and adjust to proper position (see *"Hydraulic Lifter Adjustment" below*). Tighten rocker arm cover screws to 30-50 inch-lbs.

CYLINDER REMOVAL: *NOTE - Cylinder can be removed with engine in car.* Remove cylinder heads and install holding fixtures (see above). Remove crankcase cover and blower assembly (see above). Remove cylinder air baffles (secured by retainer spring clips at base of cylinder). Turn crankshaft and remove connecting rod caps. Remove cylinder holding fixture and remove cylinder, piston and rod as an assembly. *NOTE - If desired, cylinder can be removed without removing piston and connecting rod. In this case, use Tool J-8356 to compress piston rings when installing cylinder.* **Installation** - Install new copper gasket over cylinder pilot and install cylinder into crankcase. Reverse removal procedure.

CRANKCASE STUD DIMENSIONS

CRANKCASE TIGHTENING SEQUENCE

PISTON PIN REMOVAL & INSTALLATION: Use Tool Set J-8355 to remove and install piston pin in piston and connecting rod (see illustration). When installing, press pin in until pilot of tool bottoms on adapter and support.

CONNECTING ROD BEARING REPLACEMENT: *NOTE - Bearings can be replaced without removing engine from car.* Remove crankcase cover and blower assembly (see above). Remove spark plugs. Remove connecting rod bearing caps (turn crankshaft to position rods for access to cap bolts).

FLYWHEEL HOUSING: Crankshaft Front Oil Seal Replacement - Tap out old seal, clean surface in housing and check for nicks. Coat beaded outer surface of seal with lubriplate and install with Tool J-2221-A or suitable installer. *CAUTION: Sealing lips of seal must be packed with a good grade of cup grease with a minimum melting point of 350°F.*

ENGINE REAR HOUSING REPLACEMENT: Observe the following: 1) Grooved pin holding oil pump pressure regulator valve must be installed with a suitable drift. 2) Oil pump gallery plug must be flush with counterbore (use sealing compound). 3) Distributor holding stud should project 1 1/8" from distributor mounting pad on housing.

CRANKSHAFT PULLEY REMOVAL: *Following procedure supersedes previous recommendations.* Rework Crankshaft Pulley Remover J-6978-1 by drilling two 7/16" holes through puller. Place holes 180° apart on a 2¼" circle which is concentric with screw hole in center of tool. Proceed as follows:

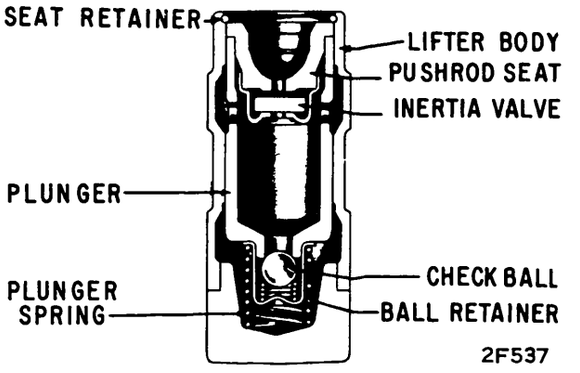
1) Raise and support rear of car. Loosen blower belt, remove oil filter assembly, and remove engine grille. Remove engine rear sealing strip retainer and sealing strip, then remove engine rear center shield.

2) Support rear of engine, disconnect and remove rear engine mount and remove mount bracket from engine. *NOTE - On trucks, lower rear of engine to obtain sufficient clearance.* Remove pulley attaching bolt, then remove pulley using reworked Puller J-6978-1 (see above).

Crankshaft Rear Oil Seal: *See CAUTIONS below.* Tap out old seal, clean surface in housing and check for nicks. Coat beaded outer surface of seal with lubriplate and install with Tool J-270-6 or suitable installer. *CAUTION - Sealing lips of seal must be packed with a good grade of cup grease with a minimum melting point of 350°F.*

CRANKCASE SEPARATION: After cylinders, rear housing, and flywheel housing removed, loosen crankcase holding bolts. Tilt crankcase on right side at about 15° angle to prevent camshaft and crankshaft falling out. Remove holding bolts and remove crankcase left half.

CRANKCASE ASSEMBLY: Make sure split line surfaces are free of nicks and scratches. Install main bearing inserts in right half and install crankshaft. Install camshaft, guiding thrust washer into groove in crankcase and index timing marks on camshaft and crankshaft gears. Install main bearing inserts in left half and carefully install left half to right half. Torque holding nuts to proper specifications in sequence shown in diagram. *CAUTION - Hold bolt head and tighten nuts. DO NOT tighten at bolt head.*



►*THRUST BEARING (NO. 1 - REAR) INSTALLATION*

CAUTION: Later engines and replacement bearings will have only one flanged bearing half. Install this flanged half in **left half of crankcase only.**

MAIN BEARING REPLACEMENT: When testing bearing clearance, crankcase must be assembled without camshaft exactly as indicated under "Crankcase Assembly" above.

CRANKSHAFT DRIVE FLANGE: Drive flange and crankshaft timing gear are a one-piece unit with a tight press fit on crankshaft. A hydraulic press is necessary to remove and install gear and flange. To remove, use Support Plate J-358-1, Adapter Rings J-7028, and a

CONTINUED ON NEXT PAGE

CORVAIR HYDRAULIC VALVE LIFTER

CONTINUED FROM PRECEDING PAGE

hydraulic press. To install, support crankshaft between front crankshaft throw and front journal (support must clear thrust face of No. 6 crankpin). Install woodruff key and install crankshaft gear. Press gear on shaft with Tool J-6175 and a hydraulic press.

►*FLYWHEEL SEALING CAUTION:* Flywheel or flex plate-to-crankshaft gear bolts must have sealing compound applied before installation to prevent oil leakage.

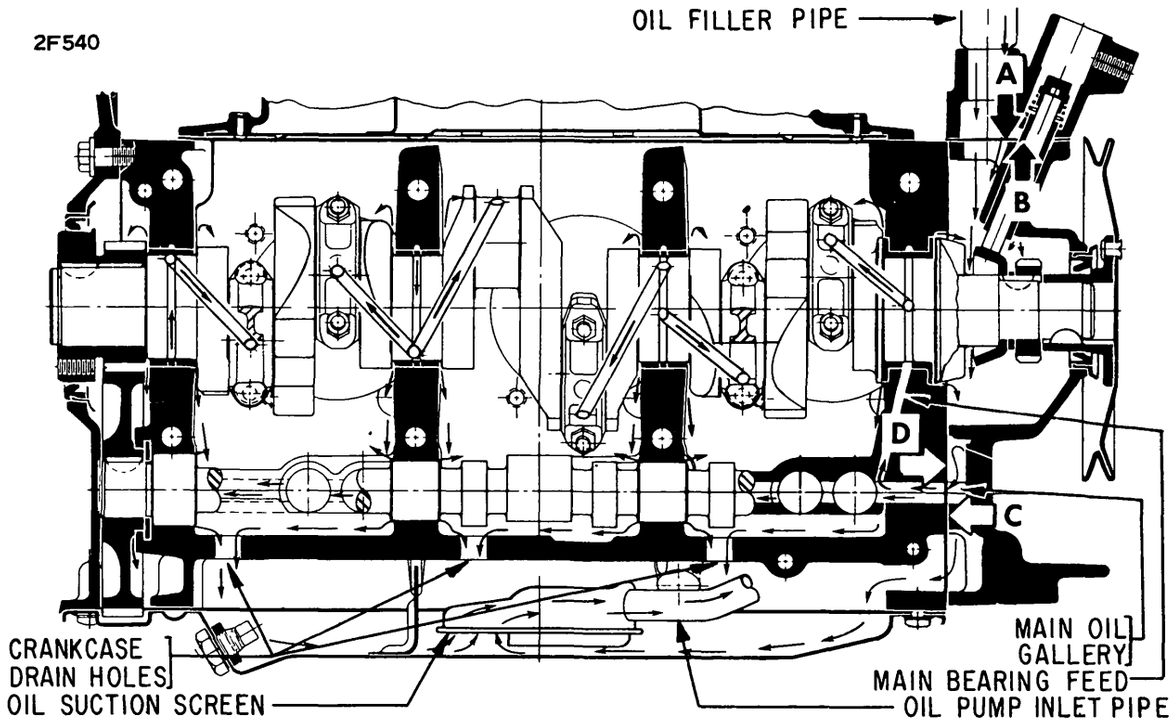
CAMSHAFT GEAR REMOVAL & INSTALLATION: Remove gear by supporting gear with Tool J-971 and pressing out shaft with an arbor press. To install, support camshaft at back of front journal, install thrust washer and woodruff key and press gear on shaft with an arbor press (support gear with Tool J-971) until gear bottoms on thrust washer.

PUSHROD, PUSHROD GUIDE & DRAIN TUBE INSTALLATION: Place "O" rings on each end of drain tubes and install with long end of tube toward cylinder head. Insert pushrods into drain tubes with .050" side oil hole at rocker arm end (pushrod marked with blue paint). Install pushrod guides and rocker arm studs. Install rocker arms and make valve lifter adjustment.

HYDRAULIC LIFTER ADJUSTMENT: For initial adjustment after overhaul, proceed as follows: Set distributor at No. 1 firing position and crankshaft pulley notch at 0° on timing tab. Adjust No. 1, 3, 6 Intake and No. 1, 4, 5 Exhaust valves as follows: Turn rocker arm adjusting nut down until no axial movement of pushrod is felt, then turn adjusting nut 1 turn additional. With distributor at No. 2 firing position (pulley notch at 0°), adjust No. 2, 4, 5 Intake and No. 2, 3, 6 Exhaust valves.

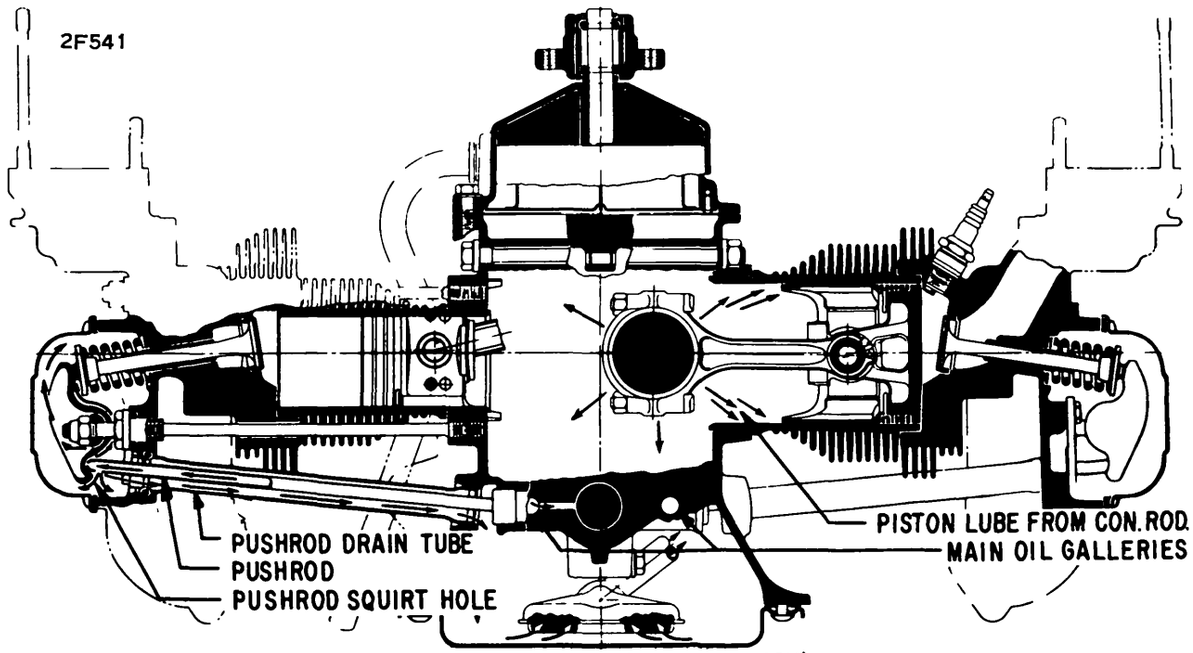
HYDRAULIC LIFTERS: Removal - Lifters are removed from lifter bores after pushrods and drain tubes removed by means of a magnet or wire hook and should be reinstalled in same bore from which removed.

Disassembly - Hold plunger down and remove pushrod seat retainer. Remove pushrod seat and inertia or metering valve assembly, plunger, and spring from lifter body. Remove check ball retainer, ball and spring. *NOTE* - Replace entire lifter if any part damaged.



Reassembly - Insert check ball in plunger, place spring in seat in ball retainer and insert retainer on plunger. Place plunger spring over ball retainer and slide lifter body over spring and plunger. Install pushrod seat and inertia or metering valve assembly into plunger and install retainer. *NOTE - Fill lifter with SAE 10 engine oil at reassembly and before installing in engine.*

OILING SYSTEM



ENGINE LUBRICATION: Force feed type with oil under full pressure supplied to all crankshaft, camshaft, and connecting rod bearings, and to hydraulic valve lifters. Oil metered by lifters lubricates pushrods and rocker arms. All other parts are lubricated by oil spray.

OPERATION: Oil pump located in engine rear housing & driven by distributor shaft which is driven by crankshaft. Pump draws oil through fixed oil screen and intake pipe in crankcase and delivers oil to full-flow type filter mounted on Filter & Generator Adapter which is mounted on engine rear cover. Oil is then directed through oil cooler (mounted on side of engine

CONTINUED ON NEXT PAGE

ENGINE OILING SYSTEM (SIDE VIEW - SEE VIEWS A, B, C, D)

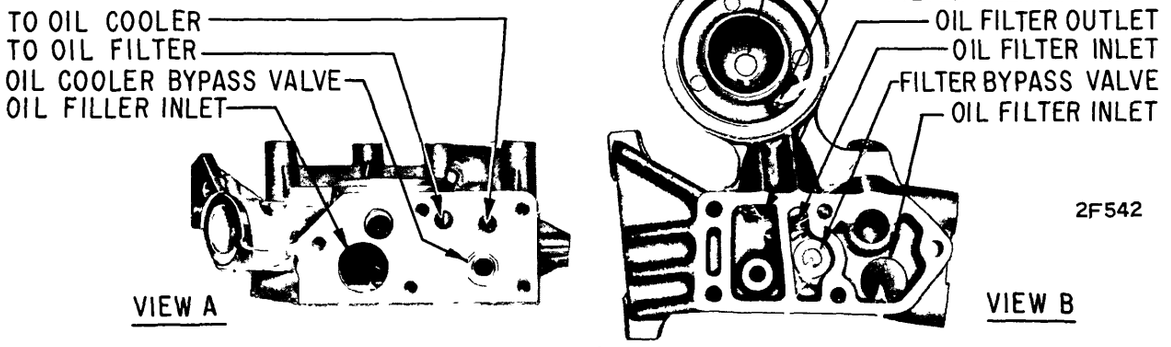
ENGINE OILING SYSTEM (CROSS SECTION)

CONTINUED FROM PRECEDING PAGE

rear cover) and then to the two main oil galleries (one on either side of camshaft) which extend entire length of crankcase. Oil is distributed through the main galleries as detailed below. *NOTE - See Engine Rear Cover and Filter & Generator Adapter illustrations for location of channels and passages in these parts and for location of bypass valves for oil filter and oil cooler.*

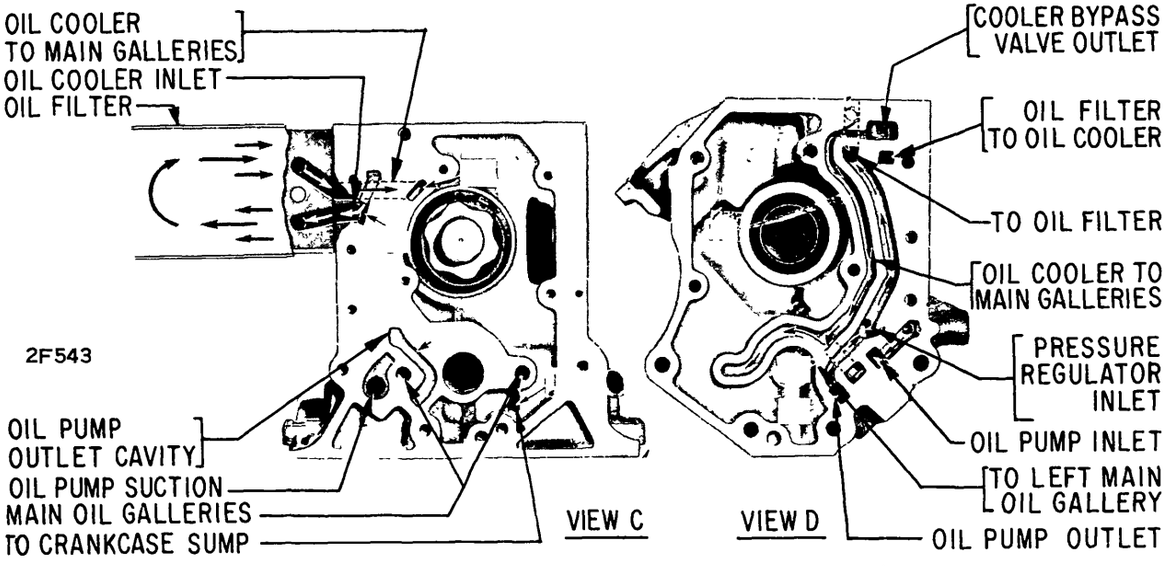
Crankshaft & Camshaft Bearings - Lubricated through passages in crankcase webs from main oil galleries. Individual bearings are lubricated from right or left main oil galleries as follows: **Crankshaft Bearings** - Nos. 1 & 3 (right gallery), Nos. 2 & 4 (left gallery). **Camshaft Bearings** - Nos. 1, 3, 4 (right gallery), No. 2 (left gallery).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.



Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from ends of connecting rod bearings.

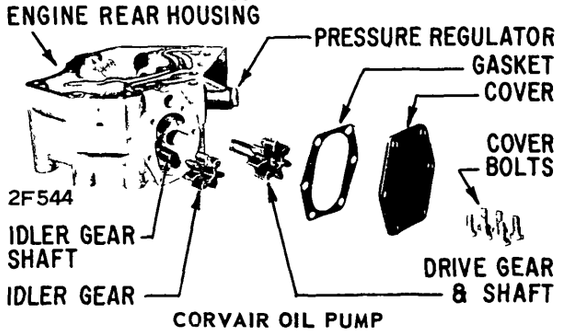
Timing Gears - Lubricated by oil spray from forward end of crankshaft and camshaft No. 1 bearings.



Fuel Pump Eccentric & Distributor Drive Gear - Lubricated through drilled orifice and pressed in nozzle in engine rear housing which directs oil on these parts (early cars), lubricated by overspray from No. 1 (rear) main bearing (later cars - orifice and nozzle omitted from rear housing).

Hydraulic Valve Lifters - Main oil galleries intersect lifter bores and lifters are supplied with oil directly from these galleries.

Rocker Arms, Pushrods, & Valves - Pushrods are hollow and are supplied with oil from hydraulic lifter (inertia valve in upper end of lifter permits oil to flow through hole in end of pushrod). Upper end of pushrod has a side hole which sprays the valve chamber (lifter and pushrod rotate in operation and this oil spray is directed around valve chamber) and a through hole in the end which lubricates pushrod socket and rocker arm ball (pushrod hole registers with hole in rocker arm once during each revolution directing oil upward to the rocker arm ball). Oil in rocker arm chamber is returned to crankcase through the tubular pushrod drain tubes.



OIL FILTER-GENERATOR ADAPTER (SEE OILING SYSTEM SIDE VIEW)

ENGINE REAR HOUSING (SEE OILING SYSTEM SIDE VIEW)

OIL FILTER: Full-flow type mounted on Filter & Generator Adapter at rear of engine. Bypass valve (10 lb. type) located in adapter (see illustration) permits oil circulation through engine if filter element is clogged.

OIL COOLER: Finned cooler mounted on side of Engine Rear Housing in the engine cooling air stream. Bypass valve (10 lb. type) located in Filter & Generator Adapter (see illustration) permits oil circulation through engine if cooler is clogged.

CORVAIR OIL PUMP

OIL PUMP: Disassembly - Drain crankcase, remove rear grille, center shield and engine rear mount (support engine). Remove oil pump cover. Remove oil pump drive gear and shaft and idler gear from rear housing. Remove pressure regulator valve plug, gasket, spring,

Reassembly: Lubricate gears with engine oil. Install idler gear on idler shaft and make sure shaft is 010-.020" below housing gasket surface. Insert drive gear and shaft in housing. Clearance between gears and housing should be .002-.005". Gear backlash should be .002-.008". *NOTE - Oil pump gears should extend .0025-.0045" above housing gasket surface for oil pump prime. Gears of .001" oversize thickness are available.* Install oil pump gasket and cover and pressure regulator valve assembly.

ELECTRICAL NOTES

GENERATOR INSTALLATION: *CAUTION - If preload on generator exists, end frame will break. To prevent this condition, use following installation procedure exactly.* Tighten generator-to-adapter bolts to 15-22 ft. lbs. and loosely assemble mounting bracket-to-generator bolt and nut (at commutator end of generator). Bracket must be able to move. Tighten generator bracket-to-cylinder head bolts finger tight. Now tighten bracket bolt at commutator end of generator to 8-11 ft. lbs. Tighten front bracket-to-cylinder head bolt to 15-22 ft. lbs. and rear bolt to same torque.

STARTER REMOVAL: *Following procedure is recommended as easiest method of removal and installation.* Disconnect battery and raise and support car. Disconnect rear throttle control rod from transmission bellcrank, and from carburetor cross shaft. Disconnect starter solenoid wires (use ¼" drive midget socket set). With 3/8" drive, 9/16" shallow socket on a 9" extension with ratchet, remove upper starter mounting bolt. Then remove lower bolt. Pull starter forward and remove from engine compartment.

►*JACKING & HOISTING CAUTION: Before jacking or hoisting, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

►*ENGINE APPLICATION & IDENTIFICATION NOTE* Four engines used as follows: 1) Std. Engine, 8.0-1 compr. ratio, 80 HP, used on all models except Monza with Powerglide. 2) Std. Engine, 9.0-1 compr. ratio, 84 HP, used on all Monzas with Powerglide. 3) Super Turbo Air Engine, 9.0-1 compr. ratio, 102 HP, optional on all models. Cars with Super Turbo Air Engine may be identified by a special crossed flag emblem under car nameplate on rear deck lid. 4) Turbocharged Engine, 8.0-1 compr. ratio, 150 HP, optional on Monza 2-Door Coupe & Convertible with 4-speed synchro-mesh transmission only. These models will be designated "Monza Spyder" when equipped with this engine. *NOTE - In the following data, reference to individual engines, where necessary, will be as follows: Std. (8.0-1); Std. (9.0-1); Hi Perf.; Turbocharged.*

MODEL IDENTIFICATION

Body Style	Series Name	Series Prefix
2-Door Coupe	500 Std.	527
2-Door Coupe	700 Deluxe	727
4-Door Sedan	700 Deluxe	769
4-Door Station Wagon	700 Deluxe	735

Turbocharged Engine	YR

TUNE-UP

►*AIR CONDITIONED CAR ENGINE ACCESS PROCEDURE: For access to engine for tune-up and other engine service on air conditioned cars without disconnecting refrigerant line or purging system, use the following procedure:* 1) Remove compressor mounting bracket pivot bolt nut and compressor-to-adjusting bracket attaching parts. Remove compressor belt. Disconnect wiring from compressor. Remove triangular bracket from front of compressor. Work mounting bracket pivot bolt forward until threaded end of bolt is out of compressor rear mounting boss. Reposition compressor in engine compartment.
2) Remove compressor belt, then remove condenser and shroud assembly-to-bracket attaching screws. Carefully lift assembly from engine and rotate toward right rear of car as far as refrigerant lines will permit.

COMPRESSION PRESSURE: 130 lbs. at cranking speed with throttle wide open. Maximum variation between highest and lowest cylinders 20 lbs.

VACUUM READING: 14-18" at idle speed.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

Hydraulic Lifter Adjustment (Engine Running) - With engine at normal operating temperature and running at idle speed, back off rocker arm stud adjusting nut until rocker arm starts to clatter against valve stem, then turn nut down until clatter just stops. This is "zero lash" position. Now turn nut an additional ¼-turn and wait until engine runs smoothly. Continue to turn nut down in ¼-turn increments until nut has been turned down 1 full turn from "zero lash" position. *CAUTION - Make adjustment slowly so lifter will adjust itself and prevent engine damage.*

MANIFOLD HEAT CONTROL: None used.

POSITIVE CRANKCASE VENTILATION: Std. - Consists of tube and hose arrangement from crankcase ventilation outlet into right carburetor air cleaner. *No valve used in this system.* Clean hose and pipe at 10,000 mile intervals or sooner if needed, and check cleanliness of system before performing a "Tune-Up" for ignition and carburetion troubles.
Optional - Consists of a tube and hose arrangement with a metering valve from crankcase ventilator outlet to vacuum balance tube. Additional hose at inlet side of valve into air cleaner allows excessive blow-by to go directly into air cleaner. Clean valve at 5000 mile intervals or sooner if needed, and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-4-5-2-3-6.
Cylinders - RIGHT BANK 1-3-5, LEFT BANK 2-4-6. *NOTE - Right rear cylinder is No. 1 and left rear cylinder is No. 2. Engine rotation, as viewed from rear of car, is counterclockwise.*

SPARK PLUG GAP: .035".
Spark Plugs - AC No. 46FF (Std. 8.0-1), No. 44FF (Std. 9.0-1, Hi Perf. & Turbocharged). *Use No. 42FF on Turbocharged Engine when used in competition.* 14 mm. Torque to 20-25 ft. lbs.

COIL: Delco-Remy No. 1115135 (Except Turbocharged), No. 1115172 (Turbocharged).
Ignition Current - 1.8 amps. idling, 4.0 amps. stopped.
Resistor - Turbocharged - Delco-Remy No. 1931385 resistor unit mounted on engine right side shield between distributor and coil. Bypassed during cranking by lead from starter solenoid to coil.
Other Engines - Resistance wire (1.8 ohms at 80°F) connected in circuit between instrument panel disconnect plug and rear wiring harness connector. Bypassed during cranking by lead from starter solenoid to coil.

DISTRIBUTOR: Delco-Remy - Pivoted breaker plate type. *NOTE - On Turbocharged Engines, pressure retard unit used which replaces vacuum advance unit. Pressure retard unit retards spark when intake manifold is pressurized, thus partially opposing centrifugal advance at high engine RPM.*

Application	Distributor No.
Synchro-mesh	1110269
Powerglide (Std. 8.0-1 Engine)	1110271
Powerglide (Std. 9.0-1 Engine)	1110278
Hi Performance Engine	1110272
Turbocharged Engine	1110290

Condenser - Delco-Remy No, 1956007 (Std. 9.0-1 Engine), No. 1928111 (Other Engines). **Capacity** - .18-.25 mfd.
Contact Point Set - Delco-Remy No. 1954566 (All Engines).
Breaker Gap - .019" (new points), .016" (used points).
Cam Angle - 31-34°, 33° preferred.
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Clockwise viewed from above.

11.5	23	14-16.25

Vacuum Advance - 1116200

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
11.5	23	15-17.25

① Aut matic R tard - 1110290 Distr.

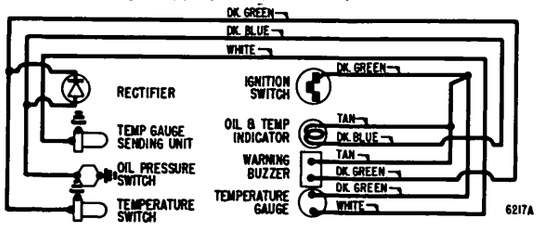
Distr. Degrees	Eng. Degrees	Pressure
Start	0	② 1 lb.
4½	9	③ 2 lbs.

① - This is a retard of the timing point.
② - At 2500 Engine RPM. ③ - At 2750 Engine RPM.

IGNITION TIMING

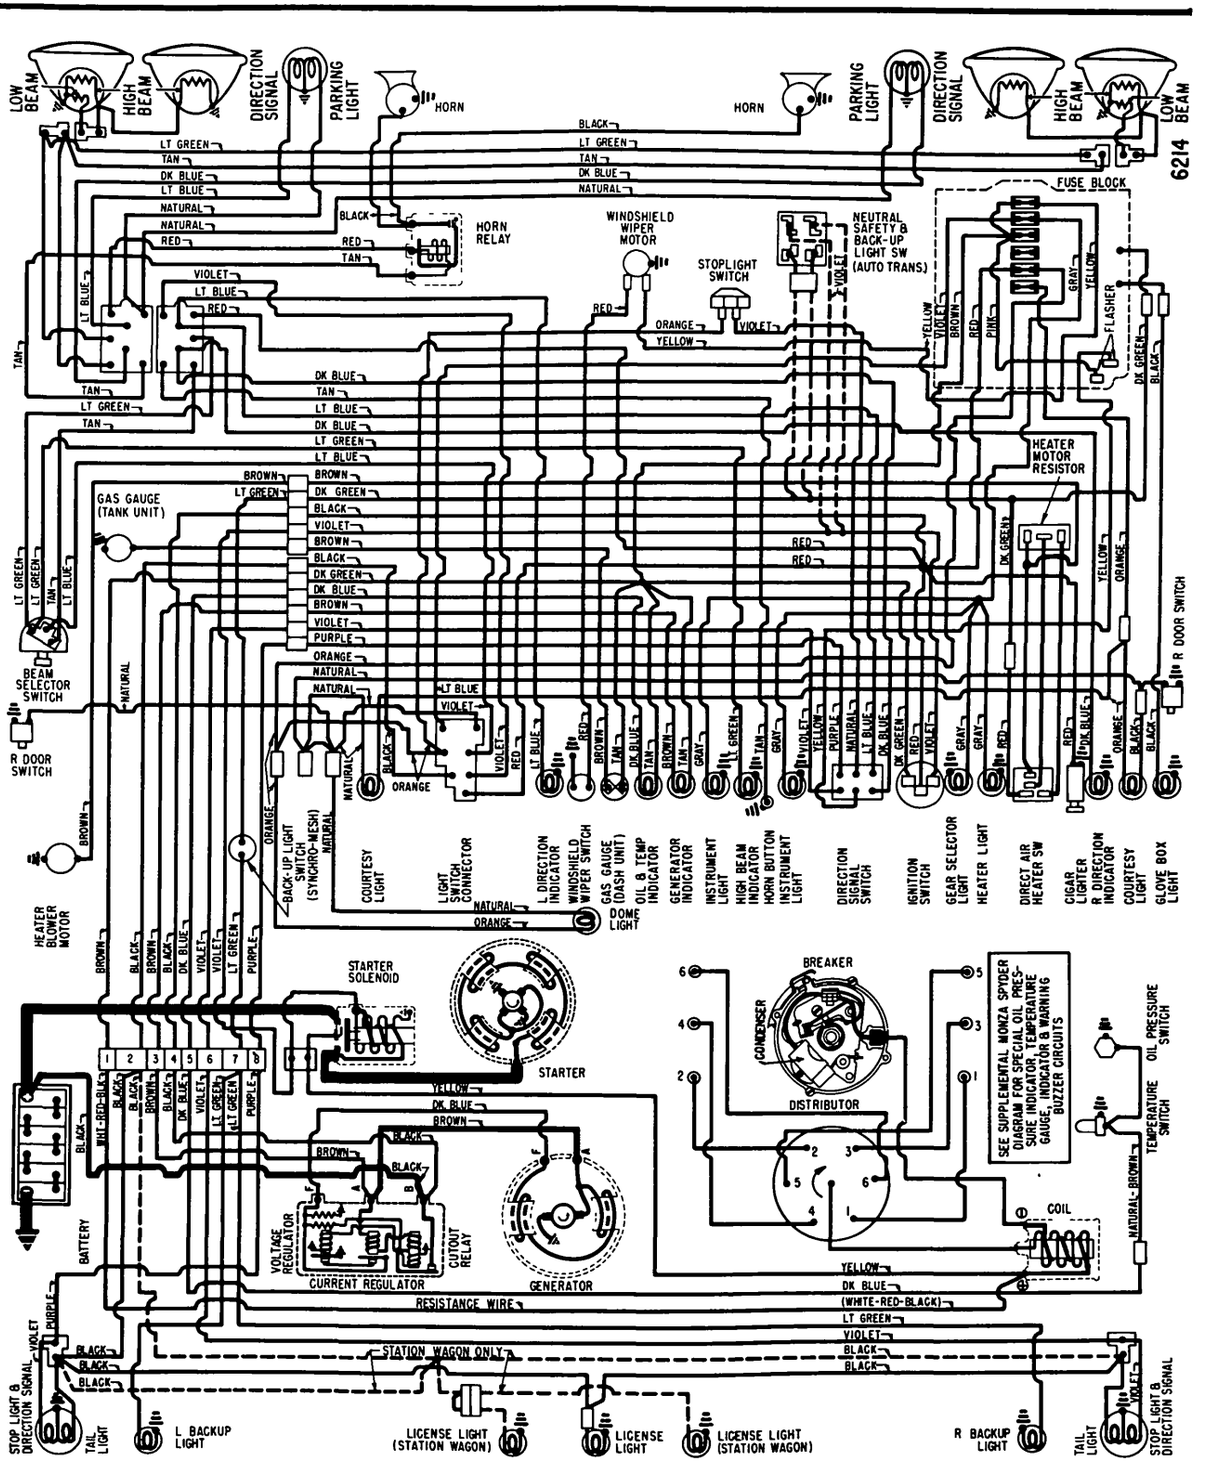
Engin & Trans.	Std. Setting	Allowable Range
Synchro-mesh(Exc.Hi Perf.)	4° BTDC	4-10° BTDC
Powerglide & Hi Performance	13°BTDC	13-18° BTDC
Turbocharged	24° BTDC	None

►*TIMING SETTING NOTE (EXCEPT TURBOCHARGED):* Set timing with engine running at idle speed and with distributor vacuum line disconnected.



►*TIMING SETTING CAUTION (TURBOCHARGED):* Set timing with engine running at correct idle speed. Unnecessary to disconnect spark retard hose. *DO NOT s t timing mor than 24° under any circumstances or s v r ngine damage will result.*

Timing Mark - "0", "4", "8", and "16" marks on timing tab and a notch on crankshaft pulley. Align notch on pulley with correct mark on timing tab.



CARBURETOR

►*CARBURETOR APPLICATION: Two Rochester Model "H" singl barr l carbur tors used on all models ex- c pt Turb charged Engine. One Carter "YH" used on Turb charg d Engine.*

CONTINUED ON NEXT PAGE

MONZA SPYDER ENGINE WARNING SYSTEM

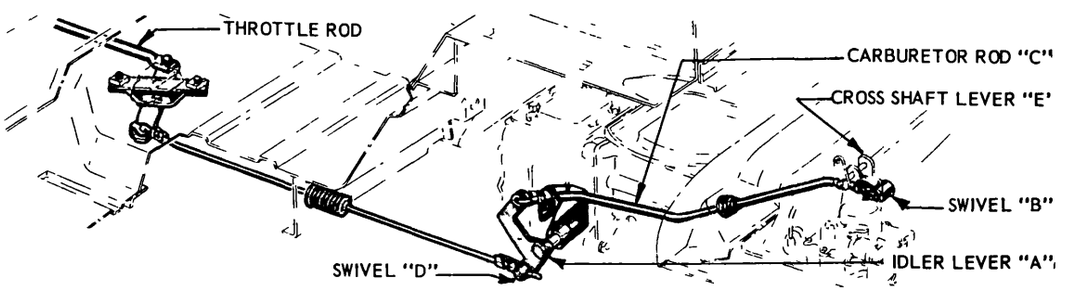
CONTINUED FROM PRECEDING PAGE

PASSENGER CARS (EXCEPT TURBOCHARGED ENGINE)

ACCELERATOR CONTROL LINKAGE ADJUSTMENT: Remove mudguard over idler lever "A" (see illustration) on transmission, then disconnect swivel "D" from lever "A". Disconnect swivel "B" from left carburetor cross shaft lever "E". Pull rod "C" to wide open throttle (through detent for Powerglide and against stop for standard transmission) and turn lever "E" to wide open throttle position (carburetor throttle lever against the stop). Adjust swivel "B" to align with hole in lever "E", then lengthen rod "C" by backing off swivel **five full turns.** Position accelerator pedal by placing a block of wood 1" thick (Synchro-mesh), 1¼" thick (Powerglide) between pedal and floor mat. Hold lever "A" in wide open throttle position (through detent for Powerglide) and turn swivel "D" to align with hole in lever "A". Install mudguard. *NOTE - This complete procedure provides proper clearance between accelerator pedal and floor mat at wide open throttle.*

►*ADJUSTMENT NOTE: After above adjustment completed, proceed with carburetor synchronization, idle speed and mixture, and other adjustments as listed under "Rochester Model H" below.*

CORVAIR "95" TRUCKS



ACCELERATOR CONTROL LINKAGE ADJUSTMENT (ALL MODELS): *Make Carburetor Cross Shaft Linkage Adjustment as detailed under "Rochester Model H" b low, then proceed as follows:* Place a 3/4" spacer between floor mat and upper end of accelerator pedal and block pedal against spacer. Rotate carburetor cross shaft lever for wide open throttle position, then unsnap accelerator cable adjustment rod clip and rotate adjusting rod to remove all slack from cable. Install clip. Return accelerator pedal and carburetor cross shaft to idle position and disconnect return spring from accelerator pedal lever. Clearance between accelerator lever and cable shield with lever arm held up to remove freeplay should be 1/8". Adjust by moving shield in desired direction, then tighten mounting screws. Install pedal return spring (cable shield should now act as a pedal lever stop). *NOTE - Cable in engine compartment should now have some slack at idle to allow engine to r turn to idle speed.*

►*ADJUSTMENT NOTE: On Powerglide models, proceed with "Throttle Valve Linkage Adjustment" below. On Synchro-mesh models, proceed with idle speed and mixture and other adjustments as detailed under "Rochster Model H" below.*

THROTTLE VALVE LINKAGE ADJUSTMENT: After accelerator control linkage adjustment correctly made (see above), disconnect throttle valve rod at carburetor cross shaft lever and rotate cross shaft to wide open throttle position. Pull throttle valve rod so throttle valve is through the detent and adjust swivel on rod to just enter hole in cross shaft lever, then lengthen rod **5 full turns** and connect to lever. *Proceed with idle speed and mixture, and other adjustments as detailed under "Rochester Model H" below.*

ROCHESTER MODEL "H"

Applicati n	Carbur tor N .
Synchro-mesh	7020101
Powerglide	7020100

POWERGLIDE THROTTLE LINKAGE

Single barrel, downdraft type similar in design to previous models. Two carburetors used, one on each intake manifold. Each carburetor has an automatic choke mechanism consisting of a vacuum diaphragm (to replace conventional vacuum piston) which is attached to float bowl cover and linked to choke pivot shaft. Choke valve plate is linked to a bi-metal coil thermostat attached to a flat milled surface on bottom of each cylinder head. Vacuum for diaphragm operation is received from base of carburetor through an external rubber hose.

►*ADJUSTMENT CAUTION: Make accelerator and throttle valve linkage adjustments (see above), then make following adjustments exactly in the order listed.*

Carburetor Synchroni zation (Cross Shaft Adjustment): Make following adjustments on each carburetor in sequence with both throttle rods disconnected at cross shaft, choke control rods disconnected at choke levers, and engine off: Back off idle speed screw from throttle lever and open choke valve so throttle lever does not ride fast idle cam. Insert a .003" feeler gauge between idle speed screw and throttle lever, turn screw in until it just contacts gauge, and then 1½ additional turns to set throttle valve. Turn idle mixture screw out 1½ turns from a lightly seated position. Connect right carburetor throttle rod to cross shaft lever. On left carburetor, rotate cross shaft (with accelerator rod) so right carburetor throttle valve is completely closed. Adjust throttle rod in swivel so rod freely enters hole on cross shaft lever, **then shorten rod 1 full turn** and connect to lever. *NOTE - It may be necessary to hold choke valve open so fast idle cam is clear of throttle lever.*

Preliminary Idle Mixture & Speed Adjustment: Bring engine to normal operating temperature, make sure ignition timing is correct, connect a vacuum gauge to adapter on vacuum balance tube, and a tachometer to engine. Adjust idle speed screw on each carburetor as close to 500 RPM (Powerglide in "D"), 600 RPM (Hi Perf. Engine with Synchro-mesh) as possible. Adjust idle mixture screws for highest steady vacuum. *NOTE - On Air Conditioned Cars, set idle speed at 550 RPM with Auto. Trans. in "D" and with a compressor head pressure of 300 lbs. (air conditioning on).*

Vacuum Balance Check: Remove choke diaphragm hose from each carburetor base adapter and connect equally calibrated vacuum gauges to each adapter. *CAUTION - Do n t turn tubing in carburetor body.* With engine running at idle speed, note difference in vacuum at each carburetor. If difference 1" or less, carburetors are synchronized. If difference more than 1", adjust left carburetor throttle rod 1 turn (up to increase left carburetor vacuum down to decrease vacuum). *Adjust by disconnecting rod at cross shaft and r tating in swiv l. NOTE - Higher vacuum reading pr ferr d on right carburetor (spark advance side). CAUTION - Mov cr ss shaft by grasping accelerator r d only or g ometry and synchronization will be ups t.* Remove gauges and replace choke diaphragm hoses.

Final Idle Mixture & Speed Adjustment: *Mak sur air cleaners are installed.* Connect vacuum gauge to vacuum balance tube adapter and adjust idle speed and mixture screws on each carburetor for highest steady vacuum reading between 14-18".

Fast Idle: *Make this adjustm nt aft r idl sp d correctly set.* Stop engine and place throttle lever on second highest step of fast idle cam. Bend tang on throttle lever to obtain .078" clearance between idle speed screw and throttle lever. Recheck idle speed.

Choke Vacuum Diaphragm: With diaphragm arm squarely against diaphragm, clearance between lower edge of choke valve and wall of air horn should be .145-.170". Disconnect and bend diaphragm link to adjust. *NOTE - Throttle lever fast idle tang sh uld r st n s c nd highest step of fast idle cam. B nd ut r ch k shaft lever tang to adjust.*

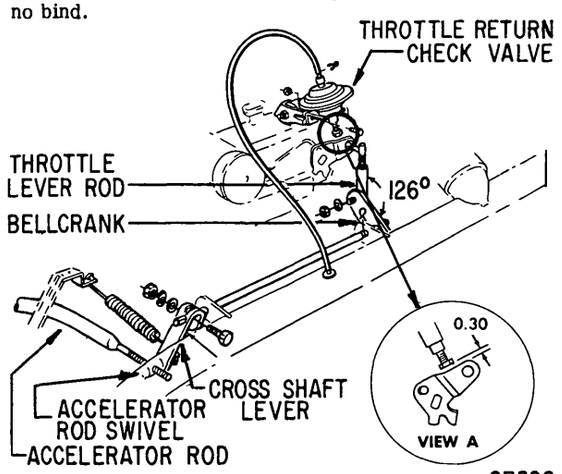
Choke Rod Adjustment: Stop engine and disconnect choke control rod at choke shaft lever. With choke valve held closed, pull control rod up against stop in thermostat bracket and adjust control rod until it freely enters hole in choke shaft lever. *CAUTION - Turn rod in vertical portion only, do not crank at ffset part.* Check choke position after engine at operating temperature. Choke valve should be open and fast idle cam clear of throttle lever.

Unloader: Clearance between choke valve lower edge and wall of air horn with throttle valve in wide open position should be .250". To adjust, bend tang on throttle lever.

Float Level: 1 13/64" (Gauge BT-174 or J-9577) with air horn inverted and gasket in place. Gauge must be centered in air horn bore, front and rear upper surfaces of float must touch gauge, and floats must be parallel to air horn. To adjust, bend float tang.

Float Drop: 1¾" from gasket surface to bottom of float with air horn upright and float hanging freely. To adjust, bend float tang.

►*OTHER DATA: S "Roch st r H Corvair Carbur tors" in Carbur tion S ction.*



CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

TURBOCHARGED ENGINES

ACCELERATOR LINKAGE ADJUSTMENT: With engine at normal operating temperature (or with air cleaner removed to block choke valve open), proceed as follows: Disconnect accelerator rod swivel from cross shaft lever and make sure throttle lever is against idle speed screw. Angle between throttle lever rod and bellcrank should be 126°. Adjust by changing length of throttle lever rod. Pull accelerator rod rearward against bellcrank stop on transmission, then rotate cross shaft lever to full throttle position (carburetor throttle lever against stop boss on flange). Adjust accelerator rod swivel so it just enters hole in cross shaft lever, then connect swivel to lever and install retaining clips. *NOTE - Swivel pin should be just short of cross shaft lever hole rather than just past, or linkage may be bent.* Move linkage from idle to full throttle and check that carburetor throttle lever operates correctly with no bind.

MONZA SPYDER ACCELERATOR LINKAGE

CARTER YH

Carter YH, N. 3311S. Single barrel, side draft (horizontal) type used with exhaust driven supercharger. Automatic choke and throttle return check are used.

Idle Setting: Initial setting ¾-turn out from lightly seated position. With engine at normal operating temperature (tachometer and vacuum gauge connected), proceed as follows:

Idle Speed: 850 RPM with choke valve fully open and fast idle inoperative.

Idle Mixture: With engine operative at correct idle speed, adjust idle mixture screw to obtain highest vacuum. Readjust idle speed and repeat idle mixture adjustment.

Throttle Return Check: With engine at normal operating temperature and with idle mixture and speed correctly set (choke valve fully open and fast idle not operating), measure distance between throttle valve lever and return check valve bolt. Distance should be .030". To adjust, hold a wrench on flat of diaphragm stem and turn selflocking nut as necessary.

Float Level: 5/8" (Gauge J-21056). Invert bowl cover and measure distance between float at center and gasket surface of bowl cover (gasket removed). Adjust by bending float arm.

Float Drop: 2 3/8". Hold bowl cover in upright position and let float hang freely. Measure distance between gasket surface (gasket removed) and float seam at free end of float. Adjust by bending tang at hinge end of float.

Automatic Choke Setting: 1 notch rich.

Fast Idle: No adjustment on engine.

Accelerator Linkage Adjustment: *See above.*

►*OTHER DATA: See "Carter YH Carburetors" in Carburetion Section.*

SUPERCHARGER

Exhaust driven turbine and a centrifugal impeller used with a single horizontal type carburetor mounted directly on supercharger unit.

►*OTHER DATA: See "Corvair Supercharger" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC No. 4886. Fuel only.
Fuel Pump Pressure - 4-5 lbs. at idle to 1000 RPM.

Gasoline Gauge: AC Electric type.
Dash Unit - AC No. 5643032 (Pass. Except Turbocharged), No. 5644251 (Pass. Turbocharged), No. 5643525 (Trucks).
Tank Unit - AC No. 5641645 (Pass.), No. 5641632 (Trucks).

Fuel Filter: Except Turbocharged - In carburetor fuel inlet. Replace if dirty, plugged, or if carburetor floods.
Turbocharged - In carburetor inlet line mounted on air cleaner support bracket. Replace every 10,000 miles.

Air Cleaner: Oil wetted plastic foam type. Clean and reoil every 2000 miles or sooner under severe dust conditioning.

►*PLASTIC ELEMENT CLEANING CAUTION:* Remove element carefully from wire mesh support and wash in solvent. Squeeze element (do not wring) to remove all solvent and reoil with 10W-30 engine oil.

BATTERY

Delco No. 557 (Dry Type). 12 volt, 9 plate, 42 ampere hour capacity (20 hour rate).
Battery Ground - Negative, to body and generator.
Engine Ground - Left and right sides of engine to body.

STARTER

Delco-Remy No. 1108306 (Synchro-mesh), No. 1108307 (Powerglide).
Armature - Delco-Remy No. 1946226 (All).
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

Ⓒ - Includes Solenoid.

Starting Switch: Delco-Remy Solenoid No. 1119910 mounted on starter and controlled by Ignition & Starter Switch, Delco-Remy No. 1116569.

Neutral Safety Switch: Delco-Remy No. 1998717. Combination neutral safety and back-up light switch.
Adjustment - *See "Corvair Transaxle" in Transmission Section.*

Starter Removal: *See "Electrical Notes" in Corvair Special Data.*

GENERATOR

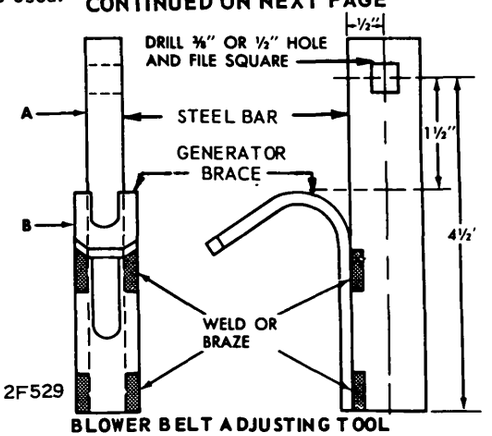
Delco-Remy. Used as follows:

Application	Generator No.	Armature No.
Coupes & Sedans	1102226	1952301
Station Wgn. & Corvair "95"	1102227	1952301
Optional	1105135	1950521
Optional	1105139	

Performance Data

Generator	Amperes	Volts	Gen. RPM
1102226 & 227	30	14.0	2240
1105135	35	14.0	1730
1105139	40	14.0	1930

Rotation - Clockwise at commutator end.
Brush Spring Tension - 28 ozs.
Field Current - 1.69-1.79 amps. (1102226 & 227), 2.73-3.0 amps. (1105135 & 139) at 12.0 volts and 80°F.



Blower Belt Adjustment: *NOTE - New belt is one installed for less than 1000 miles. Used belt is one installed for more than 1000 miles. Use either of two methods listed below for belt adjustment.*

Strand Tension Gauge Method - Use a variable reading strand tension gauge and adjust idler pulley to obtain 70 lbs. strand tension on **new** belt, or 50 lbs. strand tension on **used** belt.

Special Torque Tool Method - *Refer to "Tool Fabrication Note" and illustration below.* Place slot of hooked end of tool over reinforcing rib of pulley bracket with shank end of tool toward rear of car (relative to idler pulley installed position). Loosen idler pulley attaching bolt. Insert torque wrench into tool shank and pull wrench to rear of car to apply 20 lbs. torque for **new** belt, or 15 lbs. torque for **used** belt. Tighten the pulley attaching bolt and nut while holding tension load. *CAUTION - DO NOT allow torque to exceed specifications even momentarily. Any slight variation in tension will result in an excessively tight belt. If specifications are exceeded, complete readjustment is necessary.*

►*TOOL FABRICATION NOTE:* Make tool shown in illustration from a steel bar ¼" thick, ¾" wide, and 5" long; and the slotted end of a generator brace, Part No. 3836330 or 3739845. Hook has a developed length of 5". *CAUTION - Hold dimensions shown in illustration to plus or minus 1/16" to assure correct tension when tool is used.*

CONTINUED ON NEXT PAGE

BLOWER BELT ADJUSTING TOOL

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*NEW BLOWER BELT INSTALLATION NOTE:* When a new belt is installed, adjust tension as for new belt (see above), then operate engine at 1500 RPM for a minute or two to seat belt, then readjust tension (new belt specifications). *NOTE - This procedure supersedes previous recommendations.*

Air Conditioning Compressor Belt Adjustment: ½-¾" deflection midway between compressor and crankshaft pulleys under a 15 lb. load.

►*GENERATOR PULLEY INSTALLATION CAUTION:* Pulley nut has **left-hand threads.** DO NOT attempt to turn nut in opposite direction nor install a right-hand thread nut as severe damage to armature will result.

Generator Installation: *See "Electrical Notes" in Corvair Special Data.*

REGULATOR

Delco-Remy. Used as follows:

Regulator	Generator
1119001	1102226 & 227
1119604 & 635 Ⓒ	1105135
1119610 & 654 Ⓒ	1105139

Ⓒ - "Double Contact" type.

Cutout Relay

Cuts In - 11.8-13.5 volts (1119001), 11.8-13.0 volts (1119604,610,635 & 654)

Contact Gap - .020".

Air Gap - .020" (1119604 & 610), .023" (1119635 & 654) with contacts just closed.

Voltage Regulator

Setting - 13.8-14.7 volts (1119001), 13.8-14.6 volts (1119604,610,635, & 654) at 125°F ambient temperature. *NOTE* - On "Double Contact" regulator, .1-.3 volt lower when operating on lower contacts.

Contact Gap (1119604,610,635 & 654) - .016" (upper contacts) with lower contacts just touching.

Air Gap - .075" (1119001), .067" (1119604,610,635 & 654) with armature pressed down to point where contacts just touch.

Current Regulator

Setting - 27.0-31.0 amps. (1119001), 31.0-35.5 amps. (1119635 & 604), 36.0-40.5 amps. (1119654 & 610) at 125°F ambient temperature.

Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-Remy 1119000 Series (Single Contact) Regulators" and "Delco-Remy 1119600 Series (Double Contact) Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlights: 4-Headlight System.

Stop Light Switch Location: Under instrument panel.

Adjustment - Adjust switch in mounting bracket so electrical contact is made when brake pedal depressed ½-¾" from fully released position.

Lighting Switch Removal: Disconnect battery ground cable and pull switch to ON position. Depress switch shaft retaining button (top of switch under instrument panel) and remove shaft and knob. Remove switch retaining ferrule and bezel and remove switch.

Ignition Switch Removal: With negative cable disconnected at battery, position ignition switch in "Lock" and insert a wire in small hole in cylinder face. Depress plunger with wire and continue to turn key counterclockwise until cylinder can be removed. Use a spanner wrench (Tool J-7607 or J-5893, with inside of tangs filed off), and remove attaching nut, then remove switch. To remove "theft resistant" connector, use a piece of heavy wire stock and press on lock clip in slot in connector. Hold wire in place and work connector away from switch.

Instrument Cluster Removal (Pass. Cars): Disconnect battery ground cable and disconnect connectors from back of cluster. Pull wiring harness out of retaining clips on cluster. Disconnect speedometer cable. Remove lighting switch (see above). Remove cigar lighter attaching nut from behind panel and remove lighter. Lower mast jacket and steering wheel or remove steering wheel (see Steering Section). Remove instrument panel-to-cluster attaching screws and remove cluster, instrument center panel and seal by pulling straight out and turning slightly to clear transmission range selector. *NOTE - Individual bulb sockets and fuel gauge may be removed without removing cluster.*

Instrument Cluster Removal (Greenbrier & Trucks): Disconnect battery ground cable. On Powerglide trucks, remove "C" clip holding transmission cable assembly to transmission control assembly. Remove cable assembly attaching nut from control support arm. Move selector lever to "Low". On all trucks, remove speedometer cable and cluster attaching screws. Remove cluster from instrument panel, disconnect cluster wiring and remove from truck. *NOTE* - When installing, Powerglide selector lever must be in full DOWN position.

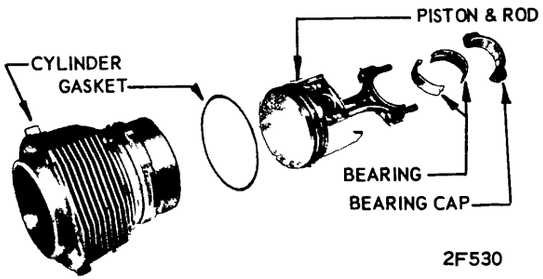
CIRCUIT BREAKER: 15 Ampere - Protects headlight circuit. Integral with lighting switch.

14 Ampere - Two-speed windshield wiper.

FUSES: *Fuses are located in junction block beneath dash panel.*

3AG/AGC 20 Ampere - Gasoline Heater.
3AG/AGC 20 Ampere - Back-up Light & Heater.
3AG/AGC 20 Ampere - Single speed Windshield Wiper.
3AG/AGC 10 Ampere - Glove Box Light & Heater Blower.
3AG/AGC 10 Ampere - Tail, Stop, Direction Signals, Dome, License lights & Cigar Lighter.
3AG/AGC 4 Ampere - Radio.
3AG/AGC 3 Ampere - Instrument Panel & Control lights.

ENGINE



►*ALUMINUM THREAD REPAIR NOTE: A thread repair kit, Part No. 3780960, is available for repairing stripped or damaged threads in aluminum parts.*

►*ANTI-SEIZE COMPOUND NOTE: Permatex No. 404 Anti-Seize Compound (or equivalent) must be used on threads of all bolts, studs or capscrews entering an aluminum part to prevent thread seize and damage.*

ENGINE SPECIFICATIONS: Own. 6 Cyl., horizontally opposed, overhead valve, air-cooled aluminum engine of same design used previously.

►*ENGINE APPLICATION & IDENTIFICATION: See "Engine Application & Identification Note" at beginning of Corvair Data Pages.*

►*TURBOCHARGED ENGINE NOTE & CAUTION:* This engine uses different cylinder heads and crankcase cover vent baffle plates, and heavy duty main and connecting rod bearings, connecting rods, piston rings,

CORVAIR CYLINDER ASSEMBLY

and crankshaft. *DO NOT install supercharger from this engine on any other engine.*

Bore	Stroke	Displacement	Rated HP
3.4375	2.60"	145 cu. ins.	28.4

Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Power Train" in Corvair Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Corvair Special Data.*

ENGINE MOUNTS: *See "Engine Service" in Corvair Special Data.*

CRANKCASE COVER, BLOWER & BLOWER BEARING: *See "Engine Service" in Corvair Special Data.*

OIL COOLER: *See "Engine Service" in Corvair Special Data.*

CYLINDER HEAD: *See "Engine Service" in Corvair Special Data.*

EXHAUST MANIFOLD: *See "Engine Service" in Corvair Special Data.*

CRANKCASE & CYLINDER HEAD STUDS: *See "Engine Service" in Corvair Special Data.*

OIL PAN REMOVAL: Drain crankcase and remove oil pan retaining bolts. Remove pan.

CYLINDER

Individual cast iron type with integral cooling fins. Replacement cylinders are furnished only as an assembly with piston and pin.

Bore - 3.4370-3.4400". Maximum wear limit .005".

Removal - *See "Engine Service" in Corvair Special Data.*

PISTONS

Aluminum alloy, tin plated, slipper type skirt with steel strut. Piston pin is offset toward major thrust side.

Removal - Piston and rod removed as an assembly with cylinder. *See "Engine Service" in Corvair Special Data.*

Clearance - .0011-.0015" measured 2.20" from top of cylinder bores.

Installing Pistons: Install piston with notch on top of piston toward front (flywheel end) of engine on both banks.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Replacement Pistons: Standard size only. Piston, pin, and cylinder are furnished as a complete assembly.

PISTON PIN

Pin is press fit in connecting rod.
Diameter - .7999-.8002". **Length** - 2.630-2.650".
Pin Fit In Piston - .00015-.00025". Pin should support its own weight in either pin boss when coated with light engine oil and at 60°F. *Higher or lower temperatur will give fals int rpr tations.*
Pin Fit in Connecting Rod - Press fit. *See "Engine Service" in Corvair Special Data.*

Replacement Pins: Standard size only furnished in assembly with piston and cylinder.

PISTON RINGS

Compression rings are cast alloy iron with wear resistant coating. Oil ring is a single piece, uncoated, with a slotted expander. *NOTE - Upper compression ring on Turbocharged Engine is chrome plated.*

Ring	Width	End Gap	Side Clearance
Compr. (1 & 2)	.0770-.0780"	.010-.020"	.0012-.0032"
Oil (3)	.1860-.1865"	.010-.020"	.002-.0035"

Installing Rings - Install rings with identification marks and inside bevel **away from** top of piston.
Replacement Rings: Furnished Standard size only.

CONNECTING ROD

Length - 4.719-4.721" center-to-center.
Journal Diameter - 1.799-1.800".
Lower Bearing - Replaceable precision type.
Clearance - .0007-.0027".
Sidplay - .005-.010".
Bearing Replacement: Furnished Std., .001", .002", .010", & .020" Undersize, To replace bearings, *see "Engine Service" in Corvair Special Data.*
Installing Rods: No squirt hole. Install in either direction.

CRANKCASE

Cast aluminum alloy, vertically divided into two halves held together at parting line by bolts. Studs for mounting cylinders, cylinder heads, rocker arms, and rear housing are mounted in each half and are replaceable. Crankcase must be separated for service on either crankshaft or camshaft.
Crankcase Separation: Crankcase can be separated after removal of cylinder heads, cylinders, rear housing, and clutch housing. *See "Engine Service" in Corvair Special Data.*
Stud Replacement: *See "Engine Service" in Corvair Special Data.*

CRANKSHAFT

Journal Diameter - 2.0978-2.0998" (No. 1 & 2), 2.0983-2.0993" (No. 3 & 4).
Bearings - Steel backed babbitt precision type. No adjustment.
Clearance - .0012-.0027" (No. 1 & 2), .0007-.0022" (No. 3 & 4).

Replacement Bearings: Furnished Std., .001", .002", .010", & .020" Undersize. Also No. 1 bearing furnished .003" Undersize. To replace bearings, crankcase must be separated. *See "Engine Service" in Corvair Special Data.*

►*NO. 4 MAIN BEARING NON-INTERCHANGEABILITY CAUTION:* No. 4 bearing upper half is .0015" thicker and lower half .0015" thinner than corresponding bearing halves of No. 2 & 3 bearings to lower centerline of No. 4 bearing. No. 4 bearing halves have brown dye on edges for identification. DO NOT install a No. 4 bearing in No. 2 or 3 positions, nor a No. 2 or 3 bearing in No. 4 position.

End Thrust - Taken by flanged type No. 1 (rear) main bearing (at accessory drive end of engine). *NOTE - Left half of bearing only is flanged on later cars.*

Endplay - .002-.006".

Crankshaft Front & Rear Oil Seals: *See "Engine Service" in Corvair Special Data.*
Vibration Damper: None used.

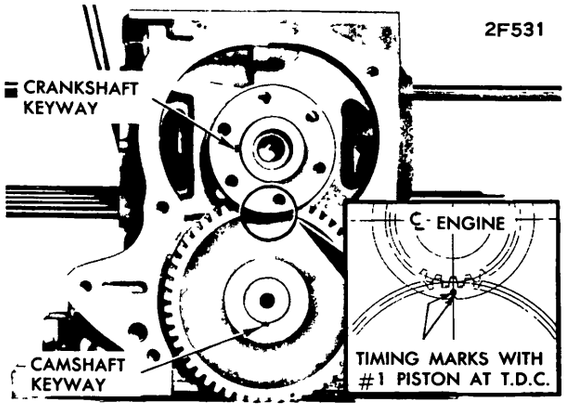
Crankshaft Drive Flange: Integral with steel timing gear. Pressed on crankshaft. *See "Engine Service" in Corvair Special Data.*

Crankshaft Pulley Removal: Unnecessary to remove power train. *See "Engine Service" in Corvair Special Data.*

CAMSHAFT

Alloy cast iron camshaft located below crankshaft on split line of engine. Camshaft journals ride directly on machined base metal of crankcase and bearing inserts are not used. Exhaust valve lobes are twice the width of intake lobes and actuate a pair of exhaust valve lifters.

►*CAMSHAFT USAGE NOTE:* Two camshafts used as follows: **No. 3777255** - Used on Monza with Powerglide and Air Conditioning, and High Performance and Turbocharged Engines. **No. 3779332** - Used on all other engines. *DO NOT interchange camshafts.*



Journal Diameter - 1.4395-1.4405" (front), 1.1995-1.2005" (all others).
Clearance - .0015-.0035" (new), .002-.004" (used). *NOTE - If beyond the above limits, replace either crankcase or camshaft.*

End Thrust: Controlled by thrust washer located between camshaft gear and front bearing.
Endplay - .002-.007".

Camshaft Removal: Crankcase must be separated. *See "Engine Service" in Corvair Special Data.*

Timing Gear: Aluminum, with steel crankshaft gear, pressed on camshaft. Replace gears in matched sets only. To remove gear, remove camshaft and *see "Engine Service" in Corvair Special Data.*
Backlash - .002-.004".

Camshaft Setting: Align notch in crankshaft gear flange with mark in camshaft gear adjacent to each other across shaft centers. Notches can be aligned only when crankcase reassembled. *See "Engine Service" in Corvair Special Data.*

CORVAIR VALVE TIMING MARKS

VALVES

Valve	Head Diam.	① Stem Diam.	Length
Intake	1.335-1.345"	.3415-.3422"	4.489-4.509"
Exhaust	1.235-1.245"	② .3410-.3417"	4.494-4.514"

Valve	Seat Angle	⑦ Lift	Stem Clearance
Intake	45° ③	④ .314"	⑤ .0010-.0027"
Exhaust	45° ③	④ .344"	⑥ .0014-.0029"

① - Standard. Also furnished .003" & .010" Oversize (Intake), .003", .010", .020" Oversize (Exhaust).
② - Top of stem. .3400-.3407" at bottom of stem. *Note - Valve stems are tapered .001".*
③ - Valve Face Angle 44° (Except Turbocharged), 45° (Turbocharged).
④ - .378" Intake & Exhaust on Camshaft No. 3777255.
⑤ - Wear limit .004". ⑥ - Wear limit .006".
⑦ - Cam Lobe Lift .209" Intake, .229" Exhaust (Camshaft No. 3779332); .252" Intake & Exhaust (Camshaft No. 3777255).
Valve Seat Width - 1/32-3/32" Intake, 1/16-1/8" Exhaust.
Valve Seat Inserts: Steel, not replaceable.
Valve Guides: Pressed into cylinder head. Not replaceable. Guides may be reamed for oversize valve stems if valve clearance excessive. Intake valves furnished with .003" & .010" oversize stems; exhaust valves furnished with .003", .010" & .020" oversize stems. Use Reamer Set J-5830.
Valve Springs: Spring must be installed with a hardened shim (minimum .020" - furnished .030") under it to protect aluminum head.
Free Length - 1.74" (Std. 8.0-1), 2.08" (Std. 9.0-1, Hi Perf. & Turbocharged).

Spring Specifications - Std. (8.0-1)

Valve	Lbs. Pressure	Length
Closed	58-64	1.508"
Open	141-149	1.148"

Spring Specifications (Std. 9.0-1, Hi Perf., Turbocharged)

Valve	Lbs. Pressure	Length
Closed	69-79	1.696"
Open	159-169	1.306"

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*VALVE SPRING INSTALLED HEIGHT CAUTION:* Check installed height of valve spring after grinding valves by measuring distance from spring seat on cylinder head to top of valve spring. If this dimension exceeds "Preferred Height" listed in table below, install additional 1/32" shim, Part No. 6255818 (Std. 8.0-1), No. 3781876 (All Others), under valve spring to bring height within limits. *CAUTION - Do not add shims to bring height to less than "Minimum Height" below.*

Valve Spring Height Specifications

Engine	Valve	Preferred Height	Min. Height
Std. (8.0-1)	Intake	1 15/32"	1 7/16"
	Exhaust	1 1/2"	1 15/16"
All Others	Intake	1 11/16"	1 21/32"
	Exhaust	1 11/16"	1 21/32"

Pushrods: Externally mounted type between cylinder head and crankcase and enclosed in drain tubes. For servicing, see *"Engine Service" in Corvair Special Data.*

Hydraulic Lifter Adjustment - *See "Engine Service" in Corvair Special Data.*

Rocker Arms: Mounted individually on cylinder-cylinder head studs.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications
(Camshaft No. 3779332)

Intake Valves - Open 43° BTDC. Close 93° ALDC.
Exhaust Valves - Open 87° BLDC. Close 69° ATDC.

(Camshaft No. 3777255)

Intake Valves - Open 54° BTDC. Close 118° ALDC.
Exhaust Valves - Open 95° BLDC. Close 78° ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Corvair Special Data.*

Crankcase Capacity: 4 quarts refill, 4½ quarts with filter change.

Normal Oil Pressure: 35 lbs. at 2000 RPM.

Pressure Relief Valve - In engine rear housing. Not adjustable.

Oil Filter: Full flow type. Replace element every 4000 miles. Use a new seal and tighten center bolt to 20-25 ft. lbs.

Replacement Filter Element - AC No. PF-4.

►*AIR CONDITIONED CAR OIL FILTER REPLACEMENT NOTE:* To prevent oil spilling into engine compartment when changing filter, remove both filter and adapter as as a unit and separate filter from adapter at the bench.

Oil Pump: Gear type pump located in engine rear housing and driven by distributor shaft.

Pump Overhaul - *See "Oiling System" in Corvair Special Data.*

Oil Cooler: Located at rear of engine left side shield. Clean every 5000 miles by removing access cover and removing dirt, twigs, etc.

Crankcase Ventilation: Standard - Air intake through oil filler cap and outlet pipe from top of crankcase cover and down on right side of engine.

Positive - Two types used. *See "Positive Crankcase Ventilation" under TUNE-UP above.*

ENGINE COOLING SYSTEM

Air cooled by blower mounted on top of engine. Engine temperature regulated by a bellows type thermostat filled with butyl alcohol in each lower shroud exhaust duct. Each thermostat operates a damper door at rear of each lower exhaust duct. Exhaust damper doors restrict blower air exhaust until engine reaches operating temperature. *NOTE - If thermostat fails, damper doors will remain open.*

Thermostat: Chevrolet No. 3152003 (Std.), No. 3153516 (Air Cond.), No. 3156432 (Turbocharged). Standard thermostats start to open damper doors at 200-210°F and doors are fully open at 225-230°F. If thermostats fail, atmospheric pressure causes damper doors to remain open.

Exhaust Damper Door Adjustment: *Make this adjustment whenever a new thermostat is installed.* With exhaust damper door fully open, pull thermostat actuating rod out to maximum travel (thermostat against bellows stop). There should be 2 3/8" opening from top of damper door to top of opening (exhaust duct top edge). Adjust by turning swivel on actuating rod until it enters damper door, then install retaining clip.

ENGINE WARNING SYSTEM

ALL MODELS (EXCEPT TURBOCHARGED ENGINES):

Oil Pressure-Temperature Indicator - Light on instrument panel comes on when ignition switch turned on but goes off during normal engine operation. If oil pressure is low, or if cylinder head temperature reaches 450°F, light will come on. Light controlled by an oil pressure switch and a disc type temperature switch on underside of right cylinder head near No. 3 cylinder as follows:

Oil Pressure & Temperature Switches

Model	Oil Switch No.	Temperature Switch No.
Standard	3818783	1993533
Air Conditioned	3818783	1993574

►*OIL PRESSURE & TEMPERATURE SWITCHES INSTALLATION CAUTION:* Switches are grounded through threads of body. **Do not** coat threads with sealer or anti-seize compound. Torque oil pressure switch to 45-65 **inch-lbs.**, and temperature switch to 10-15 ft. lbs.

TURBOCHARGED ENGINES: Oil Pressure-Temperature Indicator - 1) Same system as for standard cars (see above) with Oil Pressure Switch No. 3818783, and Temperature Switch No. 1993599. 2) In addition to indicator light system, a temperature gauge, No. 6400538, is installed in instrument cluster and controlled by a sending unit, No. 1513431, in left cylinder head. A warning buzzer, No. 3815936, to indicate excessive engine temperature, is located under instrument panel. A silicon rectifier in wiring harness near warning buzzer allows light current to flow to ground through closed engine temperature switch (right head), but prevents oil pressure switch from completing buzzer circuit. *See "Monza Spyder Engine Warning System" supplementary wiring diagram for circuits.*

Manifold Pressure Gauge - A pressure gauge, calibrated in inches of mercury, located in instrument cluster and connected to intake manifold by a tube, indicates manifold pressure.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

88, SUPER 88 & 98

	Ft. Lbs.
Cylinder Head	60-80

ALUMINUM ENGINES SERVICE CAUTIONS

SERVICE PRECAUTIONS: *NOTE* - Extreme caution must be observed when working on aluminum engines to prevent damage by scratching, nicking, or scoring. Note the following:

1) Do not drop or slide machined surfaces on bench or floor.

2) Do not use gasket cement (Except as indicated under Cylinder Head Installation).

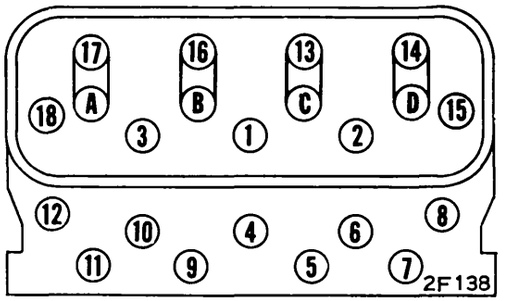
3) Lubricate all bolts or screws entering an aluminum part. See "Bolt Thread Lubrication Note" below.

4) Tighten bolts and nuts to the specified torque. DO NOT overtighten. Torque valves are for clean lubricated threads.

►*BOLT THREAD LUBRICATION NOTE:* Use engine oil or special thread lubricant on all threads entering an aluminum part.

DAMAGED OR WORN THREAD REPAIR (ALUMINUM BLOCK): "Heli-Coils" are available locally for repairing damaged or worn threads in aluminum. The repair consists of drilling out worn or damaged threads, tapping hole with special "Heli-Coil" tap, and installing a "Heli-Coil" insert in tapped hole. This brings hole back to original thread size. See following table.

"Heli-Coil" Thread Inserts



Thread Size	Insert Part No.	Drill Size	Special Tap Part No.	Inserting Tool No.
1/4"-20	1185-4	266"	.4 CPB	528-4N
5/16"-18	1185-5	332"	.5 CPB	528-5N
3/8-16	1185-6	397"	6 CPB	528-6N

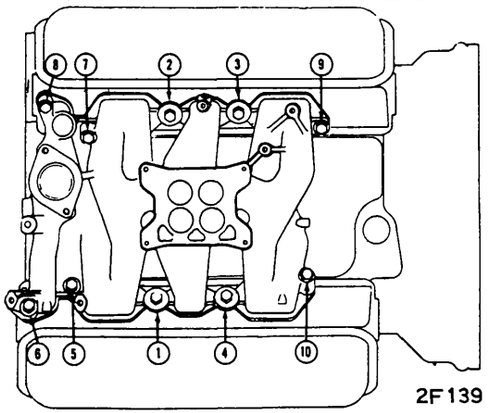
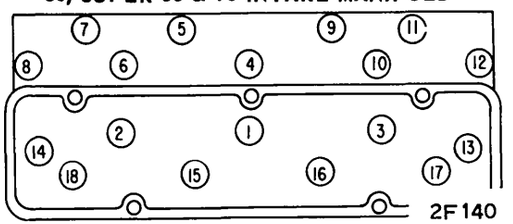
14 MM Long 513			137-11	542

CYLINDER HEAD & MANIFOLD



88, SUPER 88 & 98

CYLINDER HEAD: Removal - Drain cooling system, remove intake manifold and generator, then disconnect exhaust pipes. On right hand head, disconnect ventilator tube or hose from rocker arm cover. Remove cover. On Air Cond. Cars, remove compressor and generator bracket attaching bolts and tip compressor rearward to remove cover. On Power Steering Cars, remove pump mounting bracket bolts and move assembly to one side for access to left hand cover. Remove rocker arm shaft assembly. Disconnect ground strap and remove pushrods. *NOTE - Keep pushrods in order so they can be reinstalled in original positions.* Remove cylinder head bolts and remove head with exhaust manifold attached. **Installation** - Place guide studs J-3455 in bolt holes at each end of block. Apply P.O.B. No. 3 Gasket Sealer to both sides of gasket and place gasket over studs. Place cylinder head in position and apply C.P. Sealer to head bolts. Install center and lower row of bolts finger tight. Install pushrods and rocker arm shaft assemblies making sure pushrods are properly seated in rocker arms and lifters. Tighten rocker arm shaft bracket and cylinder head bolts in sequence shown in diagram to 14-22 ft. lbs. (lettered bolts), to 50-60 ft. lbs. (numbered bolts), then recheck all bolts to final specifications shown above. *NOTE - Complete installation using C.P. No. 9 Sealer on intake manifold bolts.*



INTAKE MANIFOLD: Removal - Drain radiator, disconnect upper radiator hose from water outlet. Remove air cleaner and disconnect spark plug wires and throttle linkage. Remove fuel and vacuum lines that interfere with manifold removal and disconnect primary coil wire and remove ignition wires from resistor. On power steering cars, disconnect power steering pump and bracket as an assembly. On air conditioned cars, remove external fuel filter. Disconnect generator, then remove attaching bolts and tip compressor and bracket rearward to obtain clearance for manifold removal. Remove intake manifold with coil and carburetor attached. Clean cylinder head and manifold machined surfaces.

88, SUPER 88 & 98 CYLINDER HEAD

88, SUPER 88 & 98 INTAKE MANIFOLD

OLDSMOBILE V8 F-85 CYLINDER HEAD

Installation - Reverse removal operations using new graphite coated metal gaskets. Apply Permatex No. 3 sealer or equivalent around gasket water holes. Dip manifold bolts in C.P. No. 9 sealer, install bolts and nuts and torque to specifications. Adjust power steering belt tension, adjust throttle linkage.

F-85 MODELS

►*ALUMINUM ENGINE CAUTION: Use care in handling all aluminum parts.*

CYLINDER HEAD: Removal - Drain radiator and cylinder block. Remove intake manifold (see below), then disconnect exhaust pipe. Disconnect spark plug wires and remove valve cover.

To remove right cylinder head, remove generator rear mounting bracket bolt. Remove ground straps at front and rear of cylinder head. If equipped with heater, remove all head bolts except rear rocker arm shaft bracket bolt. Then loosen rear rocker arm shaft bracket bolt

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

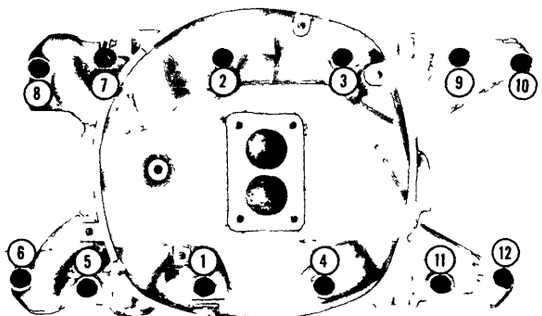
and raise shaft assembly from head and remove all pushrods except No. 16. Lift No. 16 to within 1" of blower case and tape to rocker shaft. Lift head, rocker shaft assembly, and exhaust manifold off dowel pins and remove as a unit by angling it forward to clear blower case.

To remove left cylinder head, remove power steering belt (if so equipped), then remove power steering pump bracket-to-cylinder head bolts. Remove rocker arm shaft assembly and push rods. Remove cylinder head bolts and cylinder head with exhaust manifold attached.

Installation - Head gaskets should be coated on both sides with POB No. 4 Sealer or equivalent. Likewise coat the cylinder head bolts and torque to specifications *(see diagram).*

F-85 MODELS

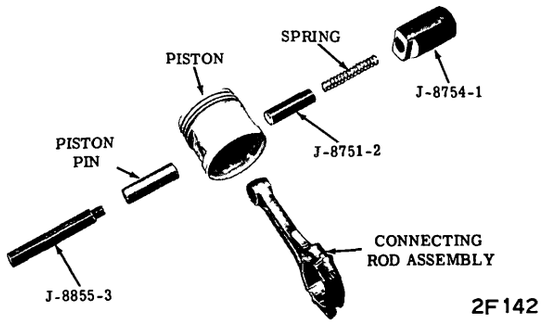
INTAKE MANIFOLD: Removal - Drain radiator and disconnect upper hose from outlet. Disconnect heater hose at rear of manifold. Disconnect spark plug wires and remove carburetor cover. Disconnect throttle linkage from accelerator bellcrank and then disconnect choke heat tube and lower throttle rod. Remove fuel and vacuum lines from carburetor. Disconnect primary wiring from coil and secondary lead. Disconnect temperature gauge wire. Slide thermostat bypass hose clamp back on hose at water pump. Remove intake manifold bolts, then remove manifold with coil and carburetor attached. Remove intake manifold gasket clamp bolts, clamps, seals, and gasket.



Installation - Reverse removal procedure and note the following. Coat either side of gasket with POB No. 3 and install. Install end seals and clamps then lubricate clamp bolts with engine oil and torque to 10-15 ft. lbs. *NOTE - When tightening clamp bolts, intake gasket must be positioned so manifold-to-head bolt holes will be open.* After positioning intake manifold on engine and connecting thermostatic bypass hose to water pump, coat intake manifold bolts with engine oil and install. Torque bolts alternately to specifications.

PISTON PINS

F-85 MODELS



Piston Pin Removal: Place piston on Tool No. J-8754-1 with letter "F" on piston facing up. Press pin out with Tool No. J-8855-3.

Installation - Place spring and guide stop Tool No. J-8751-2 in main body of Tool No. J-8754-1. Place

2F141

F-85 INTAKE MANIFOLD

2F142

F-85 PISTON PIN ASSEMBLY

piston on this tool with Letter "F" up. Place connecting rod in piston with identification mark **up** on right hand bank cylinders, with mark **down** on left bank cylinders. Coat pin with engine oil and press into piston and rod with Tool J-8855-3 until it contacts guide stop Tool J-8751-2 in Tool J-8754-1 to automatically center pin in piston. Pin-to-connecting rod fit is .0007-.0013" tight.

CRANKSHAFT & MAIN BEARINGS

►*F-85 CRANKSHAFT ASSEMBLY REPLACEMENT PARTS CAUTION & BALANCING NOTE:* Crankshaft, balancer, and flywheel are balanced individually in production and complete assembly is then balanced by installation of unstaked pins in holes provided around rim of flywheel and balancer. *NOTE* - Flywheel is balanced individually in production by installation of **staked** pins in above holes. When replacing balancer or flywheel, maintain crankshaft assembly balance by transfering balance pins (unstaked) to new unit as follows:

Balancer - If no pins used on old balancer, install new balancer as is. If balance pins are found on old balancer, transfer these pins (unstaked) to corresponding position on new balancer.

Flywheel - If no balance pins (unstaked) found on old flywheel, install new flywheel as is. If balance pins (unstaked) found on old flywheel, transfer pins to corresponding position on new flywheel. *NOTE - If* the presence of a staked pin on new flywheel prevents transfer of balance pin, place unstaked pin in nearest corresponding hole.

88, SUPER 88 & 98

REAR MAIN BEARING OIL SEAL: Asbestos covered wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove).

Oil Seal Installation - Crankshaft must be removed to replace upper half of seal. Place seal in groove in cap or block by hand, then drive tightly into groove by tapping Tool 23-18 with hammer. Seal is bottomed in cap or block when Tool 23-18 is seated in cap only and the undercut area of tool will pass over seal, when tool moved across cap or block. Hold Tool 23-18 tightly against seated seal and cut seal flush with parting line between upper and lower bearing. *NOTE* - Ends of seal must be cut clean (no frayed ends) and seal must entirely fill groove. After bearing cap installed, wipe DuPont Cement No. 5402 in grooves in block on both sides of bearing cap and press two cork seals into place in grooves.

F-85 MODELS

REAR MAIN BEARING OIL SEAL: Replacement - Oil pan and rear main bearing cap, insert and seals must be removed. Install seal into bearing cap, packing by hand. Using Installer Tool No. J-8807, hammer seal into place. To check if seal is fully seated, slide tool away from seal. With tool seated fully in bearing cap, slide tool against seal. If undercut area of tool slides over seal, seal is fully seated. Rotate tool before cutting off excess seal packing. Cut seal 1/16" from bearing surface. Taper end of seal into a point. With screwdriver, pack fibers toward center, away from edges. Rotate tool to cut seal between notch and handle. Install two side bearing cap seals, leaving seal extended on each side. Coat back of insert with light film of oil and install in bearing cap. Clean crankshaft bearing journal and seal contact. Install bearing cap guide pins. Install bearing cap into place by tapping with wood block. Remove guide pins. Apply lubricant Part No. 980131 to cap bolts then torque to specifications. Do not trim ends of side seals.

►*NOTE: Seal in block installed with crankshaft removed.*

ENGINE FRONT COVER

88, SUPER 88, & 98

ENGINE FRONT COVER: Removal - Drain cooling system and disconnect lower radiator hose and heater hose from front cover. Disconnect generator link at generator and remove front engine mount to crossmember nuts. Use Tool J-8568 to raise engine to clear bolts of crossmember, then insert wood block 8" x 2" x 4" between each exhaust manifold and upper control arm and allow engine to rest on 2 x 4's. Remove oil pan, radiator assembly, fan blades and pulley, then remove crankshaft pulley. Remove distributor cap and rotate engine until rotor points toward cowl, then remove fuel pump assembly. Remove front cover attaching bolts and front cover assembly.

Installation - Reverse removal procedures and tighten belts to gauge line on Tool 33-70. *NOTE* - Use a new front oil seal and coat fuel pump rocker arm pad with Special Seal Lubricant Part No. 567196. Front cover bolts should be dipped in P.O.B. No. 3 Sealer and torqued to specifications. Coat on side of fuel and vacuum pump gasket with gasket cement such as P.O.B. No. 4.

Engine Front Cover Oil Seal (Crankshaft Front Oil Seal) Replacement: *NOTE - Front cover oil seal can be replaced without removing radiator or crankshaft pulley key as follows:* Remove crankshaft pulley and thread Pilot Bolt J-7583-3 into crankshaft. Thread Tool J-7583-1 into oil seal and then tighten Forcing Screw J-7583-2 until seal is free from front cover. Remove seal from tool and pilot bolt from crankshaft.

Installation - *NOTE - Two types seal (½" & ¾" thick) used in production. Both seals can be installed with Seal Installer J-7584-1 and Adapter Ring J-7584-2 must be used with ¾" seal.* Coat outer diameter of seal with P.O.B. No. 3 sealer and lips of seal with Special Lubricant, Part No. 567196. Position seal in front cover. If ¾" seal used, place Adapter Ring J-7584-2 between Installer J-7584-1 and seal. Place Installer

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

over seal and thread Forcing Screw J-7584-3 into crankshaft until Installer contacts front cover. Remove tools and install pulley and belts.

F-85 MODELS

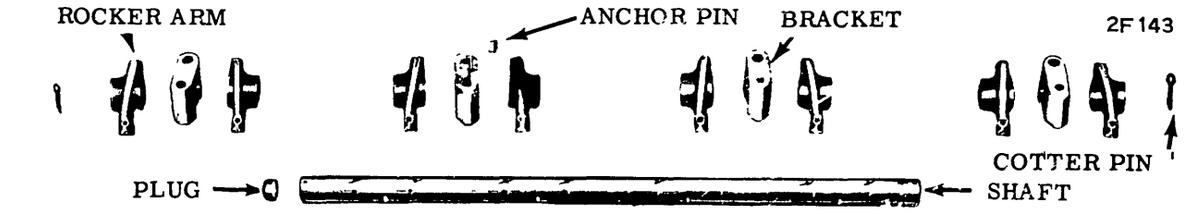
ENGINE FRONT COVER: Removal - Drain cooling system disconnect heater hose, bypass hose and radiator hoses and oil pressure switch wire. Remove crankshaft balancer, fan and pulleys, distributor cap, vacuum hose, generator and mounting bracket. Remove fuel pump and two front oil pan bolts. Remove cover bolts and remove cover.

Installation - *NOTE - Whenever front cover is removed, the oil pump cover must also be removed, and Petrolatum packed around pump gears. This will prevent loss of oil pump prime.* To install front cover, apply Permatex No. 2 to new gasket and place on block. Install front cover. Apply engine oil to bolts and torque evenly to specifications. Install balancer (see above). Connect oil pressure switch. Install generator, mounting bracket, and adjusting link. Install new fuel pump gasket using Permatex No. 2. Apply special seal lubricant on fuel pump arm. Torque to specifications. Connect other parts in reverse order of removal procedure.

Engine Front Cover Oil Seal (Crankshaft Front Oil Seal) Replacement: Remove front cover *(see above)*. Lay front cover flat on bench. Remove seal retainer with drift.

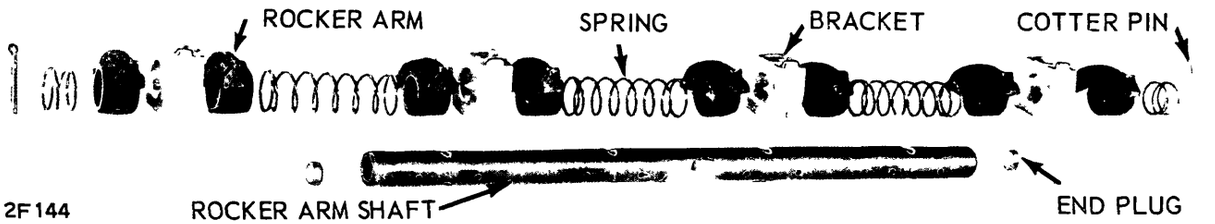
Installation - Assemble seal in retainer. Support front cover on wood block. Apply POB No. 4 sealer to outside of seal retainer. Place seal and retainer in cover with seal joint towards top of cover and install with Tool No. J-8753 until seated. Stake retainer securely. Place Tool No. J-8753-2 in seal and push tool, a little at a time, from both sides until tool goes through seal.

CAMSHAFT & BEARINGS



ALL MODELS

CAMSHAFT: Removal - Remove grille and radiator. Remove valve lifters as outlined in *HYDRAULIC LIFTERS* below. Remove distributor. Remove engine front cover as outlined in *ENGINE FRONT COVER* above. Remove camshaft assembly, fuel pump eccentric, camshaft sprocket and timing chain. Slide camshaft carefully out front of engine.



Installation - Coat camshaft liberally with engine oil mixed with GM Concentrate No. 582099. Reverse removal procedure being careful not to damage parts.

Camshaft Bearings Removal & Installation (88, SUPER 88, & 98): *NOTE - DO NOT replace bearings individually.* Use Tool Set No. J-4476 to replace bearings. DO NOT remove or disturb camshaft plug at rear of block.

Camshaft Bearings Removal & Installation (F-85): *NOTE - Bearings must be replaced in complete sets.* Remove bearings in numerical order. Drive them rearward out of their bores (exc. No. 5). To remove No. 5 bearing, drill a 3/16" hole in block (do not drill through the bearing) and with a small drift, dent the bearing enough to allow removal out front of bore. Install No. 5 bearing first (align all oil passages) then install other bearings opposite of removal sequence. Position bearings in block as follows: No. 5 bearing - 18 7/32", No. 4 - 13 13/32", No. 3 - 9 11/64", No. 2 - 4 15/16", No. 1 - 1/8", from front face of block.

88, SUPER 88 & 98 ROCKER ARM ASSEMBLY

F-85 ROCKER ARM ASSEMBLY

VALVE SYSTEM

ROCKER ARMS

ROCKER ARM SHAFT ASSEMBLY: 88, Super 88, & 98 - Removal - Remove rocker arm cover. *NOTE* - On Air Cond. Cars it will be necessary to remove compressor and generator bracket bolts and tip compressor rearward to remove R.H. cover. On Power Steering Cars, it will be necessary to remove pump mounting bracket bolts and move assembly to one side to remove L.H. cover. Remove rocker arm bracket bolts.

Disassembly - Remove cotter pins from ends of rocker shaft. Remove the brackets and the rocker arms from shaft. *NOTE* - One bracket is attached to shaft by anchor pin. When necessary to remove this bracket, insert drift through oil passage in bracket to drive out pin. If necessary to remove plug, punch hole in plug and pry plug from end of shaft.

Reassembly - Reverse disassembly procedure and note the following: Pinned bracket must have pin driven in flush with bracket. Rocker shaft plug must be driven in until outer shoulder is 9/32" into end of shaft.

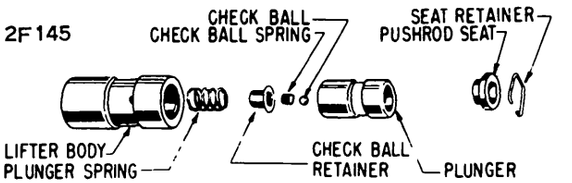
ROCKER ARM SHAFT ASSEMBLY: F-85 Models - Removal - Remove carburetor cover. Disconnect heat tube from carburetor and manifold on right side. Disconnect spark plug wires and valve cover-to-cylinder head screws and rotate cover off breather pipe and remove cover. Remove rocker arm shaft bracket-to-head bolts. Remove heater blower assembly to remove right rocker arm assembly.

Disassembly - Remove cotter pins from ends of shaft. *NOTE* - Disassemble one shaft assembly at a time and mark for correct reinstallation. Remove springs, arms, and brackets from shaft. If necessary to remove shaft end plug, punch hole in plug, then pry plug from shaft.

Reassembly - If shaft plug was removed, drive new plug in shaft to clear cotter pin hole. Lubricate frictional surfaces of rocker arms and shaft with engine oil and reverse removal procedure.

Installation - Reverse removal procedure and note the following: Coat bolt threads with POB No. 4 Sealer or equivalent and torque to 45-55 ft. lbs. Engage shaft with dowel.

HYDRAULIC LIFTERS



VALVE LIFTERS: Hydraulic, Barrel Type. Consists of plunger and valve assembly operating in a cylinder formed by valve lifter body (see illustration). Oil is forced into lifter from main oil gallery through hole in side of body and plunger.

Removal - *NOTE - Keep lifters in order for reinstallation in original bores in block.* Remove intake manifold, *see "Intake Manifold"*, engine top cover, valve rocker arm covers and rocker arm shaft assemblies. On varnished lifters, apply "D-Carb" solution to lifter body. Allow 5 minutes for solution to remove varnish. Use Tool BT-39 (F-85), Tool 23-13 (88, Super 88 & 98) to remove varnished lifters.

Disassembly: Use Tool BT-31 or small screwdriver to remove retainer spring. Remove pushrod seat, plunger and plunger spring. Remove ball check retainer from plunger, then remove ball and spring.

Cleaning & Inspection: Use cleaning brush J-5099 and clean solvent to remove all foreign material from all parts. Check all parts for nicks, burrs, or scoring. *NOTE* - Ball, ball check retainer, springs, pushrod seat and snap ring are interchangeable or can be replaced individually. Body and plunger are selective fit and are not interchangeable. Replace lifter when body or plunger are worn or damaged. *CAUTION - DO NOT replace lifter when a slight gap appears or lifter shows leakage where foot is welded to body unless leak-down is not within specifications.* Place straightedge across

CONTINUED ON NEXT PAGE

HYDRAULIC VALVE LIFTER (TYPICAL)

CONTINUED FROM PRECEDING PAGE

lifter foot. If light appears under straightedge placed across foot of lifter, it indicates a flat or concave surface and lifter should be replaced and camshaft lobe checked for wear. Wear at camshaft cam center is normal, but wear across entire width of cam base circle requires replacing of camshaft.

Reassembly & Testing: Lifter must be assembled while submerged in test fluid to obtain accurate leak-down rate.

1) Install Adapter 105-2 in reservoir of Tester BT-60, then fill reservoir with Hydraulic Lifter Test Fluid BT-59 to ½" of top of reservoir.

2) Assemble ball check, spring, and retainer into plunger with flange pressed tight against bottom of recess in plunger.

3) Install spring over ball check retainer. Hold plunger with spring up and insert into lifter body (to prevent cocking spring). Place assembly in tester cup, then position pushrod seat into plunger. Position ¼" steel test ball on pushrod seat and lower tester ram until it contacts steel ball. *NOTE* - Allow ram to move downward by its own weight until air bubbles disappear.

4) Raise ram, then allow it to lower. Repeat several times or until all air is expelled from lifter. *CAUTION - DO NOT ATTEMPT TO EXPEL AIR FROM LIFTER BY PUMPING RAM.*

5) When all air is removed, allow ram to bleed down lifter to expose ring groove and install retaining ring.

6) Adjust ram screw so it contacts steel ball in pushrod seat when pointer is at start line. Raise ram and start test by resting arm on steel ball.

7) Rotate reservoir one revolution every two seconds, and time indicator from start to stop line. Allowable leak-down time is shown in table below. *NOTE* - If lifter is within specifications, it can be placed in service without removing test fluid.

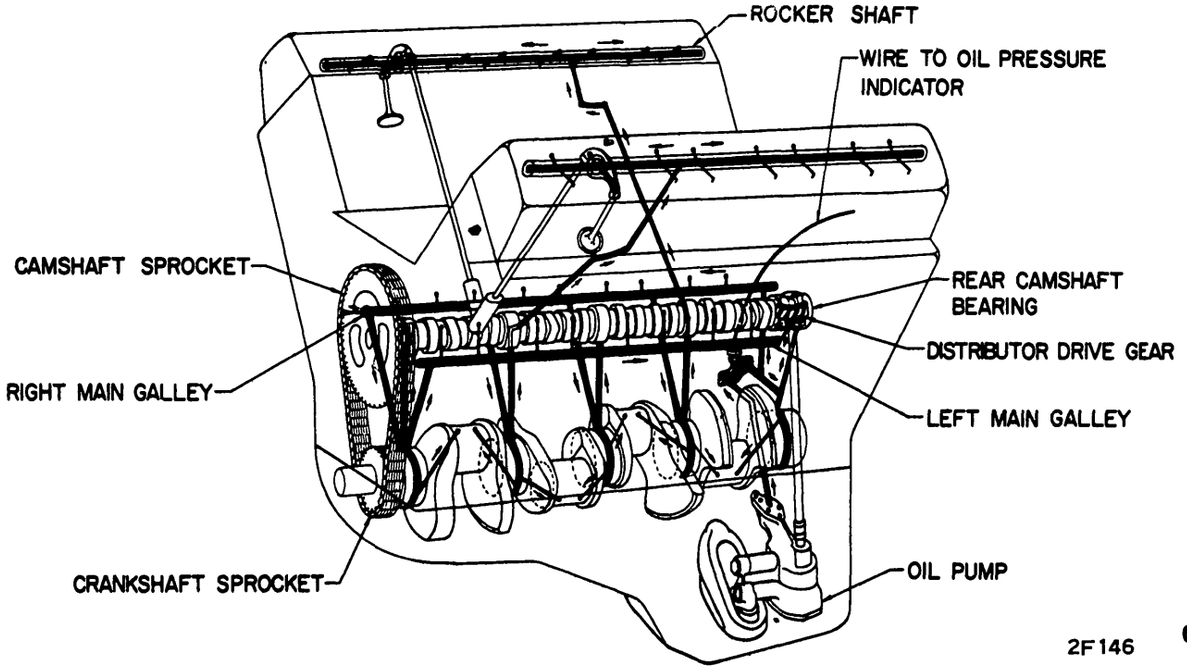
Lifter Leak-down Rate

Model	Used Lifters	New Lifters
F-85	8-40 seconds	12-40 seconds
88, Super 88, 98	12-90 seconds	20-90 seconds

Lifter Identification (Exc. F-85)

Identification Note - Production engines used Standard, .001", or .010" oversize lifters. Use correct size when replacing lifters. All lifters have identification numeral (Except Standard) on lifter body. Cylinder block marked "1" or "10" for lifter size on rail under rocker arm cover. When no mark appears, lifters are standard.

Lifter Identification (F-85)



Standard size only (Heavy Duty lifters are mechanical type).

OILING SYSTEM

ENGINE LUBRICATION

88, SUPER 88, & 98

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, camshaft bearings, and to hydraulic valve lifters, fuel pump eccentric and lever, and distributor drive gear. Oil metered by camshaft bearings lubricates other valve parts (rocker arms, pushrods, and valve stems). Other parts are lubricated by oil spray.

88, SUPER 88 & 98 ENGINE OILING SYSTEM

OPERATION: Gear type oil pump mounted on rear main bearing cap in crankcase draws oil through fixed oil strainer and intake pipe mounted on pump cover and delivers oil through a passage in the pump body, rear main bearing cap, and crankcase to the oil filter intake port (filter mounted on pad at right rear corner of crankcase). From the filter outlet port on the pad, a horizontal cross passage and vertical passage connect with the right main oil gallery extending the full length of the engine just below the right bank valve lifters. At the forward end of this gallery, a "V" passage connects to front main bearing and to the forward end of the left main oil gallery extending back along the engine just below the left bank valve lifters. Oil is distributed from these main oil galleries as follows:

Crankshaft & Camshaft Bearings - Rear crankshaft and camshaft bearings are lubricated by a vertical passage intersecting the horizontal cross passage from the oil filter (see above). **Other** crankshaft and camshaft bearings are lubricated by a "V" shaped oil passage in each crankcase web leading down from the right main oil gallery to the crankshaft bearing and then up to the camshaft bearing (additional passage at front crankshaft bearing supplies oil to left main oil gallery).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod is lubricated through passage from adjacent main bearing (separate oil lead to each rod on each crankshaft throw).

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from slot in side of bearing cap of rod for opposite bank of cylinders (slot in rod cap must be upward or toward center of engine to provide this cross-lubrication).

Valve Lifters - Each lifter supplied with oil through short passage leading upward from main gallery at point directly below lifter.

Rocker Arms, Pushrods & Valves - Hollow rocker arm shafts are supplied with oil through passage in block leading from No. 2 camshaft bearing (left bank), No. 4 camshaft bearing (right bank), and connecting passage in head which registers with drilled oil passage in rocker shaft bracket (see Note below). Rocker arm is drilled to provide lubrication for pushrod socket and valve tip. Oil return holes are provided on lower side of heads.

ROCKER SHAFT BRACKET NOTE - Rocker shaft bracket with drilled oil lead has anchor pin which locates shaft properly so that oil hole in bracket and shaft line up (pin is driven in flush with top of bracket). This bracket is No. 2 or 3 (left bank), No. 4 or 3 (right bank) depending on whether end brackets are used (discontinued during 1960 production).

Distributor Drive Gear - Lubricated from drilled hole in plug at rear end of left main oil gallery.

Timing Chain & Sprockets, Fuel Pump Lever & Eccentric - Lubricated from drilled hole in hexagonal headed plug which closes front end of right main oil gallery.

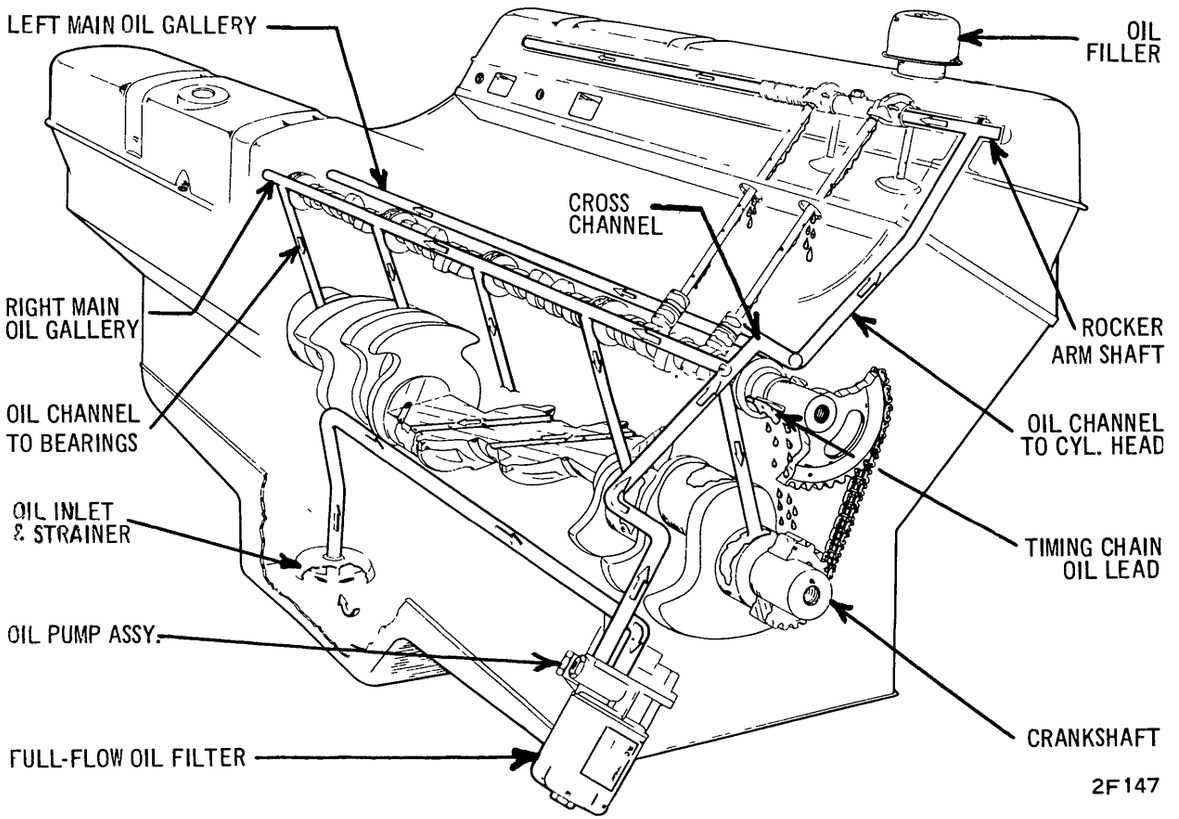
OIL FILTER: Full flow type mounted on pad on right rear of crankcase. Filter has bypass valve to ensure engine lubrication if filter element clogged.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

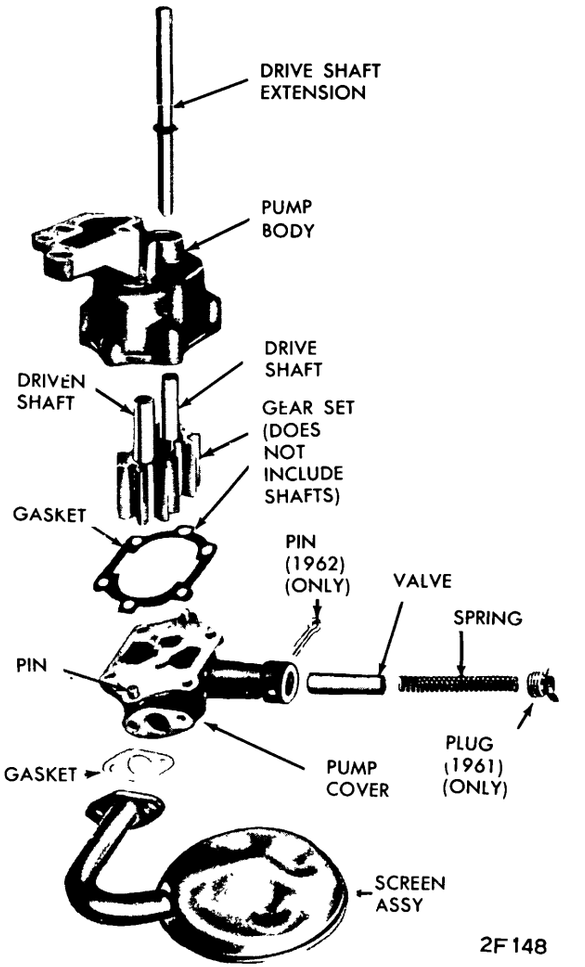
►*CAUTION:* **On cars where filter not used, a cover with a channel oil passage connecting the inlet and outlet ports is installed on filter pad to provide oil circulation. If cover removed, install with new gasket (coat both sides of gasket with POB No. 5 sealer), and torque cover bolts to 35-40 ft. lbs.**

F-85 MODELS



ENGINE LUBRICATION: Force feed type with oil supplied under pressure to crankshaft, connecting rod and camshaft bearings and to valve lifters. Oil is supplied under controlled pressure to rocker arm bearings and pushrods. All other moving parts are lubricated by gravity flow or splash. See *Engine Oil Flow Diagram.*

OPERATION: Gear type oil pump located in timing chain cover, draws oil through screen and pipe assembly (or over top of screen if clogged) and a drilled passage in crankcase connecting, to drilled passage in timing chain cover. All oil is discharged from pump to cover assembly. Spring loaded relief valve (in cover) limits oil pressure to a maximum of 33 lbs. per square inch. A bypass valve (in cover) opens when filter becomes clogged (4½-5 lbs. pressure difference between filter inlet and outlet) to bypass unfiltered oil directly to oil galleries in engine. Oil from filter (mounted on oil pump cover) supplies oil through oil pump cover and drilled passages in crankcase to two main oil galleries that run full length of the crankcase.



Crankshaft & Camshaft - Both crankshaft and camshaft are supplied oil through drilled passages in crankcase, from right main oil gallery.

Connecting Rod & Pistons - Main bearings supply oil through drilled passages in crankshaft to connecting rod bearings. Pistons and cylinder walls are lubricated by oil forced through small notch in connecting rod bearing parting surface that registers with hole in crankshaft every revolution. Piston pins are lubricated by splash.

Timing Chain & Sprockets - Drilled holes in camshaft connect front camshaft bearing to key slot in front of camshaft. Oil flows from camshaft journal into keyslot over woodruff key in space between key and camshaft sprocket and fuel pump eccentric. A relief in forward end of fuel pump eccentric allows oil to escape between eccentric and camshaft distributor gear. Oil strikes distributor gear once each camshaft revolution, supplying lubrication to timing chain and sprockets.

F-85 ENGINE OILING SYSTEM

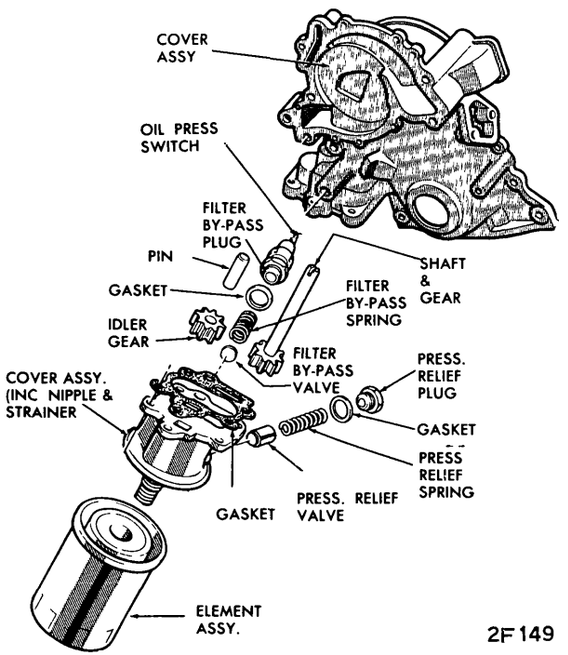
88, SUPER 88 & 98 OIL PUMP

Hydraulic Lifters - Full pressure lubrication is supplied hydraulic lifters from cutouts in lifter bores in main oil galleries

Rocker Arms, Valves and Pushrods - These items receive oil from main oil galleries through drilled holes in front of cylinder block and head, leading up from forward end of corresponding main oil gallery. Hole in head ends beneath front rocker arm shaft bracket. A notch cast in base of bracket allows oil to flow up inside bracket (between bracket and bolt) to hollow rocker arm shaft (plugged at both ends). Each rocker arm receives oil trhough hole in underside of shaft. Grooves in arm provide lubrication to bearing surfaces. Oil is metered to pushrod seat and valve stem through holes drilled in rocker arm. Excess oil returns to oil pan through passages in cylinder head and block.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



OIL PUMP
88, SUPER 88 & 98

OIL PUMP: Removal & Disassembly - Remove oil pan, oil pump to rear main bearing cap, screws and remove oil pump and drive shaft extension. Remove drive shaft extension. *CAUTION - DO NOT remove special washers from drive shaft extension.* Remove intake pipe and screen, pressure regulator nut, spring and valve. Remove cover screws and cover. Remove drive gear and idler gear from body.

Cleaning & Inspection: Wash all parts in solvent and blow out passages with compressed air. Inspect all parts for scores. Use fine hone to clean up small imperfections. Relief valve clearance should be .0025-.005". End clearance of gears should not exceed .0025-.008".

Reassembly - Reverse disassembly procedure, tightening cover screws to 5-8 ft. lbs. and pressure regulator nut to 30-40 ft. lbs. Install intake pipe and screen assembly with screen facing away from pump mounting pad and tighten screws to 4-7 ft. lbs.

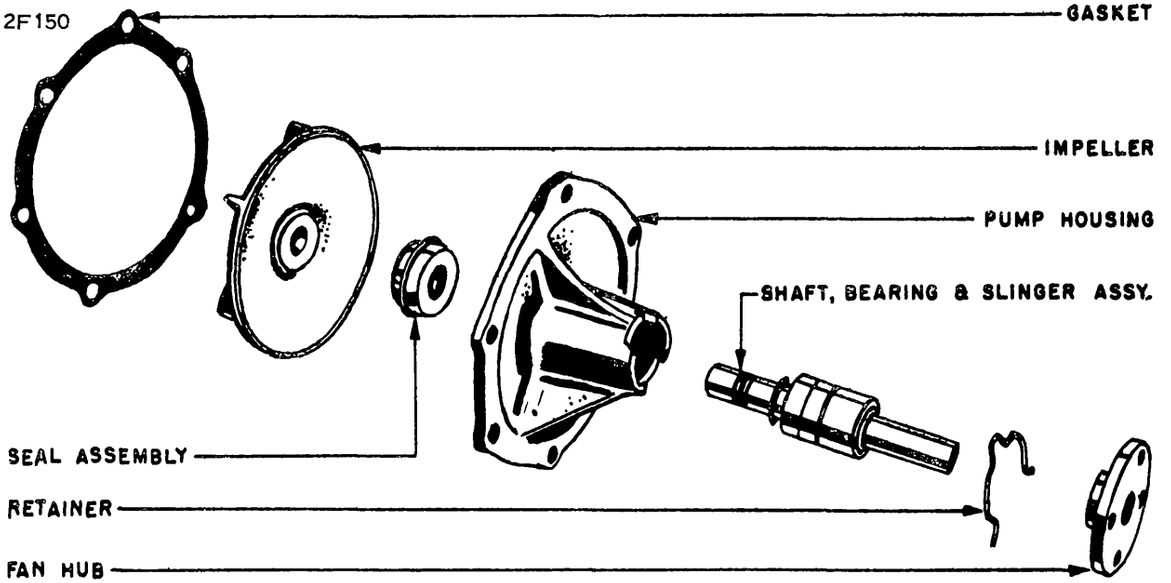
Installation: Assemble drive shaft extension to drive shaft so that end nearest special washers is inserted into oil pump drive shaft. Insert other end of drive shaft extension through opening in block until shaft mates with distributor drive gear. Position pump on bearing cap and tighten bolts to specifications.

F-85 OIL PUMP

F-85 MODELS

OIL PUMP: Removal & Disassembly - Disconnect pressure switch wire. Remove all dirt from connections and joints. Remove oil filter and pump cover-to-front cover attaching screws. Remove cover carefully, then slide idler and oil pump drive gears out. Remove oil filter bypass valve cap, spring and valve. Remove oil pressure valve cap and spring. Remove pressure regulator valve by tapping housing in palm of hand.

Cleaning & Inspection: Wash all parts in solvent and blow dry with air. Inspect all parts for scoring, cracks, nicks, or warping. Check pressure relief valve clearance in bore. Clearance should be .0015-.0035". Gear end clearance should be .0015-.0075".



Reassembly - Install filter bypass valve into output passage bore (inside diameter ribs) seating valve squarely in bottom of passage. Install spring (light weight), gasket and cap. Replace gasket if damaged. Install pressure regulator valve (flat end first),pressure regulator spring, gasket and cap. Torque caps to 30-35 ft. lbs. Install pump drive gear and idler gear. Install new pump gasket. Fill gear pocket with petrolatum and force into every cavity and between gear teeth. *NOTE - Packed petrolatum helps in priming pump.*

ENGINE COOLING SYSTEM
WATER PUMP
88, SUPER 88, & 98

WATER PUMP: Disassembly - Remove bearing retainer wire from front of housing. Support outside surface of pump housing in press and press shaft through impeller and housing pressing impeller end of shaft toward front of housing. Remove seal assembly from rear of housing by driving against face of seal with drift. Support hub and press shaft through hub to remove hub.

Reassembly - Place Gauge 33-68 in impeller side of housing, use driver, Tool 5175, to press shaft and bearing assembly into housing from opposite side until shaft bottoms on gauge. Install retainer wire. Support inner end of shaft on press and use Tool BT-16 to press hub on shaft. Coat outer diameter of new seal with C.P. No. 9 Sealer and use Tool 23-17 to press it into place. Clean mating surface of impeller of any foreign particles and use Tool BT-15 to support impeller while pressing shaft through impeller until bottom edges of vanes are 13/16" from machined face at edge of housing.

Installation - Use gasket cement on pump housing to retain gasket on housing, then install pump assembly in front cover and tighten 5/16" bolt to 14-22 ft. lbs., 7/16" bolts to 24-40 ft. lbs. Install fan pulley, spacer and fan. Tighten fan to hub bolts to 10-15 ft. lbs. Install pulley belts and adjust belt tension.

88, SUPER 88 & 98 WATER PUMP

►*JACKING & HOISTING CAUTION: Before jacking or hoisting, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

►*STARTING CAR BY PUSHING CAUTION: Hydra-Matic cars cannot be started by pushing because of transmission design.*

MODEL IDENTIFICATION

Series	① Designation	Engine
Dynamic 88	32	394"
Super 88	35	394"
Starfire	36	394"
98	38	394"

① - First two digits of series and body style designation following "62" year number under STYLE on Body Identification Plate.

SERIAL NUMBER: Stamped on plate on left front door pillar. Number (example below) includes identification data.

① ② ③ ④
62 2 M 01001

① - Year. 62 (1962).
② - Series Designation. 2 - Dynamic 88. 5 - Super 88. 6 - Starfire. 8 - 98.
③ - Assembly Plant. M - Lansing. A - Atlanta, K - Kansas City, L - Linden, C - South Gate, W - Wilmington, T - Arlington.
④ - Beginning Vehicle Number.

Engine Unit Number: Stamped on pad located above center exhaust port of left cylinder head.

Starting Unit Number - 300,001 with prefix and suffix letters as follows:

Model	Prefix	Suffix	Carb.	Compr. Ratio
88	F		2-Bbl.	① 10.25-1
88 (Opti.)	F	L	2-Bbl.	① 8.75-1
88 (Opti.)	G		4-Bbl.	① 10.25-1
88 Exp.	F	E	2-Bbl.	② 8.3-1
S88, 98	G		4-Bbl.	① 10.25-1
Starfire	G	S	4-Bbl.	② 10.50-1
S88, 98, Starfire, Exp.	G	E	4-Bbl.	② 8.3-1

① - Head gasket thickness .025".
② - Head gasket thickness .040".

►*STARFIRE DATA NOTE:* Starfire data is same as Super 88 & 98 unless otherwise specified.

TUNE-UP

►*ENGINE STARVES OUT AT HIGHWAY SPEEDS CORRECTION:* Caused by: 1) Fuel hose pinched in clip on frame near pump or bend in hose too short. To correct, reposition hose in large opening in clip or open clip to relieve pressure. Reroute hose to eliminate kink. 2) Incorrect fuel filter installed in tank (A.C. Cars with 2GC Carburetor with fuel return line). Replace short filter with long filter, No. 584183.

COMPRESSION PRESSURE: 100 lbs. minimum at cranking speed with throttle and choke open and spark plugs removed. Reading on low cylinder must not be less than 80% of high cylinder.

VALVE TAPPET CLEARANCE: Zero lash (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic coil type, located on left side between exhaust manifold and exhaust pipe.

CRANKCASE VENTILATION VALVE: Service at 10,000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *see "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-7-3-6-5-4-2.

Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .030".

Spark Plugs - AC No. 45 (Low Compr. engine), 44 (High Compr. Engine), 42 or 43 (Heavy Duty), 46 (Export). Torque to 18-34 ft. lbs.

COIL: Delco-Remy 1115112 (Std.), No. 1115159 (88 Heavy Duty).

Ignition Current - 2.0 amps. idling, 4.0 amps. stopped.

Resistor - (1115112) In wiring harness, not serviced separately. Bypassed during cranking by second lead from switch. **Capacity** - 1.75-1.85 ohms.

Resistor - (1931385) 88 Heavy Duty.

DISTRIBUTOR: Delco-Remy 1111004 (88 Low Compr. Eng.), 1110989 (All High Compr. Engs.). Window type with external adjustments.

Heavy Duty - Delco-Remy 1110978 or 1110991. Double breaker type with conventional distributor cap (not window type). Vacuum spark control not used (centrifugal weight advance only).

Condenser - Delco-Remy 1932004 (1111004 & 1110989 Distr.).

Capacity - .18-.23 mfd.

Contact Point Set - Delco-Remy 1931988 (1111004 & 1110989 Distr.).

Breaker Gap - .016" (1111004 & 1110989 Distr.), .014-.018" (1110978 & 1110991 Distr.). Will be correct when cam angle correctly set.

Cam Angle (1111004 & 1110989) - 28-32° (Set to 30°).

Cam Angle (1110978 & 1110991) - 29°±1° (each set), 34°±1° (both sets operating together).

►*HEAVY DUTY DISTRIBUTOR NOTE:* After adjusting each breaker individually, cam angle with both breakers operating must be 34°±1°.

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance (1111004 & 1110989)

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	400	0-4	800
9-11	1200	18-22	2400
12-14	2000	24-28	4000

Automatic Advance - 1110978,991

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	400	0-4	800
6.5-8.5	975	13-17	1950
8-10	1200	16-20	2400
11-13	2200	22-26	4400

Vacuum Spark Control: Delco-Remy No. 1116204 (1111004 Distr.), No. 1116203 (1110989 Distr.).

Vacuum Advance (1116203)

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
13.5	27	15.25-18.25

Vacuum Advance (1116204)

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	7-9
13	26	16.75-19.25

►*VACUUM ADVANCE OPERATIONAL CHECK:* Vacuum advance operation should be checked whenever ignition timing is set. After setting ignition timing (with vacuum advance cut off by disconnecting vacuum line), reconnect vacuum line and check ignition timing. If vacuum advance operating correctly, engine RPM should increase and timing should advance; if not, vacuum unit is defective.

IGNITION TIMING

Setting - 5° BTDC (10.25-1 Compr. Ratio), 2½° BTDC (8.75-1 Ratio). With low octane fuel or carbon build-up, retard setting 2½°. Set timing with engine idling at 850 RPM, vacuum line disconnected and vacuum line fitting taped closed. After setting timing, reconnect vacuum line and check vacuum unit operation. See above.

►*HIGH OCTANE FUEL NOTE:* When using extra high octane fuel, timing may be advanced providing spark knock is not encountered.

Timing Mark - Three slots in rim of crankshaft balancer and pointer on upper left side of front cover. Slots indicate 0°, 5°, and 10° BTDC.

CARBURETOR

►*CARBURETOR APPLICATION:* Rochester carburetors are used. Rochester 2GC carburetor used on Dynamic 88 (Std. or Opt. W4 and Export.). Rochester 4GC carburetors used on Dynamic 88 Opt. W3 and all Super 88 and 98 (Domestic & Export).

Throttle Return Check Adjustment: With transmission in "N" (Neutral) and engine at normal operating temperature, set carburetor on fast idle and adjust to 1600 RPM (4-Bbl.), 1900 RPM (2-Bbl.). Turn off engine. Rotate fast idle cam so fast idle screw rests on highest step of fast idle cam. Clearance between contact screw and contact on throttle lever should be .020" (4-Bbl.), .050" (2-Bbl.). To adjust, turn contact screw using two wrenches so that diaphragm is not permitted to turn.

THROTTLE LINKAGE ADJUSTMENT: Transmission Throttle Lever Adjustment - Raise car and remove lower throttle valve relay rod from lever at side of transmission. Place short end of Gauge BT-33-1 into manual lever shaft. Hold throttle lever to end of its rearward travel and adjust lever (by bending as required) so that hole in throttle valve lever is visible within hole in gauge (not necessarily centered). Lower car and make the next three adjustments with carburetor throttle valves in closed position. To completely close throttle valves, start engine, remove air cleaner and block intermediate choke lever (at climatic control housing) to release fast idle cam. Use Tool J-6342-01 to hold plunger away from throttle lever. Stop engine, BACK OUT SLOW IDLE ADJUSTING SCREW UNTIL CARBURETOR THROTTLE VALVES ARE COMPLETELY CLOSED. There should now be clearance at end of fast idle screw, slow idle screw, and throttle return check plunger.

Lower Throttle Valve Rod Adjustment: Loosen jam nut on lower throttle valve rod and remove both rods from bellcrank. Hold throttle valve bellcrank and lower throttle valve rod against their rearward stops, adjust lower throttle valve rod clevis so that pin will enter freely into holes in clevis and throttle valve bellcrank. Install cotter pin and tighten jam nut.

Carburetor Lever to Auxiliary Bellcrank Link Adjustment: Bend link as necessary to obtain .020-.040" clearance as shown in diagram.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Upper Throttle Valve Rod Adjustment: Adjust length by rotating rod until bellcrank is .002-.005" off its stop with throttle valves closed. *NOTE - Do not apply pressure when making this adjustment.* Tighten jam nut.

Idle Speed Adjustment: Make this adjustment as shown below, then make Throttle Downshift Stop Screw Adjustment and Accelerator Pedal Alignment & Height Adjustment with choke completely off, fast idle off, and carburetor throttle valves in slow idle position.

Throttle Downshift Stopscrew Adjustment: Loosen jam nut and back out stopscrew (located in auxiliary bellcrank adjacent to carburetor throttle lever) several turns Hold throttle lever so that throttle valves are in wide open position, and rotate throttle valve bellcrank counterclockwise to point of maximum transmission lever travel. *NOTE - Do not bend or stretch linkage.* Hold linkage in this position and adjust stopscrew to just touch tang on downshift lever. Allow throttle valves to close, then turn screw in 1½-2 turns and tighten jam nut.

Accelerator Pedal Alignment & Height Adjustment: Bend left ball stud (located behind lower end of accelerator pedal) up or down as required to correct pedal alignment. Adjust accelerator rod to position rod to bellcrank bushing so that Gauge BT-33-1 just touches dash (see diagram). Lubricate linkage pivot points

ROCHESTER 2GC 2-BARREL

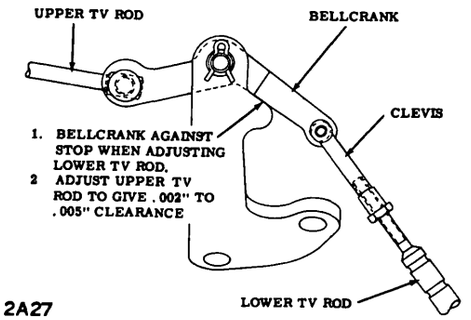
Model	Rochester No.
88 (No C.C.V.) Std. Ⓒ	7020052
88 (No C.C.V.) Air Cond. Ⓒ	7020058
88 (With C.C.V.) Std. Ⓒ	7020954
88 (With C.C.V.) Air Cond. Ⓒ	7020956

C.C.V. - Closed crankcase ventilation.

Ⓒ - All transmissions.

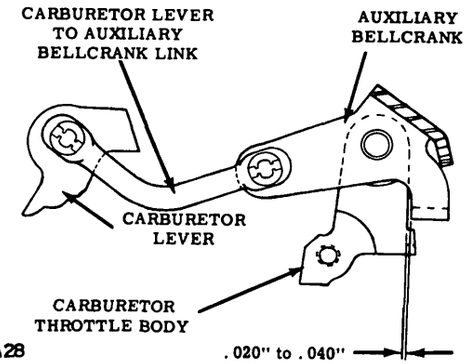
►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel Cyls. 1-4-6-7.*

►*IDLE COMPENSATOR CAUTION:* When making idle Setting and Idle Speed Adjustments, Idle Compensator must be in closed position (remove air cleaner and insert pencil or suitable tool in throttle bore). If engine speed **increases** when air cleaner installed, do not decrease speed. Readjust if engine speed **decreases.**



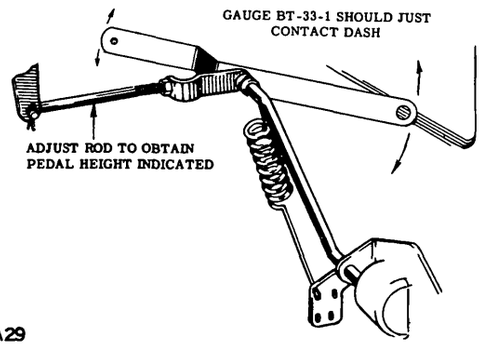
Idle Setting - After idle speed set to dorrect specifications (see Idle Speed below), turn both idle mixture screws for smoothest idle with highest vacuum reading and RPM, then turn each screw out ¼ turn.

Idle Speed - 550 RPM Synchro-mesh, 500 RPM Auto. Trans. in Drive. *NOTE - On cars with Idle Compensator, air conditioning must be turned OFF. On cars without Idle Compensator, air conditioning must be ON.*



Float Level - 1/2" (Gauge BT-197) before Code Tag "B"; 13/32" (Gauge BT-212) Code Tag "B" or later. With air horn inverted and gasket in place, place edge of gauge across air horn gasket at outer end of float. Sharp (lower) edge of float seam should be even with edge of cutout in gauge. Adjust by bending float arm.

Float Drop - Bend float tang to obtain a distance of 1 3/4" from gasket surface to bottom of float with air horn upright and float hanging free. Use Gauge BT-197 or BT-212.



Fast Idle - Rotate fast idle cam so fast idle screw is on high step of cam. With engine running at normal operating temperature and transmission in "N" (Neutral), adjust fast idle screw to obtain an engine speed of 1900 RPM (2200 RPM for sub-zero temperatures). Readjust throttle return check.

UPPER & LOWER THROTTLE VALVE ROD

OLDSMOBILE PRINTED CIRCUIT

CONTINUED FROM PRECEDING PAGE

V-Itag Regulator

Setting (1119253E) - 13.8-14.7 volts at ambient temperature of 125°F.

Setting (1119600) - 13.8-14.6 volts operating on upper contacts, .1-.3 volts lower operating on lower contacts. At ambient temperature of 125°F.

Contact Gap (1119600) - .016" (upper contacts) with lower contacts just touching.

Air Gap - .060" (1119253E), .067" (1119600), with contacts just touching.

Current Regulator

Setting (111925E) - 31.0-35.5 amps. (Adjust to 35 amps.), at ambient temperature of 125°F.

Setting (1119600) - 38-45 amps. at 125°F ambient temperature.

Air Gap - .075" with contacts just touching.

►*OTHER DATA: See "Delco-Remy 6 & 12 Volt Single Contact Regulators" & "Delco-Remy 1119600 Series Double Contact Regulators" in Electrical Section.*

ALTERNATOR

Delco-Remy No. 1117070 or 1100601. Internal rectifier type. *NOTE - No. 1117070 is "A" circuit, No. 1100601 is "B" circuit.*

Performance Data - Cold

Alternator	Amperes	Volts	RPM
1117070	① 58	14.0	① 2500
1100601	② 52	14.0	② 6500

① - 31 amps. at 1000 RPM. ② - 5 amps. at 1100 RPM.

Rated Output - 52 amps. (1100601), 60 amps. (1117070).

Field Current - 1.9-2.3 amps. (1100601), 6.0-6.6 amps. (1117070) at 12.0 volts and 80°F.

►*OTHER DATA: See "Delco-Remy Delcotron Alternators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy No. 9000554 (1117070). No. 1119508 (1100601). *NOTE - No. 9000554 is Transistorized type, No. 1119508 is Double Contact type.*

►*OTHER DATA: See "Delco-Remy Double Contact Alternator Regulators" or "Delco-Remy Transistorized Alternator Regulators ("A" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

►*INSTRUMENT CLUSTER NOTE:* Cluster consists of Speedometer Head, Fuel Gauge, Safety Sentinel, Instrument Lights, and Indicators (Generator Charge, Oil Pressure, Temperature "Hot" and "Cold", High Beam, and Turn Signals).

INSTRUMENT CLUSTER: Removal 1) Remove windshield side garnish mouldings and instrument panel side panels. Disconnect steering column assembly (All Strg.), plus gear at frame (Std. Steering) and remove Console.

2) Disconnect heater and Air Cond. controls, printed circuit connector, speedometer cable, front and rear seat speaker and antenna leads, ignition and headlight switch connectors, power top, courtesy light and power antenna switch leads, instrument panel harness connector, hoses from deck lid vacuum release control, courtesy lights, and cigar lighter leads.

3) Remove cluster attaching screws and remove cluster.

Installation - Reverse removal procedure.

SPEEDOMETER CLUSTER: Removal - Disconnect printed circuit connector, speedometer cable from speedometer head and remove three cluster to instrument panel screws and remove cluster.

Installation - Reverse removal procedure.

SPEEDOMETER CABLE ASSEMBLY: Removal - Disconnect speedometer cable by reaching behind end of instrument panel and front door hinge pillar. Remove left air outlet grille and cowl trim panel. Disconnect cable from transmission and remove cable from car.

Installation - Reverse removal procedure.

PRINTED CIRCUIT: Removal - Remove speedometer cluster assembly, *see above,* then remove printed circuit screws and fuel gauge connector nuts and washers. Disconnect safety sentinel actuating wire and remove printed circuit.

Installation - Reverse removal procedure.

SPEEDOMETER HEAD: Removal - Remove instrument cluster assembly, *see above.* Remove safety sentinel control knob actuating wire and case to bezel screws. Remove speedometer head attaching screws and remove head.

Installation - Reverse removal procedure.

FUEL GAUGE: Removal - Remove instrument cluster and printed circuit. Remove fuel gauge retainer to case screws and remove gauge from cluster. Remove gauge to retainer connecting studs, flat washers and insulator and remove gauge from retainer.

Installation - Reverse removal procedure.

CIRCUIT BREAKERS: 20 Ampere, protects headlights, beam indicator and parking lights.

FUSES: All fuses located in fuse panel on firewall behind instrument panel. Color coded to simplify servicing.

9 Ampere. Tail, License Plate, Glove Compt. Under Hood and Trunk, lights.

20 Ampere. Stop (88, S88), Dome and Courtesy lights.

25 Ampere. Stop (98) lights.

9 Ampere. Direction Indicator.

3 Ampere. Instrument, Ignition, Clock and Heat Control lights.

9 Ampere. Back-up, Indicator, Parking Brake, and Fuel Gauge lights.

1 Ampere. Westclox, **2 Ampere** Borg, Clock.

2½ Ampere. Deluxe, **7.5 Ampere** Super Deluxe, Radio.

20 Ampere. Windshield Wiper, Cigar Lighter and Heater (88, S88).

25 Ampere. Heater (98).

HORN RELAY: Delco-Remy No. 1116946.

ENGINE

ENGINE SPECIFICATIONS: Own 90° V8, Valve-in-head.

Engine	Bore	Stroke	Displacement
All	4 1/8"	3 11/16"	394 cu. in.

Engine	Compr. Ratio	Rated HP	Developed HP
88 Std.	10.25-1 ①	54	280 at 4400 RPM
88 Optl.	8.75-1 ③	54	260 at 4400 RPM
88 Optl.	10.25-1 ②	54	330 at 4600 RPM
S88 & 98 Std.	10.25-1 ②	54	330 at 4600 RPM
Starfire Std.	10.50-1 ②	54	345 at 4800 RPM
88 Exp.	8.3-1 ①	54	
Other Exp.	8.3-1 ②	54	

① - 2-Bbl. Carb. & Premium Fuel. ② - 4-Bbl. Carb.
③ - 2-Bbl. Carb. & Regular Fuel.

Compression & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Drain oil and disconnect battery. Position No. 1 piston at bottom of stroke. Remove exhaust crossover pipe (if so equipped). Disconnect idler arm support from frame. Remove starter. Remove engine front mount attaching nuts and raise engine. Remove oil pan. *NOTE - Front oil pan bolts can be removed through holes in frame crossmember.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*

INTAKE MANIFOLD: *See "Cylind r Head & Manifold" in Oldsmobile Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Oldsmobile Special Data.*

PISTONS

Aluminum alloy, Auto-Thermic, Cam Ground, Tin plated, with Steel Strut.

►*PISTON IDENTIFICATION NOTE:* Pistons used in all engines are "dished" head type but amount of dish varies as follows:

88 Low Compr. Engine - Dish is approx. 5/8" deep.

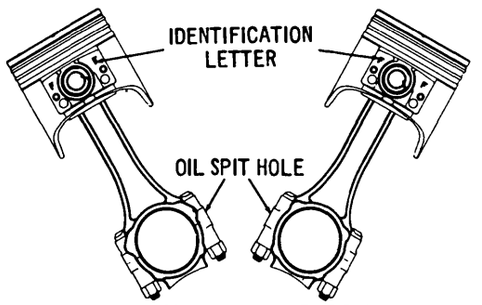
All High Compr. (Except Starfire) - Dish is 1/16" deep.

Starfire Engine - Dish is 1/32" deep and piston has raised ring in center of dish.

Turbo-Rocket Engine - Pistons have heavier dome.

Weight - 26.349 ozs. **Length** - 4.050".

Removal - Pistons & Rods removed from above.



►*CAUTION:* Mark pistons and stamp rods and bearing caps with number of cylinder bore before removing to insure correct installation.

Clearance - .0075-.00125" at thrust surface (selective fit). *NOTE* - Some engines have .005" or .010" Oversize pistons.

Fitting Pistons - Use a .0015" x ½" x 12" ribbon feeler between inverted piston (pin and rings removed) and cylinder wall at right angles to piston pin position. Pull to withdraw feeler should be 3-12 lbs.

Replacement Pistons: Furnished with fitted pins in Std. Codes A,B,C,D,E,W,X,Y,Z, (Exc. Starfire), Codes A,B, C,D,E (Starfire) and .010", .020" & .030" Oversize.

Installing Pistons: Install piston on same numbered connecting rod with "F" on pin boss and notch or notches toward front of engine. *See Rod Installation.*

2F60

OLDSMOBILE PISTON & ROD ASSY.

PISTON PIN

Floating type with lock ring at each end. Pins are offset in piston .090" toward right side of engine.

►*CAUTION:* Discard old lock rings and install new service type lock rings when installing pins.

Diameter - .9803"-.9807". **Length** - 3.126".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Pin Fit in Piston - .0003-.0005" loose. Pin should not fall through piston of own weight when using the low limit (.0003"). Can be pushed into place with hand.
Pin Fit in Rod Bushing - .0003-.0005" loose.
Replacement Pins: Std., .001" & .003" Oversize.

PISTON RINGS

Two compression rings and one oil ring used.

Ring	Width	End Gap	Side Clearance
Compr. (1)	.0775-.078"	.013-.023"	.001-.004"
Compr. (2)	.0925-.0935"	.013-.023"	.001-.004"
Oil	①	.015-.055"	.0005-.007"

① - .1831-.1889" (Perfect Circle), .1840-.1890" (Sealed Power).
Replacement Rings: Std. and .010" Oversize.
Installing Rings: Install upper "Chrome" and lower "Parco Lubrite" compression rings with side up that is marked with a dimple (Sealed Power) or word "TOP" (Perfect Circle).

CONNECTING ROD

►*CONNECTING ROD JOURNAL CAUTION:* Engines with Letter "X" 3/8" high stamped on left upper front face of block adjacent to water outlet nozzle above ground strap hole have crankshaft with connecting rod journals 2.4898-2.4893 in diameter. Use Connecting Rod Bearing Package Part No. 5458315 (Upper and lower half for each journal) for these engines.

Length - 6.996-7.000" center-to-center. **Weight** - 34.55 ozs.
Crankpin Journal Diameter - 2.4992-2.5002".
Lower Bearing - Moraine 400 steel backed aluminum with babbitt overlay.
Clearance - .0005-.0026" (vertical), .0013-.0034" (horizontal).
Sidplay - .002-.011" (total both rods).

Replacement Bearings: Std. and .002", .010", .020" Undersize.

Installing Rods: Install connecting rod in engine with oil spit hole toward center of engine. Install connecting rod caps with bearing index notches in rod and cap on same side.

►*CAUTION: Use Guide Tool BT-22 over rod bolts to prevent damaging crankpin journals when removing and installing piston and rod assemblies.*

CRANKSHAFT

Journal Diameter - 2.9990-3.000". Five bearings.
Bearings - Moraine 400 steel-backed aluminum with babbitt overlay (Nos. 1 through 4), Durex 100A steel-backed babbitt overlay (No. 5).

Clearance - .0005-.0021" (Nos. 1 & 2), .0008-.0024" (Nos. 3 & 4), .0020-.0034" (No. 5). **Wear Limit** - .0035" (Nos. 1 through 4), .0045" (No. 5).

►*MAIN BEARING DESIGN CHANGE:* 1962 Nos. 2,3 & 4 main bearings are 5/32" wider than 1961 bearings. Both upper and lower main bearing shells have center hole groove and are now interchangeable.

Main Bearing Identification
(On Shell Tang)

Thickness	No. 1 Through 4	No. 5
Standard	None	None
.0005"	B	A
.0010"	C	B
.0015"	E	C

Replacement Bearings: Furnished Std. and .0005", .001", .0015", .002", .010" .020" Undersize. See table above for identification. **Install bearings in pairs (upper and lower shells).**
End Thrust: Taken by No. 5 (flanged) bearing.
Endplay - .004-.008".
Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Oldsmobile Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Oldsmobile Special Data.*

CAMSHAFT

►*IDENTIFICATION NOTE:* Camshaft used in Series 88 (Regular Fuel) is identified by step on thrust flange.
Journal Diameter - 1.9977-1.9985".
Bearings - Steel-backed babbitt.
Clearance - .001-.0033".
End Thrust: Taken by flange at front of camshaft against front camshaft bearing. Camshaft held to rear by plunger and spring at front end of camshaft.
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Oldsmobile Special Data.*
Timing Chain: Single flanged side guide type. **Width** - 27/32". **Pitch** - .50". **Length** - 24" or 48 links.
Camshaft Setting: Mesh chain with sprocket marks adjacent and in line with a straightedge across shaft centers (or use Tool BT-11).
►*FUEL PUMP ECCENTRIC NOTE:* Fuel pump eccentric bolted to front of camshaft ahead of sprocket with cupped side out.

►*CAMSHAFT REPLACEMENT CAUTION:* Coat camshaft liberally with engine oil mixed with G.M. Concentrate Part No. 567725 to insure proper installation and provide initial lubrication.

Engine Front Cover Removal & Installation: *See "Engine Front Cover" in Oldsmobile Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: Two types used and either type can be removed and installed without removing Engine Front Cover. *See "Engine Front Cover" in Oldsmobile Special Data.*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.870-1.880"	.3427-.3432"	5.093"
Exhaust	1.557-1.567"	.3940-.3945"	5.081"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	①	.0010-.0025"
Exhaust	45°	②	.0015-.0030"

① - .428" (88), .435" (S88,98).
② - .435" (88), .437" (S88,98).

Valve Seat Width - .037-.075", all valves.
Valve Stem Seals - Cup type oil seal (deflector) installed cup side down on valve stem below valve spring retainer on all valves.
Valve Springs: Outside diameter at bottom is larger than at top. No damper springs used.

Valve Spring Specifications

Valve	Pressure	Length
Open	175-189 lbs.	1.437"
Closed	85-95 lbs.	1.837"

Free Length - 2.25".

Valve Guides: To remove old guides, support head and drive guides out through top of head using Remover Tool J-3062. Install new guides as follows: Place Gauge Washer J-5158-3 on valve spring seat. Use Valve Guide Installer Tool J-5158-2 to drive new guide in head (grooved end of guide up) until tool seats against gauge washer. This will correctly position guides in head (guide should extend 25/32" above face of valve spring seat).
►*OVERSIZE VALVE GUIDE NOTE:* Valve guides with .010" oversize outside diameter may be identified by a groove on guide.
Valve Lifters: Hydraulic lifters standard on all models.
►*HYDRAULIC LIFTER INSTALLATION CAUTION:* Production engines use Standard, .001" or .010" oversize lifters. Use correct size when replacing lifters. All lifters have identification numeral (Except Standard) on lifter body. Cylinder block marked "1" or "10" for lifter size on rail under rocker arm cover. When no mark appears, lifters are standard.
Diameter - .9210-.9215" (Std.). **Length** - 2.125".
Clearance in Block - .0005-.0020" (Selective).

Replacement Lifters: Std., .001", .002", .003", .005" & .010" Oversize.
Hydraulic Lifter Removal, Overhaul & Testing - *See "Valve System" in Oldsmobile Special Data.*
Rocker Arm Assembly: *See "Valve System" in Oldsmobile Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications (88 - Reg. Fuel)
Intake Valves - Open 14° BTDC. Close 50° ALDC.
Exhaust Valves - Open 54° BLDC. Close 16° ATDC.

Valve Specifications (88, S88, 98 - Premium Fuel)
Intake Valves - Open 11° BTDC. Close 59° ALDC.
Exhaust Valves - Open 59° BLDC. Close 25° ATDC.

Valve Timing Check: Remove left hand cylinder head rocker arm assembly and rotate engine so that No. 1 piston is on top dead center (firing stroke). Install Tool No. J-5374-01 in place of rear rocker shaft bracket with step plunger over No. 7 cylinder exhaust pushrod. The pilot at bottom of tool will fit into cylinder head bolt hole. Screw main body of gauge down so step plunger contacts pushrod and small diameter of plunger is flush with top of main body. Tighten clamp bolt. Rotate engine one complete revolution so that No. 1 piston

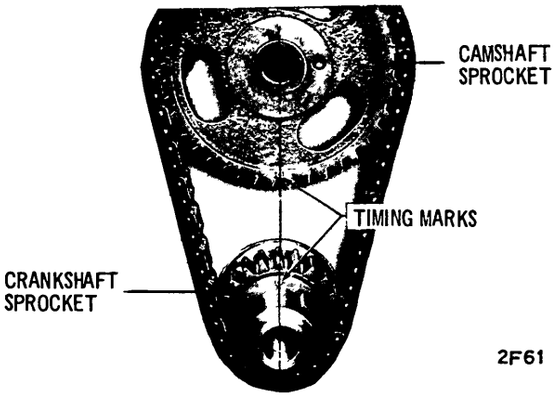
CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

is again at TDC (intake stroke). If timing chain is installed properly, third step of plunger will rise 1/32" above (8.75-1 Eng.), be nearly flush to (10.0-1 Eng.), top of main body. If plunger rises more, camshaft is advanced, and if less, camshaft is retarded.

ENGINE OILING SYSTEM



►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Oldsmobile Special Data.*

Crankcase Capacity: 4 qts. refill. 5 qts. with filter change.

Normal Oil Pressure: 35-45 lbs. at 50 MPH.
Pressure Regulator - In pump body. Not adjustable. Valve starts to open at 45 lbs. Maximum pump pressure is 45-55 lbs.
Oil Pressure Indicator - Oil pressure warning light on instrument panel and oil pressure switch in engine block or oil filter. Lights when pressure below 3 lbs.

Engine Unit - AC No. 1508668.
Oil Pump: Gear type. In crankcase at rear end.
Oil Pump Removal, Overhaul & Installation - *See "Oiling System" in Oldsmobile Special Data.*

Oil Filter: Full-flow type. Replace element every 4,000 miles or sooner if needed. Located on lower right side of crankcase.

OLDSMOBILE VALVE TIMING MARKS

Replacement Filter: Element - AC No. PF-7.

Crankcase Ventilation: Standard Cars - Air intake in oil filler cap, outlet pipe at right rear corner of engine. **Filler Cap Cleaning Note** - Clean at every oil change by washing in solvent and re-oiling with engine oil. **Positive Crankcase Ventilation Cars** - Road draft tube replaced by hose to manifold with valve in line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 20¼ qts. (Std.), 22 qts. (With Air Cond.).
Pressure Valve - 15 lb. radiator filler cap.
Thermostat: Choke type, 170°F.

Water Pump: Packless, sealed ball bearing type.
See "Cooling System" in Oldsmobile Special Data.

Removal - Drain cooling system, and loosen belts. Remove fan, spacer and pulley from pump hub. Remove four pump housing to engine front cover bolts and two pump housing to block bolts, and remove pump.

Temperature Indicator: Two light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and goes out when engine temperature reaches 113°F±2°F. RED light remains off during normal engine operation but comes on when engine temperature reaches 243°F±2°F. *NOTE* - Red light will come on when ignition key turned to "Start" position (to test bulb and circuit) but should go out when key returned to running position.
Engine Unit - Delco-Remy No. 1998741.

Fluid Fan Drive: Std. on Air Cond. cars. Fan clutch engages when radiator air temperature reaches 160°F and fan rotates to a maximum of 2000 RPM. When air temperature drops to 135°F or below, clutch disengages which allows fan to run at maximum of 1000 RPM. Serviced as assembly.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

►*STARTING CAR BY PUSHING NOTE (AUTOMATIC TRANSMISSION CARS): Because of transmission design, car cannot be started by pushing.*

MODEL IDENTIFICATION

Series	①Series Designation
3000 (Standard)	30
3100 (Deluxe)	31

① - First two digits of series and body style designation following "62" year number under STYLE on Body Identification Plate

SERIAL NUMBER: Stamped on plate attached to left front door pillar. Number (example below) includes identification data.

① ② ③ ④
62 O M 01001

① - Year. 62 (1962).
② - Series. O - 3000. 1 - 3100.
③ - Assembly Plant. M - Lansing. C - South Gate, K - Kansas City.
④ - Beginning Vehicle Number.

ENGINE UNIT NUMBER: Stamped on front of right hand cylinder head.

Starting Unit Number - S-100001. Suffix letter indicates following: E - Low Compression Export Engine. G - 4-Bbl. Carburetor. H - Low Compression Export Engine and 4-Bbl. Carburetor. T - Turbo-Rocket Engine.

TUNE-UP

VALVE TAPPET CLEARANCE: Zero lash, hydraulic.

MANIFOLD HEAT CONTROL: None used. Intake manifold is heated by engine coolant.

CRANKCASE VENTILATION VALVE: Service at 10,000 mile intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. See *"Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .030".

Spark Plugs - AC 46FFX (2-Bbl. Carb.), 45FF (4-Bbl. Carb. & Turbo-Rocket Eng.), 42FF or 44FF (Heavy Duty). Tighten to 12-17 ft. lbs.

COIL: Delco-Remy 1115168 (Std.), 1115160 (Heavy Duty), 1115170 (Stamped 170) Turbo-Rocket Engine.

Ignition Current - 2.0 amps. idling, 4.5 amps. stopped.

Resistor (1115168 Coil) - Resistance wire (1.75-1.85 ohms) integral part of wiring harness connected in circuit between coil and No. 1 terminal of ignition switch. Bypassed during cranking by second lead from switch.

Resistor (1115160 Coil) - Delco-Remy No. 1931385.

Resistor (1115170 Coil) - .5 ohm.

DISTRIBUTOR: Delco-Remy 1110975 (Std. Eng. Synchro-mesh). 1110992 (Std. Eng. Hydra-Matic), 1110979 (Heavy Duty), 1111021 (Turbo-Rocket Eng. Synchro-mesh), 1111013 (Turbo-Rocket Eng. Hydra-Matic).

Condenser - Delco-Remy. **Capacity** - .19-.23 mfd.

Breaker Gap - .016" (1110975 & 992), .014-.018" (1110979). Gap will be correct when cam angle correctly set.

Cam Angle (1110975 & 992) - 30° (Limits 28-32°).

Cam Angle (1110979) - 29°±1°. Set each breaker individually. Will give .014-.018" breaker gap.

►*HEAVY DUTY DISTRIBUTOR NOTE:* After adjusting each breaker individually, cam angle with both breakers operating must be 34°±1°.

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Clockwise viewed from above.

Automatic Advance - 1110975 & 992

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	500	0-4	1000
5-7	1000	10-14	2000
8-10	1550	16-20	3100
11-13	2100	22-26	4200

Automatic Advance - 1110979

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	500	0-4	1000
5-7	950	10-14	1900
10-12	1400	20-24	2800

Automatic Advance - 1111013, 1111021

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	500	0-4	1000
5-7	1000	10-14	2000

Vacuum Spark Control: Delco-Remy 1116175 (1110975 Distr.), 1116194 (1110992 Distr.).

Vacuum Advance - 1116175 & 194

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5-7
12.5	25	15.25-17.0

Vacuum Advance - 1111013 Distr.

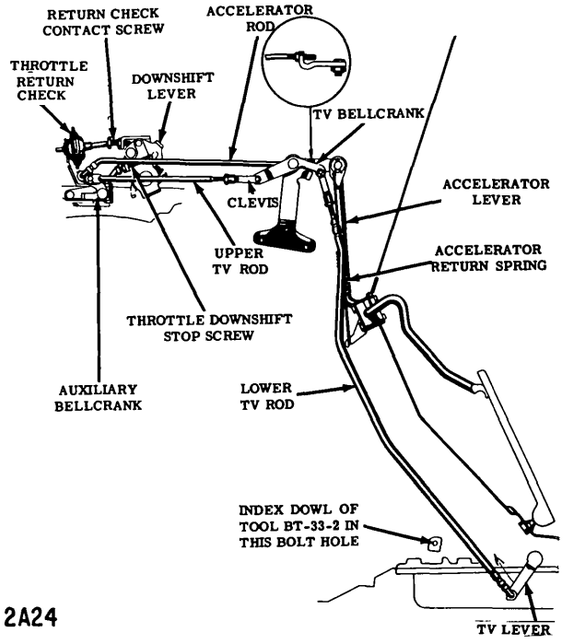
10.5-13	21-26	17

Vacuum Advance - 1111021 Distr.

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	9-11
10.5-13	21-26	17

IGNITION TIMING

Setting - 5° BTDC (Std. Eng. Synchro-mesh), 7½° BTDC (Std. Eng. Auto. Trans.), 10° BTDC (Turbo-Rocket Eng.), all at 850 RPM with distributor vacuum line disconnected and pipe plugged.



►*DETONATION NOTE:* If engine detonates with above setting due to low octane fuel or carbon build-up, timing should be retarded 2½°. If extra high octane fuel is used, timing may be advanced beyond 5° setting if no detonation occurs.

Timing Mark - Timing Indicator on chain case cover marked "O" (TDC), "5" (5° BTDC), "10" (10° BTDC). Align groove on harmonic balancer with correct mark on Indicator.

CARBURETOR

►*CARBURETOR APPLICATION: Rochester 2-Bbl. (Std.), Rochester 4-Bbl. (Optional on Std. Eng.), Rochester RC (Turbo-Rocket Eng.).*

THROTTLE LINKAGE ADJUSTMENT (Std. Eng. - All Carbs): Raise car and disconnect lower throttle valve rod from throttle valve lever on transmission, position Gauge BT-33-2 on transmission with index dowel on gauge in bolt hole on case (in boss at lower left front corner of case). Hole in lever must be centered within hole in gauge with lever held in rearward position. Bend lever as necessary with Tool BT-33-7. Connect rod to transmission throttle lever, then disconnect

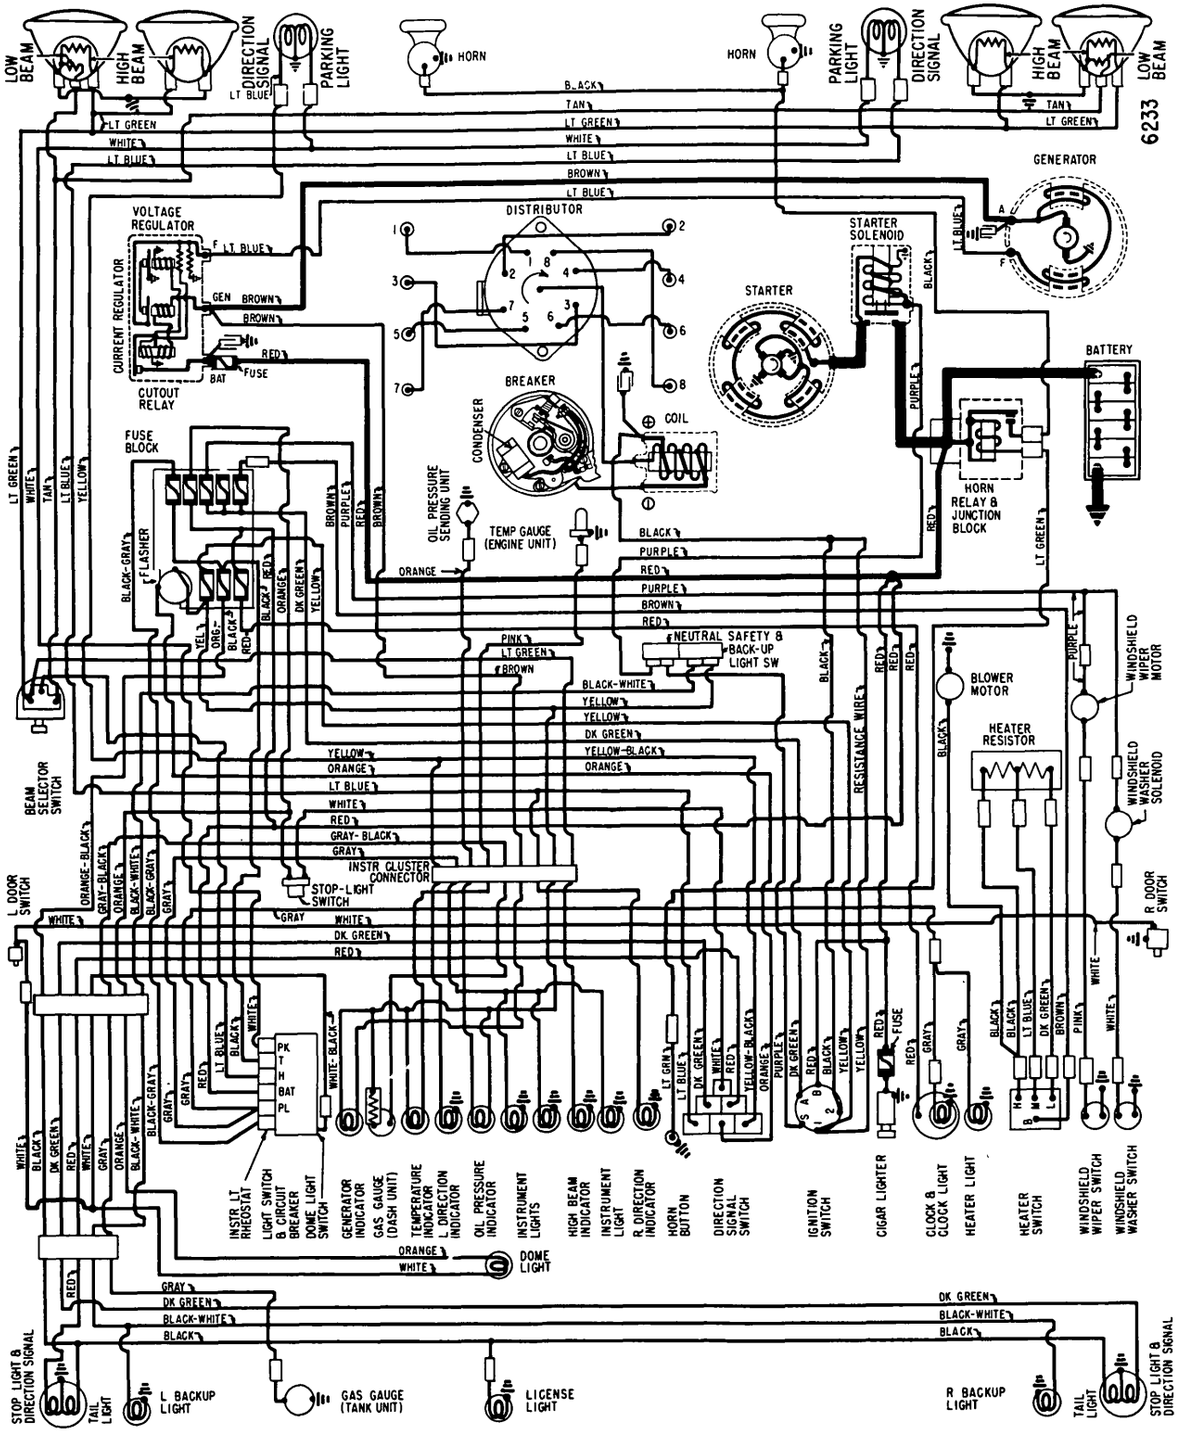
OLDSMOBILE F-85 AUTO. TRANS. THROTTLE LINKAGE (EXC. TURBO-ROCKET ENGINE)

upper end of rod from bellcrank, disconnect rear end of upper throttle valve rod from bellcrank. Hold bellcrank down at rear, press downward on lower throttle valve rod, adjust clevis at upper end of rod so that clevis pin is free fit in rod and bellcrank, connect rod. Remove air cleaner, block or move throttle return check out of the way, block choke valve open (on 4-Bbl. Carb., block intermediate choke lever) so that fast idle cam is released, back off throttle lever stopscrew so that throttle valves are completely closed. On 2-Bbl. Carbs., place Tool BT-6117 on machined surface of manifold and bend auxiliary bellcrank link as necessary so that top of accelerator rod just touches tool. On 4-Bbl. Carbs., bend auxiliary bellcrank link as necessary so that clearance between auxiliary bellcrank and gauging surface of carburetor throttle body is .020-.040". Adjust swivel on rear end of upper throttle valve rod so that rod is slightly short *(CAUTION - Swivel must turn freely on rod threads)*, connect rod to bellcrank. Hold bellcrank against stop and turn swivel to lengthen rod until swivel turns freely and feels "sloppy", continue to lengthen rod until all play has just been taken up and slight resistance is felt when turning swivel (resistance will be very slight and adjustment should be repeated until point where play has just been taken up has been determined), hold swivel from turning and tighten locknut. Loosen throttle downshift stopscrew locknut and back off stopscrew approximately six full turns. Use accelerator lever to move throttle valves to wide open position and overtravel the linkage to point of maximum transmission

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE



throttle valve lever travel *(CAUTION - Do not bend or str tch linkag)*, hold accelerator lever in this position and turn downshift stopscrew in until it just touches downshift lever tang, then **turn stopscrew in an additional 1½ turns (2-Bbl. Carb.), 1½-2 turns (4-Bbl. Carb.),** tighten locknut. Free choke valve. Run engine until normal operating temperature is reached, adjust slow idle speed to 500 RPM (550 RPM on Air Cond. Cars), fast idle speed to 1800 RPM (4 Bbl. Carbs. only), shut off engine. Adjust pedal height (see below) adjust throttle return check (see below).

Pedal Height Adjustment: With choke valve wide open and fast idle screw not contacting fast idle cam (4-Bbl. Carb.), position Tool BT-33-2 on rear end of accelerator rod (engage center hole of tool with clevis pin) with dowel pin end of tool extending forward. Loosen locknut and turn adjusting clevis on accelerator rod until end of gauge just touches cowl, tighten locknut.

Throttle Return Check Adjustment: With fast idle screw on high step of fast idle cam, adjust plunger screw for .020" clearance between end of screw and throttle lever.

THROTTLE LINKAGE ADJUSTMENT (Turbo-Rocket Eng.): Raise car and disconnect lower throttle valve rod from throttle valve lever on transmission, position gauge BT-33-2 on transmission with index dowel on gauge in bolt hole on case (in boss at lower left front corner of case). Hole in lever must be centered within hole in gauge with lever held in rearward position. Bend lever as necessary with Tool BT-33-7. Connect rod to throttle valve lever, then disconnect upper end of rod from bellcrank. Hold rod in downward position and bellcrank down at rear. Adjust clevis on upper end of rod as necessary so that clevis pin is free fit in bellcrank and rod clevis, connect rod. Remove air cleaner, disconnect upper end of carburetor rod from carburetor throttle lever, install Throttle Return Check Tool, J-6342-01, on return check plunger to hold plunger out of the way, back out slow idle stopscrew, make certain that fast idle screw does not contact fast idle cam (if necessary, block choke valve open with screwdriver inserted in carburetor bore). Back out auxiliary bellcrank stopscrew until bellcrank contacts the stop. Loosen locknut at lower end of carburetor rod adjusting sleeve, turn sleeve to shorten rod and connect upper end to front carburetor throttle lever, then while holding throttle valve in closed position by pressing on rear carburetor throttle lever, turn adjusting sleeve to lengthen carburetor rod until the rod links close and a slight load is felt on the sleeve threads, **then shorten rod one turn of the adjusting sleeve,** tighten the locknut. Loosen locknut at adjusting sleeve on rear end of upper throttle valve rod (at bellcrank), shorten rod slightly, then while holding bellcrank against its stop, lengthen rod until slight resistance is felt on adjusting sleeve threads, tighten locknut. Adjust engine idle speed to 550 RPM in Drive by turning throttle lever stopscrew, then adjust auxiliary bellcrank stopscrew until idle speed is affected (throttle valve begins to open), **back stopscrew out one turn.** Adjust fast idle speed to 1500 RPM with fast idle screw on second step of fast idle cam. Adjust accelerator pedal height *(s Std. Engin Adjustm nt data above)*. Adjust throttle return check *(see below)*. Loosen throttle down-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

shift stopscrew locknut (on auxiliary bellcrank) and back off stopscrew approximately six full turns. Use accelerator lever to move throttle valve to wide open position and overtravel the linkage to point of maximum transmission throttle lever travel *(CAUTION - Do not bend or stretch linkage)*, hold accelerator lever in this position and turn downshift stopscrew in until it just touches the downshift lever tang, then **turn stopscrew in an additional 1½ turns,** tighten locknut.

Throttle Return Check Adjustment: With fast idle speed correctly set, and fast idle screw on high step of fast idle cam, adjust plunger screw for .050" clearance between end of screw and lug on throttle lever.

ROCHESTER 2GC 2-BARREL

Model	Rochester Number Synchro-mesh	Auto. Trans.
No C.C.V. Early	7020053	7020051
No C.C.V. Late	7020981	7020980
With C.C.V. Early	7020959	7020957
With C.C.V. Late	7020983	7020982

C.C.V. - Closed Crankcase Ventilation.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

Idle Setting - Initial setting 1½ turns open. Turn screws out for richer mixture.

Idle Speed - 550 RPM (Synchro-mesh, & Air Cond.) 500 RPM (Auto. Trans. with Selector lever in "DR").

Float Level - 35/64" (Early Carbs.), 25/32" (Late Carbs.) with air horn inverted and gasket installed. Measure distance between lower edge (sharp edge) of float seam at outer end of float at toe and air horn gasket. To adjust, bend float arm.

Float Drop - 1 29/32" (Gauge BT-187) distance from gasket to bottom of float with air horn upright and gasket in place. To adjust, bend float tang.

Fast Idle: No adjustment. Will be correct when hot or slow idle correctly set.

Automatic Choke Setting: Centered at index.

Carb-Airator Adjustment: *NOTE - This is an external breather attached to carburetor on air conditioned cars to assist in reducing rich fuel and air mixture during hot idling.* In extreme hot temperature (95°F or over), if hot idle is rough or erratic or stalling occurs, tighten temperature screw (on side of unit) one turn and road test car. *CAUTION - Do not upset normal idle setting and do not overtight n screw.* If engine idles too fast under these extreme hot temperatures, tighten the air screw (directly below temperature screw unit).

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 2G & 2GC Carburetors" in Carburetion Section.*

ROCHESTER 4GC 4-BARREL

Model	Rochester No.
All Trans. Early, Std.	7020952
All Trans. Later, Std.	7020984
All Trans. Early Air Cond.	7020953
All Trans. Later Air Cond.	7020985
Heavy Duty	7020958

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

►*IDLE COMPENSATOR CAUTION:* Idle Compensator (Thermostatically controlled idle air bypass) used on air conditioned cars and must be in closed position when making idle setting and idle speed adjustments. Remove air cleaner and insert pencil or suitable tool in throttle bore.

Idle Setting - Turn adjusting screws in or out for desired mixture.

Idle Speed - 550 RPM (Synchro-mesh & Air Cond.), 500 RPM (Auto. Trans., with selector in "DR").

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 4GC 4-Barrel Carburetors" in Carburetion Section.*

ROCHESTER RC

For all data on this carburetor and Fluid Injection System used on supercharged Turbo-Rocket Engine, see "Oldsmobile F-85 Supercharged Jetfire Carburetor and Fluid Injection System" in Carburetion Section.

SUPERCHARGER

Turbo-supercharger used on Turbo-Rocket Engine. *See "Oldsmobile F-85 Supercharger" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC. Used as follows:

	Oldsmobile No.
Early Cars (Metal Cover)	5621774
Later Cars (Glass Bowl)	5621820

Fuel Pump Pressure - 5-6 lbs. at 1800 RPM (Std. Eng.), 6-8 lbs. at 1800 RPM (Turbo-Rocket Eng.).

Fuel Filter: Saran fuel filter on tank end of suction line and replaceable element type filter located in fuel line between fuel pump and carburetor.

Gasoline Gauge: AC Electric.

Dash Unit - AC No. 5643430.

Tank Unit - AC No. 5641870 (3-Seat Sta. Wgn.), No. 5642248 (Others).

Air Cleaner: Non-Disposable type. Service every 8,000 miles. Wash dirt from filter by plunging it up and down several times in clean kerosene and wringing dry. Oil filter element with SAE 20 oil, then squeeze out excess oil and reinstall.

Disposable Type (Heavy Duty) - Replace element every 16,000 miles or more frequently as required.

BATTERY

Delco-Remy No. 454. 12 volt, 9 plate, 40 ampere hour capacity (20 hr. rate).

Battery Ground - Negative.

Engine Ground - Rear of right hand cylinder head.

STARTER

Delco-Remy No. 1108303. Armature No. 1935829.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs. minimum.

Performance Data

Torque	RPM	Volts	℄ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

℄ - Includes solenoid.

Starter Switch: Delco-Remy 1114266 (solenoid) mounted on starter and controlled by combination Ignition & Starter Switch, Delco-Remy 1116587, and Neutral Safety & Back-up Light Switch (Hydra-Matic Transmission Cars).

Hydra-Matic Neutral Safety & Back-up Light Switch: Delco-Remy 579438 (Except cars with Console), 585058 (With Console).

Adjustment - *See "Oldsmobile F-85 Hydra-Matic Transmission" in Transmission Section.*

FUEL PUMP PRESSURE: 5-6 lbs. at 1800 RPM.

GENERATOR

Delco-Remy 1102236 (Std.), 1102230 (Police).

►*CHARGING CIRCUIT FUSE CAUTION: Battery charging circuit is protected by a fuse to "BAT" terminal of generator regulator. Check for blown fuse when diagnosing generator, regulator or battery failures.*

Performance Data

Model	Amperes	Volts	RPM
Std.	35	14.0	2630
Police	45	14.0	2520

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.69-1.79 Amps. (Std.), 2.66-2.86 Amps. (Police), at 12 volts and 80°F.

Belt Adjustment: Place Tension Tool BT-33-70 on generator belt (from under car between generator and crankshaft pulley). Loosen generator adjusting link bolt until index groove on tool plunger aligns with notches just above pointer (will provide recommended belt tension of 90 lbs.). Tighten adjusting link bolt to 14-17 ft. lbs.

GENERATOR REGULATOR

Delco-Remy No. 1119253 (Std.), 1119600 (Police).

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

►*DOUBLE CONTACT REGULATOR NOTE: Regulator 1119600 has double contacts for voltage regulation. NOTE - Specifications below are for "Normal" settings.*

Cutout Relay

Cuts In - 11.8-13.5 volts (1119253), 11.8-13.0 volts (1119600).

Contact Gap - .020" (All).

Air Gap - .020" (All) with contacts just closed.

Voltage Regulator

Setting (1119253) - 13.8-14.7 volts at 125°F ambient temperature.

Setting (1119600) - 13.8-14.6 volts (upper contacts), .1-.3 volt lower (lower contacts) at 125°F ambient temperature.

Contact Gap - .016" (upper contacts) with lower contacts just touching.

Air Gap (1119253) - .075" with contacts just touching.

Air Gap (1119600) - .067" with contacts just touching.

Current Regulator

Setting (1119253) - 31.0-35.5 amps. at 125°F ambient temperature.

Setting (1119600) - 38.0-45.0 amps. at 125°F ambient temperature.

Air Gap - .075" (All) with contacts just touching.

►*OTHER DATA: See "Delco-Remy 6 & 12 Volt Single Contact Regulators" & "Delco-Remy 1119600 Series Double Contact Regulators" in Electrical Section.*

ALTERNATOR

Delco-Remy Delcotron No. 1117070. Three phase type with internal rectifiers.

℄ Performance Data - Cold (70°F)

Amperes	Volts	RPM
58	14.0	2500

℄ - Rated output hot 60 amps.

Current Output - 25 amps. (approx.) at 525 Engine RPM.

Field Current - 6-6.6 amps. at 12 volts and 80°F.

Brush Spring Tension - 13 ozs.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Rotation - Clockwise at drive end.
Belt Adjustment: Tension Gauge J-7316 should read 80.
►*OTHER DATA: See "Delco-Remy Delcotron Alternators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy 9000554 (Indicator Light Relay & Transistorized Voltage Regulator) with separate Field Relay, Delco-Remy No. 1116895.

Indicator Light Relay

Setting - Points should close 2 volts lower than voltage regulator setting.
Air Gap - .075" with armature pressed down to point where contacts just touch.

Voltage Regulator

Setting - 13.0-13.6 volts, adjust to 13.4 volts at 125°F.
Air Gap - .075" with armature pressed down to point where contacts just touch.

Field Relay

Closing Voltage - 7.0-9.0 volts.
Sealing Voltage - 11 volts maximum.
Air Gap - .010" with contacts just touching.
Contact Gap - .015-.025".

►*OTHER DATA: See "Delco-Remy Transistorized Alternator Regulators ("A" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

►*INSTRUMENT PANEL PRINTED CIRCUIT NOTE:* Entire instrument cluster served by a printed circuit. All units in cluster are connected by a multiple contact plug which is keyed to prevent improper assembly. Service of printed circuit is by **replacement only.**

Instrument Cluster Removal: Disconnect positive cable from battery. Remove cluster cover attaching screws. Disconnect wiring harness, clock and speedometer cable at cluster. Remove cluster-to-instrument panel attaching nuts and washers from under instrument panel. To install, reverse removal procedure.

Speedometer Head Removal (Cluster Removed): Remove instrument cluster bezel-to-case attaching screws. Remove bezel and face. Remove speedometer head attaching screws from case assembly, then remove speedometer head. To install, reverse removal procedure.

Speedometer Head Printed Circuit Removal (Cluster Removed): Remove all cluster lamp sockets and circuit attaching screws. Remove hex nuts from fuel gauge mounting studs. Remove printed circuit. To install, reverse removal procedure.

Fuel Gauge Assembly Removal: Disconnect positive cable from battery. Remove cluster cover. Disconnect fuel gauge wiring connector and light socket from printed circuit. Remove attaching nuts and withdraw fuel gauge from front of cluster. To install, reverse removal procedure.

Headlight Switch Removal: Disconnect positive cable from battery. Disconnect wiring from light switch. Remove knob and rod by first pulling out to "ON" position, then depressing button on top of switch assembly and pull rod out. Remove escutcheon with Tool No. J-6592-01. Remove headlight switch from rear of instrument panel. To install, reverse removal procedure.

Stop Light Switch Location: Mechanical type mounted on bracket on pedal stop above brake pedal arm.
Adjustment - Adjust switch in its mounting bracket by loosening locknuts.

CIRCUIT BREAKERS: 20 Ampere - Headlights, High Beam Indicator, Parking & Tail Lights. In headlight switch. *NOTE - Tail lights and Instrument panel lights also protected by fuse, see below.*
FUSES: All fuses (Except as noted), located on fuse block attached to inside of cowl panel to left of steering column.
20 Ampere. Dome, Courtesy and Stop lights.
9 Ampere. Temperature Indicator, Oil Pressure Warning, Generator Warning, Back-up, License & Tail lights, Fuel Gauge, Turn Signal.
4 Ampere. Deluxe Radio.
20 Ampere. Heater and/or Air Conditioning, Electric Windshield Wipers & Washers.
3 Ampere. Instrument Cluster, Clock, Shift Indicator, Heater Ventilator & Air Cond. lights.
20 Ampere. Cigar Lighter (Instrument Panel). On back of lighter.
HORN RELAY: Delco-Remy 1116946.

ENGINE

ENGINE SPECIFICATIONS: Own V8. 90° valve-in-head aluminum block with non-replaceable cast iron cylinder liners. Cylinder heads are aluminum.

►*TURBO-ROCKET (SUPERCHARGED) ENGINE NOTE: This engine has modifications for higher power output including Pistons with heavier dome; Aluminum steel-backed bearings with heavier Main Bearing Caps; and Valves with aluminized heads. Specifications for all engines are listed below.*

Engine	Bore	Stroke	Displacement
All	3.5"	2.80"	215 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
Std.	8.75-1	39.2	155 at 4800 RPM
Optl. ①	10.25-1	39.2	185 at 4800 RPM
Optl. ②	10.25-1	39.2	215 at 4600 RPM

① - 4-Bbl. Carb. ② - Turbo-Rocket (Supercharged) Engine.

►*ENGINE SERVICE NOTE: For Aluminum Engine Service Cautions see "Engine" in Oldsmobile Special Data.*

►*ENGINE OPERATION IN LOW OCTANE AREAS (FOREIGN TRAVEL):* The following modifications should be made before attempting travel in low octane areas to prevent excessive detonation and resultant engine damage. Lower the compression ratio by making changes listed for fuel or octane rating listed below. *NOTE* - "Normal" octane requirements are 90 for standard engine and 99 for Power Pack Engine.

8.75-1 Compr. Ratio Engine

Octane Rating	Head	Gasket ①	Compr. Ratio	Spark Plugs
86	no change	.045" ②	8.25-1	47FF

10.25-1 Compr. Ratio Engine

88	8.75-1 Head	no change	8.5-1	47FF
85	8.75-1 Head	.045" ②	8.0-1	47FF

① - Std. Head Gasket Thickness .020".
② - Kit No. 583457 (incl. Head and Intake Manifold Gaskets).

►*MODIFIED ENGINE (FOREIGN TRAVEL) TIMING NOTE:* Ignition timing may have to be set in range of 5°BTDC to 0° TDC if detonation still occurs.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*
INTAKE MANIFOLD: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*
TIGHTENING TORQUES: *See "Tightning Specifications" in Oldsmobile Special Data.*
OIL PAN REMOVAL: Raise car and drain oil, then disconnect relay rod from steering idler arm. Remove cover on front of lower flywheel housing and remove pan bolts. *NOTE* - On some types of lifts, it may be necessary to drop oil intake pipe and screen assembly into oil pan before removing pan. Position crankshaft so counterweights do not interfere with pan removal.

PISTONS

►*PISTON IDENTIFICATION NOTE:* Standard engine piston has elongated "V" notch in head. Turbo-Rocket engine has square end "V" notch in head.
Aluminum alloy, All-Aluminum, cam ground, tin plated.
Weight - 14.78 ozs. (Std. Eng.), 14.92 ozs. (Turbo-Rocket Eng.).
Removal - Pistons & Rods removed from above.
►*CAUTION:* Mark pistons, rods, and bearing caps with number of cylinder before removing to insure correct reinstallation.
Clearance - .0005-.0011" at thrust surface.
Fitting Pistons - Use a .0015" x ½" x 12" feeler(ribbon) between inverted piston (pin and rings removed) and cylinder wall at right angles to piston pin position. Pull to withdraw feeler should be 3-8 lbs.
Replacement Pistons: Furnished with fitted pins in Std., and .010" Oversize (Std. Eng.), .030" Oversize (H.D. Eng.).
Installing Pistons - Install piston on connecting rod with "F" on piston pin web and notch in head toward front of engine. *See Rod Installation.*

PISTON PIN

Pressed in rod. Pins are offset in piston .040" to right of cylinder bore centerline.
Diameter - .8747-.8750". **Length** - 2.860-2.880".
Pin Fit in Piston - .0003-.0005" loose. Pin should not fall through piston of own weight when using the low limit (.0003"). Can be pushed into place with hand.
Pin Fit in Rod - .0009-.0014" tight. *NOTE - Special tools required. See "Piston Pins" in Oldsmobile Special Data.*
Replacement Pins: Furnished in Std. size only.

PISTON RINGS

Two compression and one oil ring used. Upper ring chrome plated, lower ring Ferrox treated. Oil ring is spring steel.

Ring	Width	End Gap	Side Clearance
Compr. (1&2)	.0780-.0785"	.010-.020"	.002-.004"
Oil (3) ①	.2184-.2319"	.015-.055"	.0005-.0055"

① - Three-piece, consisting of two rails and a spacer.
Replacement Rings: Std. & .010" oversize.

CONNECTING ROD

Length - 5.660" center-to-center.
Crankpin Journal Diameter - 1.999-2.000".
Bearings - Steel back Durex 100 with 4167M babbitt overlay (Std. Eng.), Moraine M-400 steel back aluminum (Turbo-Rocket Engine). *IDENTIFICATION NOTE:* Bearings marked on back as follows: GMMA (Std. Eng.); M-400 (Turbo-Rocket Engine).
Clearance - .0002-.0022".

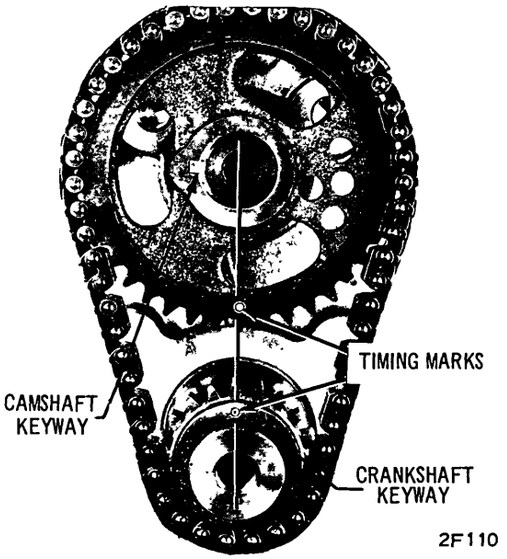
CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Endplay - .006-.014" (total for both rods).
Installing Rods - Install piston and rod assembly in engine with identification boss on rod and cap toward **front of engin** (Right Hand Cylinders); toward **rear of engin** (Left Hand Cylinders). Oil spurt hole in rod must be upwards.
Replac ment B arings: Std., .002", .010" & .020" Undersize.

CRANKSHAFT



►*TURBO-ROCKET ENGINE CAUTION:* Special bearing caps and longer bolts used. Bolts can be identified by length (from end to underside of head) as follows: 3 5/32" (Std. Engine), 3 7/16" (Turbo-Rocket Engine). *See Bearing data below.*

B arings - Steel back Durex 100A with 4176M babbitt overlay (Std. Eng.), Moraine M-400 steel back aluminum (Turbo-Rocket Eng.). *IDENTIFICATION NOTE:* Bearings marked on back as follows: GMMA (Std. Eng.), M-400 (Turbo-Rocket Eng.).

Clearance - .0008-.0024". **Wear Limit** - .0035".
►*CAUTION: UPPER AND LOWER MAIN BEARING SHELLS MUST BE INSTALLED IN MATCHED PAIRS.*
Replac ment B arings - Furnished in Std., .001", .002" & .010" Undersize.
End Thrust: Taken by No. 3 (center) main bearing.
Endplay - .004-.008".
Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Oldsmobile Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Oldsmobile Special Data.*
►*BALANCER, CRANKSHAFT, FLYWHEEL REPLACEMENT CAUTION: See "Crankshaft & Bearings" in Oldsmobile Special Data.*

CAMSHAFT

►*HEAVY DUTY ENGINE NOTE:* Special camshaft No. 583043 used.
Journal Diameter - (1) 1.785-1.786", (2) 1.755-1.756", (3) 1.725-1.726", (4) 1.695-1.696", (5) 1.665-1.666".
Bearings - Five Steel Backed Babbitt.
Clearanc - .0005-.0025" (1), .0005-.0035" (Others).
Endplay - .011-.059".
Camshaft S tting - Mesh chain with sprocket marks adjacent and in line with straightedge across shaft centers.
Timing Chain: Width - .875". **Length** - 54 links. **Pitch** - .375".
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Oldsmobile Special Data.*
►*FUEL PUMP ECCENTRIC NOTE:* Fuel pump eccentric bolted to front of camshaft ahead of sprocket with cupped side out.
►*CAMSHAFT REPLACEMENT CAUTION:* Coat camshaft liberally with engine oil mixed with GM Concentrate Part No. 567725 to insure proper installation and provide initial lubrication.
Engine Front Cover Rem val & Installation: *See "Engine Front Cover" in Oldsmobile Special Data.*
Engine Fr nt C v r Oil Seal (Crankshaft Front Seal) Installation: *Se "Engine Front Cover" in Oldsmobile Special Data.*

VALVE TIMING MARKS

VALVES

►*TURBO-ROCKET ENGINE NOTE:* Valve heads and seats are Aluminized.
Tappet Clearance: None in service (hydraulic).

Valve	Head Diam.	Stem Diam.	Length
Intake	1.517-1.527"	.3427-.3432"	①
Exhaust	1.348-1.358"	②	③

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.384"	.0010-.0025"
Exhaust	45°	.384"	④

① - 4.863" (2-Bbl. Carb.), 4.943" (4-Bbl. Carb.).
② - .3427-.3422" (Top), .3417-.3412" (Bottom).
③ - 4.861" (2-Bbl. Carb.), 4.941" (4-Bbl. Carb.).
④ - .0015-.0030" (Top), .0025-.0040" (Bottom).
Valve Seat Width - .037-.075".
Valve Stem Oil Seals: Inverted cup (Oil deflector) over valve stem inside valve spring.
Valve Springs: Single spring used on all valves.

Spring Specifications

Valve	Lbs. Pressure	Length
Closed	70-80	1.750"
Open	160-175	1.350"

Free Length - 2.150".
Valve Guides: Press fit. To remove, support cylinder head and drive out valve guide with Tool No. BT-68-5A. To install, lubricate guide and bore with engine oil. Place valve guide into cylinder head with outside beveled end up. *NOTE* - Intake guides must be installed with grooved end up. Place guide installer Tool No. BT-68-5B over new guide and drive until tool makes contact with cylinder head. This positions guide.
►*OVERSIZE VALVE GUIDE NOTE:* Oversize valve guides identified by 2 grooves (.001"OS), 1 groove (.010"OS), 3 grooves (.011"OS). When replacing guides use .001" oversize guides.
Valv Lifters: Hydraulic lifters standard on all models. Mechanical lifters available with special camshaft on heavy duty engines.
Diameter - .8422-.8427". **L ngth** - 1.997-2.007".
Clearance in Block - .0008-.0023" selective.
Replacement Lifters: Standard only.
Hydraulic Lifter Removal, Overhaul & Testing: *S "Valve System" in Oldsmobile Special Data.*
Rocker Arm Assembly: *See "Valve System" in Oldsmobile Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications (Standard Engine)

Intake Valves - Open 22° BTDC. Close 58° ALDC.
Exhaust Valves - Open 60° BTDC. Close 20° ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM:* *See "Engine Lubrication" under OILING SYSTEM in Oldsmobile Special Data.*
Crankcase Capacity: 4 qts. refill, 5 qts. with filter change.
Intake Valves - Open 22° BTDC. Close 58° ALDC.
Exhaust Valves - Open 60° BLDC. Close 20° ATDC.
Normal Oil Pressure: 30 lbs. at 2400 RPM.
Pressure Regulator - In pump body. Not adjustable.
Oil Pressure Indicator - Oil pressure warning lights on instrument panel and oil pressure switch on oil pump. Lights when pressure below 3 lbs.
Engine Unit - AC No. 1508668.
Oil Pump: Gear type. Located in front engine cover.
Oil Pump Removal, Overhaul & Installation - *S e "Oiling System" in Oldsmobile Special Data.*
Oil Filter: Full-flow type with throwaway filter element. Located on oil pump cover. Replace filter every 4,000 miles or more frequently as operating conditions require.
Replacement Filter Element - AC PF-7.
Crankcase Ventilati on: Standard Cars - Air intake at oil filler and breather cap at rocker arm cover. Air outlet is connected to ventilating baffle at other rocker arm cover.
Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to intake manifold with a valve in the line. *See "Positive Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 10½ qts. (Less Air Cond. & Heater). 11 qts. (Air Cond. less Heater), add 1½ qts. for heater.
Pressure Valve - 15 lb. radiator filler cap.
Thermostat: AC No. 1199784 (170°F). Located in water outlet on intake manifold.
Water Pump: Packless, sealed ball bearing type. Serviced by replacement only.
Removal - Drain cooling system, disconnect heater and lower radiator hoses from pump. Loosen pulley belts, then remove fan and pulley from pump. Remove pump-to-front cover attaching bolts. Remove pump.
Fluid Fan Drive: Standard on all cars with Air Cond.
Temperature Indicator: Controlled by thermal switch in right front of intake manifold. A red light indicates temperature has reached 238°±2°F (Cars without A.C.).
Engin Unit - Delco-Remy 1993513.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

PONTIAC V8 & TEMPEST 4 CYLINDER

	Ft. Lbs.
Cylinder Head	85-100
Intake Manifold	30-45
Exhaust Manifold	20-35
Oil Pan	8-15
Main Bearing Cap (Rear)	110-130
Main Bearing Caps (Others)	90-110
Flywheel	85-100
Vibration Damper	130-190
Crankshaft Pulley	130-190
Con Rod Caps	40-46
Camshaft Sprocket	30-45
Rocker Arm Cover	45-80 in. lbs.
Pushrod Cover	25-70 in. lbs
Engine Front Cover (To Oil Pan)	10-20
Water Pump	10-25
Oil Pump	20-35
Oil Filter	20-35
Clutch Housing (Pontiac V8)	60-90
Clutch Housing (Tempest 4 Cyl)	40-60
Transmission to Clutch Housing (Pontiac V8)	45-60
Transmission to Clutch Housing (Tempest 4 Cyl)	35-40

ENGINE

ENGINE REMOVAL: Pontiac - *NOTE* - Engine removed with or without transmission Detail following includes transmission with engine

1) Drain water, engine and transmission oil Remove hood Disconnect all wires, pipes and throttle linkage Remove carburetor, crankcase ventilator pipe, heater hoses, cooler lines, radiator and fan, battery and cables

2) On Power Steering Cars, remove pump belt and pump from mounting bracket and secure assembly out of way

3) Disconnect exhaust pipe from crossover pipe, and disconnect gearshift linkage.

4) On synchro-mesh cars, disconnect clutch fork linkage and remove clutch countershaft bracket from flywheel housing

5) Remove propeller shaft assembly Raise engine slightly by hooking chain to intake manifold, threading chain through holes behind carburetor

6) Remove front and rear insulator mounting screws. Disconnect cooler lines at timing cover

7) On Auto-Trans cars, place transmission jack under transmission and remove frame crossmember *CAUTION - Without jack for support, transmission will swing down when crossmember removed*

8) Hoist engine and transmission out of chassis

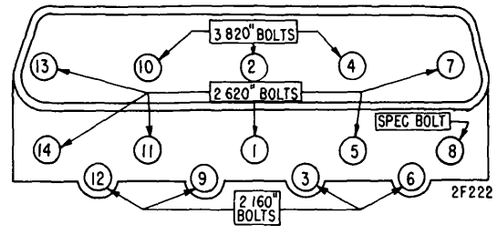
ENGINE REMOVAL: Tempest - Remove hood, drain and remove radiator Disconnect heater hoses at engine Disconnect all accessible wires Disconnect fuel line at fuel pump, then disconnect vacuum modulator line (Auto Trans.). Disconnect battery ground strap Remove front fender cross brace, fan and pulley, and disconnect accelerator rod at engine Raise front of car Disconnect clutch and shifting linkage (Synchro-mesh). Disconnect exhaust pipe at manifold. Place wooden block at rear of engine Disconnect propeller shaft and torque tube from rear of engine Disconnect engine support at crossmember Carefully raise engine with chainfall or overhead hoist Move engine forward to clear firewall and heater. To install, reverse removal procedure.

CYLINDER HEAD & MANIFOLD

PONTIAC V8 & TEMPEST 4 CYL.

CYLINDER HEAD: Removal - Remove intake manifold, pushrod and rocker arm cover Loosen rocker arm retaining nuts and move rocker arms off pushrods. *NOTE - Remove pushrods but keep them separated for reinstallation in original position.* Remove crossover pipe to manifold attaching screws. Remove battery ground and engine ground straps on left head or engine ground strap and Hydra-Matic oil level indicator tube bracket on right head Remove head screws (head held in place by dowels) and remove head with exhaust manifold attaching Hooks J-4266 *CAUTION - Handle head carefully as rocker arm studs are hardened and may crack if struck NOTE* - Left head must be raised off dowels, moved forward and "jockeyed" to clear power steering and brake equipment

Installation - Right and left heads are the same. *NOTE - When installing new head, transfer all serviceable parts to new head Use new seals on all valve stems and new exhaust manifold gasket. Install new intake manifold mounting studs Check rocker arm position with Gauge J-6324* Reverse removal procedure and note the following Head screws are of three different lengths and will project an equal distance from head DO NOT use sealer of any kind on threads



TEMPEST ALUMINUM V8

CYLINDER HEAD: Removal - Remove intake manifold. Pull spark plug wire retainer from brackets on rocker arm cover, disconnect wire at plugs, then swing wires and loom out of way. Remove rocker arm cover, gasket, vent pipe (right side of engine), 4 bracket-to-cylinder head attaching bolts, rocker arm and shaft assembly Remove pushrods. *NOTE - Keep pushrods separated for reinstallation in original positions.* Disconnect exhaust manifold at exhaust pipe, then disconnect battery ground strap at right front outer cylinder head bolt stud Remove cylinder head bolts (14) and rear generator attaching bolt. Remove cylinder head, gasket, and exhaust manifold as an assembly *CAUTION - Aluminum is easily damaged. Use care to protect gasket surfaces*

Installation - Install new gasket on block dowels. DO NOT USE SEALER Install cylinder head after coating head bolts with special non-hardening sealing compound. Tighten head bolts a little at a time until snug, then torque to 50-55 lbs using sequence in diagram. *Locations of different length bolts also illustrated in diagram.* Install pushrods in original location and position through cylinder head opening so rods are correctly positioned on lifter plungers. Notch at one end of rocker arm shaft must be upward Set rocker arm and shaft assembly in place and start several bolts into head Tilt rocker arms toward pushrods and locate top of pushrod in its rocker arm seat. Draw down rocker arm and shaft assembly by tightening 4 bracket bolts a little at a time. Torque bolts to 25-35 lbs. Install rocker arm cover and gasket. Install vent pipe, connect spark wires and battery ground strap

PISTON PINS

Removal: *NOTE Piston Pin Remover & Replacer Set, J 6901 is used Individual parts are marked with respective numbers* Place plunger of Tool J 6901 into

TEMPEST V8 ALUMINUM ENGINE
CYLINDER HEAD DIAGRAM

piston pin bore and position on arbor press Put J-6901 5 between connecting rod and piston boss Put J-6901 3 in pin and press until pin bottoms in J 6901 Remove J 6901 5 and plunger and spring from J-6901 Reposition on arbor press and press pin out of rod

Installation: Place plunger and spring in J-6901 and place plunger in piston pin bore Position on arbor press Coat pin and rod lightly with graphite lubricant Insert pin put J 6901 3 in pin and press pin in until it bottoms against plunger of J 6901 Piston must turn freely on pin *Pin must not move under 1500 lb minimum load after assembly*

Oversize Pin Installation - 001" and 003" oversize pins can be installed Connecting rod can be honed to fit **but must be 0008- 0016' smaller than th pin used**

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL REPLACEMENT·

1) Drain oil and remove oil pan, oil pump, and oil pump drive shaft Remove oil baffle and cylinder block to oil baffle tube (lower oil level indicator tube) Remove transmission (See Synchro-mesh Transmission Removal on Car Page or Hydra-Matic Drive in Transmission Section). On 4 Cylinder cars, support engine and remove front crossmember assembly

2) Remove rear center main bearing cap and upper half of rear center main bearing shell to allow crankshaft to be lowered and to prevent damage to thrust surfaces of bearing Remove rear main bearing cap and loosen remaining bearing caps sufficiently to allow crankshaft to be lowered approximately ½" at rear

3) With crankshaft lowered to provide clearance, remove upper half of rear main bearing oil seal and bearing shell

4) Install seal in cap, compress with Tool J-7588, and trim one end flush with cap *NOTE - On engines with no cast slots in seal groove in block, rotate seal in cap and recompress slightly to eliminate bumps caused by seal retention slots in cap* Remove seal from cap and turn end-for-end and install in block by slipping up over crankshaft into seal cavity Install rear center main bearing cap and bearing shell and torque to 95 ft lbs Trim both ends of seal flush with block

5) Install a new seal in cap as above and trim flush with cap Install cap with shell and tighten to 120 ft lbs Remove rear main bearing cap again and inspect split line to be certain that none of seal material has been compressed between cap and block Make sure mating surfaces are clean

6) Next, apply a bead of sealer (Permatex No. 3) approx.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

1/16" in diameter to mating surface of cap extending from packing seal groove outward to the groove for oil pan cork rear gasket. Install rear main bearing cap and tighten to 120 ft. lbs. torque.

7) Remove rear center main bearing cap and reinstall upper half of bearing shell. Install cap and tighten to 95 ft. lbs. Tighten remaining bearing caps to 95 ft. lbs. Replace transmission, oil pump, oil pump drive shaft, oil baffle, oil pan and flywheel lower cover and shield.

►*CAUTION:* Seal must be installed exactly as detailed above to prevent oil leaks at rear bearing. Make certain that seals not cut too short and that mating surfaces of bearing cap and block are free of any packing material, dirt or oiliness (except for Permatex bead on cap) and that they are not scratched or burred.

VIBRATION DAMPENER

VIBRATION DAMPENER: Removal–Loosen generator at adjusting strap and remove fan belt from vibration dampener. On cars equipped with power steering, also remove power steering pump belt. Position fan so wide angles will be at top and bottom allowing access to dampener Remove dampener attaching screw (15/16" socket) and retaining washer, and slide dampener off shaft.

Installation: Reverse the removal procedure.

ENGINE FRONT COVER

ENGINE FRONT COVER: Removal - Drain cooling system. Remove generator adjusting strap, fan and accessory belt, and fan pulley and fan from water pump. Disconnect radiator hoses and remove fuel pump and vibration damper. On 4 cylinder cars, loosen timing cover attaching bolts and loosen timing cover-to-intake manifold draw bolt, then remove cover. On V8, remove oil pan-to-cover screws, cover-to-oil cooler line screws, and cover-to-block screws and nuts, then pull cover forward to clear studs and remove.

CRANKSHAFT FRONT OIL SEAL REPLACEMENT: After front cover removed (above), slide old seal off end of crankshaft. Coat face of new seal with graphite lubricant and install on crankshaft before installing front cover.

CAMSHAFT & BEARINGS

►*NOTE:* Camshafts on 4 cylinder cars can be removed by first removing radiator grille lower panel, grille, and hood latch as an assembly. Then remove front bumper assembly, drain radiator and remove. Engine will then be accessible for camshaft removal.

CAMSHAFT REMOVAL & INSTALLATION: Drain radiator. Remove intake manifold, crankcase ventilator outlet pipe, pushrod cover and rocker arm covers. Disconnect and move spark plug wires out of way. Loosen rocker arm ball nuts so rocker arms can be disengaged from pushrods and turned sideways. Remove pushrods and hydraulic lifters. Mark or store pushrods and lifters so they can be installed in original positions Remove radiator and timing chain cover. Remove timing chain cover seal and fuel pump eccentric. Slide timing chain and sprockets off ends of crankshaft and camshaft. Remove distributor. Remove camshaft thrust plate attaching screws and remove thrust plate. Slide camshaft out of engine carefully, making sure not to damage bearings in block. Front of engine should be raised as necessary to permit shaft to slide between grille and hood catch support plate. To install, reverse removal procedure.

TIMING CHAIN

►*1961-1962 4 CYL. TIMING CHAIN FAILURE CORRECTION, TIMING CHAIN BUMPER AND BRACKET PRODUCTION CHANGE NOTE & TIMING CHAIN WEAR CHECK:* Install new bumper spring damper Part No. 543287, new bumper bracket Part No. 543285 and new timing chain bumper spring Part No. 539298. Install these new parts whenever timing chain cover removed. Above change went into production beginning Eng. No. 116591. *NOTE - When replacing these parts, check timing chain as follows:*

1) Turn crankshaft clockwise to remove slack from timing chain tension span.

2) Place straightedge against slack span, tangent to sprockets.

3) Apply 10 lbs. minimum force against center of slack span. Slack span should not displace more than 3/8" from straight line. Replace chain if chain slack exceeds 3/8".

TIMING CHAIN TENSIONER (4 CYLINDER CARS): Removal - Right hand bumper must be removed first, because of hook in each end of spring. DO NOT attempt to remove spring by twisting or stretching spring. *To install, reverse removal procedure, and note the following:* Bumper bolts should not bottom in threads. If they do, tap deeper with bottoming tap. Check to see that two-bolt bumper bracket is wider than gap between each bolt head and block. The single bolt shoulder should bottom on block face, allowing bracket to rotate freely.

VALVE SYSTEM

CHECKING VALVE STEM LENGTH: Position rocker arm on stud and hold in place using Rocker Arm Stud Installer J-8927. Slip valve into place and hold it against valve seat. While holding rocker arm and valve in position securely, insert Valve Train Gauge J-8928 through pushrod hole and seat snugly in pushrod seat of rocker arm. With all parts seated, step end of gauge should be flush with gasket face of head *(See NOTE below),* but should not project past step on gauge. If gauge projects too far (valve stem too long), grind off tip of valve stem as necessary. *CAUTION* - When grinding end of valve stem be careful not to overheat it (may soften hardened stem).

►*NOTE:* Undercut cylinder head requires a straightedge at this point. Clamp straightedge on lower inboard side of head (flush with bottom of head). This is the reference point.

ROCKER ARMS

ROCKER ARM STUD REPLACEMENT: *NOTE - Use oversize stud (.003") only when original stud is found to be loose in cylinder head. Use standard size stud for replacement when original stud threads are damaged.*

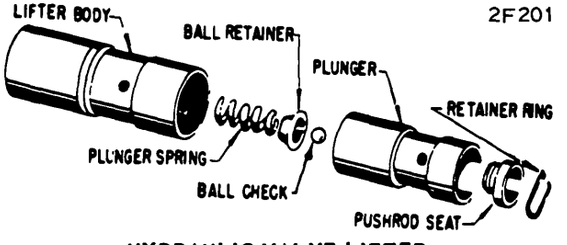
Removal: 1) Remove cylinder head. With rocker arm removed, file two slots, 3/32"x1/8" deep, on opposite sides of rocker arm stud. Top of slots should be 1/4-3/8" below thread travel. Place washer J-8934-3 at bottom of rocker arm stud. Position rocker arm stud Remover J-8934-1 on rocker arm stud and tighten screws securely with 5/32" Allen wrench. Place spacer J-8934-2 over stud remover. Thread 7/8" standard nut on stud remover and turn nut until rocker arm stud is out of cylinder head. If oversize stud being installed, ream out stud hole with Reamer J-5715.

2) Remove plugs from ends of cylinder head oil gallery and thoroughly clean out metal deposits and foreign matter from cylinder head (head must be right side up so metal or foreign material will not lodge around studs).

Installation: 1) Position rocker arm on new rocker arm stud and place Rocker Arm Stud Installer on stud in place of rocker arm ball. Carefully press stud into head using a 2-ton press, until it is installed about half-way (7/16").

2) Position Valve Train Gauge in pushrod hole so that it seats properly in the rocker arm. With valve seated, slowly press rocker arm stud into cylinder head until gauge projects about midway between end of gauge and step with respect to gasket surface of cylinder head

►*NOTE:* It will be necessary to clamp a straightedge along edge of cylinder head (undercut head) to simulate this gasket surface.



3) Remove Rocker Arm Stud Installer, rocker arm and ball. Blow air through hole in new stud to insure that passage is not restricted, and blow air through oil gallery. Replace plugs in ends of oil gallery. Check oil passages from oil gallery to all studs. Install rocker arm and ball and install nut loosely. Replace cylinder head.

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTER OVERHAUL: Removal– Remove intake manifold, pushrod cover and rocker arm cover. Loosen rocker arm ball nut and move rocker arm off pushrod. Remove pushrods and lifters.

Disassembly: Remove pushrod seat retaining ring by holding down seat with pushrod while dislodging spring from lifter body with pointed tool (*NOTE*–it may be necessary to unseat lifter ball, using plunger unloader J-5097, before plunger can be pushed down). Invert lifter and allow plunger to slide out of body. If plunger sticks, place lifter in large end of Hydraulic Valve Lifter Plunger Remover J-4160-A, with pushrod end of lifter downward. Hold tool firmly in hand with thumb over lifter body and strike sharply against a block of wood until plunger falls out (it may be necessary to soak a lifter with a stuck plunger in cleaning solvent to loosen plunger in body). *CAUTION–If more*

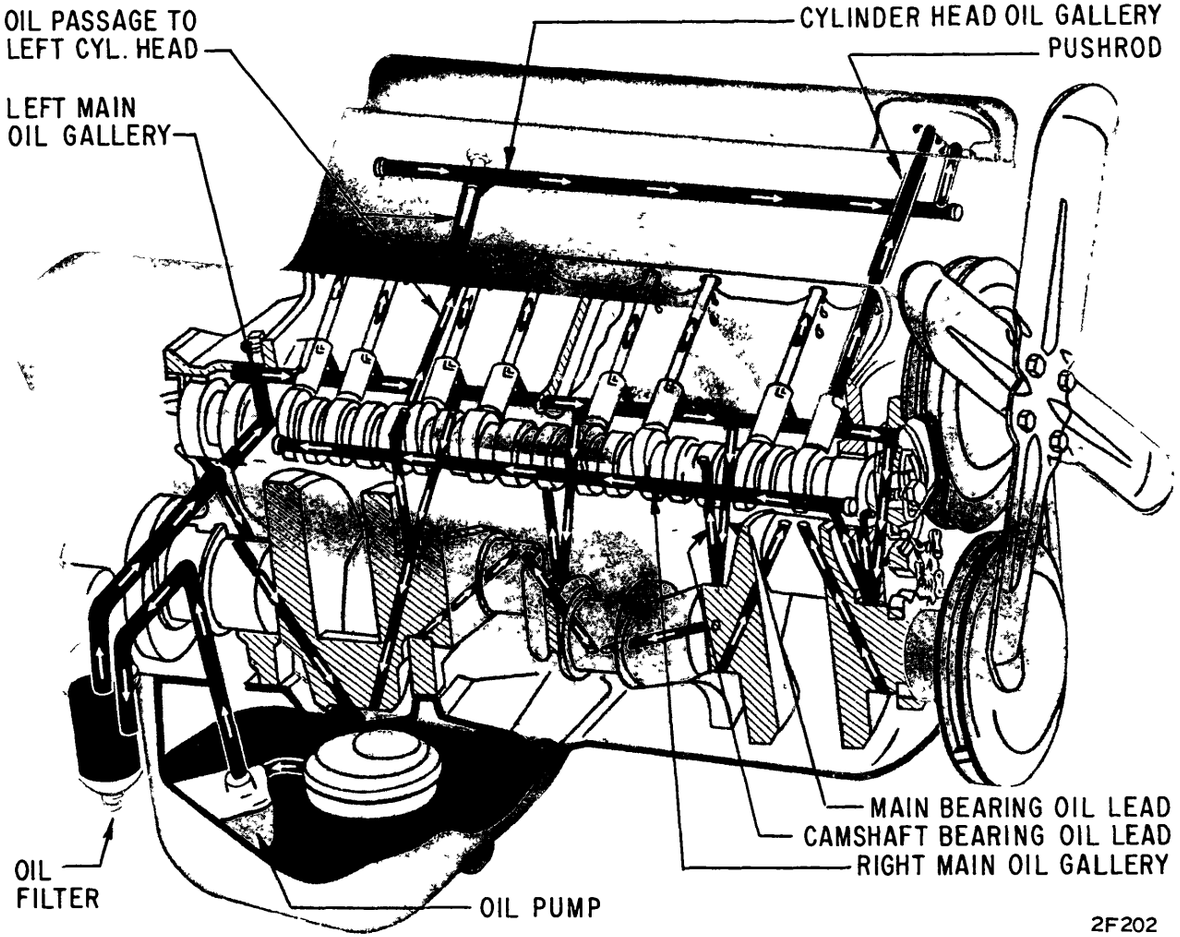
CONTINUED ON NEXT PAGE

HYDRAULIC VALVE LIFTER

CONTINUED FROM PRECEDING PAGE

than one lifter is being disassembled at a time, make very sure that parts for each individual lifter be kept together so that parts are not intermixed.

Inspection: Wash individual lifters separately, keeping parts for each lifter together. If necessary, soak lifter in suitable carbon solvent to dissolve varnish and carbon. Using a lint free cloth, clean each part with a hard wiping action. Use a bristle brush if required. Do not use a wire brush or sandpaper. Inspect lifter body for scoring, and check cam surface at end of lifter for wear. Check plunger, and using a magnifying glass, inspect check ball seat for defects, and outer surface of plunger for scratches or scores. Inspect pushrod seat for roughness and make sure hole in seat is open. Inspect lifter ball for nicks or scoring. If any part of lifter is found defective, replace entire unit.



Assembly: Rinse all parts in clean kerosene before assembly and assemble without drying. Rinse plunger spring and ball retainer and position retainer in spring. Install ball in retainer. Rinse plunger and place on retainer so seat on plunger mates with ball. Invert plunger with parts assembled thus far and, after rinsing body, install body over spring and plunger. Place lifter body on clean paper; rinse and install pushrod seat and retainer ring.

Checking Leakdown Rate: Fill tester cup in Valve Lifter Leakdown Tester J-5790, to approximately 1 inch from top with special testing fluid. Swing weight arm up out of way, raise ram, and position lifter into boss in center of tester cup. Place 7/32" steel ball in pushrod seat of lifter and lower ram onto ball. Adjust ram (with weight arm clear of ram) so that pointer is positioned on set line (marked "S"). Tighten jam nut to maintain setting. Operate lifter through full travel of plunger by pumping weight arm to fill lifter with test fluid and force out air, (Lifter must be completely submerged at all times). Continue pumping for several strokes after definite resistance is felt (*NOTE*–If noticeably weak resistance is felt during any one of last few strokes (of hard pumping), replace ball in lifter and repeat test to this point. Raise weight arm to allow plunger spring to expand fully; lower arm onto ram and commence turning crank slowly (1 revolution every 2 seconds). Time indicator travel from lower line (first line above set line) to line marked .125" or 1/8", while still rotating cup with crank. **Lifter is satisfactory if rate is between 12 and 40 seconds. Check a questionable lifter 3-4 times before discarding.**

Installation: *(CAUTION–If new lifter is to be installed, remove sealer coating from new lifter, making sure that hole in pushrod seat is not plugged with sealer coating. Check leakdown rate).* **Place new lifter in lifter boss and replace pushrod exactly as removed (same end against rocker arm). Tighten rocker arm ball** retaining nuts to 15-25 lbs. Replace rocker arm cover, pushrod cover and intake manifold.

OILING SYSTEM
ENGINE LUBRICATION

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and to hydraulic valve lifters.

PONTIAC V8 ENGINE OILING SYSTEM (4 CYL. ENGINE SIMILAR)

Metered oil is supplied to pushrod seats, rocker arms, timing chain and sprockets, and distributor drive gear. All other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted on lower face of block in rear of crankcase draws oil up through floating oil strainer and intake pipe mounted on pump body and delivers oil through passages in pump body and crankcase to inlet port on oil filter mounting pad on right side of crankcase. From filter outlet, oil flows through transverse passage in rear end of block to rear end of left main oil gallery which extends along entire length of engine block. At forward end of left main oil gallery a "V" passage extends down to crankshaft bearing and up to forward end of right main oil gallery which also extends along entire length of engine block. Oil is distributed through these oil galleries as follows:

Crankshaft & Camshaft Bearings - Rear bearings are lubricated through short vertical passage extending between crankshaft bearing bore and camshaft bearing bore and intersecting the oil filter outlet passage (above) from which oil is supplied to these bearings. **Other** bearings are lubricated by "V" passage in each crankcase web which extends down from left main oil gallery to crankshaft bearing bore and then up to camshaft bearing bore (additional passage at front crankshaft bearing supplies oil to right main oil gallery).

Connecting Rods - Crankshaft is drilled and each connecting rod bearing is lubricated through drilled hole from adjacent main bearing.

Pistons & Pins - Lubricated by oil jet thrown on cylinder walls through groove between rod and bearing cap of connecting rod for opposite cylinder when this groove lines up with oil hole in crankpin journal. *NOTE* - Rods must be installed with this groove upward or toward camshaft for this cross-lubrication.

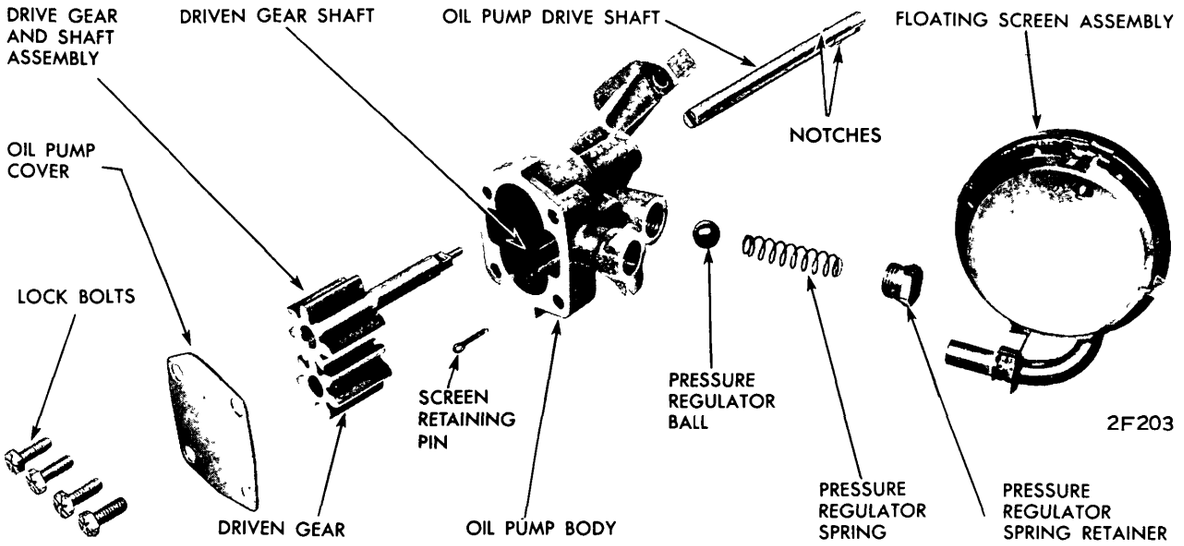
Pushrods, Rocker Arms, & Valves - Pushrods are filled with oil directly through small hole in top of lifter for lubrication of upper and lower pushrod seats. Vertical passages in block at No. 2 camshaft bearing (for right bank), and No. 4 camshaft bearing (left bank) extend up

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

through engine block and matching passages in head (passage in head is around one cylinder head bolt with grooved channel in lower face of head to connect with hole in block) to connect with cylinder head oil gallery which extends along entire length of each cylinder head. Oil in this system is metered by camshaft bearing and is fed intermittenly when oil holes line up. Rocker arm studs (pressed in head) extend down into this cylinder head oil gallery and have drilled oil passage with side hole at rocker arm ball seat through which oil flows to lubricate ball seat and up through grooves in ball to fill channel section of arm. This oil overflows end of rocker arm to lubricate valve tip. Excess oil in rocker chamber drains down pushrod openings into lifter chamber and oil drain holes in floor of lifter chamber (at each side of center crankcase web) return oil to the oil pan.

Valve Lifters - Hydraulic valve lifters are supplied with oil through short vertical passage extending from main oil gallery directly to lefter bore.



Timing Chain, Sprockets, & Fuel Pump Eccentric - Drilled holes in camshaft front journal provide a jet of oil when hole in journal lines up with oil hole in bearing. This jet strikes camshaft thrust plate and part of the oil is diverted downward through grooves in front face of engine block and thrust plate for sprocket and chain lubrication. An additional hole in the thrust plate permits an oil jet to pass through opening in camshaft sprocket and lubricate fuel pump eccentric and rocker arm.

Distributor Shaft & Bushings - Lubricated through passage in block from main oil gallery.

OIL FILTER: Full flow type mounted on base adapter bolted on right side of crankcase. Bypass valve located in filter base assures engine lubrication if filter element clogged.

4 CYLINDER ENGINE

Engine design and oiling system similar to Pontiac V8 except for absence of left bank. See above.

PONTIAC OIL PUMP (ALL MODELS)

OIL PUMP

OIL PUMP OVERHAUL: ***Removal***–Remove oil pan and remove oil pump attaching screws while holding pump in place. Carefully lower oil pump away from block with one hand while removing oil pump drive shaft with the other hand.

Disassembly: Remove cotter pin which retains floating screen to pump inlet and remove screen. Remove pressure regulator and spring retainer, spring and pressure regulator ball. Remove screws retaining cover to oil pump body and remove cover. Remove driven gear and drive gear with shaft.

Cleaning & Inspection: Clean all parts thoroughly (clean screen with Bendix Cleaner). Inspect pressure regulator spring for distortion, cracks, and wear on sides. Inspect pressure regulator ball for nicks or other damage. Inspect oil pump drive shaft (distributor to pump shaft) for wear or cracks. Inspect all other pump parts for wear. Replace parts as necessary.

Assembly: Install drive and driven gears. Install cover and turn drive shaft by hand to insure that it turns freely and has a slight amount of endplay. Install pressure regulator ball, spring and retainer using a new gasket on retainer. *(CAUTION–Do not attempt to change oil pressure by varying length of pressure regulator spring).* Install screen assembly on oil pump and install new cotter pin retainer.

Installation: To install pump, position drive shaft into position in distributor and oil pump drive gear, then position oil pump in place on block, indexing drive shaft with pump drive gear shaft. Install two attaching screws with lockwashers and tighten securely. *(NOTE–* Removal and installation of pump does not disturb distributor timing). Install oil pan.

►*JACKING & HOISTING CAUTION: B for jacking, hoisting, or working under car, s "Jacking & H isting Pr cauti ns" in Susp nsion & Wh l Alignment Section.*

►*STARTING CAR BY PUSHING CAUTION: Hydra-matic cars CANNOT be started by pushing because of transmission design.*

MODEL IDENTIFICATION

Series	①Series Designation
Catalina	23
Star Chief	26
Bonneville Safari (Station Wagon)	27
Bonneville Coupe, Sedan, Convertible	28
Grand Prix	29

①—First two digits of series and body style designation following "62" year number under STYLE on body identification plate.

SERIAL & ENGINE NUMBER: Stamped on plate on left front door hinge pillar post, on front of right bank of engine on lower outer edge near water pump outlet hose (see also engine production code number below), and on most 4—speed synchro-mesh transmission cars, on top of transmission case. Number (example below) includes identification data.

①	②	③	④
3	62	P	1001

①—Series. 3 - 23, 6 - 26, 7 - 27, 8 - 28, 9 - 29.
②—Model Year. 62 1962.
③—Assembly Plant. P Pontiac, S South Gate, W Wilmington, K Kansas City, L Linden, D Doraville, A Arlington.
④—Beginning vehicle number for each prefix combination.

Engine Production Code Number: Stamped on front face of right cylinder bank on upper edge near water pump outlet. Do not confuse this number with Serial and Engine Number.

►*ENGINE IDENTIFICATION LETTER CODE:* Thirty—five different engine combinations used. Letter code (O1A, 11B, etc.) stamped on small pad directly below Engine Production Code Number. Letter code indicates various items of equipment used in a particular engine and will be listed in following data as necessary.

TUNE-UP

►*HARD START OR LOW CRANKING RPM IN COLD WEATHER CORRECTION:* Replace battery with Heavy Duty Battery No. 775 (72 amp. hr.).

►*ENGINE MISFIRE OR IGNITION SHORT CORRECTION:* On non-air conditioned cars, rotate No. 4 spark plug wire connector beneath generator rear brace to about 7 o'clock position.

►*IGNITION SHORTING OUT CORRECTION:* If condition occurs on cars with tachometer, check for short in tachometer wiring (shorting against ignition coil) and make sure tachometer fuse is 1 ampere capacity.

COMPRESSION PRESSURE: 140-150 lbs. (8.6-1 ratio), 155-165 lbs. (10.25-1 & 10.75-1 ratios) at 155-165 RPM. Lowest cylinder must not be less than 80% of highest cylinder.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: Thermostatic coil type in right exhaust manifold outlet. Inspect at 4000 mile intervals. Valve must operate freely and anti-rattle spring must be installed in a downward position. Bend anti-rattle bracket so counterweight strikes stop before heat valve strikes inside of manifold in closed position.

CRANKCASE VENTILATION VALVE: Replace valve at 12,000 mile intervals or yearly and check operation before performing a "Tune—Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders—RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.
SPARK PLUG GAP: .035".
Spark Plugs — AC No. 45S (No. 44S on Police Cars). 14mm. Torque to 25 ft. lbs.
COIL: Delco-Remy No. 1115133.
Ignition Current — 2.1 amps. idling, 3.4 amps. stopped.
Resistor — Resistance wire (1.28-1.36 ohms at 80°F) connected in circuit between coil and IGN 1 terminal of ignition switch. Bypassed during cranking by second lead from ignition switch.
DISTRIBUTOR: Delco-Remy No. 1110997 (8.6-1 ratio), No. 1110996 (10.25-1 & 10.75-1 ratios). External adjustment ("Window") type.
Condenser-Delco-Remy 1932004. **Capacity**.18-.23 mfd.
Contact Point Set-Delco-Remy No. 1931988.
Breaker Gap - Gap (.016") will be correct when cam angle correctly set.
Cam Angle - 28-32°. Set at 30°. Will give .016" breaker gap.
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Counterclockwise viewed from above.

Automatic Advance — 1110997

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0—2		450	0—4		900
6—8		1050	12—16		2100
9—11		1800	18—22		3600

Automatic Advance — 1110996

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0—2		400	0—4		800
4—6		750	8—12		1500
7—9		1000	14—18		2000
8—10		1450	16—20		2900

Vacuum Spark Control: Delco-Remy No. 1116172 (1110996 Distr.), No. 1116173 (1110997 Distr.).

Vacuum Advance - 1116172

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	8-10
10	20	14.75-16.75

Vacuum Advance - 1116173

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
10.5	21	13-15

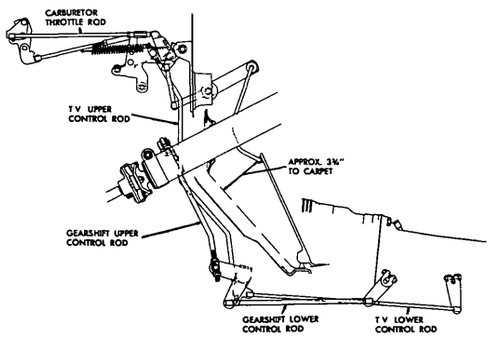
IGNITION TIMING

Setting — 6° BTDC with engine at normal operating temperature and operating at idle speed; and with distributor vacuum line disconnected.

►*IGNITION TIMING NOTE:* Above timing setting (6° BTDC) is for operation on regular fuels (8.6-1 ratio), and for premium fuels (10.25-1 & 10.75-1 ratios). Do not retard later than 0° for any reason.

Timing Marks — TDC and 6° BTDC marks on harmonic balancer. Align pointer on chain case cover with correct mark on balancer.

CARBURETOR



►*CARBURETOR APPLICATION: Cart r and Roch st r carburetors used as follows:*

Model	Carbur t r
Catalina & Star Chief	Rochester 2—Bbl.
Bonneville & Grand Prix	Carter AFB 4—Bbl.
All Models (Optional)	Rochester Triple 2—Bbl.

THROTTLE LINKAGE ADJUSTMENT: With engine and transmission at normal operating temperature, idle speed correctly set, proceed as follows: Loosen both nuts on transmission throttle control rod trunnion. Stop engine and install Linkage Adjusting Pin J-7687 through holes in throttle control lever and bracket. *NOTE — On cars with throttle r turn ch ck, r mov throttle return check or install Holding Tool J-6342-01 over return check.* Close throttle valves fully and loosen locknut on transmission throttle control rod. Adjust length of rod so gauge pin is a free fit in holes. Tighten locknut, but leave pin in place. Push transmission throttle control rod down until transmission throttle control outer lever reaches end of its travel. *CAUTION — Upper locknut must not touch trunni n.* Hold rod and tighten upper and lower trunnion locknuts finger tight. **Then shorten r d by backing ff l w r nut 2½ turns.** Tighten upper nut securely. Remove gauge pin. Loosen locknut on carburetor throttle rod and adjust rod so there is 4 35/64" clearance from underside of attaching boss on accelerator pedal to body toe pan (3¾" to carpet). Tighten locknut. Remove Tool J-6342-01.

THROTTLE RETURN CHECK ADJUSTMENT: Set Hot Idle Speed and Mixture Adjustment to specifications. With transmission in Neutral and engine running, disconnect vacuum hose from throttle return check and plug end of vacuum hose. Adjust contact screw of throttle return check to obtain 1050 RPM. *CAUTION - While adjusting c ntact scr w, hold adjustment screw plunger from turning to pr v nt damag to diaphragm inside return ch ck.* This procedure supersedes previous manufacturer's recommendations.

① — 1 7/16" throttle bore with choke on air horn.

② — 1 11/16" throttle bore with choke on throttle body.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel f ds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

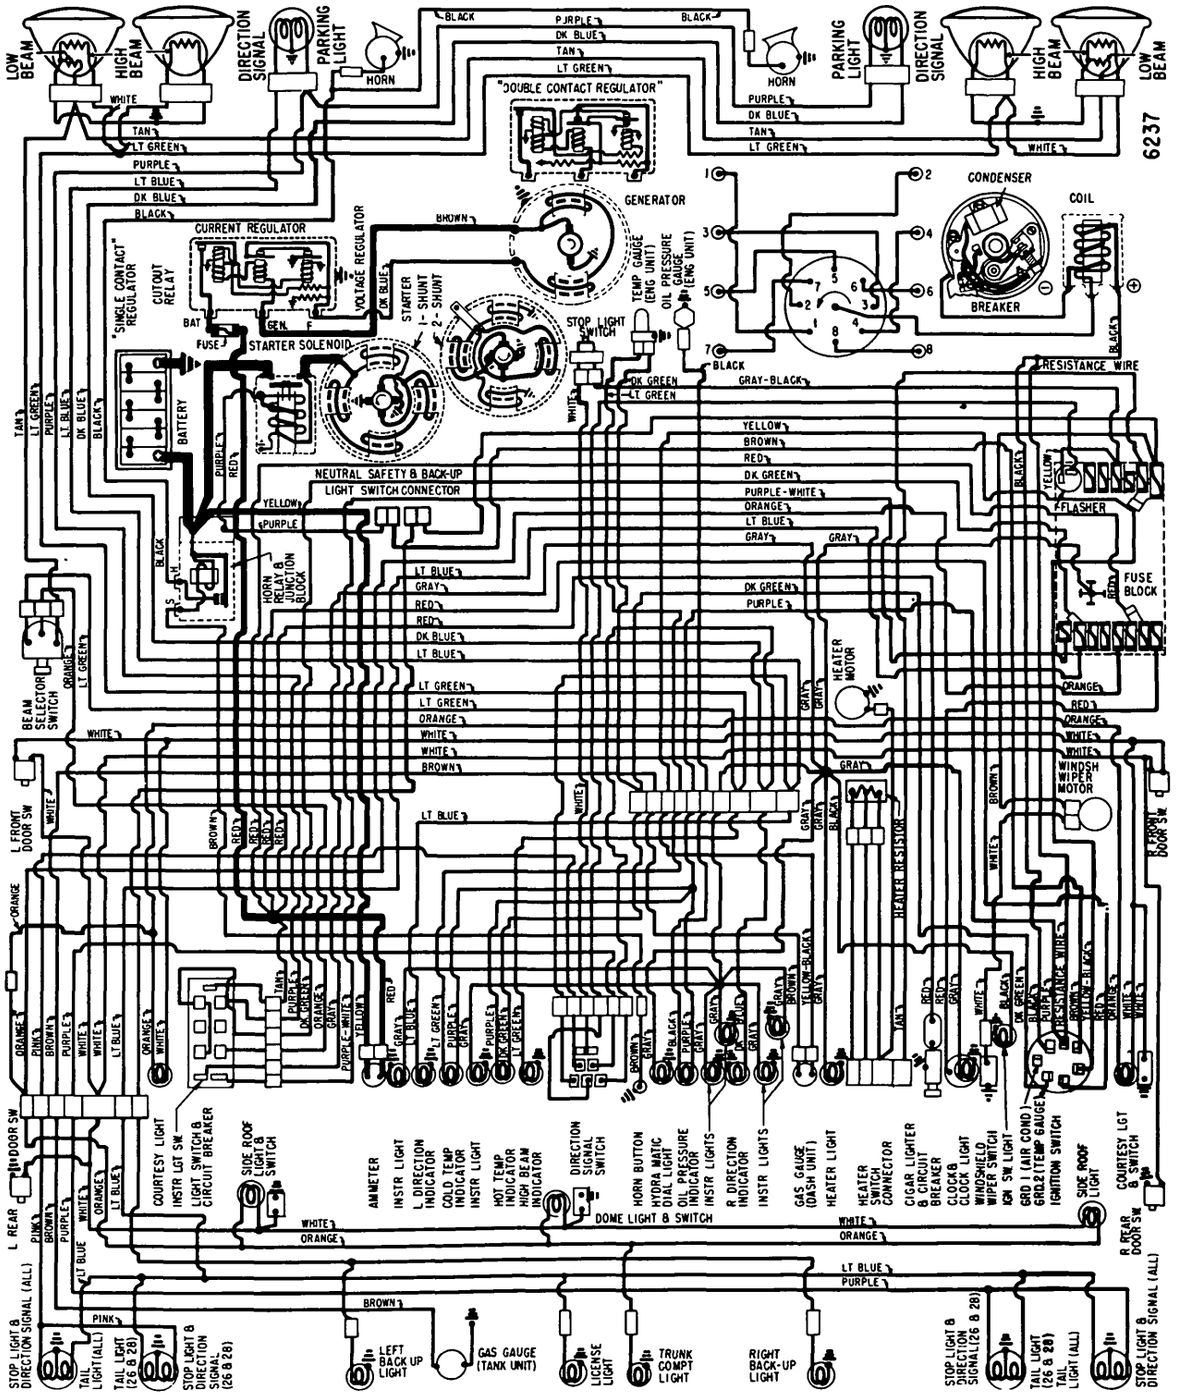
►*IDLE COMPENSATOR CAUTION:* Idle compensator (thermostatically controlled idle air bypass) used on all cars with Air Conditioning. Compensator valve must be closed when making idle setting and idle speed adjustments. Press on spring-loaded button on rear of carburetor throttle body.

Idle S tting – Initial setting 1½ turns open. Turn screw out for richer mixture.

Idl Speed – 480-500 RPM with Hydra-Matic in "DR" (540-560 RPM with Air Cond. "Off" and Hydra-Matic in "DR").

Fl at L vel – 5/8" ± 1/16" (Std. Eng. Hydra-Matic), 11/16" ± 1/16" (Std. Eng. Synchro-mesh & 425E Eng.) between bottom of float seam at toe end and air horn gasket with air horn inverted, gasket in place and needle seated. Use Gauge BT-177 or J-8556 (5/8"), BT-176 or J-8557 (11/16"). To adjust, bend float arm.

Fl at Drop – 1¾" (Gauge BT-176, BT-177, J-8556, J-8557) from gasket surface to lowest point of float with air horn upright, gasket in place and float hanging free. To adjust, bend float tang.



Fast Idl : No adjustment. Fast idle will be correct when hot or slow idle correctly set.

Aut matic Ch k S tting: Centered at index.

Thr ttl Linkage Adjustm nt: See *CARBURETOR abov .*

►*OTHER DATA: Se "Rochester 2GC 2-Barr l Carburetors" in Carbur tion S ction.*

CARTER AFB 4-BARREL

►*PART THROTTLE STUMBLE OR HESITATION CORRECTION & PRODUCTION CHANGE (HYDRA-MATIC CARS) NOTE:* Later Carter Carburetors have recalibrated metering rods and vacuum step-up springs. These carburetors can be identified by letters SA following model number on carburetor tag. *See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

Carter AFB. Standard on Bonneville and Grand Prix, *Optional on all other models as follows:*

Transmission	Carburetor No.
Synchro-mesh	①3123SA
Super Hydra-Matic (Early)	②3300S
Super Hydra-Matic (Late)	④3300SA
Roto Hydra-Matic (Early)	③3326S
Roto Hydra-Matic (Late)	④3326SA

① - With black identification tag.
② - With yellow identification tag.
③ - With red identification tag.
④ - Stamped on carburetor tag.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

Idle Mixture & Speed Setting – Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter AFB 4-Barrel Carburetors" in Carburetion Section.*

TRIPLE CARBURETORS
(Rochester 2G & 2GC)

Transmission	Front	Center	Rear
	Rochester Carburetor No.		
Synchro-mesh	7013063	7020064	7013065
Super Hydra-Matic	7013063	7020067	7013065
Roto Hydra-Matic	7013063	7020069	7013065

Idle Speed - *Same as other models (see 2GC data above).*

►*For complete adjustment data on these carburetors (including linkage adjustment to insure correct synchronization), see "Rochester Triple Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC No. 4512. Fuel only.
Pressure - 5¼-6½ lbs. at 500-1000 RPM.

Fuel Filter: AC No. GF-61P (Exc. Air Cond.), No. GF-73 (Air Cond.). Located near fuel pump in line between pump and carburetor. Replace every 12,000 miles or yearly.

Gasoline Gauge: AC electric type.
Dash Unit - AC No. 5643990 (Std.), 5643993 (Optl.).
Tank Unit - AC. Used as follows:

Model	Std. Cars	Air Cond. Cars
All (exc. Sta. Wgn.)	5641736	5641737
Station Wagon	5641570	5641571

Air Cleaner: Wire mesh, paper element or plastic foam types used.
Wire Mesh Type - Clean every 8000 miles or six months.
Paper Element Type - Clean or replace every 16,000 miles or yearly, sooner under severe dusty conditions. *NOTE* - Clean by blowing air on inner surface of filter element.
Plastic Foam Typ - Clean and reoil every 16,000 miles or yearly (sooner under severe dusty conditions).

►*POLYURETHANE ELEMENT NOTE & CLEANING CAUTION:* Plastic type. May be used to replace other elements and may be found on cars in service. Clean element by removing it from screen and washing in solvent (such as kerosene at room temperature) and squeezing dry (*CAUTION - DO NOT wring dry*). Dip element in SAE 10W-30 oil, squeeze to remove excess oil, reinstall element on screen with sealing edges evenly overlapping the screen.

BATTERY

Delco. Used as follows:
Synchro-mesh Cars - 2SMR53, No. 458. 12 volt, 9 plate, 53 ampere hour capacity (20 hr. rate).
Hydra-Matic Cars - No. 558. 12 volt, 11 plate, 63 ampere hour capacity (20 hr. rate).
Heavy Duty Battery - 3SMR72, No. 670 & 775. 12 volt, 11 plate, 72 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - At either cylinder head.

STARTER

Delco-Remy No. 1107791 (8.6-1 ratio except 425E Eng. with Air Cond.), No. 1107781 (All others). *NOTE - Starter No. 1107781 is "Two Shunt" type.*
Armature - Delco-Remy No. 1950563 (1107791 Str.), No. 1949770 (1107781 Str.).
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data - 1107791

Torque	RPM	Volts	①Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	3.5	300-360

Performance Data – 1107781

Torque	RPM	Volts	①Amperes
0 ft. lbs.	3900-5400	10.6	80-120
	Lock	2.0	290-370

① – Includes Solenoid.

Starting Switch: Delco-Remy Solenoid No. 1119798 (Synchro-mesh), No. 1114257 (Auto. Trans.) mounted on starter and controlled by Ignition & Starter Switch.

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1998705 located on steering column behind instrument panel.
Adjustment - *See "Dual-Coupling Hydra-Matic Drive" in Transmission Section.*

GENERATOR

►*CHARGING CIRCUIT FUSE CAUTION: Battery charging circuit protected by a 45 amp. fuse, No. 1945172 (Std. Reg.), 60 amp. fuse, No. 1945171 (Double Contact Reg.) clipped to "BAT" terminal of generator or regulator. Check for blown fuse when diagnosing generator, regulator, or battery failure.*

Delco-Remy. Used as follows:

Model	Generator No.
Standard (Less Heater)	1102263
Standard (With Heater) Early	1102303
Standard (With Heater) Late	1102264
Heavy Duty & Air Cond.	1102220
Heavy Duty Low Cut-in	1105143
425A Eng. with 3 2-Bbl. Carbs. (Early)	1102304
425A Eng. with 3 2-Bbl. Carbd. (Late)	1102265

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

►*1102303 & 1102304 GENERATOR CORRECTION & PRODUCTION CHANGE NOTE: See Generator Regulator below.*

Performance Data

Generator	Amperes	Volts	Gen. RPM
1102263	30	14.0	2310
1102303 & 304	35	14.0	2540
1102264 & 265	35	14.0	2730
1102220	45	14.0	2520
1105143	45	14.0	2200

Rotation - Counterclockwise at commutator end.
Field Current - 1.48-1.62 amps. (1102263,64,65), 2.66-2.86 amps. (1102220,303,304). 2.73-3.0 amps. (1105143).
Brush Spring Tension - 28 ozs.
Belt Adjustment: Borroughs Tension Gauge should read 70-75.

GENERATOR REGULATOR

►*BURNED REGULATOR CONTACTS AND/OR POINT MATERIAL BUILD-UP (CARS EQUIPPED WITH 1102303 OR 1102304 GENS.) CORRECTION AND PRODUCTION CHANGE NOTE:* Condition may be corrected by installing rectifier resistor assembly Part No. 1960461. To install, attach blue lead to generator field terminal and brown lead to generator armature terminal. Replace regulator if necessary. Above changes not necessary with later production generators (higher field resistance). Production change effective approximately March 15, 1962 with Generator Parts Nos. 1102264 (replacing 1102303), and 1102265 (replacing 1102304).

Delco-Remy. Used as follows:

Regulator No.	Generator
1119623	1102220 & 1105143
1119263	1102263
1119668	1102264,265 & 1102303,304

►*REGULATOR NOTE:* 1119623 & 1119668 regulators are "Double Contact" type.

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

Cutout Relay

Cuts In - 11.8-13.0 volts (1119623 & 668), 11.8-13.5 volts (1119263).
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting (1119623 & 668) - 13.8-14.6 volts at 125°F ambient temperature operating on upper contacts. .1-.3 volt lower operating on lower contacts.

Setting (1119263) - 13.8-14.7 volts at 125°F ambient temperature.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Contact Gap - .016".
Air Gap - .067" (1119623 & 668), .075"(1119263)with armature pressed down to point where contacts just touch.

Curr nt Regul ator

S tting (1119668) - 31.0-35.5 amps. at 125°F.
S tting (1119623) - 38.0-45.0 amps. at 125°F.
S tting (1119263) - 27.0-31.0 amps. at 125°F.
Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: S "D lco-Remy 6 & 12-Volt Single C ntact R gulators" or "Delco-Remy Double Contact R gulators" in El ctrical Section.*

ALTERNATOR

D lco-Remy D lcotr n N . 1117070 & 1117750. Three-phase type with internal rectifiers.

©P rformanc Data - Cold (70°F)

Alt rnator	Amperes	RPM
1117070	31	1000
	58	2500
1117750	18	1100
	62	6500

© - Rated output hot 60 amps. (1117070), 62 amps. (1117750).
Current Output - 25 amps. (approx.) at 525 Engine RPM (1117070).
Fi ld Curr nt - 6-6.6 amps. (1117070), 3.7-4.4 amps. (1117750) at 12 volts and 80°F.
Brush Spring T nsion - 10 ozs.
Rotation - Clockwise at drive end.
►*OTHER DATA: Se "D lco-Remy Delcotron Alternators" in El ctrical Secti n.*

ALTERNATOR REGULATOR

D lc -R my N . 9000562. Two-unit type containing a Field Relay and a Transistorized Voltage Regulator.

V ltag Regulator

N rmal S tting – 13.9-14.6 volts. Adjust within range regardless of temperature.
Air Gap – .070" with armature pressed down to point where contacts just touch.

Fi ld Relay

Cl sing V ltag – 5.0-9.5 volts.
Air Gap – .014" with contacts just touching.
C ntact Gap – .027".
►*OTHER DATA: See "D lco-Remy Transistorized Alternator Regulators ("A" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

Dir ction Signals: Switch located on steering column behind instrument panel. To remove, remove attaching screws and washers, remove assembly and horn wire retainer from steering column housing. To install, reverse removal procedure.
►*FLASHER IDENTIFICATION NOTE:* Use flasher unit marked AP 2 (on 23 & 25 Series), AP 3 (on 26 & 28 Series). Flasher mounted on fuse block located on dash shroud above front edge of left floor mat.

Instrument Clust r R moval: Disconnect battery. Disconnect cluster wire at chassis wiring harness connection below plenum chamber. On cars with Circ-L-Aire Conditioning remove instrument cluster pad and trim plate (retained with clutch head screws). Remove radio knob and retaining nut. Push cluster toward front seat and using a sprin wrench or deep socket, remove lockwashers and nuts. Disconnect speedometer cable and remove wire connector from ammeter terminals and other electrical connections. On all cars without Circ-L-Aire Conditioning, push cluster toward front of car, turn cluster upside down and remove. To install, reverse removal procedure.
Speedometer Removal (Cluster Removed): Disconnect Safeguard control cable (if so equipped) by pulling straight out. Remove cluster face plate and lens by unsnapping face plate from housing. Remove screws on back of cluster at speedometer cable fitting area. Remove speedometer and instruments carefully. If car is equipped with Safeguard speedometer, disconnect ground wire at clip terminal and also the wire retainer clip. Carefully note routing of wires before removing ground wire. Remove screws retaining numeral plate and remove speedometer head assembly. To install, reverse removal procedure.
Lighting Switch Removal: Disconnect battery. Pull headlight switch knob "ON". Push latch button on side of switch assembly and pull out switch knob assembly. Screw bushing from switch assembly, freeing switch from instrument panel.
Stop Light Switch Location: Mechanical type located on bracket attached to steering column behind instrument panel.
Adjustment - Loosen locknut and position switch thread 3/16" to pedal arm with brake fully released. *NOTE - Switch must not restrict pedal action.*

CIRCUIT BREAKER: 22 Ampere – Headlights, high beam indicator, parking and tail lights. In headlight switch. *NOTE – Tail lights also protected by 14 ampere fuse in fuse block.*

FUSES: *All fuses (except as noted) are in a fuse block on passenger side of dash on left side of car.*
3AG or AGC 30 Ampere – Air Conditioner system. *In line above fuse block.*
SFE 25 Ampere – Windshield wiper and washer, and back-up lights.
SFE 20 Ampere – Heater blower, Safe Guard speedometer circuit, and Low Fuel Level warning circuit.
SFE 14 Ampere – Tail and license lights.
SFE 14 Ampere – Interior (courtesy, dome, etc.) and Trunk lights.
SFE 14 Ampere – Glove Box light, and Clock.
SFE 14 Ampere – Cigar lighter light, and ash tray light.
SFE 14 Ampere – Parking brake warning light.
SFE 14 Ampere – Spotlight and underhood light.
SFE 14 Ampere – Power Antenna.
SFE 7.5 Ampere – Radio.
SFE 4 Ampere – All instrument panel, control, and indicator lights (except cigar lighter light and ash tray light).
SFE 4 Amp r – Lighting control rheostat.
SFE 1 Amp re – Tachometer. *In wiring n ar ignition coil.*
Special – Fuse or Circuit Breaker for cigar lighters located on forward end of lighter housing. Capacity depends on heat from lighter element and amperes used.

ENGINE

ENGINE SPECIFICATIONS: Own. 90° V8, valve-in-head. 389" engine of same design used previously. All engines are basically the same with modifications and optional equipment as indicated. *See "Engine Identification Letter Code" under MODEL IDENTIFICATION above. Reference will be made to Letter Code to indicate on which engines various items will be found.*
►*425A ENGINE NOTE:* These engines are Letter Codes 08B, 11B, 25J, 28J, 47N, 50N.
►*425E ENGINE NOTE:* These engines are Letter Codes 20L, 21L, 40R, 41R.

Engine	Bore	Stroke	Displacement	Rated HP
All	4 1/16"	3 3/4"	389 cu. ins.	52.8

Engine①	Compr. Ratio	Developed HP
Std. (2-Bbl., S-M)	8.6-1	215 at 3600 RPM
Std. (4-Bbl., S-M)	8.6-1	235 at 3600 RPM
425E(2-Bbl., All H-M)	8.6-1	230 at 4000 RPM
Optl.(2-Bbl., Roto H-M)	10.25-1	267 at 4200 RPM
Optl.(2-Bbl., All H-M)	10.25-1	287 at 4400 RPM
Optl.(4-Bbl., All Trans.②)	10.25-1	303 at 4600 RPM
Optl.(3 Carbs., All Trans.)	10.75-1	318 at 4600 RPM
425A(4-Bbl., All Trans.)	10.75-1	333 at 4800 RPM
425A(3 Carbs., All Trans.)	10.75-1	348 at 4800 RPM

① – **S-M** – Synchro-mesh (All).
Roto H-M – Roto Hydra-Matic.
② – Except Std. 3-speed synchro-mesh.
Compression Reading – *See TUNE-UP.*

►*421" ENGINE NOTE:* This high performance engine can be built from the following special parts:

Part	Part N .
Cylinder Block (4 3/32" bore x 4" stroke)	542981
Rear Main Bearing Seal Packing	1193133
Cylinder Head Gasket①	542973
Crankshaft	542990
Pistons (Standard Bore)	542983
Oil Pump & Oil Pan②	983684
Intake Manifold③	983683
Camshaft (McKellar No. 11)	542992
Crankshaft & Connecting Rod Bearings	543012
Piston Rings	543296

① – Use with Cylinder Head Package No. 989798 to replace Gasket No. 535458.
② – 60 lb. pump and 8 quart oil pan.
③ – Package consists of: Intake Manifold No. 542991; Two 4-Bbl. Carburetors No. 534628; Throttle Linkage No. 543025; Spacer No. 543294.

OIL PAN REMOVAL: Drain radiator and crankcase. Remove hood and air cleaner. Disconnect battery ground cable and radiator hoses. Move coil away from body. Disconnect exhaust manifolds from exhaust pipes. Lower idler arm and tie rod by disconnecting idler arm bracket from frame. Disconnect engine front mounts. Lower starter from clutch housing. Remove oil pan retaining bolts. Remove clutch housing lower cover. Raise engine as high as possible and remove flywheel cover. Let oil pan drop from block. Remove front main bearing cap and position crankshaft at No. 1 firing position. Hold crossover pipe and tie rod down and remove oil pan.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Installation - Use new gaskets and cement gasket in rear main bearing cap 1-1¼" from both sides of groove. Push pan into place (hold crossover pipe and tie rod down) and install front main bearing cap. *NOTE - Place a jack stand under front frame and lower engine to torque cap bolts to 95 ft. lbs.* Reverse removal procedure to complete installation.

ENGINE REMOVAL: *See "Engine" in Pontiac Special Data.*

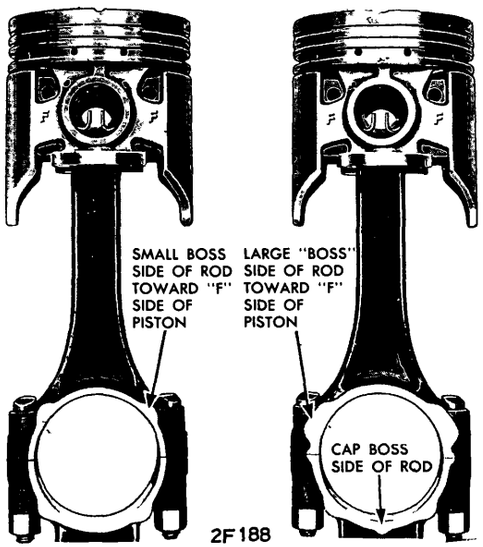
CYLINDER HEAD: *See "Cylinder Head & Manifold" in Pontiac Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Pontiac Special Data.*

PISTONS

Aluminum alloy, tin plated, with piston pin offset 1/16" to right. *See "Piston Note" below.*

►*PISTON NOTE:* Various types used as follows:



Low Compression (8.6-1 Ratio) - Pistons have recess or dish in head and are identified by TWO notches at front of piston head and mark "L" on rear piston pin boss. *These pistons must not be used in 10.25 & 10.75-1 ratio engines.*

High Compression (10.25 & 10.75-1 ratios) - "Flat Top" type. Pistons have valve clearance reliefs machined on head and are identified by ONE notch at front of piston head.

Removal - Pistons and rods removed from above.

Piston Clearance - .0007-.0013" measured 1.18" below top of skirt. Fit pistons with .0015" x ½" feeler. Pull to withdraw feeler should be 8-15 lbs. *NOTE - .0022-.0027" clearance on 425A engines, police cars, and 3 carb. synchro-mesh engines.*

Installing Pistons - Install piston with notches in piston head and "F" mark on piston boss toward front of engine. *See Rod Installation.*

PISTON & ROD ASSEMBLY

Replacement Pistons: Police, T425A & Thr 2-Bbl. Carb. - Furnished Std. (4.060", 4.061", 4.062" "Flat Top") and .005", .010", .020", .030" Oversize.

All Others - Furnished Std. (4.061", 4.062", 4.063" "Flat" or "Recessed" Top) and .005", .010", .020", .030" Oversize

PISTON PIN

Pin is press fit in rod.

Diameter - .9802". **Length** - 3.25".

Pin Fit in Piston - .0003-.0005" loose. Piston must turn freely on pin.

Pin Fit in Rod - .0008-.0016" press fit.

Piston Pin Removal & Installation - *See "Piston Pins" in Pontiac Special Data.*

Replacement Pins: Furnished Std. and .001", .003" Oversize.

PISTON RINGS

Compression rings are cast iron, taper faced. No. 1 has thick chrome, No. 2 has Lubrite finish. Oil ring is segmented spring steel with chrome face on rails.

Ring	Width	End Gap	Side Clearance
Compr. (1)	.078"	.016-.026"	.0015-.0030"
Compr. (2)	.078"	.013-.025"	.0015-.0035"
Oil	.184"	.015-.035"	.0015-.0085"

Installing Rings - Step or chamfer on upper compression ring and letter "T", dot, or word "TOP" on lower compression ring toward the top.

Replacement Rings: Std. and .005", .010", .020", .030" Oversize.

CONNECTING ROD

Length - 6 63" (center-to-center)

Crankpin Journal Diameter - 2.2492-2.2502".

Lower Bearing - Durex 100A, steel-backed, replaceable precision type, no shims.

Clearance - .0005-.0025".

Sideplay - .006-.011"

Replacement Bearings: Std., .001" and 002" Undersize

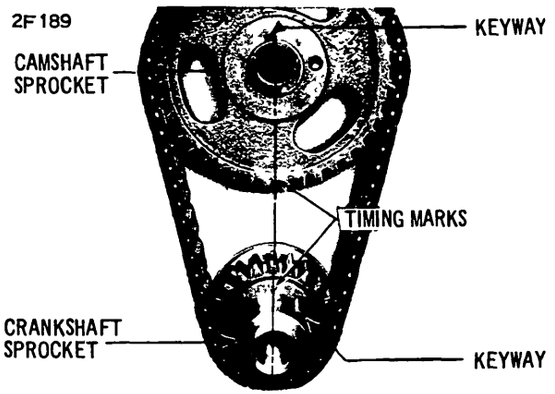
Installing Rods: Pistons have F marks and one notch (10.25-1 & 10.75-1 ratios), two notches (8.6-1 ratio) on front. Install rods so that LARGE machined boss at lower end of rod on same side as "F" mark and notch in piston (Left bank cyls. 1-3-5-7), on opposite side of piston from "F" mark and notch (Right bank cyls 2-4-6-8). Install assemblies in engine with "F" marks and notches on piston toward front of engine and oil groove in lower end of rod toward center of engine.

CRANKSHAFT

Journal Diameter - 3.000". Five bearings.

Bearings - M-400 (No. 4) Durex 100-A (Others). Steel backed inserts, precision type, no shims.

Clearance - .0005-.0025" (Front), .0005-.003" (All Others).



End Thrust: Taken by No. 4 (rear center) main bearing.

End Play - .0035-.0085".

Replacement Bearings: Furnished Std. and .001", .002" Undersize.

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Pontiac Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Pontiac Special Data.*

VALVE TIMING MARKS

Vibration Dampener Removal & Installation: *See "Vibration Dampener" in Pontiac Special Data.*

CAMSHAFT

►*CAMSHAFT IDENTIFICATION & APPLICATION NOTE:* Different camshafts used in various engines identified by number stamped on end of shaft as follows: *NOTE – See "Engine Identification Letter Code" under MODEL IDENTIFICATION above for Engine Identification.*

Engine (Letter Code)	Camshaft Identification
01A, 02B, 03B, 04B	1
15H, 17H, 20L, 21L, 23H, 40R, 41R	0
05A, 06B, 10B, 16K, 16KJ, 18K, 27J, 35M, 86P, 37M	4
38P, 39N, 44M, 45P, 49N	4
08B, 11B, 25J, 28J, 47N, 50N	6

Journal Diameter - 1.8987-1.8997". Five bearings.

Clearance - .0015-.0030".

End Thrust - Taken by thrust plate behind camshaft sprocket.

Endplay - .003-.007",

Timing Chain: Length 60 links. **Width** .88" (Morse), 1" (Link Belt). **Pitch** .375".

►***TIMING CHAIN REMOVAL CAUTION:*** **Do not rotate crankshaft with timing chain out of engine.** Damage to valves, pistons or both will result due to piston striking valve. To rotate camshaft with timing chain off, crankshaft must be positioned so pistons are 45° before or after TDC, to avoid damage.

Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line across shaft centers.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Pontiac Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Pontiac Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Pontiac Special Data.*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters.

Valve	Head Diameter	Stem Diameter	Length
Intake	1.88"	.3407-.3414"	①4.85"
Exhaust	1.60"	.3402-.3409"	②4.84"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°③	⑤	.0021-.0038"
Exhaust	45°④	⑤	.0026-.0043"

①—4.89" on 425A Engines. ②—4.87" on 425A Engines. ③—Valve Face Angle 29°. ④—Valve Face Angle 44°. ⑤—.33" (Camshaft "1"); .37" (Camshaft "0"); .40" (Camshafts "4" & "6").

Valve Seat Width — .045-.071" Intake, .048-.070" Exhaust.

Replacement Valves: Furnished Std., .001", .003", .005" Oversize stems.

Valve Stem Oil Seals: Used on all valves as follows:

Oil Shield - Inverted cup over upper end of outer valve spring (under spring retainer cup).

Oil Seal - Neoprene seal installed in second groove on valve stem (under valve locks).

Valve Stem Length Checking: *See "Valve System" in Pontiac Special Data.*

Valve Springs: Single or double (inner and outer) springs used depending on camshaft used as follows:

Valve Spring Specifications

①Camshaft "1"

Valve	Spring Pressure	Length
Closed	80 lbs.	1.53"
Open	171 lbs.	1.20"

①Camshaft "0"

Valve	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	26 lbs.	1.48"	58 lbs.	1.53"
Open	61 lbs.	1.11"	107 lbs.	1.16"

①Camshaft "4"

Valve	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	26 lbs.	1.48"	60 lbs.	1.52"
Open	64 lbs.	1.08"	114 lbs.	1.12"

①Camshaft "6"

Valve	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	32 lbs.	1.48"	62 lbs.	1.52"
Open	96 lbs.	1.08"	131 lbs.	1.12"

① — *See "Camshaft Identification & Application Note" above.*

►*VALVE SPRING REMOVAL NOTE: To remove one or more valve springs without removing cylinder heads, see VALVES in Pontiac Special Data.*

Valve Guides: Cast integral with cylinder head.

Valve Stem Clearance in Guide: .0021-.0038" (Intake), .0026-.0043" (Exhaust). Oversize reamers ream guides to next oversize.

Hydraulic Lifters: Standard on all models.

Diameter - .8424-.8427" **Length** - 2".

Clearance in Lifter Boss - .0013-.0028".

Hydraulic Lifter Overhaul - *See "Valve System" in Pontiac Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.

Installation of Rocker Arm to Stud - Tighten rocker arm stud nut to 15-25 ft. lbs. torque.

Rocker Arm Stud Replacement - *See "Valve System" in Pontiac Special Data.*

VALVE TIMING

See "Camshaft Setting" and "Camshaft Identification & Application Note" under CAMSHAFT above.

Valve Timing Specifications

Camshaft "1"

Intake Valves — Open 14° BTDC. Close 58° ALDC.
Exhaust Valves — Open 48° BLDC. Close 24° ATDC.

Camshaft "0"

Intake Valves — Open 22° BTDC. Close 67° ALDC.
Exhaust Valves — Open 63° BLDC. Close 27° ATDC.

Camshaft "4"

Intake Valves — Open 30° BTDC. Close 63° ALDC.
Exhaust Valves — Open 77° BLDC. Close 25° ATDC.

Camshaft "6"

Intake Valves — Open 29° BTDC. Close 74° ALDC.
Exhaust Valves — Open 82° BLDC. Close 31° ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Pontiac Special Data.*

Crankcase Capacity: 4 qts. refill, add 1 qt. when changing filter element.

Normal Oil Pressure: 30-40 lbs. at 2600 RPM.

Pressure Regulator - In oil pump body. Not adjustable.

Oil Pump: Gear type, located on right rear bottom of cylinder crankcase and driven by distributor drive gear. Distributor timing is not affected by removal and installation of pump.

Pump Overhaul - *See "Oiling System" in Pontiac Special Data.*

Oil Filter: Full-flow type. Replace element every 15,000 miles or once a year. Use only AC No. PF-7 filter element.

Crankcase Ventilation: Standard Cars - Filter elements in oil filler caps in each rocker arm cover, and ventilator pipe at engine rear. Clean filter elements every 2,000 miles by plunging in gasoline or kerosene. Re-oil with engine oil.

Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

Oil Pressure Indicator: Warning light on instrument panel controlled by pressure switch on oil filter pad. Light goes on when ignition turned on; goes out when oil pressure reaches 5 lbs.±1.5 lbs.

►*LOW OIL PRESSURE CORRECTION:* If oil pressure indicator remains on, clean oil pump thoroughly. Dirt or chips may be lodged in oil pressure regulator ball seat.

ENGINE COOLING SYSTEM

Water Capacity: 18½ qts., add 1 qt. for heater.

Pressure Valve: Radiator filler cap. 14-17 lbs. (Std.).

Thermostat: Pellet type, in water outlet passage in intake manifold. 170°F (Pontiac No. 3148225) Std., 180°F (No. 3149016) Optl. for use with permanent anti-freeze.

Water Pump: Packless, sealed double row ball bearing shaft. Serviced as an assembly.

Temperature Gauge: Two-light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and goes off when engine temperature reaches 113°±2°F, RED light remains off during normal engine operation but will come on when engine temperature reaches 238°±2°F. *NOTE* - Red light will light up when ignition switch turned to "Start" position but should go out when key returned to running position (this tests bulb and circuit each time engine is started).

Engine Unit - Delco-Remy No. 1993521 (Std.), No. 1993522 (Air Conditioning).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

SERIAL & ENGINE NUMBER: Stamped on plate on left front door hinge pillar and on pad on front face of cylinder block (4 Cyl.), on front face of right cylinder bank (V8). *See also Engine Production Code Number below.* Number (example below) includes identification data.

① ② ③ ④
1 62 P 1001

① – Series. 1 21 (All Body Styles).
② – Year. 62 1962.
③ – Assembly Plant. P Pontiac; S. South Gate; K Kansas City.
④ – Beginning vehicle number for each prefix combination.

Engine Production Code Number: Stamped on pad on front face of cylinder block (4 Cyl.), on front face of right cylinder bank (V8). *Do not confuse this number with Serial and Engine Number.* Not used for licensing.

►*ENGINE IDENTIFICATION LETTER CODE:* Twelve different engine combinations available. Letter Code (89Z, 97Y, etc.) stamped on small pad directly below Engine Production Code Number. Letter Code indicates various items of equipment used in a particular engine and will be listed in the following data where necessary.

TUNE-UP

►*1961-1962 4 CYLINDER TEMPEST DIESELING OR RUN-ON CORRECTION:* To correct, adjust idle speed and idle mixture (see below). Remove and discard throttle return check (except 4-Bbl. Carbs. or any Air Cond. Cars). Free up throttle linkage. Be sure engine returns to idle speed (increase return spring tension if necessary). Set timing 6° BTDC. Check atmospheric idle vent adjustment (4-Bbl. Carbs.). Tighten fan belt, check cooling system and free up manifold heat valve.

COMPRESSION PRESSURE: 4 Cyl. - 140-150 lbs. (8.6-1 ratio), 155-165 lbs. (10.25-1 ratio) at 155-165 RPM. Lowest cylinder must be within 80% of highest cylinder.
V8 - 160 lbs. at cranking speed. Lowest cylinder must be within 80% of highest cylinder.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: 4 Cyl. - Thermostatic coil type in exhaust manifold outlet. Inspect at 4000 mile intervals. Valve must operate freely and anti-rattle spring must be installed in a downward position. Bend anti-rattle bracket so counterweight strikes stop before heat valve strikes inside of manifold in closed position.
V8 - None used. Intake manifold is heated by engine coolant.

CRANKCASE VENTILATION VALVE: Clean or replace valve at 12,000 mile intervals or yearly and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 4 Cyl. - 1-3-4-2. **V8** - 1-8-4-3-6-5-7-2. **Cylinders (V8)** - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs (4 Cyl.) - AC No. 45S (No. 44S for Police cars and cars pulling trailers). 14 mm. Torque to 15-25 ft. lbs.

Spark Plugs (V8) - AC No. 44FFS. 14 mm. Torque to 15-20 ft. lbs. *CAUTION - Use thread lubricant.*

COIL: Delco-Remy No. 1115169 (4 Cyl.), No. 1115136 (V8).

Ignition Current - 2.1 amps. idling, 3.7 amps. stopped (1115136).

Resistor - Resistance wire (1.80 ohms) connected in circuit between coil and IGN 1 terminal of ignition switch. Bypassed during cranking by lead from IGN 2 terminal of ignition switch.

DISTRIBUTOR: Delco-Remy. Used as follows:

Engine (Compr. Ratio)	Distributor No.
4 Cyl. (8.6-1)	1110282 (Early Ⓒ), 1110284 (Late Ⓓ)
4 Cyl. (10.25-1)	1110283 (Early Ⓒ), 1110285 (Late Ⓓ)
V8	1110983 Ⓒ

Ⓒ - External adjustment "Window" type.

Ⓓ - Pivoted Breaker Plate type. No external adjustments.

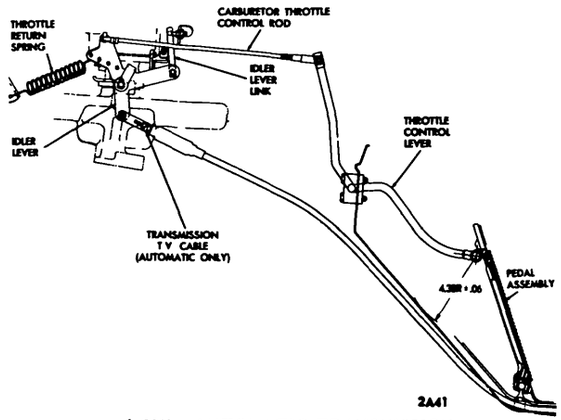
►*PIVOTED PLATE DISTRIBUTOR NOTE: For all service procedures, see "Delco-Remy Pivoted Breaker Plate Distributors" in Electrical Section.*

Condenser - Delco-Remy No. 1928111 (V8), No. 1932004 (4 Cyl.).
Capacity - .18-.23 mfd.
Contact Point Set - Delco-Remy No. 1931988.
Breaker Gap (All Models) - Gap (.016") will be correct when cam angle correctly set.
Cam Angle (1110282 & 283) - 74-76°. Set at 75°. Will give .016" breaker gap.
Cam Angle (1110284 & 285) - 31-34°. Set at 33°. Will give .016" breaker gap.
Cam Angle (1110983) - 28-32°. Set at 30°. Will give .016" breaker gap.

►*CAM ANGLE SETTING CAUTION (PIVOTED PLATE DISTRIBUTOR): Set with vacuum line disconnected.*

Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Counterclockwise (4 Cyl.), Clockwise (V8) viewed from above.

Automatic Advance - 1110282 & 284



Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		625	0-4		1250
9-11		1300	18-22		2600
12-14		2200	24-28		4400

Automatic Advance - 1110283 & 285

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		400	0-4		800
7-9		1000	14-18		2000
9-11		1875	18-22		3750

Automatic Advance - 1110983

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		525	0-4		1050
6.5-8.5		1050	13-17		2100
12-14		1850	24-28		3700

4 CYL. AUTOMATIC TRANSMISSION THROTTLE LINKAGE (V8 SIMILAR)

Vacuum Spark Control: Delco-Remy No. 1116206 (1110282 & 283 Distr.), 1116195 (1110284 & 285 Distr.), 1116190 (1110983 Distr.).

Vacuum Advance - 1116195 & 1116206

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
10 ± .75	20 ± 1.50	13-15

Vacuum Advance - 1116190

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
8 ± .75	16 ± 1.50	14.5-15.75

IGNITION TIMING

Setting - 6° BTDC (4 Cyl.), 5° BTDC (V8) at hot idle speed with distributor vacuum line disconnected and manifold opening taped closed.
Timing Marks (4 Cyl.) - Pointer on engine front cover and TDC and 6° BTDC (top mark) on vibration damper.
Timing Marks (V8) - Mark on vibration damper to be aligned with 5° mark cast in block.

CARBURETOR

►*CARBURETOR APPLICATION: Rochester B or BC 1-Barrel Standard on 4 Cyl., Rochester 4GC 4-Barrel Optional on 4 Cyl., Standard on V8.*

►*ACCELERATOR LINKAGE BIND & FUEL LINE FAILURE CORRECTION (4 Cyl. With 4-Bbl. Carb.):* Carburetor pump arm clip may be rubbing on fuel line caused by incorrect installation of fuel filter which will misposition fuel line.

THROTTLE LINKAGE ADJUSTMENT (AUTO TRANS.): 1) Adjust threaded trunnion on carburetor throttle control rod for accelerator pedal height of 4.38" ± .06" through centerline of throttle control lever pivot at accelerator pedal to floor mat. Disconnect throttle valve cable from carburetor and depress accelerator pedal to floor. Carburetor throttle valves should be at wide open position.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

2) With throttle valve cable disconnected at carburetor, block carburetor throttle valves in wide open position and pull throttle valve cable fully forward until throttle valve lever is against stop in transmission. *NOTE - Do not confus transmission detent feel with lever stop contact.* Adjust front connector at cable trunnion so it fits freely into carburetor adapter lever. Tighten locknuts.

3) Recheck adjustment after linkage connected. When carburetor is at wide open position, throttle valve lever must be against its stop. Road test car and if shift points do not correspond with specifications in table below, readjust cable length as necessary. *CAUTION - Do not adjust cabl mor than 2 turns from original setting. If mor turns n cessary for correct shift patt rn, oth r transmission trouble is indicated.*

Transmissi n Upshift Speeds

Thr ttl P siti n	4 Cyl. –MPH–	V8
Minimum Throttle	12-15	17-21
Full Throttle	43-50	49-55
Part Throttle (Detent)	35-45	40-49

THROTTLE RETURN CHECK ADJUSTMENT (4 Cyl.): With idle mixture and speed adjustments correctly set, engine at normal operating temperature and idling, and transmission in neutral, disconnect vacuum hose from throttle return check and plug end of vacuum hose. Adjust contact screw of throttle return check to obtain 1175 RPM (1-Bbl.), 1050 RPM (4-Bbl.). *NOTE - Hold sl v n xt to diaphragm to prevent turning while adjusting contact scr w.*

ANTI-STALL DASHPOT ADJUSTMENT (V8): With throttle linkage and idle speed correctly set, place idle speed adjusting screw on high step of fast idle cam. Adjust dashpot to obtain a clearance of .000-.010" between dashpot plunger and throttle lever.

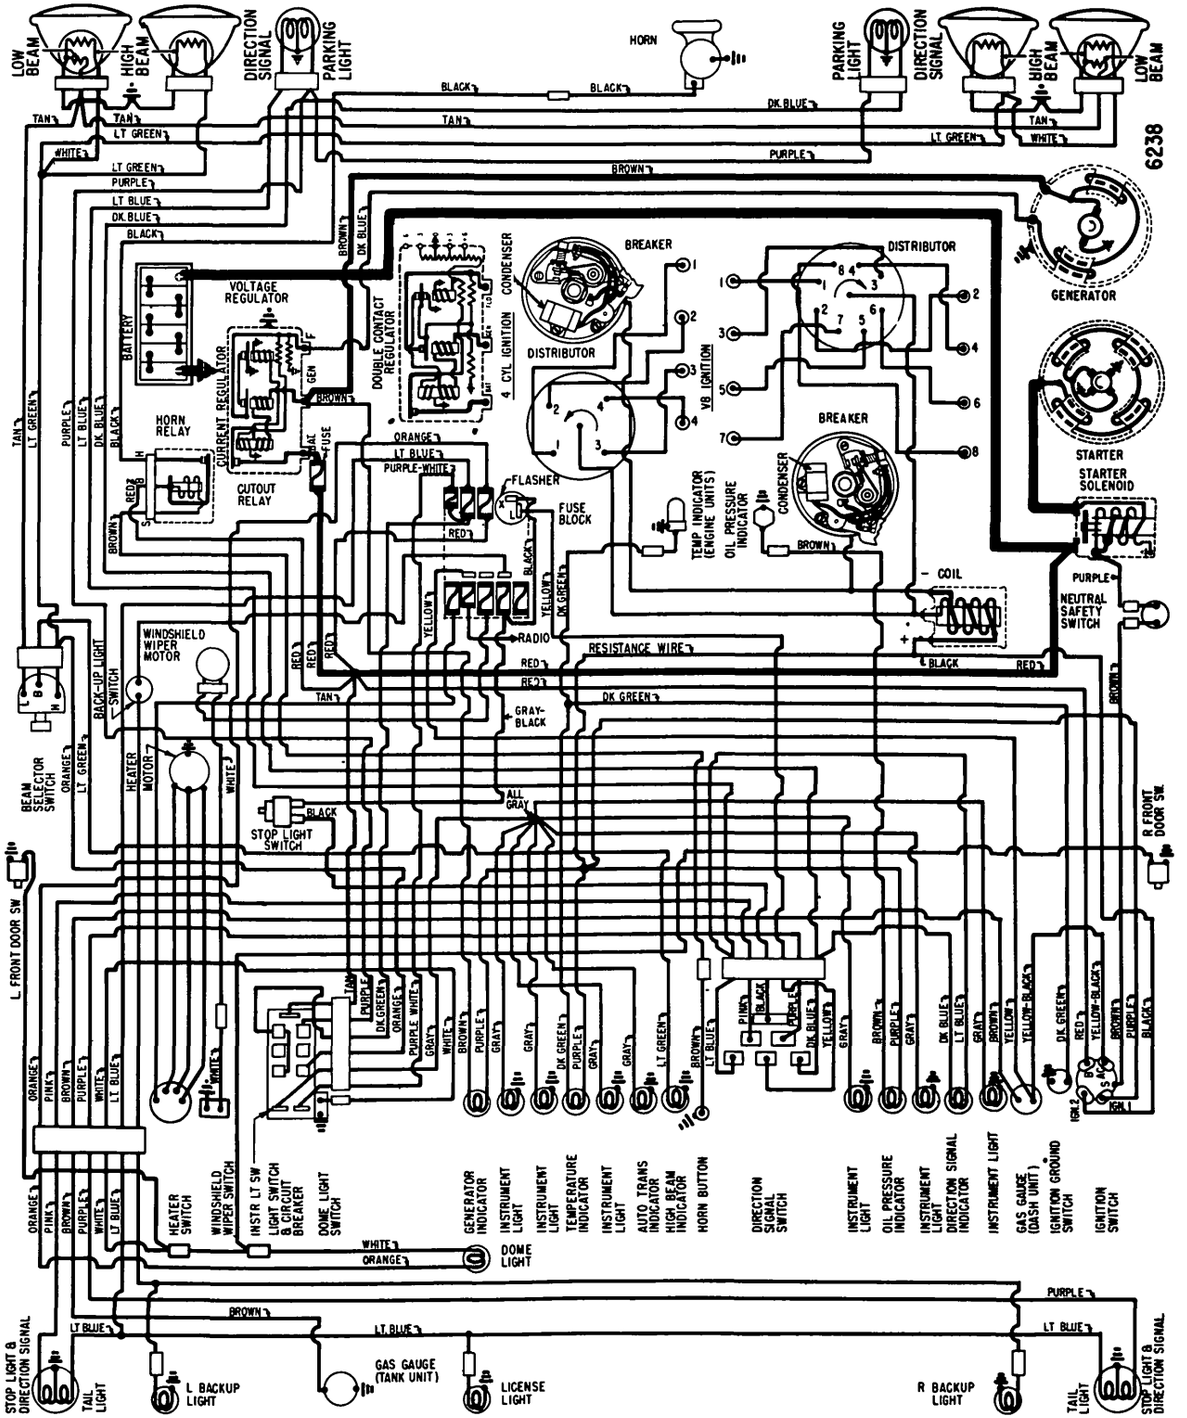
ROCHESTER B & BC

Mdl	Rochester No.
4 Cyl. Synchro-mesh (Manual Choke)	B 7020061
4 Cyl. Auto. Trans. (Automatic Choke)	BC 7020062

Idl S tting - Initial setting 1½ turns open. Turn screw out for richer mixture.

Idl Sp ed Setting

Mdl	Idle Setting
Synchro-mesh (Air Cond. "Off")	680-700 RPM
Auto. Trans. in "D" (No Air Cond.)	580-600 RPM
Auto. Trans. in "D" (With Air Cond. "Off")	630-650 RPM



Fl at L v l - 1 9/32" (Gauge M-250). With air horn inverted and gasket in place, place gauge over floats with gauge tang inserted in discharge nozzle. Bend float arms so top of each float just touches gauge and float is centered between gauge legs.

Fl at Drop - 1 3/4" (Gauge BT-93). With air horn upright and float hanging freely, bend float tang as required for distance from gasket surface to bottom of float.

Thr ttl St p (Manual Ch ke Only) - With choke valve wide open, rotate eccentric washer to obtain .001-.006" clearance between upper end of kick lever and kick cam.

Fast Idl : No adjustment (will be correct when hot or slow idle correctly set).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Automatic Choke Setting: Centered on Index (Supersedes previous specifications of 1 or 2 notches rich).

Throttle Linkage Adjustment: See *CARBURETOR above.*

►*OTHER DATA: See "Rochester B & BC Carburetors" in Carburetion Section.*

ROCHESTER 4GC 4-BARREL

Model	Rochester No.
4 Cyl. Synchro-mesh	7020079
4 Cyl. Auto. Trans.	7020066
V8 (All Trans.)	7020078

►*MANIFOLD FUEL DISTRIBUTION (4 Cyl.):* Carburetor FRONT barrels feed Cyls. 2 & 3; REAR barrels feed Cyls. 1 & 4.

►*MANIFOLD FUEL DISTRIBUTION (V8):* Carburetor RIGHT barrels feed Cyls. 2-3-5-8; LEFT barrels feed Cyls. 1-4-6-7.

Idle Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Rochester 4GC Carburetors" in Carburetion Section.*

Throttle Linkage Adjustment: See *CARBURETOR above.*

►*OTHER DATA: See "Rochester 4GC 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC No. 4843 (4 Cyl.), 4827 (V8). Fuel only.
Pressure - 4-5¼ lbs. at 1800 RPM.

Fuel Filter: AC No. GF-61 (Exc. V8 with Air Cond.), No. GF-67 (V8 with Air Cond.). GF-61 filter located in carburetor fuel inlet (integral), and GF-67 filter located in carburetor inlet line. Replace every 12,000 miles.

Gasoline Gauge: AC Electric.
Dash Unit - AC No. 5643990.
Tank Unit - AC No. 5641735 (Std.), No. 5641843 (V8 with Air Cond.).

Air Cleaner: Oil wetted wire mesh or oil wetted plastic foam (polyurethane) types used.
Wire Mesh Type - Clean and reoil every 8000 miles or sooner under severe dusty conditions.
Plastic Foam Type - Clean and reoil every 16,000 miles or yearly, or sooner under severe dusty conditions.

►*PLASTIC ELEMENT CLEANING CAUTION:* Remove element carefully from wire mesh support and wash in solvent. Squeeze element (do not wring) to remove all solvent and reoil with 10W-30 engine oil.

BATTERY

Delco No. 454 (30 Amp. Generator) - 12 volt, 9 plate, 42 ampere hour capacity (20 hour rate).
Delco No. 459 (35 Amp. Generator) - 12 volt, 9 plate, 53 ampere hour capacity (20 hour rate).
Delco No. 558 (Heavy Duty) - 12 volt, 11 plate, 61 ampere hour capacity (20 hour rate).
Batt ry Gr und - Negative.
Engin Gr und - To crossmember at each side of engine.

STARTER

D lc -Remy N . 1107796 (4 Cyl.), 1108303 (V8).
Armature - Delco-Remy No. 1932185 (4 Cyl.), No. 1935828 (V8).
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data - 1107796

Torque	RPM	Volts	℄ Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	4.3	300-360

Performance Data - 1108303

Torque	RPM	Volts	℄ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

℄ - Includes solenoid.

Starting Switch: Delco-Remy No. 1116612 Ignition & Starter Switch Assembly controls Delco-Remy Solenoid No. 1119798 (4 Cyl. exc. AC), No. 1114266 (V8). Solenoid mounted on starter.

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1998717. Located on steering column behind instrument panel.
Adjustment - *See "Pontiac Tempest Transaxle" in Transmission Section .*

GENERATOR

►*CHARGING CIRCUIT FUSE CAUTION: Battery Charging Circuit protected by a 45 amp. fuse, No. 1945172 clipped to "BAT" terminal of generator regulator. Check for blown fuse when diagnosing generator, regulator or battery failure.*

Delco-Remy. Used as follows:

Model	Delco-Remy No.
4 Cyl. (Synchro-mesh)	1102266
4 Cyl. (Auto. Trans.)	1102273
4 Cyl. (With Air Cond.)	1102319
V8 (Less Air Cond.)	1102267
V8 (With Air Cond.)	1102307
V8 (Heavy Duty & Taxi)	1105145

Armature - Delco-Remy No. 1946931 (1102266 & 267 Gen.), No. 1940161 (1105145 Gen.).

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

Performance Data - Cold (70°F)

Generator	Amperes	Volts	Gen. RPM
1102266 & 267	30	14.0	2310
1102273	30	14:0	2150
1102307 & 319	35	14:0	2730
1105145	35	14.0	1730

Rotation - Counterclockwise at commutator end.
Field Current - 1.48-1.62 amps. (1102266,267,273,307 & 319), 2.73-3.0 amps. (1105145).
Brush Spring Tension - 28 ozs.

B lt Adjustment: Borroughs Tension Gauge should read 70-75 lbs.

GENERATOR REGULATOR

D lco-Remy. Used as follows:

Generator	Regulator N .
1102266, 267 & 273	1119263
1102307 & 319	1119264
1105145	1119641

NOTE - Regulator 1119641 is External Adjustment Double Contact type.

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

Cutout Relay
Cuts In - 11.8-13.5 volts (1119263 & 264), 11.8-13.0 volts (1119641).
Cont act Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage R gulator
Setting (1119263 & 264) - 13.8-14.7 volts at 125°F ambient temperature.
Setting (1119641) - 13.5-14.4 volts at 125°F ambient temperature operating on upper contacts with external adjustment screw set at "0". .1-.3 volts lower when operating on lower contacts.

►*EXTERNAL ADJUSTMENT NOTE:* External adjustment feature provides quick adjustment of voltage regulator setting for temporary unusual driving conditions and high or low battery temperature. Move adjustment screw as required.
Contact Gap (1119641) - .016".
Air Gap - .075" (1119263 & 264), .067" (1119641) with armature pressed down to point where contacts just touch.

Current R gulator
Setting (1119263) - 27.0-31.0 amps. at 125°F.
Setting (1119264 & 641) - 31.0-35.5 amps. at 125°F
Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-R my 1119600 (Doubl Contact) Series Regulators" or "D lco-Remy 1119000 Series Regulators" in Electrical Section.*

ALTERNATOR

Delco-Remy Delcotron No. 1117070. Three-phase type with internal rectifiers.

℄ Performance Data - Cold (70°F)

Amperes	Volts	RPM
58	14.0	2500

℄ - Rated output hot 60 amps.

Current Output at Idle Sp ed - 25 amps. (approx.) at 525 engine RPM.
Field Current - 5.6-6.3 amps. at 12 volts and 80°F.
Brush Spring Tension - 13 ozs.
Rotation - Clockwise at drive end.

►*OTHER DATA: See "D lco-Remy D lcotron Alt rnators" in Electrical Section.*

ALTERNATOR REGULATOR

Delco-Remy No. 9000562. Two-unit type containing a Field Relay and a Transistorized Voltage Regulator.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Voltage Regulator

Normal Setting - 13.9-14.6 volts. Adjust within range regardless of temperature.
Air Gap - .070" with armature pressed down to point where contacts just touch.

Field Relay

Closing Voltage - 5.0-9.5 volts.
Air Gap - .014" with contacts just touching.
Contact Gap - .027".
►*OTHER DATA: See "Delco-Remy Transistorized Alternator Regulators ("A" Circuit Type)" in Electrical Section.*

MISC. ELECTRICAL

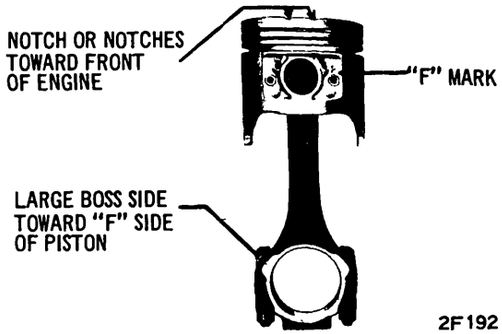
Direction Signals: Switch located on steering column jacket behind instrument panel. To remove switch, loosen clamp screw and remove control cable assembly from switch. To install, reverse removal procedure, making sure switch and lever are in neutral position before tightening switch clamp screws.
Lighting Switch Removal: Unhook one battery cable. Pull headlight switch to "ON" position. Push latch button on bottom of switch assembly and pull out switch knob assembly. Screw bushing from switch assembly allowing switch to be removed from instrument panel.
Instrument Cluster Removal: Disconnect battery. Remove upper and lower retaining screws, and remove screws from lower steering column bezel. Remove speedometer cable. Pull cluster and housing out from instrument panel opening to gain access to wiring. Remove bulbs and wiring. Remove retaining screws (cluster-to-housing). To install, reverse removal procedure.
Speedometer Removal: Remove instrument cluster (see above) then remove all speedometer head retaining screws. Remove speedometer. To install, reverse removal procedure.
Fuel Gauge Removal: Remove instrument cluster (see above) then remove wire connector and bulb. Remove retaining screws, then remove gauge. To install, reverse removal procedure.
Stop Light Switch Location & Adjustment: Mechanical type located on bracket attached to steering column behind instrument panel. To adjust, loosen locknut and position switch thread 3/16" to pedal arm with brake released. *NOTE - Switch must not restrict pedal pedal action.*
CIRCUIT BREAKER: 22 Ampere - Headlights, Parking lights, and High Beam Indicator. In headlight switch. *NOTE - Following circuits are wired in series with headlight switch circuit breaker in addition to the individual fuse for that circuit on fuse block: Tail, Trunk, & License lights; Instrument, Clock, & Ash Tray lights; Courtesy & Dome lights.*
FUSES: *All fuses are in fuse block on passenger side of dash on left side of car.*
25 Amper - Windshield wiper and washer.
25 Amper - Back-up lights.
25 Amper - Parking Brake Warning light.
20 Amper - Direction Signals.
20 Amper - Glove box light, Lighter, Clock.
20 Amper - Heater & Air Conditioner.
9 Amper - Tail, Trunk, & License Lights.
9 Amper - Courtesy & Dome lights.
9 Amper - Stop lights.
7.5 Amper - Radio.
4 Amper - All instrument panel, control, and dial lights.

ENGINE
4 CYL. ENGINES

ENGINE SPECIFICATIONS: Own. 4 Cyl., valve-in-head, inclined 45° to right. 195" engine of same design used previously.

Bore	Stroke	Displacement	Rated HP
4 1/16"	3 3/4"	195 cu. ins.	26.4

Engine	Compr. Ratio	Developed HP
1-Bbl. Carb. Synchro-mesh	8.6-1	110 at 3800 RPM
1-Bbl. Carb. Auto. Trans.	8.6-1	115 at 4000 RPM
1-Bbl. Carb. Synchro-mesh	10.25-1	120 at 3800 RPM
1-Bbl. Carb. Auto. Trans.	10.25-1	140 at 4400 RPM
4-Bbl. Carb. Synchro-mesh	10.25-1	166 at 4800 RPM
4-Bbl. Carb. Auto. Trans.	10.25-1	166 at 4800 RPM



Compression Reading - *See TUNE-UP.*
►*FLYWHEEL HOUSING LOWER COVER GASKET NOTE:* Due to a design change in flywheel housing bottom cover, the lower cover gasket is not used or required on cars after Serial Nos. 162P-8032, 162S-1893, & 162K-1001.
OIL PAN REMOVAL: Drain crankcase. Remove exhaust crossover pipe, flywheel housing front shield, and lower cover. Remove front crossmember assembly as follows: *NOTE - Crossmember assembly includes entire front suspension system.* Raise car, support crossmember and install an engine support. Remove wheels. Disconnect tie rod ends, engine mounts, engine ground straps, and brake lines at crossmember. Remove fuel line from clip on crossmember. Remove retaining bolts and remove crossmember assembly. Remove attaching bolts and remove oil pan.
►*ENGINE IDENTIFICATION LETTER CODE NOTE: Located below Engine Production Code Number. See ENGINE IDENTIFICATION above.*
ENGINE REMOVAL: *See "Engine" in Pontiac Special Data.*
CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Pontiac Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Pontiac Special Data.*

PISTONS

Aluminum alloy, cam ground, slipper type with steel struts, tin plated. *NOTE* - 8.6-1 ratio pistons have dished head, two notches in front of piston, and "L" on rear of piston near pin boss, and must not be used in 10.25-1 ratio engines. Pistons for these engines have reliefs machined in piston head for valve clearance and have a notch in front of piston.
Fitting New Pistons - Measure piston skirt perpendicular to piston pin boss (pin removed) and 1¼" below oil ring groove. Micrometer must be in full contact. Clearance between piston and cylinder bore .0007-.0013" (actually measured).
Installing Pistons: Install pistons with notch or notches in piston head and "F" mark on piston boss toward front of engine. *See Rod Installation.*
Replacement Pistons: Furnished Std. (4.060", 4.061", 4.062", 4.063" "Flat" or "Recessed Top") and .005", .010", .020", and .030" oversizes.

PISTON PIN

Diameter - .9802". **Length** - 3.25".
Clearance in Piston - .0003-.0005" loose.
Clearance in Rod - .0008-.0016" interference fit. Pin is a press fit in rod.
Piston Pin Removal & Installation - *See "Piston Pins" in Pontiac Special Data.*

PISTON & ROD ASSEMBLY

Replacement Pins: Furnished Std. and .001", .003" oversize.

PISTON RINGS

Compression rings are cast iron, taper faced. No. 1 has thick chrome, No. 2 has Lubrite finish. Oil ring is segmented spring steel with chrome face on rails.

Ring	Width	End Gap	Side Clearance
Compr. (1)	.078"	.016-.026"	.0015-.0030"
Compr. (2)	.078"	.013-.025"	.0015-.0035"
Oil	.184"	.015-.035"	.0015-.0085"

Installing Rings - Step or chamfer on upper compression ring and letter "T", dot, or word "TOP" on lower compression ring toward the top.
Replacement Rings: Std. and .005", .010", .020", .030" Oversize.

CONNECTING ROD

Length - 6.63" (center-to-center)
Crankpin Journal Diameter - 2.2492-2.2502".
Lower Bearing - Durex 100A, steel-backed, replaceable precision type, no shims.
Clearance - .0005-.0025".
Sideplay - .0045-.0085".
Replacement Bearings: Std. and .001" & .002" undersize.
Rod Installation: Install rods in pistons so that LARGE machined boss at lower end of rod is on same side as "F" mark on piston and toward front of engine.

CRANKSHAFT

Journal Diameter - 3.000". Five bearings.
Bearings - M-400 (No. 4) Durex 100-A (Others). Steel backed inserts, precision type, no shims.
Clearance - .0005-.0025" (Front), .0005-.003" (All Others).
End Thrust: Taken by No. 4 (rear center) main bearing.
End Play - .0035-.0085".
Replacement Bearings: Furnished Std. and .001", .002" Undersize.
Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Pontiac Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Pontiac Special Data.*
Vibration Dampener Removal & Installation: *See "Vibration Dampener" in Pontiac Special Data.*

CAMSHAFT

►*CAMSHAFT APPLICATION NOTE:* Three camshafts used depending on carburetion, compression ratio and transmission application. Camshaft No. 537995 used on

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

89Z, 88Z, 86Z, 85Z & 78Y Engines. Camshaft No. 541155 used on 79Y Engine. Camshaft No. 539099 used on 87Z, 77Y & 76Y Engines. *For engine letter code, refer to Engine Identification Letter Cede under MODEL IDENTIFICATION above.*

Journal Diameter - 1.8987-1.8997". Five bearings.
Clearance - .0015-.0030".
End Thrust - Taken by thrust plate behind camshaft sprocket.
Endplay - .003-.007".
Timing Chain: Length - 60 links.
►*1961-1962 4 CYL. TIMING CHAIN FAILURE CORRECTION, TIMING CHAIN PRODUCTION CHANGE NOTE & TIMING CHAIN WEAR CHECK: See "Timing Chain" in Pontiac Special Data.*
Timing Chain Tensioner - Consists of a fixed bumper on drive side of front face and a spring loaded bumper on slack side of timing chain. *See "Timing Chain" in Pontiac Special Data.*
►*TIMING CHAIN REMOVAL CAUTION:* **Do not rotate crankshaft with timing chain out of engine.** Damage to valves, pistons or both will result due to piston striking valve. To rotate camshaft with timing chain off, crankshaft must be positioned so pistons are 45° before or after TDC, to avoid damage.
Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line across shaft centers.
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Pontiac Special Data.*
Engine Front Cover Removal: *See "Engine Front Cover" in Pontiac Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Pontiac Special Data.*

VALVES

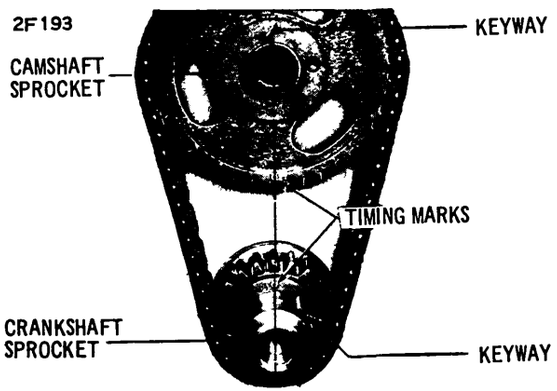
Tappet Clearance: Zero lash, hydraulic lifters.

Valve	Head Diameter	Stem Diameter	Length
Intake	1.88"	.3407-.3414"	4.85"
Exhaust	1.60"	.3402-.3409"	4.84"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°①	③	.0021-.0038"
Exhaust	45°②	③	.0026-.0043"

① - Valve Face Angle 29°. ② - Valve Face Angle 44°. ③ - .40" (Engines Codes 87Z, 77Y, 76Y). .33" (Engines Coded 89Z, 88Z, 86Z, 85Z , 78Y). .34"(Eng. Coded 79Y).
Valve Seat Width - .048-.070".
Replacement Valves: Furnished Std., .001", .003", .005" Oversize stems.
Valve Stem Oil Seals: Used on all valves as follows:
Oil Shield - Inverted cup over upper end of outer valve spring (under spring retainer cup).
Oil Seal - Neoprene seal installed in second groove on valve stem (under valve locks).
Valve Stem Length Checking: *See "Valve System" in Pontiac Special Data.*
Valve Springs: Single or double (inner and outer) springs used as follows:

Valve Spring Specifications
①Engin s Cod d 89Z, 88Z, 86Z, 85Z, 78Y, 79Y



Valv	Spring Pr ssur	L ngth
Closed	80 lbs.	1.53"
Open	171 lbs.	1.20"

①Engin s C d d 87Z, 77Y, 76Y

Valv	Inn r Spring Pr ssur	Inn r Spring L ngth	Out r Spring Pr ssur	Out r Spring L ngth
Closed	26 lbs.	1.48"	60 lbs.	1.52"
Open	64 lbs.	1.08"	114 lbs.	1.12"

① - *See "Camshaft Application Note" above.*

Valve Guides: Cast integral with cylinder head. *NOTE* - Ream guides for next oversize using tools No. J-5830-1 (.003"OS), and J-6621 (.005" OS).
Hydraulic Lifters: Standard on all models.
Diameter - .8424-.8427". **Length** - 2".
Clearance in Lifter Boss - .0013-.0028".
Hydraulic Lifter Overhaul - *See "Valve System" in Pontiac Special Data.*
Rocker Arms: Mounted individually on studs pressed into cylinder head.
Installation of Rocker Arm to Stud - Tighten rocker arm stud nut to 15-25 ft. lbs. torque.
Rocker Arm Stud Replacement - *See "Valve System" in Pontiac Special Data.*

VALVE TIMING MARKS

VALVE TIMING

See "Camshaft Setting" and "Camshaft Application Note" under CAMSHAFT above.

Valve Timing Specifications
Engines Coded 89Z, 88Z, 86Z, 85Z, 78Y
Intake Valves - Open 14° BTDC. Close 58° ALDC.
Exhaust Valves - Open 48° BLDC. Close 24° ATDC.
Engines Coded 87Z, 77Y, 76Y
Intake Valves - Open 30° BTDC. Close 63° ALDC.
Exhaust Valves - Open 77° BLDC. Close 25° ATDC.
Engines Coded 79Y
Intake Valves - Open 24° BTDC. Close 60° ALDC.
Exhaust Valves - Open 66° BLDC. Close 26° ATDC.

V8 ENGINES

ENGINE SPECIFICATIONS: Own. 90° V8, valve-in-head. Aluminum block with cast iron cylinder liners of same design used previously.

Bore	Stroke	Displacement
3.50"	2.80"	215 cu. ins.

C mpressi n Rati	Rated HP	D vel ped HP
11.0-1 (4-Bbl. Carb.)	39.2	190 at 4800 RPM

C mpr ssi n R ading - *See TUNE-UP.*
►*FLYWHEEL HOUSING LOWER COVER GASKET NOTE:* Due to a design change in flywheel housing bottom cover, the lower cover gasket is not used or required on cars after Serial Nos. 162P-8032, 162S-1893, & 162K-1001.
OIL PAN REMOVAL: Raise car, drain crankcase, and remove flywheel pan. Remove oil pan attaching bolts and remove oil pick-up pipe bolts. Remove oil pan. *NOTE - Raise engine slightly if n c ssary for cl aranc .*
ENGINE REMOVAL: *See "Engine" in P ntiac Special Data.*
CYLINDER HEAD REMOVAL & INSTALLATION: *S "Engine" in Pontiac Special Data.*
►*OTHER V8 ENGINE DATA: See 1962 BUICK SPECIAL Car Model Pages.*

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: S "Engin Lubricati n" under OILING SYSTEM in P ntiac Special Data.*
Crankcase Capacity: 4 qts. refill, 5 qts. with filter change.
Normal Oil Pressure: 30-40 lbs. at 2600 RPM.
Pressure Regulator - In oil pump body, not adjustable.
►*LOW OIL PRESSURE CORRECTION:* If oil pressure indicator flickers or remains ON, dirt or chips may be lodged in oil pressure regulator ball seat. To correct, clean oil pump thoroughly.
Oil Pump: Spur gear type. 4 Cyl. pump located on right rear lower face of cylinder block and driven by distributor drive gear. V8 oil pump located in timing chain cover.
Pump Overhaul - *See "Oiling Syst m" in P ntiac Special Data.*
Oil Filter: AC No. PF-7. Full flow type. Replace element every 4000 miles or sooner if needed.
Crankcase Ventilation (Standard Cars): Filter elements located in oil filler cap on left rocker arm cover (V8), front of rocker arm cover (4 Cyl.). Oil baffles in rocker arm cover prevent oil from being exhausted with air through vent pipe. Clean filter element every 12,000 miles or sooner if needed by washing in solvent, blowing dry and re-oiling.
Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line. *Se "Closed Crankcase Ventilation Syst ms" in Carburetion Section.*
Oil Pressure Indicator: Warning light on instrument panel controlled by switch in oil filter pad (4 Cyl.), in oil pump cover (V8). Light goes on when ignition turned on, goes out when oil pressure reaches 5 ±1½ lbs. *NOTE - If light remains on or flick rs, cl an il pump thoroughly. See LOW OIL PRESSURE CORRECTION above.*

ENGINE COOLING SYSTEM

Water Capacity: 11½ qts., with heater 12½ qts., with air conditioning 13 qts.
Pressure Valve: Radiator filler cap 14-17 lbs.
Thermostat: Pellet type in intake manifold water outlet passage. 180°F Std., 170°F Optl.
Water Pump: Packless, sealed double row ball bearing shaft. Serviced as an assembly.
Temperature Gauge: Warning light on instrument panel goes on when ignition turned on, goes out when engine warms. In case of cooling system malfunction, red light goes on at 248°F. Service thermal switch by replacement .
Engin Unit - Delco-Remy No. 1993518.

Se INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

ENGINE

►*AIR CONDITIONED CAR CAUTION:* When removing engine, air conditioning compressor must first be removed from its mounting bracket. *See "Studebaker Air Conditioning" in Miscellaneous Section.*

6 CYLINDER ENGINE

ENGINE REMOVAL: Remove hood, radiator, battery and carburetor air cleaner. Disconnect heater hoses from water pump and cylinder head. Drain crankcase. Disconnect all lines, wires, cables, and hoses from engine. Remove clevis pin connecting accelerator cross shaft and bellcrank rod. Disconnect engine front mounts and engine ground strap from right front mount. Disconnect exhaust pipe from manifold (remove "U" clamp at clutch or converter housing bracket to lower pipe). Remove starter motor. Disconnect one end of right tie-rod, remove shaft from steering bellcrank, and move bellcrank to clear oil pan. Install engine lifting eyebolts in place of Nos. 15 & 20 cylinder head bolts and raise engine so weight is off the front mounts.

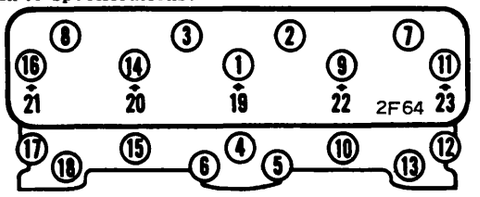
On automatic transmission cars, disconnect accelerator bellcrank-to-transmission rod. Remove converter housing lower plate and disconnect torque converter from drive plate. On all cars, remove clutch or converter housing attaching bolts and drive out dowel pins. Remove engine.

V8 ENGINE

ENGINE REMOVAL: Remove hood, upper air deflector, and fan shroud. Remove battery. On Hawk, remove fan blade assembly. On other cars, remove radiator and water pump manifold. On all cars, remove generator, starter, and exhaust crossover pipe. Turn wheels to extreme right (Hawk), remove steering bellcrank shaft (Others). Remove carburetor air cleaner, fuel pump-to-carburetor pipe, spark modifier pipe, and spark plug cable support brackets from rocker arm covers. Disconnect all hoses, lines, wires, and cables from engine. On automatic transmission cars, disconnect accelerator bellcrank rod at bellcrank. On all cars, disconnect both engine front mounts and engine ground strap. With a sling under intake manifold, raise engine to take weight off front mounts. Remove clutch or converter housing cover plate. Disconnect torque converter from drive plate. Disconnect clutch or converter housing from engine. Push engine forward to disengage clutch housing dowels and until transmission splines are clear. Remove engine.

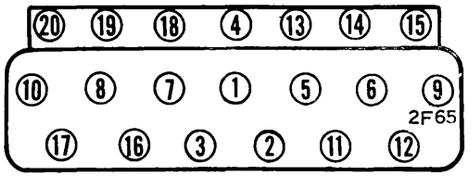
OIL PAN

ALL ENGINES



OIL PAN INSTALLATION: To install oil pan gaskets, filler block must be removed. Remove filler block attaching screws and carefully separate gasket and filler block. If gasket damaged, replace with correct portion of a new front cover gasket. Clean oil pan and mounting flanges of block and apply a sealer such as Perfect Seal to block flanges. Install oil pan gaskets. Install filler block on front cover and install one upper screw. Pry upward on filler block with a stick and install opposite upper screw. *This procedure will compress gasket ends and align filler block.* Install lower screws and tighten all screws until screw heads just engage lockwashers. Install oil pan, tighten mounting screws to specifications and then tighten filler block attaching screws securely.

CYLINDER HEAD & MANIFOLD



►*AIR CONDITIONED CAR CAUTION:* When removing cylinder head, air conditioning compressor must first be removed from its mounting bracket. *See "Studebaker Air Conditioning" in Miscellaneous Section.*

6 CYLINDER ENGINE

CYLINDER HEAD INSTALLATION: Insert dowel studs in capscrew holes Nos. 14, 15 & 17. Coat both sides of gasket with a thin coat of Perfect Seal, install gasket and place cylinder head over dowel studs. Coat capscrews with oil or graphite paste and install. Partially tighten all screws in sequence (see diagram), then again to specifications.

V8 ENGINE CYLINDER HEAD

6 CYLINDER ENGINE CYLINDER HEAD

V8 ENGINE

CYLINDER HEAD INSTALLATION: *CAUTION - Right and l ft cylind r h ads ar int rchang abl . Bl ck off rear water pump port on both heads with a dummy plat and gasket. Heat indicator unit is mounted in left head dummy plate.* Coat gasket with Perfect Seal and install. Coat cylinder head capscrews with oil or graphite paste and install nine short screws in outer two rows of holes in head, five medium length screws in center row and tighten finger tight. Install pushrods. Install rocker arm assembly with the four long screws and tighten finger tight. Install rocker arm support bracket screws and tighten alternately to specifications. Tighten cylinder head screws to specifications in sequence shown in diagram. Complete reassembly.

ORIGINAL BORE & PISTONS

ALL ENGINES

ORIGINAL BORE & PISTON SIZES: Standard cylinder bores may vary from 3.0000" to 3.0025" (6 Cyl.), 3.5625" to 3.5645" (V8) oversize in .0005" increments (not more than .001" variation in any one block). Bore size is stamped on top face of cylinder next to bore. *Example: "25" on cylinder indicates bore size 3.0025" (6 Cyl.), 3.5625" (V8).* Replacement pistons furnished for these oversizes under the standard size part number and size is marked on top of piston.

PISTON PINS

ALL ENGINES

PISTON PIN: Removal - Place Removing & Installing Tool J-1293-C in a vise and place piston and rod assembly through tool. *CAUTION - Do not overtight n tool retaining nut as piston pin may be expanded.* Remove locknut and washer from piston pin clampscrew and install on opposite end of screw. Tighten locknut to remove screw and then separate piston, pin, and rod.

Installation: Use Tool J-1293-C in same manner as for removal. Oil squirt hole in rod must be on solid side of piston. Clampscrew should be installed from slotted side of piston (all V8 pistons and 6 Cyl. pistons Nos. 1, 3, 5); from solid side of piston (6 Cyl. piston Nos. 2, 4, 6). Align flat surface of piston pin with flat surface of clampscrew. Tighten clampscrew locknut to specifications.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

►*REAR MAIN BEARING OIL LEAK CORRECTI CN:* Rear main bearing has beveled pocket adjacent to parting line of the two bearing halves. The **non-bevel d** portion of the bearing parting surface must be square and sharp. If not square and sharp, a rear main bearing oil leak can result. If this condition exists, replace bearing halves.

REAR MAIN BEARING OIL SEAL INSTALLATION: Loosen intermediate bearing cap screws **2 turns only** to aid installation. Install seals as follows:

Brummer Seal - With seal grooves in block and cap clean and dry, blunt sharp edge of flange at rear of block and carefully insert seal in block so wiping lip of seal contacting crankshaft points away from flywheel. Trim ends flush with block. Install seal in bearing cap

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

and align with block seal. Apply oil to wiping edge of seal and install bearing cap making sure exposed part of seal smoothly straddles rear flange of bearing cap.

Cork Seals - Drive into grooves between sides of cap and block. Do not damage or split seals. Tighten intermediate bearing caps.

►*LEAK TEST NOTE:* After new seals installed, run engine for 45 minutes before checking for leaks.

ENGINE FRONT COVER

6 CYLINDER ENGINE

ENGINE FRONT COVER: Removal - Remove radiator, vibration damper, fan pulley (Puller J-8111) and protect threaded end of crankshaft. Remove attaching bolts and remove cover.

Installation: Install cover on engine leaving attaching bolts loose so cover will center itself when fan pulley installed. Install fan pulley (Pusher Set J-4704-A). Reverse removal procedure.

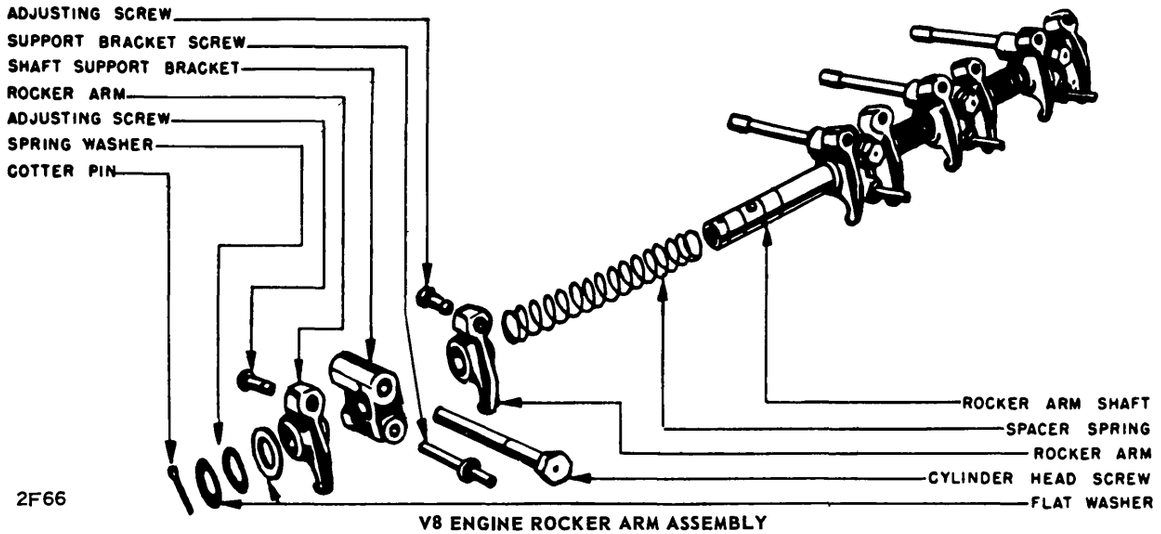
FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Install new felt seal in cover using fan pulley hub to seat it properly.

V8 ENGINE

ENGINE FRONT COVER: Removal - Remove fan shroud (Hawk), radiator, all belts, fan blade assembly, water manifold fuel pump, pump-to-carburetor pipe, vibration damper, and fan pulley hub (Puller J-8111). Remove attaching screws and remove front cover.

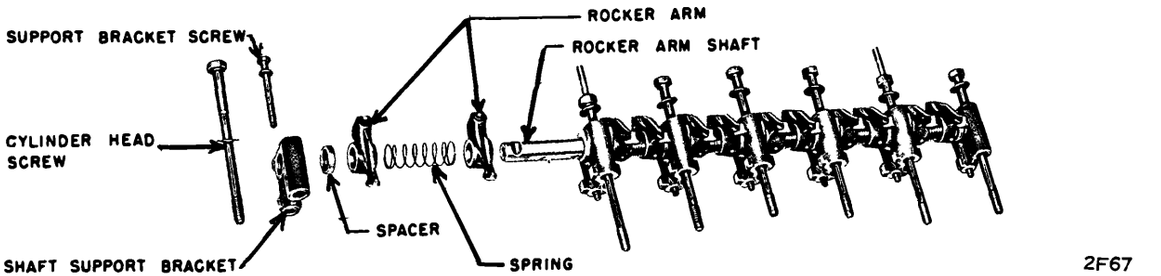
Installation: Install front cover and leave attaching screws loose until fan pulley hub installed so seal and cover will be properly centered. Install fan pulley hub (Pusher Set J-7404). Reverse removal procedure.

FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Install new felt seal in cover and wet with engine oil. Use fan pulley hub to seat seal properly.



CAMSHAFT & BEARINGS

6 CYLINDER ENGINE



CAMSHAFT REMOVAL: *NOTE - If necessary to remove camshaft without removing engine, remove fenders, grille and radiator as an assembly. Then proceed as follows:* Remove cylinder head, manifold assembly, and valve cover plates. Remove valve assemblies and either turn engine over so lifters will fall free or block lifters up away from camshaft lobes. Remove oil pan, oil pump, and pump drive shaft. Remove timing gear cover (see above). Turn crankshaft until camshaft thrust plate screws can be seen through spokes of camshaft gear. Remove capscrews and remove camshaft and gear.

V8 ENGINE

CAMSHAFT REMOVAL: Position IGN mark on vibration damper directly under timing pointer and distributor in No. 6 firing position. Remove fan shroud (Hawk), radiator, fan blade and water manifold assemblies. Remove rocker arm assemblies and pushrods, carburetor and intake manifold assemblies, lifter cover, valve lifters, fuel pump and timing gear cover. Turn camshaft just enough so thrust plate retaining screws can be exposed and removed, then return camshaft to original position. Carefully remove camshaft and gear.

V8 ENGINE ROCKER ARM ASSEMBLY

6 CYL. ENGINE ROCKER ARM ASSEMBLY

ALL ENGINES

TIMING GEAR REMOVAL: Remove front cover (see above), camshaft gear retaining screw, lock and flat washer, and fuel pump eccentric and lock plate. Use Puller No. J-8111 to remove camshaft gear. Remove crankshaft pulley key and oil slinger and pull crankshaft gear with Tool No. J-8111.

VALVE SYSTEM

VALVE GUIDES

ALL ENGINES

VALVE GUIDE REMOVAL & INSTALLATION:- Use Tool J-4673 (V8), J-9265 (6 Cyl.) to drive guides out combustion chamber side of cylinder head. *NOTE - Intake valve guides are longer than exhaust valve guides. Do not interchange.* To install valve guides with Tool J-4673, coat outside of guide lightly with white lead and insert chamfered end of guide from combustion chamber side. Place installing plate on head with "Intake" or "Exhaust" mark up depending on guide being installed, so long side of plate is parallel to end of head and plate bore aligns with guide bore. Insert driver through plate and drive guide into head until shoulder of driver contacts bottom of counterbore in plate.

ROCKER ARMS

6 CYLINDER ENGINES

ROCKER ARM ASSEMBLY: Removal - Remove air cleaner, rocker arm retaining nuts and washers. Unscrew rocker arm bracket screws from head, then unscrew cylinder head capscrews-to-rocker arm assembly. Remove rocker arm assembly with capscrews remaining in rocker arm shaft brackets.

Disassembly: Mark rocker arm, brackets, and rocker arm shaft for easy reassembly. Press in on one end shaft bracket, then remove cylinder head capscrew. Gradually release spring and carefully remove bracket, spacer, first rocker arm, compression spring, and next rocker arm from the rocker arm shaft. Proceed to next set.

Reassembly: Clearance between rocker arm shaft and rocker arms must be .0005-.0025". Install rear rocker arm shaft support bracket and insert cylinder head capscrew through bracket to hold in place. Install spacer next to end support, then install a rocker arm on the shaft next to spacer. Bottom of rocker arm must be on oil groove side of shaft and the valve stem end of rocker arm must be on same side of shaft as cylinder

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

head capscrew groove in shaft. Install spacer spring next to rocker arm then install second rocker arm and one center support bracket and secure with cylinder head capscrew. Install remainder in same manner. *NOTE* - Install spacer between end rocker arm and end bracket.

Installati n: Reverse removal procedure. Tighten cylinder head capscrews finger tight and tighten bracket screws alternately to avoid distortion. Then torque cylinder head capscrews 46-50 lbs. (refer to torque tightening sequence diagram in this section). Tighten rocker arm shaft bracket screws to a torque of 13-17 ft. lbs. Before installing rocker arm cover, check and adjust valve clearances. Install a new rocker arm cover gasket in cover flange. Torque rocker arm screws three times to 20 in. lbs., tightening rear nut last. Install air cleaner.

V8 ENGINE

ROCKER ARM ASSEMBLY: R moval - Remove air cleaner, disconnect spark plug wires, drain cooling system and remove rocker arm covers. Remove rocker arm bracket screws and the four rocker arm-cylinder head capscrews. Remove rocker arm assembly.

Disassembly: Mark rocker arms, brackets and rocker shaft for reassembly. Remove cotter pin from end of shaft and slide all parts off shaft, removing cylinder head screws when necessary.

Reassembly: Rocker arm springs should require 9½-10½ lbs. pressure to be compressed to length of 2 1/32". Replace spring if not within specifications. Clearance between rocker arm shaft and rocker arms must be .0005-.0025". Lubricate all parts with oil. Reverse removal procedure. Install parts in order shown in illustration and make sure bottom of rocker arm is on oil groove side of shaft and adjusting screw end of rocker arm is on same side of shaft as cylinder head capscrew groove in shaft. When correctly assembled, flat on end of rocker shaft will be to rear on right bank, to front on left bank.

Installation: Reverse removal procedure, tightening rocker arm bracket screws alternately to avoid distortion.

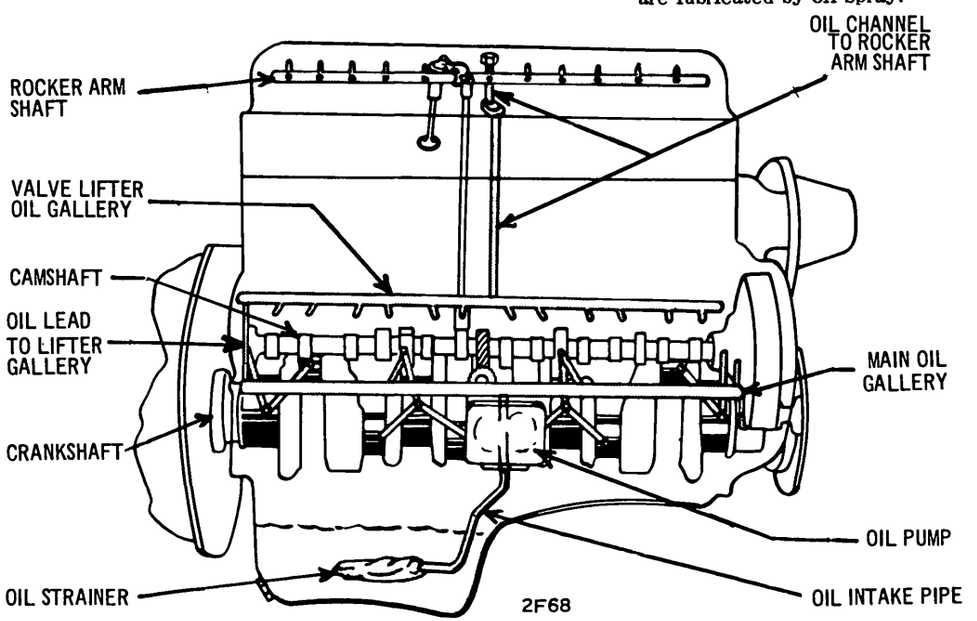
VALVE LIFTERS
ALL ENGINES

VALVE LIFTER INSTALLATION: Thoroughly clean lifter bores in cylinder block and inspect for smoothness. With lifter and bore clean and dry, check lifter fit and select correct lifter size. Lifters furnished Std., .001" and .005" oversize. *See .005" Oversize Lifter Installation below.*

Checking Lifter Fit in Bore: With proper fit, lifter should just slide into place from its own weight. If .001" oversize lifter does not restore proper clearance, bore must be reamed to .005" oversize and .005" oversize lifters installed.

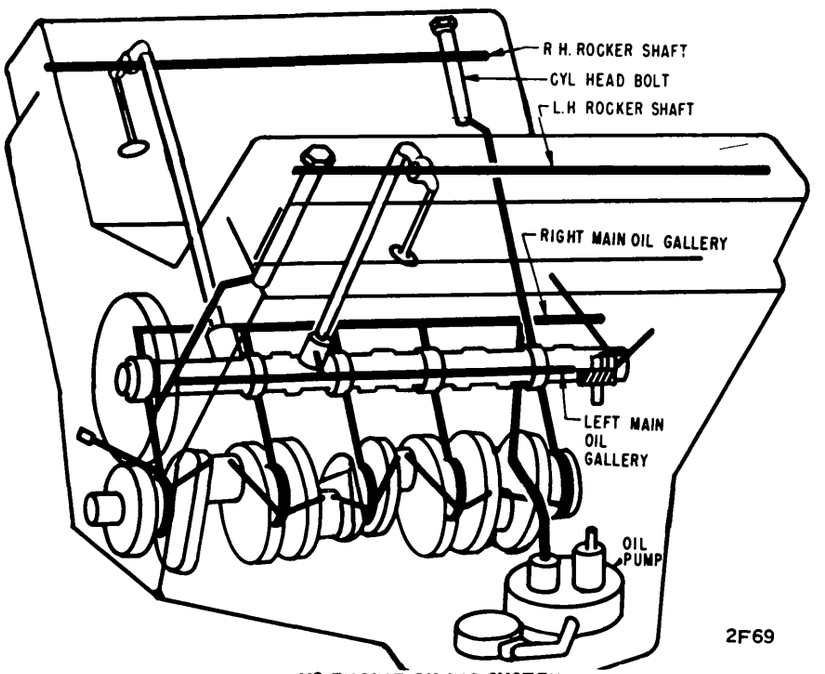
►*.005" OVERSIZE LIFTER INSTALLATION:* Special reamers required for reaming lifter bore as follows: 1352-5TB (6 Cyl.), 1352-STB (V8). These reamers will provide correct lifter clearance.

OILING SYSTEM



ENGINE LUBRICATION
6 CYLINDER ENGINE

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and valve lifters. All other parts are lubricated by oil spray.



OPERATION (Early Pr ducti n Cars): Gear type oil pump mounted externally on right side of crankcase draws oil through floating oil strainer and intake pipe in crankcase which terminates at inlet port in pump mounting base. Oil from pump flows through outlet passage in pump body and mounting pad directly to main oil gallery which extends longitudinally along right side of crankcase (oil pressure regulator is located in crankcase at forward end of this oil gallery). At rear of engine, a transverse passage connects main oil gallery with lifter oil gallery which also extends entire length of engine block on inner side of lifter chamber. Oil is distributed through these oil galleries. *See below.*

OPERATION (Later Production Cars): Gear type oil pump mounted externally on right side of crankcase draws oil through floating oil strainer and intake pipe in crankcase which terminates at inlet port in pump mounting base. Oil from pump flows through outlet passage in pump body and mounting pad into drilled passage in oil filter base (full-flow oil filter used). A valve is located in filter base to by-pass oil in the event element becomes plugged. Oil then enters main oil gallery which extends longitudinally along right side of crankcase (oil pressure regulator is located in crankcase at forward end of this oil gallery). At rear of engine, a transverse passage also connects main oil gallery with lifter oil gallery which extends entire length of engine block on inner side of lifter chamber. Oil is distributed through these oil galleries as follows:

CONTINUED ON NEXT PAGE

6 CYLINDER ENGINE OILING SYSTEM
(EARLY CARS WITH PARTIAL FLOW FILTER-FULL FLOW SYSTEM SIMILAR)

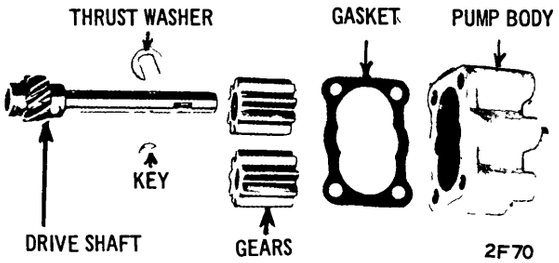
V8 ENGINE OILING SYSTEM
(EARLY CARS WITH PARTIAL FLOW FILTER-FULL FLOW SYSTEM SIMILAR)

CONTINUED FROM PRECEDING PAGE

Crankshaft & Camshaft B arings - Lubricated through drilled passages in each crankcase web extending from main oil gallery to camshaft bearing bore and then down to corresponding main bearing bore (rear camshaft bearing is lubricated from passage connecting main oil gallery to lifter oil gallery).
Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.
Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from drilled hole in connecting rod when this hole lines up with crankpin oil hole.
Valve Lifters - Each lifter lubricated through short oil passage extending from lifter oil gallery to lifter bore.
Rocker Arms, Pushrods & Valves - A vertical oil passage in center of cylinder block connects valve lifter oil gallery with passage in cylinder head. This passage leads the oil up and around the relieved cylinder head capscrew shank to the rocker arm shaft center bracket. The bracket is drilled to connect the capscrew hole with the rocker arm shaft hole. The oil enters the shaft and flows to the rocker arms through small holes drilled in the rocker arm shaft. The rocker arms are drilled from the pushrod ends to the bore and allow the oil to flow to the pushrods. Oil from rocker arm assembly returns to the oil pan through the pushrod-passages in the cylinder head and block.
Timing Gears - Lubricated by oil return from pressure regulator valve. Valve bypass port discharges into channel formed by groove in front of block behind engine front plate through which oil is directed onto timing gears. *NOTE* - Small bleed hole in valve plunger provides lubrication for gears at low speeds when pressure regulator valve is closed.

V8 ENGINES

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, valve lifters and valve mechanism on cylinder head. All other parts are lubricated by oil spray or oil return flow.



OPERATION (Early Production Cars): Gear type oil pump mounted on rear main bearing cap in crankcase draws oil through floating oil strainer and intake pipe mounted on pump body and delivers oil through passages in rear main bearing cap and engine block to rear of right main oil gallery which extends along entire length of engine. At forward end of engine, two intersecting cross-passages connect the right main oil gallery with the left main oil gallery which also extends along entire length of engine. Oil is distributed from these oil galleries. *See below.*

OPERATION (Later Production Cars): Gear type oil pump mounted on rear main bearing cap in crankcase draws oil through floating oil strainer and intake pipe mounted on pump body and delivers oil through drilled passages in oil filter base (full-flow oil filter used). A valve is located in filter base to by-pass oil in the event oil filter element becomes clogged. Oil is then delivered to passages in rear main bearing cap and engine block to rear end of right main oil gallery which extends along entire length of engine. At forward end of engine, two intersecting cross-passages connect right main gallery with the left main oil gallery which also extends along entire length of engine. Oil is distributed from these oil galleries as follows:

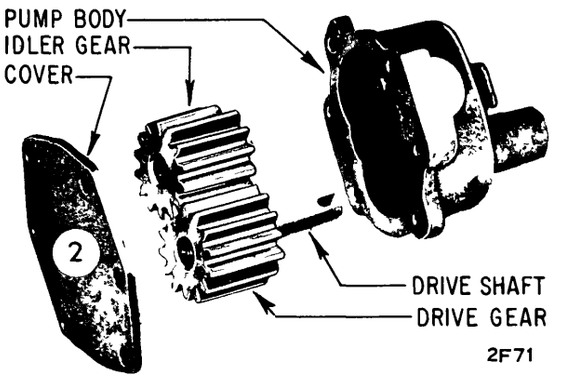
Crankshaft & Camshaft B arings - Lubricated through drilled passage in each crankcase web extending from **right hand** main oil gallery to corresponding camshaft and crankshaft bearings. *NOTE* - Rear camshaft bearing is lubricated by separate cross-passage from right main oil gallery.
Connecting Rods - Crankshaft is drilled and each connecting rod bearing is lubricated through drilled hole in shaft from adjacent main bearing.
Pistons & Pins - Lubricated by oil spray thrown on cylinder wall from spray hole in lower end of connecting rod when this hole registers with oil hole in crankpin.
Valve Lifters - Lifters are lubricated through short vertical passage leading from adjacent main oil gallery.
Rocker Arms, Pushrods, & Valves - Drilled passages in block at forward end of left main oil gallery (for left bank), and at rear end of right main oil gallery (for right bank) extend up to matching passages in cylinder head and rocker shaft support brackets (front bracket on left head, rear bracket on right head). Passage in head and support bracket is around relieved shank of cylinder head bolt which passes through bracket. Oil flowing through this passage enters hollow rocker arm shaft through angle passage in bracket. Drilled holes in shaft and in rocker arm and tappet adjusting screw provide lubrication for rocker arm, pushrod socket, and valve tip. Drain hole at rear end of each cylinder head and matching passage in block drain excess oil back into lifter chamber (drain hole in head is through hollow dowel). An oil return hole in the lifter chamber permits oil to drain back into oil pan. *NOTE* -Early engines had drain hole at each end of each cylinder head.
Timing Gears - Lubricated by oil bypassed by pressure regulator valve (pressure regulator mounted on right front corner of engine block and oil return passage directs oil on timing gears). Valve plunger has small bleed hole to provide lubrication for gears at low speeds when regulator valve is closed.
Camshaft Gear Thrust Face - Groove in front camshaft bearing permits oil to flow out and through hole in camshaft thrust plate. Two grooves in front face of plate distribute oil over face of thrust plate on which camshaft gear hub rides.
Distributor Drive Shaft & Gear - Lubricated through passage from rear of rear camshaft bearing.

OIL FILTER (Early Cars): Partial flow type mounted on bracket on cylinder head. Oil inlet line is connected to drilled hole at front of left cylinder head. Filter outlet pipe returns oil to crankcase filler pipe.

OIL FILTER (Later Cars): Full-flow type located at right rear of cylinder block above engine oil pan mounting flange. Filter element is screwed into filter base and is sealed to base by a gasket. Oil lines for filtering system are drilled passages in filter base (No external oil lines). Valve located in filter base to by-pass oil to engine should filter element become clogged.

6 CYLINDER ENGINE OIL PUMP

OIL PUMP



6 CYLINDER ENGINE

OIL PUMP: Removal & Disassembly - Disconnect oil pressure pipe and remove pump cover, gasket, and idler gear. Remove drive gear with Tool J-2959. Remove woodruff key and U-shaped thrust washer and remove pump body. To remove pump drive shaft and gear, remove oil pan and distributor. Push drive shaft inward and remove from inside crankcase.

Inspection: Clearance between cover plate and ends of gears should be no more than .007". Lower ends of gears should be flush with cover surface of pump body with gears resting on lower part of body. Total clearance between pump gears should be no more than .010". To check, place a .005" feeler gauge between teeth of gear and body on each side of pump. If gears rotate, replace pump body.

Installation & Reassembly: Reverse removal procedure, dipping each part in oil and using new gaskets. *CAUTION - Install oil pump driv shaft xactly as f llows to obtain correct ignition timing.* Install drive shaft and engage camshaft gear and pump drive gear in any position. Position No. 1 Piston at TDC of compression stroke and UDC 1-6 mark on vibration damper directly under pointer on front cover. Disengage pump gear from camshaft gear and turn shaft so keyway points directly to bottom of engine when gears start to engage. Mesh gears (keyway will point to rear of engine). Install distributor. When slot in distributor shaft engages tang on pump drive shaft, distributor rotor should line up with No. 1 terminal in distributor cap.

CONTINUED ON NEXT PAGE

V8 ENGINE OIL PUMP

CONTINUED FROM PRECEDING PAGE

V8 ENGINE

OIL PUMP: Removal - Remove oil pan. Remove retaining nuts and remove pump.

Disassembly: Remove oil strainer and pipe. Remove cover, idler gear, and drive gear and shaft (do not separate shaft from gear).

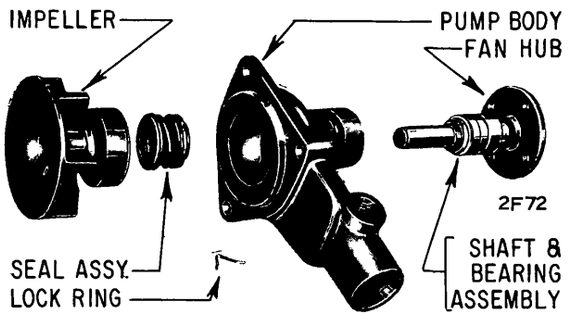
Inspection: Inspect cover for scratches or deep scores. Maximum clearance between ends of gears and cover plate is .007" measured with weight of gears on upper part of pump body and a straightedge across body. Total gear-to-body clearance should be not more than .010" measured with a .005" feeler between each gear and body. If gears rotate, replace pump body.

Reassembly: Reverse disassembly procedure and tighten strainer pipe to 30 ft. lbs.

Installation: Reverse removal procedure.

COOLING SYSTEM

WATER PUMP



►*6 CYL. & V8 ENGINES WATER PUMP PRODUCTION CHANGE NOTE:* Beginning approximately June 25, 1962, a new water pump went into production on all cars. For disassembly and reassembly procedures on early and late water pumps, see below.

EARLY 6 CYL. ENGINE

WATER PUMP: Removal - Drain cooling system, remove fan belt, fan blades and pulley. Disconnect heater hose and generator adjusting arm. Disconnect radiator-to-pump hose. Remove water pump.

Disassembly: Remove bearing lock ring, place pump in an arbor press and press shaft, bearing and hub assembly through impeller and front of housing. Press hub from shaft.

Reassembly: Press new hub on shaft until flush with end of shaft. Install shaft and lock ring in housing. Use new seal and impeller and press impeller on shaft to obtain .015-.031" clearance between impeller and housing (rotate shaft when checking clearance).

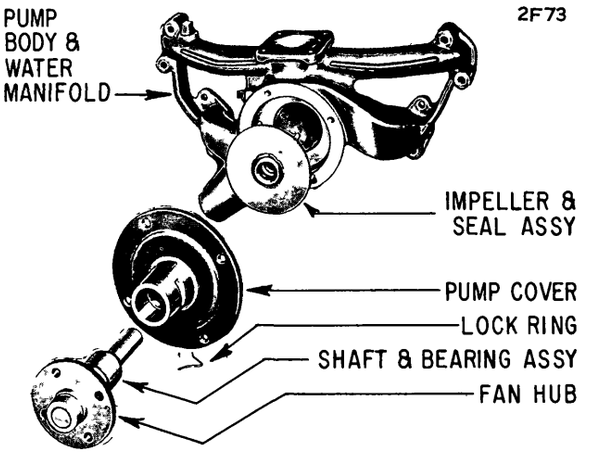
6 CYL. ENGINE WATER PUMP

Installation: Reverse removal procedure.

EARLY V8 ENGINE

WATER PUMP: Removal - Drain cooling system, remove belt, fan and pulley. On Hawk, remove fan shroud (see below). Remove pump-to-manifold screws and remove water pump.

Disassembly: Remove bearing lock ring and press hub, shaft and bearing assembly out through front of housing. Press hub from shaft.



Reassembly: Use a new hub and press on shaft until flush with end of shaft. Install shaft in housing, install new seal in impeller. Press impeller on shaft until flush with end of shaft. Impeller-to-housing clearance should not exceed .090".

Installation: Reverse removal procedure.

LATE 6 CYL. & V8 ENGINES

WATER PUMP: Removal - Same procedures as used above.

Disassembly - Place assembly in an arbor press and remove shaft, bearing and hub assembly by pressing arbor through the impeller and out through the front of the housing.

V8 ENGINE WATER PUMP

Reassembly - Press shaft and bearing into housing until distance from hub end of bearing to machined flange of housing is 2.719-2.7324" (6 Cyl.), 1.625-1.640" (V8). Press fan hub (always use a new fan hub) onto shaft so distance from outside edge of hub to machined flange of housing is 4 13/32" (6 Cyl.), 2 33/64" (V8). Press impeller and seal assembly onto shaft until .015-.031" (6 Cyl.), clearance is obtained between impeller and pump body. On V8 models, there should be a distance of 15/16" between machined edge of impeller face and machined surface of housing.

HAWK MODELS

FAN SHROUD REMOVAL: Drain radiator and remove radiator inlet hose. Remove wiring from shroud and move wiring harness out of way. Remove fan blades. Remove fan shroud attaching screws and remove shroud.

TUNE-UP

COMPRESSION PRESSURE: 140-160 lbs. at 150 RPM. Maximum variation between cylinders 10 lbs.

VALVE TAPPET CLEARANCE: .025-.027" (Cold), .023-.025" (Hot), All Valves.

►*TAPPET CLEARANCE ADJUSTING SCREW CAUTION:* Screws are located on underside of rocker arm and are self-locking type. Torque required to turn screw must be 30 in. lbs. minimum.

MANIFOLD HEAT CONTROL: Automatic thermostatic type.

CRANKCASE VENTILATION VALVE: Service every 10,000 miles or sooner if needed. Under cold weather driving conditions, more frequent cleaning of tubes and valve assembly is necessary. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

►*EARLY 1962 CRANKCASE VENTILATION VALVE PRODUCTION CHANGE & LEAN CARBURETION CORRECTION:* When a flat spot or surge condition and/or excessive oil consumption is encountered on early 1962 cars, replace crankcase ventilation valve with new "Low Flow" type. Later 1962 cars are equipped with "Low Flow" Crankcase Ventilation Valve (Studebaker No. 1555578 - Type CV-587 on external label).

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .033-.038".

Spark Plugs - Champion H14Y. 14mm. Torque to 30 ft. lbs.

COIL: Autolite 200657 (exc. Taxi & Police), 200659 (Taxi & Police). Ignition Current - 4.0 amps. idling.

►*IGNITION RESISTOR NOTE:* Pink resistance wire (2.1-2.2 Ohms) from coil to ignition switch, bypassed during cranking by lead from starter solenoid to coil.

DISTRIBUTOR: Aut lit N . IAT-4403B.

C nd ns r - Autolite 2-32. **Capacity** .18-.23 mfd.

C ntact P int S t - Autolite No. 1-47.

Br ak r Gap - .017-.022".

Cam Angle - 37-41°. *Check and adjust with vacuum modifier line disconnected.*

Breaker Arm Spring Tension - 17-22 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		300	0		600
2		400	4		800
4		500	8		1000
8		700	16		1400
12		900	24		1800

Vacuum Spark Control: Autolite integral type.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	7
4¼	8½	11
8	16	13

IGNITION TIMING

Setting - 2° BTDC.

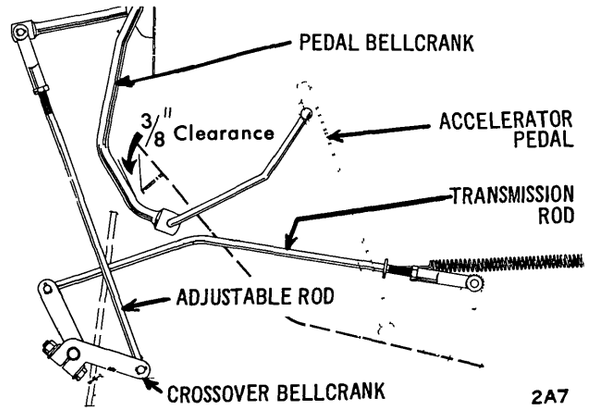
Timing Mark - On vibration damper. "IGN" mark in line with pointer on left side of timing cover.

Timing - Disconnect vacuum advance pipe at carburetor. Install plug in carburetor. With engine at idling speed, timing light should show index mark nearest IGN mark directly under pointer.

CARBURETOR

►*FLAT SPOT & SURGE CONDITION (LEAN CARBURETION) CORRECTION: See Crankcase Ventilation Valve under TUNE-UP above.*

►*CARTER AS CARBURETOR PRODUCTION CHANGE & LOW SPEED STUMBLE DURING ENGINE WARM-UP (EARLY 1962 CARS) CORRECTION:* New pump plunger Studebaker No. 1557200 incorporated into production on late 1962 cars. Install new plunger on earlier cars with above condition. *See "Carter AS Carburetors" in Carburetion Section.*



►*CARBURETOR APPLICATION: Carter AS single barrel*

FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature and carburetor off fast idle, proceed as follows:

1) On right side of engine, disconnect adjustable rod from manifold bellcrank and adjust engine idle to 550 RPM with selector lever in "P" or "N" position. Hold bellcrank against stop plate (with engine idling at 550 RPM), adjust length of crossover bellcrank-to-manifold bellcrank rod to provide .005-.010" air gap between bellcrank and stop plate. *NOTE - Engine idle should not change and bellcrank should not leave its stop when rod is connected.*

2) On left side of engine, adjust length of rod between accelerator pedal bellcrank and crossover bellcrank to provide 3/8" clearance between rib on floor pan and accelerator bellcrank arm. *CAUTION - This adjustment must be accurate to prevent engine race on hard brake application or improper kickdown operation.*

3) Install pressure gauge on transmission at left front corner of case in front of selector lever. Operate engine at 1000 RPM in "D" range (brakes applied). Adjust rod connecting crossover bellcrank to transmission throttle valve control lever for pressure of 70-75 lbs. Remove gauge.

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

CARTER CARBURETORS

Model	① Carb. M d l
All Exc. Taxi (No Pos. Crankcase Vent.)	AS 3370S & 71S
All Exc. Taxi (Pos. Crankcase Vent.)	AS 3372S & 73S
Taxi	AS 3186S

① - AS-3371S & AS-3373S on cars equipped with governors.

►*CARTER AS CARBURETOR PRODUCTION CHANGE & LOW SPEED STUMBLE DURING WARM-UP (EARLY 1962 CARS) CORRECTION:* New pump plunger Studebaker No. 1557200 incorporated into production on late 1962 cars. Install new plunger on earlier cars with above condition. *See "Cart r AS Carbur tors" in Carburetion Section.*

Idle Setting - Initial setting approximately 1 turn open from a lightly seated position. Turn screw out for richer mixture.

Idle Speed - 550 RPM (All Trans.) in neutral.

Float Level - 5/16" (Gauge T109-280) Taxi; 3/16" (Gauge J-9643-2) Others. On all models, measure from top of each float at free end to top of casting with carburetor inverted. To adjust, (Taxi, with standard needle seat) bend float lip; (Others, with resilient seat) remove float pin retainer and place Float Holding Tool J-9643-1 in carburetor bowl with tang on tool engaging hole in center of float arm. Hold tool down tightly against bowl cover surface and bend upper horizontal center section of float arm with wide blade screwdriver or pliers. *CAUTION - Us care not to damage resilient type needl valve seat.*

Fast Idle: .065" clearance between throttle valve and side of body measured opposite idle ports, with fast idle link on high step of cam. To adjust, bend choke connector rod.

Automatic Choke Setting: Centered at index.

Throttle Linkage Adjustment: *S CARBURETOR abov .*

►*OTHER DATA: S "Cart r AS Carbur tors" in Carburetion S ction.*

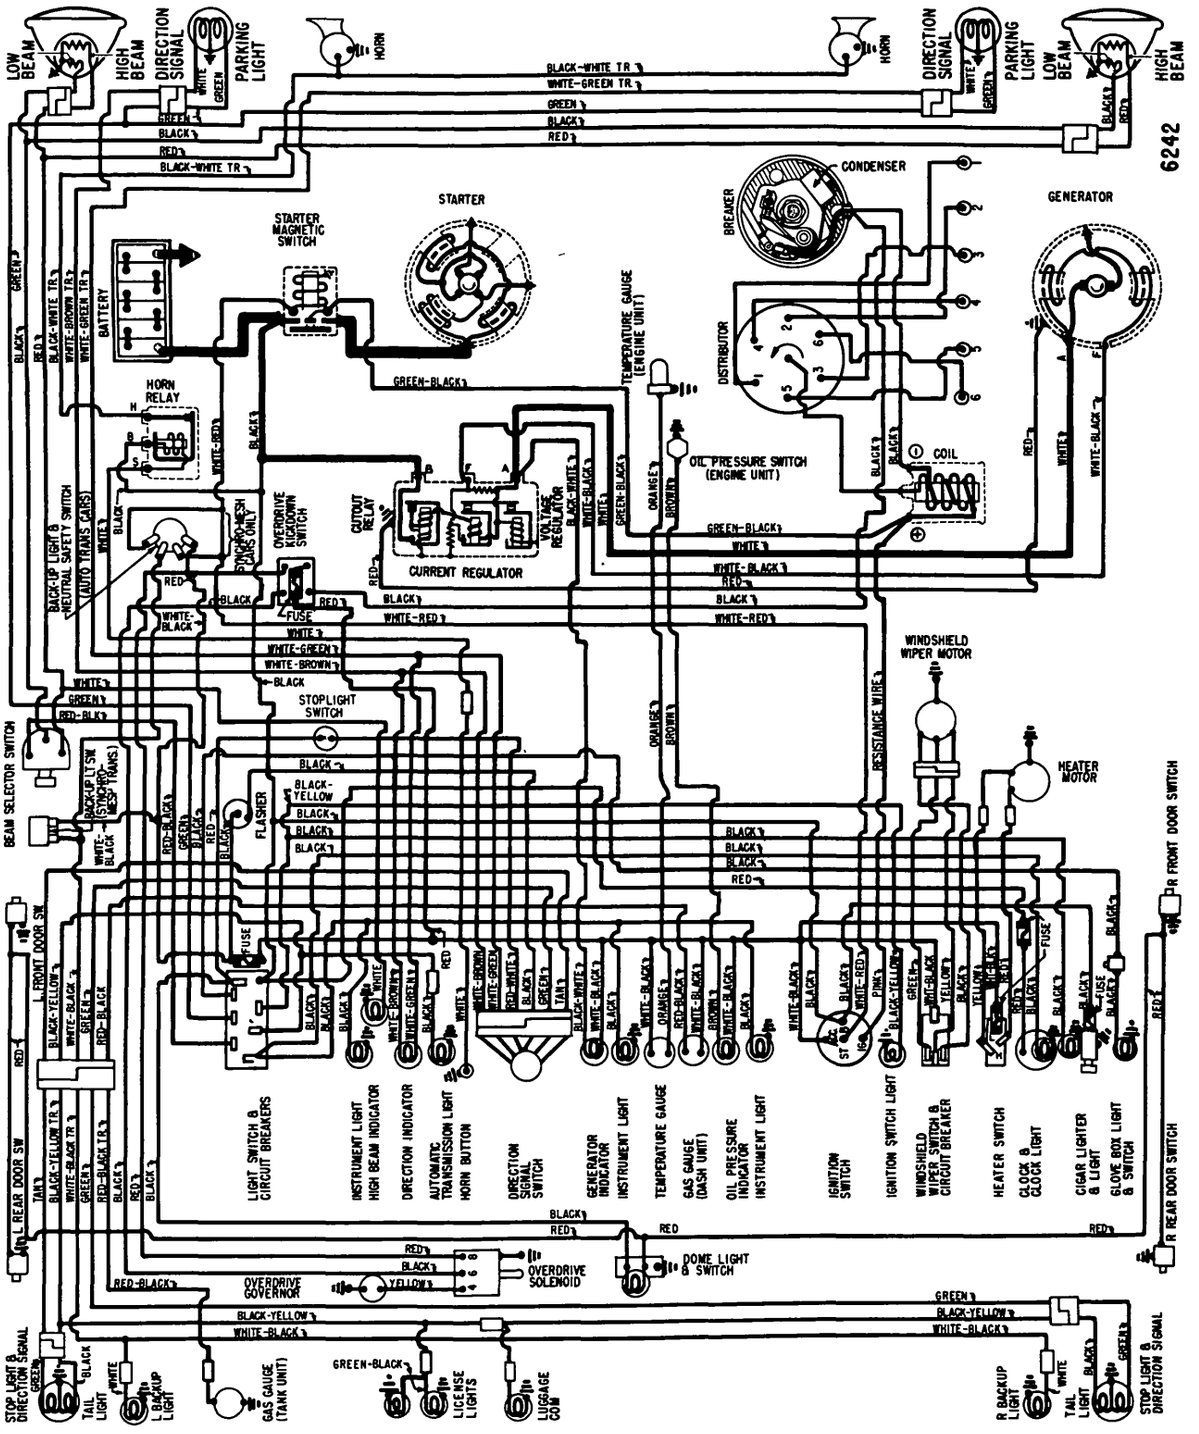
Compr ssi n & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Remove oil dipstick and drain oil. On long wheel base models, move wheels to right to move steering bellcrank out of way. On other models disconnect tie rods and reach rod from steering bellcrank. Remove retaining pinch bolt and remove bellcrank from shaft. Remove oil pan screws and remove pan.

OIL PAN INSTALLATION: *See OIL PAN in Studebaker Sp cial Data.*

ENGINE REMOVAL: *S ENGINE in Studebaker Special Data.*

CYLINDER HEAD: *S CYLINDER HEAD & MANIFOLD in Stud bak r Sp cial Data.*



TIGHTENING TORQUES: *See TIGHTENING SPECIFICATIONS in Stud bak r Special Data.*

PISTONS

T-slotted, cam ground, tin plated aluminum alloy with one oil and two compression rings. Heat dam at top of piston controls heat at top ring. *NOTE* - 7-1 compression ratio has crater head type piston.

Fitting Pist ns - Use a .002" x 1" x 12" feeler gauge inserted on camshaft side of cylinder. Insert piston (inverted) in cylinder bore with slotted side away from

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

camshaft and bottom edge of piston 1" below top edge of bore. Pull required to withdraw feeler should be 7-12 lbs.

Installing Pistons - "T" slot of piston away from camshaft side, and narrow part of rod offset to right on odd numbered rods, and to left on even numbered rods. *See Rod Installation.*

Replacement Pistons: Std. & .001", .0025", .010", .020", .030" and .040" Oversize. Pistons furnished with pins.

PISTON PIN

Pin is locked in rod by tapered pin and locknut.

Diameter - .7491-.7495". **Length** - 2.625".

Clearance in Piston - .0001-.0003" (selective fit). Light thumb push fit at 70°F.

Replacement Pins: Std. & .0025", .005" Oversize.

Piston Pin Removal & Installation - *See PISTON PINS in Studebaker Special Data.*

PISTON RINGS

Two compression rings (Cast Iron-Ferrex) and one oil ring (Cast Iron-Blued). *NOTE* - Y-1 Taxi has Chrome top (No. 1) compression ring.

Ring	Width	End Gap	Side Clearance
Compr. No. 1	3/32"	.007-.017"	.002-.005"
Compr. No. 2	1/8"	.007-.017"	.002-.005"
Oil	5/32"	.007-.017"	.0015-.004"

Replacement Rings: Std. & .020", .030", and .040" Oversize.

Installing Rings: Top compression ring has step at the inside which must be installed upward. Second compression ring has step at outside which must be installed downward. Inner and outer oil ring end gaps must not meet at the same point.

CONNECTING ROD

Length - (Center-to-center) 6 3/8". **Weight** - 19.04 ozs.

Crankpin Journal Diameter - 1.81175-1.81275".

Bearings - Steel backed, Microbabbitt lined, no shims.

►*HEAVY-DUTY ALUMINUM BEARING NOTE:* New type bearings are available for all 170 OVH 6 Cylinder Engines and went into production on 1961 S-Y1 Taxicabs beginning Engine Serial No. 61S-196221. These bearings are steel-backed, lined with aluminum alloy with a flash of babbitt over the aluminum.

Clearance - .0005-.002".

Sideplay - .005-.009".

Replacement Bearings: Std., .001", .002", .010", .020" .030" Undersize.

Installing Rods: Assemble piston on pin so "T" slot of piston on side opposite oil hole in lower end of rod. Insert tapered end of clamp screw toward heavy boss on rod. With "T" slot of piston away from camshaft side, oil squirt hole and number will be to right on odd numbered rods, to left on even numbered rods. *CAUTION* - Odd numbered (1-3-5) and even numbered (2-4-6) rods cannot be interchanged.

CRANKSHAFT

►*REAR MAIN BEARING OIL LEAK CORRECTION:* If proper installation of new rear oil seal and oil pan gaskets does not stop the leak, make sure that drain core hole in rear main bearing cap connects with groove in cap. Drill and file hole to correct.

Journal Diameter: 3.0623-3.0628".

Bearings - Steel-backed, micro-babbitt lined. No shims.

►*HEAVY-DUTY ALUMINUM BEARING NOTE (Nos. 2 & 3 Bearings):* Steel-backed, aluminum alloy bearings (with flash of babbitt over the aluminum) used in production on 1961 Y-1 Taxicabs beginning with Engine No. 61S-196221. *These bearings available for service.*

Clearance - .0005-.002".

Replacement Bearings: Standard & .001", .002", .010", .020", .030" Undersize.

►*REPLACEMENT MAIN BEARING CAUTION:* Bearings used in later production engines with full-flow oil filter have different oil hole locations (except rear main bearing) and previous type bearings must NOT be used in these engines. *NOTE* - These later type bearings can be used in earlier engines without full-flow filter.

►*FRONT MAIN BEARING CAP REMOVAL NOTE:* Turn crankshaft until No. 3 and No. 4 pistons are at top of their travel. Remove bearing cap bolts, then remove cap by twisting end away from camshaft toward rear of engine.

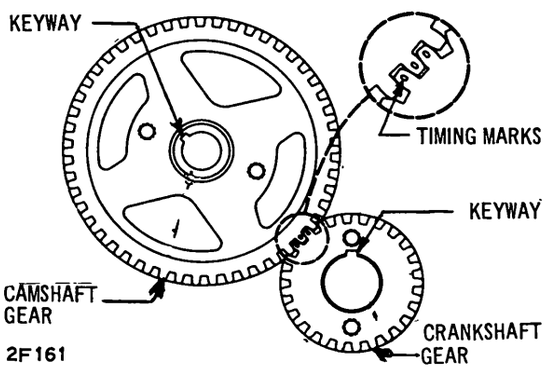
End Thrust: Taken by thrust washer assembled between front main bearing and crankshaft gear, controlled by shims between thrust washer and main bearing journal. These shims furnished .003", .005", .007" thick.

Endplay - .003-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT



Journal Diameters - (1) 1.7475-1.7480", (2) 1.7162-1.7170", (3) 1.6857-1.6865", (4) 1.6232-1.6240".

Bearings - Steel backed babbitt lined bushings.

Clearance - No. 1-.0007-.0022", Nos. 2,3,4-.0010-.0027".

End Thrust: Taken by thrust plate assembled on front face of engine block behind camshaft gear (spacer assembled on shaft between gear hub and front bearing journal controls endplay). Adjust endplay by replacing thrust plate or spacer. When installing thrust plate, tighten capscrews evenly and alternately to avoid distorting the plate.

Endplay - .003-.006".

VALVE TIMING MARKS

Camshaft Setting: Mesh marked tooth of camshaft gear between marked teeth of crankshaft gear.

Camshaft Removal & Installation; *See "Camshaft & Bearings" in Studebaker Special Data.*

Timing Gears: Crankshaft gear is Cast Iron, Camshaft gear is Celeron with steel hub.

Timing Gear Removal & Installation: *See "Timing Gears" in Studebaker Special Data.*

Backlash - .001-.003".

Engine Front Cover Removal: *See "Engine Front Cover" in Studebaker Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

NOTE - Y1 Taxicab engine has heavy duty intake and exhaust valves.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.593"	.3415"	5.250"
Exhaust	1.406"	.3415"	5.250"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.359"	.0015-.0035"
Exhaust	45°	.359"	.0015-.0035"

Valve Seat Width - 1/16-3/32".

Valve Springs: Single spring used on all valves.

►*VALVE SPRING LOCK INSTALLATION CAUTION:* When installing lock in recess of lower spring retainer, groove in lock must engage tongue in retainer.

Valve Spring Specifications

Valve	Pressure	Length
Open	105-115 lbs.	1.671"
Closed	45-55 lbs.	2.031"

Valve Guides: Use Tool No. J-9265 to drive guide out of cylinder head from combustion chamber side. Coat outside of guide with white lead, then start chamfered end into head from combustion chamber side. Drive new guide in until driver bottoms on counterbore in plate.

►*OVERSIZE VALVE GUIDE NOTE:* Engines with .010" oversize valve guides have a letter "O" stenciled in pad located at left rear of cylinder head below climatizer outlet elbow connection. All guides will be .010" oversize.

Valve Lifters: Straight Barrel Type. Interchangeable.

►*VALVE TRAIN PARTS CAUTION:* Later rocker arm and adjusting screw assemblies or interchangeable and pushrods and rocker arm shafts or **NOT** interchangeable between 6 Cyl. and V8 engines.

Valve Lifter Installation & Fitting - *See "Valve System" in Studebaker Special Data.*

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" Oversize Lifters requiring Reaming of Lifter Bore):* *See "Valve System" in Studebaker Special Data.*

Replacement Lifters - Std., .001" & .005" Oversize.

Rocker Arm Assembly: *See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 15° BTDC. Close 50°30' ALDC.

Exhaust Valves - Open 55°36' BLDC. Close 10° ATDC.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Timing Check - Adjust No. 1 intake valve at .030". Rotate engine until No. 6 piston is on the compression stroke (the IN-OP 1-6 marking on the damper should be several inches from pointer). Then, while moving pushrod up and down, continue to rotate crankshaft. Valve timing will be correct if pushrod stops moving as above marking is directly below pointer.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Studebaker Special Data.*

►*OIL FILTER PRODUCTION CHANGE:* Full-flow oil filter used in production on April 17, 1962 beginning Eng. No. S-248301. *NOTE - Correct oil filter must be used. See data below on both early and late production oil filters.*

Crankcase Capacity: 5 quarts refill, add 1 quart with filter change.

Normal Oil Pressure : 30 lbs. min. at 2000 RPM.

Pressure Regulator Valve : Opens at 50 lbs. Under plug on lower right front corner of engine. For access, remove engine front cover bolt. Replace weak spring (do not attempt to stretch spring).

Oil Pressure Indicator: Indicator light on instrument panel controlled by oil pressure switch, Studebaker No. 1539898, on left side of engine.

Oil Pump: Spur gear type, driven by gear on camshaft. **Pump Removal & Overhaul** - *See OILING SYSTEM in Studebaker Special Data.*

Oil Filter: Early Cars - Partial flow type. Replace element and housing (as a unit) every 5000-6000 miles or sooner if needed.

Later Cars - Full-flow type. Replace element every 4000 miles or sooner if needed.

Oil Filter Replacement Element - Studebaker No. 1542739 (Partial Flow - Early Cars), AC No. 3311 (Full-Flow - Later Cars).

►*EARLY CARS OIL FILTER INSTALLATION CAUTION:* Lubricate gasket with engine oil and tighten filter by hand ½-turn additional after filter gasket seats on its base. DO NOT OVERTIGHTEN.

►*LATER CARS OIL FILTER INSTALLATION & REMOVAL NOTE:* Remove filter by unscrewing element from base. If necessary use a wrench on the hexagonal boss on lower end of element. To install, lubricate gasket with light engine oil and tighten by hand only. DO NOT use a wrench or tool.

Crankcase Ventilation: Standard Cars - Filter element in oil filler cap (air intake) and in breather pipe (air outlet). Element in breather pipe replaceable (retained by cotter pin). To clean element, remove and wash in solvent, drain ,thoroughly and reoil.

Positive Crankcase Ventilation Cars - Road Draft Tube replaced by a hose to the manifold incorporating a valve in the line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 11 qts. refill, add 1 qt. for heater.

Pressure Valve: 13 lb. radiator filler cap, Studebaker No. 1551190.

Thermostat: Choke type in water outlet on cylinder head. Studebaker No. 1550956 (170°) Std., No. 1551141 (160°) and No. 1551140 (180°) optional.

Water Pump: Packless, sealed ball bearing type.

►*WATER PUMP NOISE CORRECTION:* Add 4 ozs. water soluble oil to coolant. If noise persists, replace pump.

►*WATER PUMP PRODUCTION CHANGE:* Improved type pump used in production after approximately June 25, 1962. *See "Cooling System" in Studebaker Special Data for overhaul data on this pump.*

Pump Removal & Overhaul - *See COOLING SYSTEM in Studebaker Special Data.*

Temperature Gauge: Direct reading, electric type.

Dash Unit - Studebaker No. 1552984 (All Lark Deluxe), No. 1555709 (All Lark Regal).

Engine Unit - Studebaker No. 1549452 (Marked "362-AR" on one face of hex head).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

4-Door Sta. Wgn. (Regal)	62V-P6
4-Door Police Sta. Wgn. (Deluxe)	62V-P3

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post.

Assembly Plant	Starting Numbers
South Bend	62V-1001
Canada	62VC-1001

ENGINE NUMBER: Stamped on machined pad at upper left of cylinder block.

Assembly Plant	Starting Numbers 259" Eng.	289" Eng.
South Bend	V-534901	P-79801
Canada	VC-19601	PC-2801

TUNE-UP

►*SURGE CONDITION AT 30-50 MPH or STICKING CHOKE (Cars equipped with Stromberg 2-Bbl. Carburetors) CORRECTION: See "Stromberg WW Studebaker) Carburetors" in Carburetion Section.*

►*FLAT SPOT & SURGE OR EXCESSIVE OIL CONSUMPTION CORRECTION (Cars equipped with Positive Crankcase Ventilation): See Crankcase Ventilation Valve below.*

►*ROUGH ENGINE IDLE, STUMBLE ON ACCELERATION AT LOW SPEED, OR ENGINE DYING (Early cars with Carter WCFB Carburetors): See "Carter WCFB" under CARBURETOR below for recommended modification and Carburetor Production Changes.*

COMPRESSION PRESSURE: 140-160 lbs. at 150 RPM. Maximum variation between cylinders 10 lbs.

VALVE TAPPET CLEARANCE: .025-.027" (Cold). .023-.025" (Hot). All valves.

►*TAPPET CLEARANCE ADJUSTING SCREW CAUTION:* Screws are located on underside of rocker arm and are self-locking type. Torque required to turn screw must be 30 in. lbs. minimum.

MANIFOLD HEAT CONTROL: Automatic thermostatic type located in right bank exhaust manifold outlet.

Checking Thermostatic Coil Spring - With outer end of coil free from anchor and valve closed (counterweight forward), hooked end of coil should be 90° clockwise from anchor pin at 70°F.

CRANKCASE VENTILATION VALVE: Service every 10,000 miles or sooner if needed. Under cold weather driving conditions, more frequent cleaning of tubes and valve assembly is necessary. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

►*FLAT SPOT & SURGE OR EXCESSIVE OIL CONSUMPTION CORRECTION AND CRANKCASE VENTILATION VALVE PRODUCTION CHANGE NOTE:* When above condition encountered, replace crankcase ventilation valve with new type "Low Flow", Studebaker No. 1555578. New "Low Flow" type now in production.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033-.038".
Spark Plugs-Champion H14Y. 14mm. Torque to 25-30 ft. lbs.

COIL: Prestolite (Autolite) No. 200607.
Ignition Current - 3.8 amps. idling.
Resistor - Pink resistance wire (1.8 Ohms) from coil to ignition switch. Bypassed during cranking by lead from starter solenoid to coil.

DISTRIBUTOR: Prestolite (Autolite) No. 1BP-4108.
Breaker Gap - .014-.019".
Cam Angle - 27-31°. *Check and adjust with vacuum modifier line disconnected.*
Breaker Arm Spring Tension - 17-22 ozs.
Rotation - Counterclockwise viewed from above.

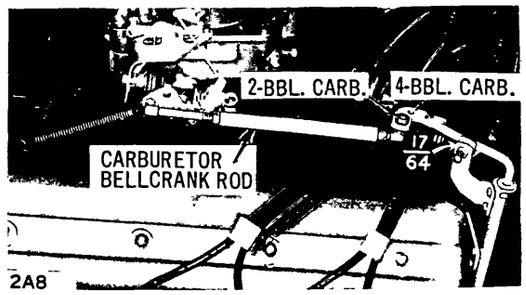
Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
3	400	6	800
4	500	8	1000
6	650	12	1300
8	800	16	1600
11	1050	22	2100
12	1100	24	2200

Vacuum Spark Control: Autolite integral type.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	8
5	10	11
9	18	13



IGNITION TIMING

Setting - 4° BTDC at 550 RPM. Vacuum line to distributor disconnected and opening in carburetor plugged.
Timing Mark - "IGN" line on vibration damper aligned with pointer on timing gear cover.

CARBURETOR

►*CARBURETOR APPLICATION: Stromberg 2-Bbl. (Std.), Carter 4-Bbl. (Opt.).*

FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature, choke valve wide open and throttle return check operating correctly, proceed as follows:

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

1) Adjust engine idle speed to 550 RPM with transmission selector in "N" (Neutral) position. Set stop on bellcrank (at rear of engine) to provide a 17/64" gap between bellcrank pads (use a 17/64" drill as a gauge). After stop is adjusted, hold in this position.

2) *NOTE - Make sure that carbur tor-to-bellcrank rod ball joint is in inner hole of bellcrank pad on cars with 2-barrel carburetors and in out r hol on cars with 4-barrel carburetors. In both cases, ball joint must b on underneath side of bellcrank l v r.*

3) Adjust carburetor-bellcrank rod until idle speed screw on carburetor throttle lever just begins to leave its stop.

4) Stop engine and remove 1/8" pipe plug located near throttle lever on side of transmission and install a pressure gauge. Place selector lever in "D" (Drive) position and run engine at 1000 RPM with rear wheels held stationary by foot brake. Adjust length of main bellcrank-to-transmission throttle valve outer lever rod to obtain 80-85 lbs. pressure on gauge (95-100 lbs. on Taxi). Stop engine, remove gauge and install plug.

THROTTLE RETURN CHECK ADJUSTMENT: Loosen throttle return check assembly screw locknut and adjust return check in bracket until plunger just breaks contact with tab on outer lever. Mark position of check assembly relative to bracket, then turn check assembly **1¼ to 2 turns toward lev r.** Tighten locknut.

STROMBERG WW

►*SURGE CONDITION AT 30-50 MPH CORRECTION: See "Strombera WW (Studebaker) Carbur tors" in Carburetion Section.*

►*STICKING CHOKE CORRECTION:* Replace choke rod with new Rod, Studebaker No. 1555388. Check all other components for correct operation. Replace as necessary.

Stromberg Series WW, Code 6-127 & 6-127A (Exc. Cl sed Crankcase Ventilation Cars), 6-128 (Cars with Closed Crankcase Ventilati n Syst m).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1-4-6-7, LEFT barrel feeds 2-3-5-8.*

Idle Setting - Initial setting 1¼ turns open, final setting approximately midway between missing and rolling points. Set both screws alike, turn screws out for richer mixture.

Idle Speed - 550-600 RPM, with selector lever in "N" on Flightomatic cars.

Float Level - 3/16" from top edge of main body to top of float measured at center of float. To check, remove bowl cover and place float level gauge of Tool J-7477 across top edge of main body at center of float. Float should just touch gauge. To adjust, bend float lip.

Accelerating Pump - Center hole, normal setting. For less fuel, install rod in inner hole; for more fuel, install rod in outer hole.

Fast Idle Setting: Close choke so that fast idle screw contacts highest part of fast Idle cam. Adjust fast idle screw so a .030" wire gauge can be inserted freely between throttle valve and throttle body on the idle port side.

Automatic Choke Setting: Centered on index.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: Se "Stromb rg WW (Studebaker) Carbur tors" in Carburetion S ction.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CARTER WCFB 4-BARREL

►*ROUGH ENGINE IDLE, STUMBLE ON ACCELERATION AT LOW SPEED, OR ENGINE DYING CORRECTION (Cars with WCFB 2829S, 2830S, 3165S & 3166S Carburetors): See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section.*

Carburetor Application

Transmission Type	Early Cars	Later Cars
Synchro-mesh & O.D.	2829S	3419S
Synchro-mesh & O.D. (CCV)	3165S	3422S
Flightomatic	2830S	3420S
Flightomatic (CCV)	3166S	3423S

CCV - Closed Crankcase Ventilation.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 1-4-6-7. LEFT barrels feed 2-3-5-8.*

Idle Setting - Initial Setting ½-1½ turns open. Turn screws out for richer setting. *CAUTION* - Thermostatic Valve plunger (used on later and modified carburetors) must be held closed when adjusting idle speed and mixture.

Idle Speed - 550-600 RPM, with selector lever in "N" on Flightomatic cars.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. 2573S. Fuel only.
Pressure - 3½-5 lbs. at 30 MPH.
Gasoline Gauge: Electric type.
Dash Unit - Studebaker No. 1555453 (Hawk), No. 1552983 (All Deluxe), No. 1555708 (All Regal).
Tank Unit - Studebaker No. 1549575 (All).
Air Cleaner: DRY TYPE (plasticized paper) Standard. Oil Bath type Optional. Clean dry type filter element. every 1000 miles, replace element every six months or 10,000 miles.

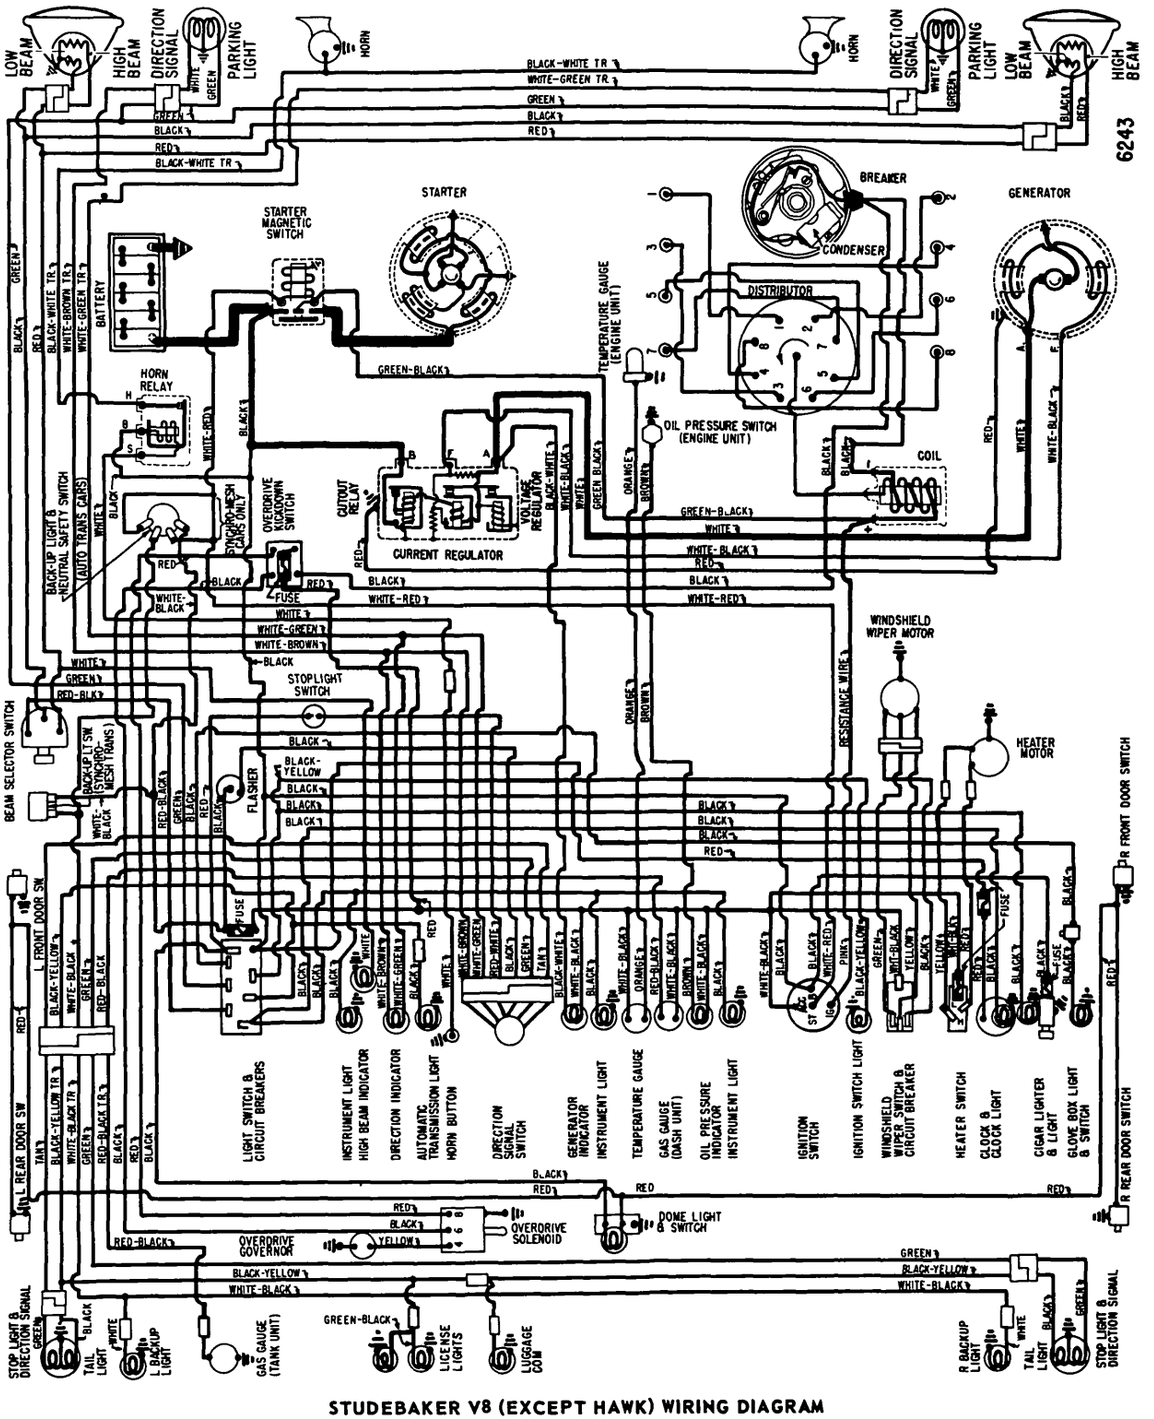
►*CLEANING CAUTION (DRY TYPE): Clean filter element by tapping lightly to remove dirt particles. DO NOT wash element in any solvent or liquids and DO NOT oil.*

BATTERY

Willard No. HO-11-50 (6 Cyl. & V8). 12 volt, 9 plate, 50 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Front engine support bracket to frame.

STARTER

Prestolite (Autolite) used as follows:



Model	Autolite No.
6 Cyl. (Exc. S.M. Y1-Taxi)	MDU-7005
6 Cyl. (S.M. Y1-Taxi)	MDU-7025
V8 Hawk	MDU-7025
V8 Lark (Exc. Auto. Trans.)	MDU-7025
V8 Lark (Auto. Trans.)	MDU-7026

Drive - Dendix "Folo-Thru" type.
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 31-47 ozs. (MDU-7005), 35 ozs. minimum (MDU-7025 & 7026).

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	5300	10.0	50 max.
6.2 ft. lbs.	Lock	4.0	280 max.

CONTINUED ON NEXT PAGE

STUDEBAKER V8 (EXCEPT HAWK) WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

Starting Switch: Magnetic switch, Studebaker No. 1539716, mounted on dash and controlled by combination Ignition and Starter Switch.

Automatic Transmission Neutral Safety Switch: Studebaker No. 1552780. Located on steering column.

Adjustment - *See "Studebaker Flightomatic Transmission" in Transmission Section.*

GENERATOR

PRESTOLITE (AUTOLITE)

Prestolite (Autolite). Used as follows:

M del	Autolite Gen. No.
6 Cyl. & V8 (Std.)	GJP-7402E
6 Cyl. & V8 (Optl. Hvy. Duty)	GGA-6001-SN

►*GENERATOR NOTE: "A" Circuit Type used on all models.*

Performance Data

G nerator No.	Amps.	Volts	RPM
GJP-7402E	35	15.0	2600
GGA-6001-SN	40	14.6	1600

Armature - Autolite No. 10-24 (GGA-6001-SN).

Brush Spring Tension - 18-36 ozs. (GJP-7402E), 34-41 ozs. (GGA-6001-SN).

Field Current - 1.6-1.7 amps. (GJP-7402E), 1.1-1.3 amps. (GGA-6001-SN) at 10 volts and 70°F.

R tation - Counterclockwise at commutator end.

B lt Adjustment: 6 Cyl. - ¼" deflection with 10 lbs. pull midway between generator and fan pulleys.

V8 - ½" deflection with 14 lbs. pull midway between generator and fan pulleys.

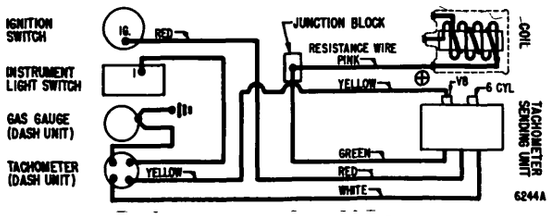
DELCO-REMY

Heavy duty only. Used as follows:

Generator No.	Amps.	Volts	RPM
1102127	45	14.0	2520
1106679	50	13.0	1600
1106981	40	13.0	1500
1106985	50	13.0	1475

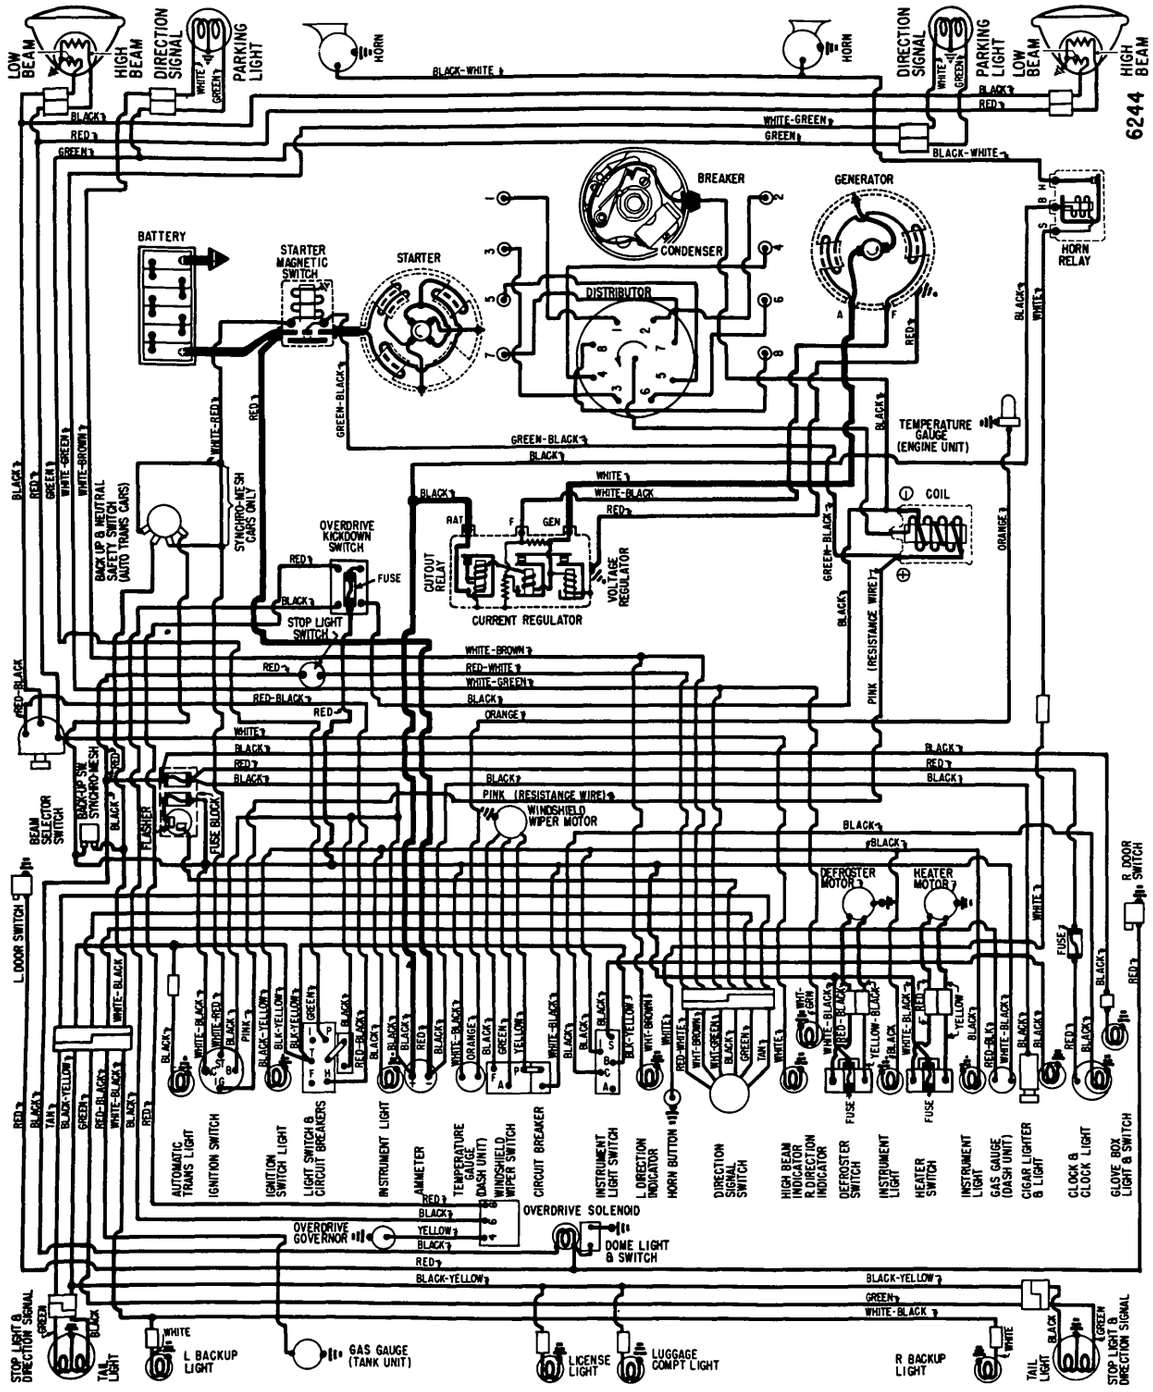
►*GENERATOR NOTE: "A" Circuit Type used on all models.*

Brush Spring Tension - 28 ozs.



Field Current - 2.66-2.86 amps. (1102127), 2.14-2.28 amps. (1106679 & 985), 1.37-1.50 amps. (1106981) at 12 volts and 80°F.

R tation - Counterclockwise at commutator end.



B lt Adjustment: 6 Cyl. - ¼" deflection with 10 lbs. pull midway between generator and fan pulleys.

V8 - ½" deflection with 14 lbs. pull midway between generator and fan pulleys.

GENERATOR REGULATOR

PRESTOLITE (AUTOLITE)

Prestolite (Autolite) No. VBO-4223F1 (Std. 6 Cyl. & V8), No. VBO-4201B-1 (Heavy Duty 6 Cyl. & V8).

►*REGULATOR NOTE: "A" Circuit Type used on all models.*

►*SPECIFICATION NOTE: Specifications below are "Normal" settings.*

Cut ut Relay

Cuts In - 12.4-13.3 volts (VBO-4223F1), 12.5-13.5 volts (VBO-4201B-1) at 70°F.
Cuts Out - 3-5 amps. discharge after a charge of 7 amps.
C ntact Gap - .015" minimum.
Air Gap - .025-.027".

V ltage Regulator

Setting - 14.2-14.8 volts at 70°F, unit operating normally while charging at 7 amperes or with a .25 ohm resistance between regulator and battery.
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).

Curr nt Regulator

►*SETTING CAUTION: "Temperature Compensated" typ . S t to following specifications at 70°F.*

Op rating Amperes

Regulator No.	Test A	Test B
VBO-4223F1	44 amps.	35 (33-37) amps.
VBO-4201B-1	49 amps.	40 (38-42) amps.

Test A - After 15 minutes operation charging at 7 amps.
T st B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts).
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).

►*OTHER DATA: S "Prestolite (Autolite) A Circuit R gulators" in El ctrical Section.*

DELCO-REMY

Used for heavy duty only.

G n rat r	Regulator
1106679	1119606
1106981	1119004
1102127	Ⓒ 1119610
1106985	Ⓒ 1119619

Ⓒ - Double Contact Regulator.

►*REGULATOR NOTE: "A" Circuit Type used on all mod ls.*

►*SPECIFICATION NOTE: Specifications below are "N rmal" s ttings.*

Cutout Relay

Cuts In - 11.5-13.0 volts (1119004), 11.8-13.0 volts (1119606, 610 & 619) at 70°F.
C ntact Gap - .020" minimum.
Air Gap - .020".

V ltage Regulator

Setting (1119004) - 13.6-14.3 volts at 125°F ambient temperature.
Setting (1119606,610 & 619) - 13.8-14.6 Volts (upper contacts), .1-.3 volts lower, operating on lower contacts at 125°F ambient temperature.
C ntact Gap (1119606,610 & 619) - .016" (upper contacts) with lower contacts just touching.
Air Gap - .063" (1119004), .067" (1119606, 610, & 619) with armature pressed down to point where contacts just touch.

Current Regulator

Setting (1119004) - 37.0-42.0 amps. at 125°F ambient temperature.
Setting (1119606) - 48-52 amps.
Setting (1119610) - 36.0-40.5 amps. at 125°F ambient temperature.
Setting (1119619) - 46.0-50.5 amps. at 125°F ambient temperature.
Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-Remy Single Contact Regulators" or "Delco-Remy Double Contact Regulators" in Electrical Section.*

ALTERNATOR

DELCO-REMY: No. 1117070. Three-phase type with internal rectifiers.
Rated Output - 60 Amperes.

Performance Data - Cold (70°F)

Amperes	Volts	RPM
31	14.0	1000
58	14.0	2500

Rotation - Clockwise at drive end.
Field Current - 6.0-6.6 amps. at 12 volts & 80°F.
Brush Spring Tension - 10 ozs.

►*OTHER DATA: See "Delco-Remy Delcotron Alternators (1-D, 2-D, 3-D, 4-D Series)" in Electrical Section.*

LEECE-NEVILLE: No. A0012000AB or No. A0012002AA. Three-phase type with internal rectifiers.
Rated Output - 60 Amperes.

►*OTHER DATA: See "Leece-Neville Alternator & Regulator" in Electrical Section.*

ALTERNATOR REGULATOR

DELCO-REMY: No. 9000554 or No. 9000581. Transistorized type with Indicator Light Relay and Voltage Regulator.

►*NOTE: Above regulators used with separate Field Relay, No. 1116985.*

Voltage Regulator

Normal Setting - 13.0-13.6 volts (adjust to 13.4 volts) at 125°F ambient temperature.
Air Gap - .075" with armature pressed down to point where contacts just touch.

Indicator Light Relay

Voltage Setting - Contacts should close 2 volts lower than voltage regulator setting.
Air Gap - .075" with armature pressed down to point where contacts just touch.

Field Relay
(Separate Relay No. 1116985)

Closing Voltage - 8.3-10.2 volts.
Sealing Voltage - 10.7 volts maximum.
Air Gap - .011" with contacts just touching.
Contact Gap - .025"

►*OTHER DATA: See "Delco-Remy Transistorized Alt rnator Regulators ("A" Circuit Type)" in Electrical S cti n.*

LEECE-NEVILLE: Voltage regulator unit and separate Rectifier Relay used.

►*OTHER DATA: Se "L c -N vill Alternator & Regulat r" in El ctrical S ction.*

MISC. ELECTRICAL

CIRCUIT BREAKERS: 18 Amp r (Lark 6 & V8). On Headlight switch. Protects headlights and High beam indicator. **20 Ampere (Hawk V8).** On Headlight switch. Protects headlights, high beam indicator, parking lamp, tail lamp, license plate lamp, instrument lamp, ignition lamp.
12 Ampere (Lark 6 & V8). On headlight switch. Protects parking lamp, tail lamp, stop lamp, license plate lamp, instrument lamp, ignition lamp, dome lamp, & clock lamp.
5 Ampere. Located in switch. Protects windshield wiper.

FUSES: SFE 14. Protects overdrive. In kickdown switch.
AGC 15 ampere - Climatizer & Defroster. In switch.
1AG 3 ampere - Clock. In lead behind Instr. Panel.
AGW 4 ampere - Radio (manual). In lead.
AGW 2½ ampere - Radio (Pushbutton). In lead.
SFE 9 ampere - Direction signal and Back-up lights. In fuse block behind instrument panel.
Thermal - Cigar Lighter. On back of lighter socket.

ENGINE

ENGINE SPECIFICATIONS: Own. V8, valve-in-head. Two engines used: 289" Engine used in Hawk Sports Coupe & Police Cars, 259" Engine used in all other models.

Engine	Bore	Stroke	Displac m nt
259"	3 9/16"	3 1/4"	259.2 cu. ins.
289"	3 9/16"	3 5/8"	289 cu. ins.

Engine	① Compr. Ratio	Rated HP	Develop d HP
259"(2-Bbl.)	8.25-1	40.6	180 at 4500 RPM
259"(4-Bbl.)	8.25-1	40.6	195 at 4500 RPM
289"(2-Bbl.)	8.25-1	40.6	210 at 4500 RPM
289"(4-Bbl.)	8.25-1	40.6	225 at 4500 RPM

① - 8.5-1 Optional (7.0 & 7.5-1 Export).
Compression & Vacuum Reading - *See TUNE-UP.*

►*EXCESSIVE OIL CONSUMPTION NOTE: See Crankcase Ventilation Valve under TUNE-UP above.*

►*ENGINE OIL LEAK AT FILTER (Cars with Full-Flow Filter):* Caused by interference between oil filter cartridge and underside of filter base mounting pad preventing filter seating tightly on base. To correct, remove filter, filter base, and right hand exhaust pipe. Mask surface of mounting pad with tape, carefully grind off underside of pad to provide 3/32-1/8" clearance between filter cartridge and pad when filter installed. Clean pad thoroughly, install filter base and cartridge using new gaskets. Operate engine and check for oil leaks.

OIL PAN REMOVAL: Remove dipstick and adapter tube (remove head bolt to remove tube clamp). Disconnect battery. Drain crankcase. Remove starter. On Hawk, swing wheels to right to move steering bellcrank out of way. On other models, remove steering bellcrank assembly and exhaust crossover pipe. Remove oil pan

OIL PAN INSTALLATION: *See OIL PAN in Stud baker Special Data.*

ENGINE REMOVAL: *See ENGINE in Studebaker Sp cial Data.*

CYLINDER HEAD: *S CYLINDER HEAD & MANIFOLDS in Stud baker Special Data.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

TIGHTENING TORQUES: *See TIGHTENING SPECIFICATIONS in Stud bak r Special Data.*

PISTONS

Aluminum alloy, cam ground, T-slot, three-ring type. *See ORIGINAL BORE & PISTONS in Studebaker Special Data.*

►*PISTON INTERCHANGEABILITY CAUTION:* Pistons for 289" engine have a dished head, and pistons for 259" engine have a flat head. DO NOT INTERCHANGE.

Weight - 16.21 ozs.

Removal - Pistons and rods removed from above.

Fitting New Pistons: Clearance determined by selective feeler fit. Use a 1" x .002" x 12" feeler inserted on camshaft side of cylinder bore. Insert inverted piston in bore with slotted side away from camshaft, and bottom edge 1" below top of cylinder bore. Pull required to remove feeler should be 7-12 lbs.

R placement Pistons: Std. & .001", .002", .010", .020", .030", .040" Oversize. Furnished with pins.

Installing Pistons: Install piston on rod so solid side of piston is on same side as oil hole in bearing bore. Install piston in cylinder with slot toward left side of engine. *See Rod Installation.*

PISTON PIN

Locked in rod by tapered pin and locknut.

Diameter - .8741-.8745". **Length** - 3 1/16".

Clearance in Piston - .0001-.0003" selective fit. Light thumb push fit at 70°F.

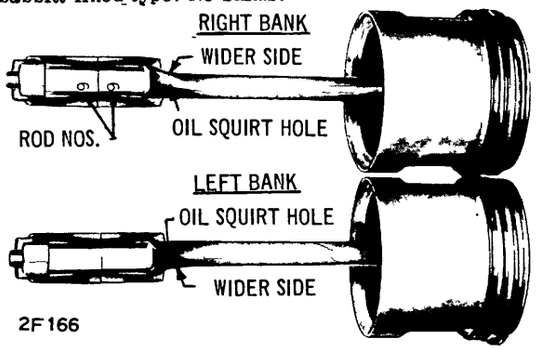
R placement Pins: Std. & .0025", .005" Oversize.

R moval & Installation: *See PISTON PINS in Studebaker Special Data.*

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.	.077-.078"	.008-.016"	.002-.005"
Oil	.1855-.1865"	.008-.016"	.0015-.005"

Replacement Rings: Sets of Std. & .020", .030", .040" Oversize.



Installing Rings: Install compression rings with chamfered side of ring upward. Gaps of inner and outer oil ring must not come at same point.

CONNECTING ROD

Length - 6 5/8" center-to-center. **Weight** - 23.71 ozs.

Crankpin Journal Diameter - 1.99925-2.00025".

Lower Bearing - Interchangeable. Steel backed, micro-babbitt lined type. No shims.

PISTON & ROD ASSEMBLY

Cl aranc - .0005-.002". **Sid play** - .008-.013".

R placem nt B arings: Std., .001", .002", .010" and .020" Undersize.

Installing R ds: Number on rod and bearing cap must be on same side. Rod is installed in same numbered cylinder with numbers down toward oil pan (toward right on right bank rods, toward left on left bank rods), and oil squirt hole on all rods toward right of engine. Rods are offset with widest half of bearing toward rear on right bank, toward front on left bank.

►*CAUTION:* Install piston and pin on rod so that T-slot of piston is on side opposite oil hole in bearing bore. Insert tapered end of clamp screw so it will be toward heavy boss. Be careful to align flat surface of screw with flat on piston pin. Bearing cap must be assembled on rod with groove in cap and rod on same side.

►*REPLACEMENT ROD IDENTIFICATION NOTE:* Replacement rods are unnumbered. To identify, hold rod upright with oil hole toward you. Wide part of offset will be to right on left bank rods, to left on right bank rods.

CRANKSHAFT

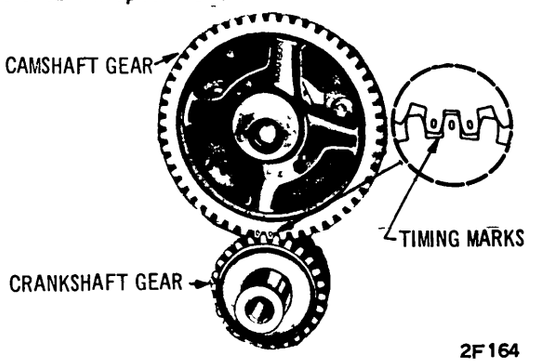
►*REAR MAIN BEARING OIL LEAK CORRECTION:* **If proper installation of new rear oil seal and oil pan gaskets does not stop the leak, make sure that drain core hole in rear main bearing cap connects with groove in cap. Drill and file hole to correct.**

Journal Diameter - 2.4995-2.5000".

Bearings - Steel-backed, micro-babbitt lined. No shims.

Clearance - .0005-.0025".

Replacement Bearings: Std. & .001", .010", .020", .030" Undersize.



►*MAIN BEARING REPLACEMENT NOTE:* Replacement main bearings are same type on all engines (furnished in heavy duty type only). Special bearings not required on engines with full-flow oil filter.

End Thrust: Taken by thrust washer assembled between front main bearing and crankshaft gear, controlled by shims between thrust washer and main bearing journal. These shims furnished .003", .005", .007" thick.

Endplay - .003-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

VALVE TIMING MARKS

CAMSHAFT

Journal Diamet rs - (1) 1.86975-1.87075", (2) 1.85375-1.85475", (3) 1.83875-1.83975", (4) 1.82275-1.82375", (5) 1.24475-1.24575".

Bearings - Precision type, steel backed babbitt lined.

Clearance - .00075-.00225" (No. 1), .001-.00275" (Others).

End Thrust: Taken by thrust plate located between front camshaft bearing and camshaft gear.

Endplay - .003-.006".

Camshaft Setting: Mesh marked tooth of camshaft gear between marked teeth of crankshaft gear.

Camshaft Removal & Installation; *See "Camshaft & Bearings" in Studebaker Special Data.*

Timing Gears: Crankshaft gear is Cast Iron, Camshaft gear is Celeron with steel hub.

Timing Gear Removal & Installati n: *See "Timing Gears" in Studebaker Special Data.*

Backlash - .001-.003".

Engine Front Cover Oil Seal (Crankshaft Fr nt Seal): *See "Engine Front Cover" in Stud baker Sp cial Data.*

Intake	45°	.359"	.0015-.0035"
Exhaust	45°	.359"	.0015-.0035"

Valve Seat Width - 1/16-3/32".

Valve Stem Oil Seal: "Umbrella" type, rubber seals installed on all exhaust and intake valve stems (with cupped side down toward top of valve guide) within valve spring below spring retainer.

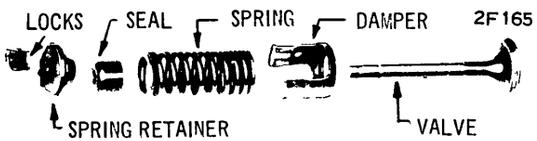
Valve Springs: Single spring used. Replace spring if 10% weaker than pressure given in specifications below. *NOTE* - Damper installed on lower (close-coiled) end of all springs.

Valve Spring Sp cificati ns

Valve	Lbs. Pressure	L ngth
Closed	45-55	2.031"
Open	105-115	1.671"

Valve Guides: Pressed in head from underside.

Guide Removal & Installation - *See "Valve System" in Studebaker Special Data.*



Valve Lifters: Straight barrel type. Remove from above. Not necessary to remove camshaft.

Valve Lifter Installation & Fitting - *See "Valv System" in Studebaker Special Data.*

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" Oversize Lifters requiring Reaming of Lift r Bore): See "Valve System" in Studebaker Special Data.*

Replacement Lifters - Std., .001" & .005" Oversize.

CONTINUED ON NEXT PAGE

VALVE ASSEMBLY

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Rock r Arm Ass mbly: *See "Valv Syst m" in Studebak r Sp cial Data.*

VALVE TIMING

S e "Camshaft S tting" under CAMSHAFT above.

Valve Timing Specificati ons

Intak Valv s - Open 11°BTDC. Close 54°36' ALDC.
Exhaust Valv s - Open 51°36' BLDC. Close 14° ATDC.

Valve Timing Ch ck - Set tappet clearance of No. 1 intake valve at .030". Turn crankshaft until No. 6 piston is on compression stroke and vibration dampener mark "IN.OP.1" is approaching pointer on timing gear cover, continue to turn crankshaft slowly while working No. 1 intake rocker arm up and down to determine point at which all clearance is taken up. Dampener mark "IN.OP.1" should be directly under pointer.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" und r OILING SYSTEM in Studebaker Special Data.*

►*OIL FILTER PRODUCTION CHANGE:* A full-flow type oil filter went in production on April 17, 1962 beginning Eng. Nos. V-559387 and P-90826. *NOTE - Corr ct oil filt r must b used. See data below on both arly and lat production oil filters.*

Crankcas Capacity: 5 qts. (add one quart when filter changed).

N rmal Oil Pr ssur - 20-40 lbs. at 40 MPH.
Pr ssur R gulator Valve - Located on right side at front of engine block slightly above crankcase flange.

Oil Pr ssur Indicator (Lark): Indicator light on instrument panel controlled by oil pressure switch. Studebaker No. 1539898.
Oil Pr ssur Indicat r (Hawk): Direct reading, non-electric type gauge, Studebaker No. 1539878.
Oil Pump: Spur gear type, on rear main bearing cap in crankcase.

Removal, Overhaul & Installation - *See "Oiling System" in Studebaker Special Data.*

Oil Filter: Early Cars - Filter is partial-flow type on cars produced before Eng. Nos. V-559387 or P-90826. Replace element and housing (as a unit) every 5000-6000 miles or sooner if needed.

Later Cars - Filter is full-flow type on cars produced after Eng. Nos. V-559387 or P-90826. Filter mounted at right rear of cylinder block above engine oil pan mounting flange. Replace filter element every 4000 miles or sooner if needed.

►*EARLY CARS OIL FILTER INSTALLATION CAUTION:* Lubricate gasket with engine oil and tighten filter by hand ½-turn after gasket seats on base. *Do not cross-thread or overtighten.*

►*LATER CARS OIL FILTER REMOVAL & INSTALLATION CAUTION:* Oil filter element is removed by unscrewing element from base. To facilitate removal, a wrench may be used on hexagonal boss on lower end of element. To install, lubricate element with light engine oil and tighten it by hand. DO NOT use wrench or tool to tighten.

Oil Filter Element Replacement - Studebaker No. 1542739 Partial-Flow (Early Cars), AC No. 3311 Full-Flow (Later Cars).

Crankcas V ntilati n: Standard Cars - Filter element is located in oil filler cap (air intake). Breather pipe (air outlet) is connected at r ear of valve chamber cover plate.
Positive Crankcase Ventilation Cars - The road draft tube has been replaced by a hose to the manifold utilizing a valve in the line. *See "Closed Crankcas Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

►*WATER PUMP NOISE CORRECTION:* Add 4 ozs. water soluble oil to coolant. If noise persists, replace pump.
►*WATER PUMP PRODUCTION CHANGE:* Improved type water pump used in production approximately July 25, 1962. For Overhaul, *see "Cooling System" in Studebaker Special Data.*
Water Capacity: 17 qts. (less heater), add 1 qt. (Lark), 1½ qts. (Hawk) for heater.

Pressure Valve: 14 lb. radiator filler cap, Studebaker No. 1551190.

Thermostat: Choke type Studebaker No. 1550956 (170°F) Std., No. 1551141 (160°F) and No. 1551140 (180°F) Optional.

Water Pump: Packless, sealed ball bearing type.

Pump Removal & Overhaul - *See COOLING SYSTEM in Studebaker Special Data.*

Radiator & Fan Shroud Removal - *See COOLING SYSTEM in Studebaker Special Data.*

Temperature Gauge: Direct reading, electric type.
Dash Unit - Studebaker No. 1552984 (All Lark Deluxe), No. 1555709 (All Lark Regal), No. 1555456 (Hawk Hardtop), No. 1539879 (Hawk Coupe).
Engine Unit - Studebaker No. 1545220 (All).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

6 CYLINDER OVERHEAD CAM ENGINE

	Ft. Lbs.
Cylinder Head	75-80
Cam Bearing Deck Stud Nuts	15-20
Exhaust Manifold	35-40
Intake Manifold	15-20
Oil Pan	12-15
Filler Block to Cylinder Block	12-15
Main Bearing Caps	85-95
Connecting Rod Caps	40-45
Vibration Damper	100-130
Water Pump to Timing Chain Cover	12-15

Water Pump	12-17	15-20
Oil Pump		30-35

CYLINDER HEAD & MANIFOLD

OVERHEAD CAM ENGINE

CYLINDER HEAD REMOVAL (WITHOUT REMOVING TIMING CHAIN): Remove rocker arm cover, install Camshaft Sprocket Removal & Installation Tool, W-268, on rocker arm cover studs. Install hook of removal tool in camshaft sprocket, tighten nut to relieve tension on camshaft. Remove capscrew, lockwasher, flat washer, and fuel pump eccentric from camshaft sprocket, pull forward on sprocket to free it from pilot on camshaft. Release tension on removal tool by backing off tool nut and allow chain and sprocket to rest on bosses on timing chain cover. *CAUTION - DO NOT slack off on chain (which would allow it to disengage from crankshaft sprocket), DO NOT attempt to remove sprocket from chain, and DO NOT attempt to crank engine with sprocket and chain resting on timing chain cover (will cause severe damage).*

CYLINDER HEAD INSTALLATION: Install cam deck with 5/16" stud nuts (Nos. 15, 16 & 17 in illustration). Position all-metal cylinder head gasket on block so coolant and vent ports are properly aligned. *NOTE - Use no seal r or other compound on gask t.* Position cylinder head squarely on block then install cylinder head bolts. Using a torque wrench, tighten cylinder head bolts (Nos. 1 through 14), then tighten cam deck stud nuts (Nos. 15, 16 & 17) to specifications, following sequence shown in diagram.

6 CYL. OVERHEAD CAM ENGINE

CRANKSHAFT & MAIN BEARINGS

6 CYL. OVERHEAD CAM ENGINE

REAR BEARING OIL SEAL INSTALLATION: Rear end of crankcase is sealed against oil leaks by a seal consisting of the filler block guard, upper seal half, two gasket inserts, a lower seal half, a rear filler block and an oil pan seal. For detailed installation, see following:

FRONT & REAR FILLER BLOCKS: Lower filler blocks are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace oil pan gasket). Rear filler block (upper filler block guard in crankcase) is grooved for seals which bear on polished surface of crankshaft. Filler blocks can be removed and replaced without disturbing crankshaft as follows:

Lower Filler Block Servicing (Front & Rear): Remove 2 socket head machining screws attaching rear filler block to cylinder block. Remove oil pan seal, filler block, gasket inserts and lower rear seal. Remove front filler block-to-cylinder block attaching bolts and remove. Discard seals and oil pan gaskets and cement. Replace front and rear bearing oil seals. Cement filler blocks for a distance of 2" from each end (also coat oil pan seals for a distance of 2" from each end) then install oil pan seals. Ends of pan seals should be 1/16" below top of filler block. Allow cement to dry before installing.

Upper Filler Block Servicing (Rear): Guard is seated in groov e in crankcase and can be rotated out without disturbing crankshaft after lower filler block removed. Remove and discard old seal, clean out seal groove, then install new seal. Do not use sealing compound in groove.

ENGINE FRONT COVER

6 CYL. OVERHEAD CAM ENGINE

FRONT COVER OIL SEAL: With timing chain cover installed, apply thin coating of sealing compound on outer edge of seal and position seal in opening so that the seal lip faces toward inside of cover. Drive seal into place using Oil Seal Installing Tool W-269.

ENGINE FRONT COVER REMOVAL: Remove hose from front cover water port. Remov e front cover-to-engine front cover plate attaching bolts, nuts and washers. Remove cover, lifting eye and gasket. Slide oil slinger and oil pump drive gear from crankshaft.

CAMSHAFT & BEARINGS

6 CYL. OVERHEAD CAM ENGINE

►*CAMSHAFT SERVICING NOTE:* Camshaft operates directly in bearing bores in Camshaft Support Deck and camshaft or support deck must be replaced if bearing clearance excessive. S *Camshaft and Support D ck data b l w.*

CAMSHAFT REMOVAL: With cylinder head removed, lift rocker arm guide off mounting studs on camshaft support deck, turn rocker arms parallel to camshaft (rotate camshaft to release tension on rocker arms, turn arms off cams as tension is relieved). Remove nuts and lockwashers attaching retainer to front of support deck, remove retainer, pull camshaft forward and out of support deck bearing bores.

CAMSHAFT SUPPORT DECK REMOVAL: After camshaft removed, remove three nuts, lockwashers, and plain washers attaching deck to cylinder head, lift support deck off head.

CAMSHAFT BEARING SERVICE: Check support deck and bearing bores for cracks, visible wear, or scoring. Check bearing bore and camshaft journal diameters with micrometers. Replace support deck or camshaft if bearing clearance more than .004". Support deck bearing bore dimensions are as follows:

Bearing	Support Deck B r	Camshaft J urnal
No. 1	1.9995-2.0005"	1.9965-1.9975"
No. 2	1.8745-1.8755"	1.8715-1.8725"
No. 3	1.7465-1.7475"	1.7495-1.7505"
No. 4	1.3715-1.3725"	1.3745-1.3755"

►*CAMSHAFT INSTALLATION CAUTION:* Some OHC Engines have a .030" thick shim installed between cam bearing deck casting and camshaft thrust plate. This shim must be reinstalled after camshaft servicing. To determine if the engine has this shim, measure between centerline of base holes to thrust plate surface. If measurement is .810", no shim required. If measurement is .780", a thrust plate shim, Willys Part No. 932076 is required.

TIMING CHAIN

OVERHEAD CAM ENGINE

TIMING CHAIN REMOVAL: Remove timing chain cover (see above). Install Camshaft, Sprocket Removal & Installer, Tool W-268, on rocker arm cover studs of cam bearing support deck. Install the hook of this tool in the sprocket and tighten the nut to relieve tension on camshaft. Remove capscrew, lockwasher and flat washer and fuel pump eccentric from sprocket. Pull forward on camshaft to remove it from pilot. Release tool hook, then slide timing chain sprocket to remove from crankshaft. Remove chain tensioner pin. Remove blade assembly and tensioner spring from lower tensioner mounting stud. Remove chain guide bracket-to-front engine plate attaching capscrews, washers and nuts. Remove chain guide bracket. To install, reverse removal procedure. *Check Valv Timing. See Car Model Pages.*

VALVE SYSTEM

ROCKER ARMS

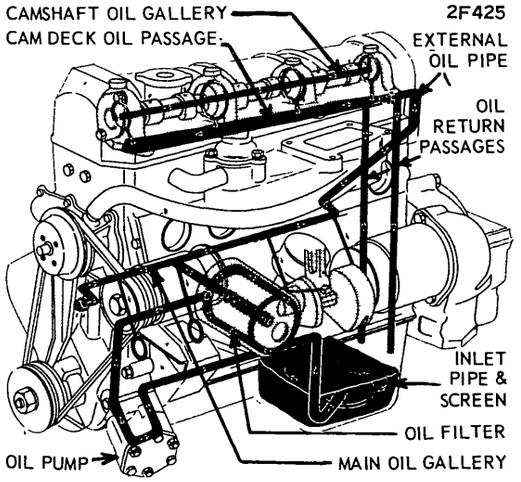
OVERHEAD CAM ENGINE

ROCKER ARM STUD REPLACEMENT (Overh ad Cam Eng.): Position cam bearing support deck on an arbor press and position the support of Rocker Arm Stud Remover and Installer Tool W-266 under defective stud. Position tool guide on top of stud with chamfered end up. Position driver in guide so that end rests on top of stud. Press on end of driver to dislodge stud. Remove stud. Invert cam bearing support deck on arbor press and install support of tool under deck aligned with hole for stud. Position new stud in hole in bearing deck (thread end first). Position tool guide on knurled end of stud with chamfered end down. Press stud into place until it seats firmly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OILING SYSTEM
ENGINE LUBRICATION
OVERHEAD CAM ENGINE



DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings. All other parts are lubricated by oil spray.

OPERATION: Double rotor type oil pump, driven by helical gear on crankshaft, draws oil through fixed intake screen, and delivers oil to full flow filter through passages in block. Oil flow from filter is through passage in block to main oil gallery which extends along left side of block. Oil is distributed from main oil gallery as follows:

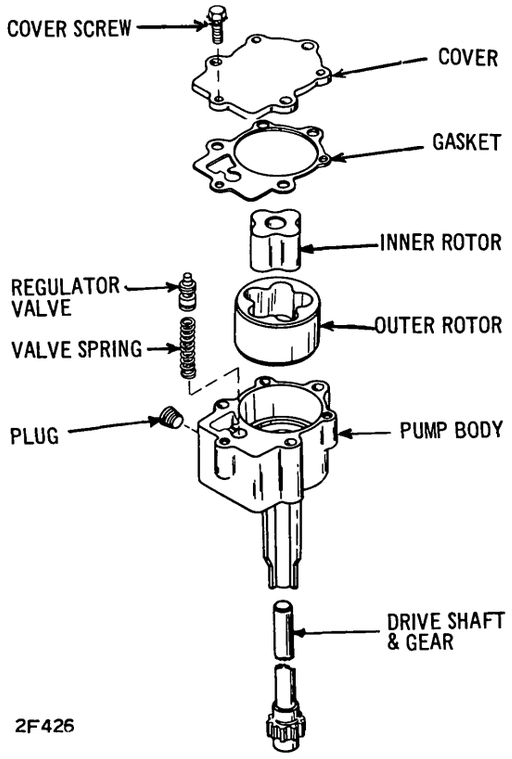
Crankshaft Bearings - Each main bearing supplied with oil from main oil gallery through angle passage in crankcase web extending down from main oil gallery to main bearing bore.

Camshaft B arings - Drilled passages in support deck provide lubrication to camshaft bearings. Oil passage to rear camshaft bearing also provides oil under pressure to fill oil passages in camshaft to keep cams lubricated.

Camshaft B aring Supp rt Deck - A ¼" steel tube is inserted in this passage to conduct oil to front of support deck and to prevent oil drain back when engine is idle. Oil enters this tube via external tube at rear of block which connects oil passage in block to oil passage in cylinder head.

6 CYL. OVERHEAD CAM ENGINE OILING SYSTEM

Conn cting Rod B arings - Oil passages in crankshaft mate with oil grooves in main bearings and these passages conduct oil to the connecting rod bearings.



Pist ns & Pins - Lubricated by oil spray thrown on cylinder wall from spurt hole in connecting rod when this hole lin ds up with oil hole in crankpin.

Timing Gears - A passage in block conducts oil to a fitting at front of block which provides a stream of oil to timing chain, sprocket, and oil pump drive gear at front end of crankshaft.

OIL FILTER: Full-flow type mounted externally on left side of cylinder block. All oil supplied by oil pump passes through filter, then through passage to main oil gallery in block. Relief valve located in pump body.

OIL PUMP

OIL PUMP SERVICING: Removal - Remove three nuts and lockwashers. Pull straight out to remove pump. **Inspection** - Cle an and check pump for cracks or leaks. Check drive gear for worn teeth, cracks, etc. Replace gear if damaged. Mount dial indicator on oil pump to check for endplay. Move pump shaft to its extremes and check for total endplay. If this exceeds .005", replace pump. *CAUTION* - Drive gear is press fit on oil pump shaft and must be removed and replaced with an arbor press. Correct axial positioning of the gear on shaft as follows: Outside end of gear hub must be 7 1/32" from mounting face of pump. Centerline of face of gear teeth should coincide with bottom of distributor shaft slot in end of oil pump shaft. **Installation** - Oil pump is driven from crankshaft by means of a helical gear. Distributor is driven by the oil pump by means of a tongue on end of distributor shaft engaging slot on end of oil pump shaft. Tongue and slot are machined off-center so they can be meshed in only one position. To install, rotate crankshaft until pointer on timing chain cover is aligned with "O" timing mark on vibration damper. Install oil pump mounting gasket and position oil pump on studs on timing chain cover. Do not engage distributor drive gear worm. Insert long bladed screwdriver in distributor shaft opening on opposite side of block and engage slot in oil pump shaft. Turn shaft so that slot is positioned at roughly the 4 and 10 o'clock position with narrow side of shaft up. Remove screwdriver and, looking down distributor shaft hole with a flashlight, recheck position of oil pump shaft slot. Replace screwdriver and, while turning screwdriver counterclockwise to guide oil pump shaft gear into engagement with camshaft gear, press against oil pump to force it into position. Remove screwdriver and recheck position of slot. If correctly installed, slot will be in roughly the 3 and 9 o'clock position with narrow side of shaft still on top. If slot out of position, remove pump assembly and repeat operation. Secure pump with three nuts and lockwashers.

6 CYL. OVERHEAD CAM ENGINE OIL PUMP

ELECTRICAL NOTES
DISTRIBUTOR

DISTRIBUTOR REMOVAL & INSTALLATION (Overh ad Cam Engine): To remove, disconnect and remove high tension wires from cap terminal towers (Note original position for correct reinstallation). Remove primary lead from terminal post at side of distributor. Unlatch 2 distributor cap springs and remove cap. Note position of rotor in relation to the base. Remove distributor-to-timing chain cover attaching screw and lift assembly from engine.

Installation - *See "Oil Pump Installation" under OIL PUMP in this section, and note the following:* No. 1 spark plug terminal tower is in the five o'clock position and starting with this tower, the wires are installed in a counterclockwise direction in firing order.

ENGINE NUMBER: Located as follows:

4 Cyl. Engines - Stamped on top of water pump boss at front of engine.
6 Cyl. Engines (Exc. Overhead Cam) - Stamped on boss on left front corner of engine block above generator.
6 Cyl. Engine (Overhead Cam) - Stamped on lower right front of cylinder block just behind ignition coil.

►*ENGINE NUMBER SUFFIX NOTE:* Letters **A, B, AB, or P** following engine number designates special sizes of some engine parts. *For details, refer to ENGINE NUMBER NOTE under Engine below.*

TUNE-UP

COMPRESSION PRESSURE: 4 Cyl. "L" Head 90-110 lbs.
4 Cyl. "F" Head 115-145 lbs. (6.9-1 Ratio), 120-130 lbs. (7.4 or 7.8-1 Ratio).
6 Cyl. "L" Head 120-130 lbs. (6.86-1 ratio), 125-140 lbs. (7.3-1 ratio).
NOTE - All cylinders must be equal within 10 lbs.
6 Cyl. Ov rh ad Cam Engine - 145-155 lbs. Cylinders equal to within 15 lbs.

VACUUM READING: 18-21" (Exc. Overhead Cam Eng.), 16-18" (Overhead Cam Eng.) at idle speed.

TAPPET CLEARANCE:	Intake	Exhaust
4 Cyl. "L" Head	.016"	.016"
4 Cyl. "F" Head	.018"	.016"
6 Cyl.	.014"	.014"

NOTE - Set clearance with engine COLD not running.

►*TAPPET ADJUSTMENT (FORWARD CONTROL MODELS):* Access panel provided in right front wheel housing.

MANIFOLD HEAT CONTROL: Used as follows:
4 Cyl. "L" Head - Thermostatic coil on manifold.
4 Cyl. "F" Head - Water jacketed intake manifold.
6 Cyl. - Exhaust heat control valve with spring tension of 180° wind-up on manifold.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-3-4-2 (4 Cyl.), 1-5-3-6-2-4 (6 Cyl.).
SPARK PLUG GAP: .030".

►*SPARK PLUG & SECONDARY COIL CABLE NOTE: Resistor type cables used. DO NOT puncture cable. NOTE - When removing cable, grasp boot or terminal ONLY.*

Spark Plugs (Exc. Overhead Cam Eng.) - Prestolite (Autolite) A7 or Champion J8, 14 mm. Torque to 28-30 ft. lbs.

Spark Plugs (Overhead Cam Eng.) - Prestolite (Autolite) AE 42 or Champion L-7. 14 mm. Torque to 28-30 ft. lbs.

COIL: Prestolite (Autolite) No. 200564.
Ignition Current - 2.8-2.9 amps. at 12.5 volts idling or stopped.

DISTRIBUTOR: Prestolite (Autolite) used as follows:

Model	Distr. No.
4 Cyl. Jeeps & Fleetvans	IAY-4401
4 Cyl. Others	IAT-4405
6 Cyl. (Exc. Overhead Cam Eng.)	IAT-4404A
6 Cyl. (Overhead Cam Eng.)	IAT-4411

Distributor Removal & Installation (6 Cyl. Overhead Cam Eng.): Distributor driven from crankshaft by oil pump drive gear. *See "Electrical Notes" in Willys Special Data.*
Condenser - Prestolite (Autolite) 2-32.
Capacity - .21-.25 mfd. (Exc. Overhead Cam Eng.), .25-.28 mfd. (Overhead Cam Eng.).
Contact Point Set - Prestolite (Autolite) 1-45 (IAY Distr.), 1-47 (IAT Distr.).

Break r Gap - .020".
Cam Angl - 37-42° (4 Cyl.), 36-42° (6 Cyl.).
Break r Arm Spring Tension - 17-22 ozs.
Rotation - Counterclockwise at commutator end.

Automatic Advanc - IAY-4401, IAT-4405

Fwd. Control (FC-170) ℂ		M957S
Utility (6 Cyl.) ℂ		M957S
6 Cyl. Overhead Cam Eng. ℂ		MP-3454S

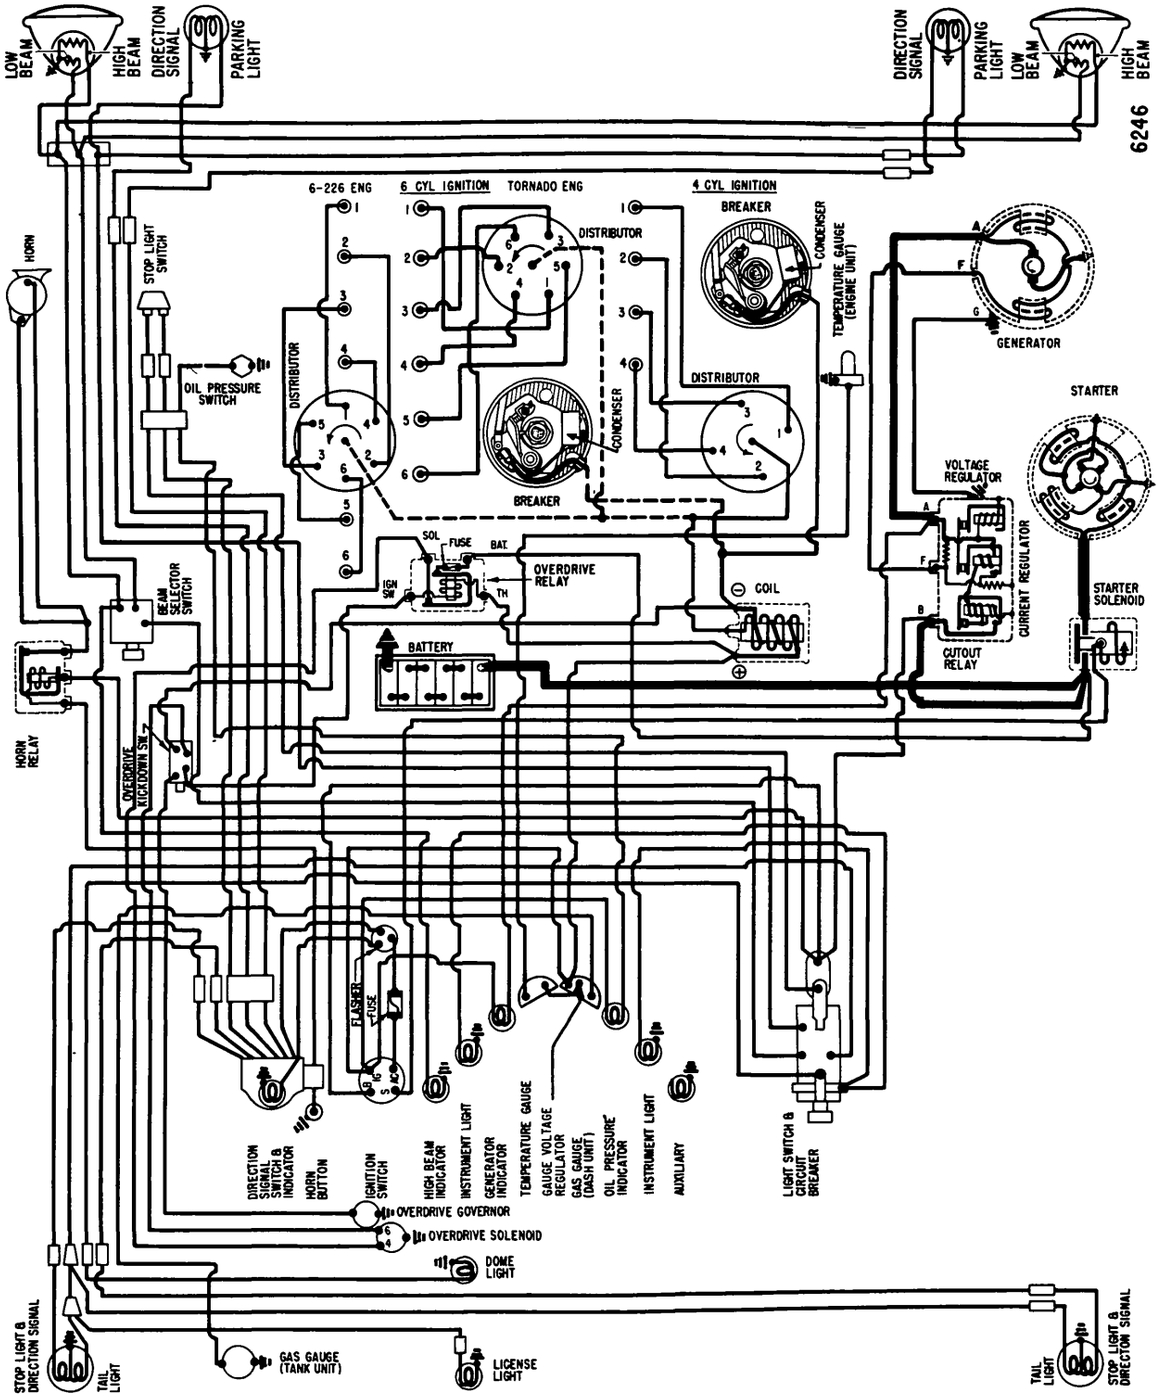
ℂ - Fuel & Vacuum. ℂ - Fuel only.

Pressure - 2½-3¾ lbs. (AC pump), 3½-5½ lbs. (Carter pump), all at 1800 RPM.

►*FUEL FILTER NOTE:* Fuel filter spool located inside fuel tank on all models except Univ. Jeep & Jeep Dispatcher.

Gas lin Gauge: Stewart-Warner Electric Constant Voltage type with gauge voltage regulator in fuel gauge.

BATTERY



Autolite 11-HS. Used as follows.

Model	V lt	Plates	ℂCapacity
Exc. P.O. Fleetvan	12	9	50 Amp.
P.O. Fleetvan	12	11	70 Amp.

ℂ - 20 hr. rate.

Batt ry Gr und - Negative.
Engin Ground - Left front engine support (6 Cyl.), right front engine support (4 Cyl.).

CONTINUED FROM PRECEDING PAGE

STARTER

Prestolite (Autolite) No. MDU-7004 (4 Cyl.), MDU-7003 (6 Cyl. exc. Overhead Cam Eng.), MDY-7021 (Overhead Cam Eng.).
Armature - Prestolite (Autolite) No. 16-82.
Drive - Bendix "Folo-Thru" type.
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 31-47 ozs. (MDU-7003 & 7004), 32-40 ozs. (MDY-7021).

Performance Data - MDU-7003,4

Torque	RPM	Volts	Amperes
0 ft. lbs.	5300	10.0	50
6.2 ft. lbs.	Lock	4.0	280

Performance Data - MDY-7021

Torque	RPM	Volts	Amperes
0 ft. lbs.	4200	10.0	60
9 ft. lbs.	Lock	4.0	405

GENERATOR

Prestolite (Autolite) No. GJP-7402A (4 Cyl.), GJP-7402B (6 Cyl.). Armature - Prestolite (Autolite) No. 10-53.

Performance Data

Amperes	Volts	RPM
16	15.0	1750
30	15.0	2300
35	15.0	2600

Brush Spring Tension - 18-36 ozs.
Field Current - 1.6-1.7 amps. at 10.0 volts.
Motoring Current - 3.1-3.5 amperes at 10.0 volts.
Rotation - Counterclockwise at commutator end.
Belt Adjustment: ½-5/8" deflection midway between generator and water pump pulleys with normal thumb pressure.

GENERATOR REGULATOR

Prestolite (Autolite) No. VBO-4201E-4A.

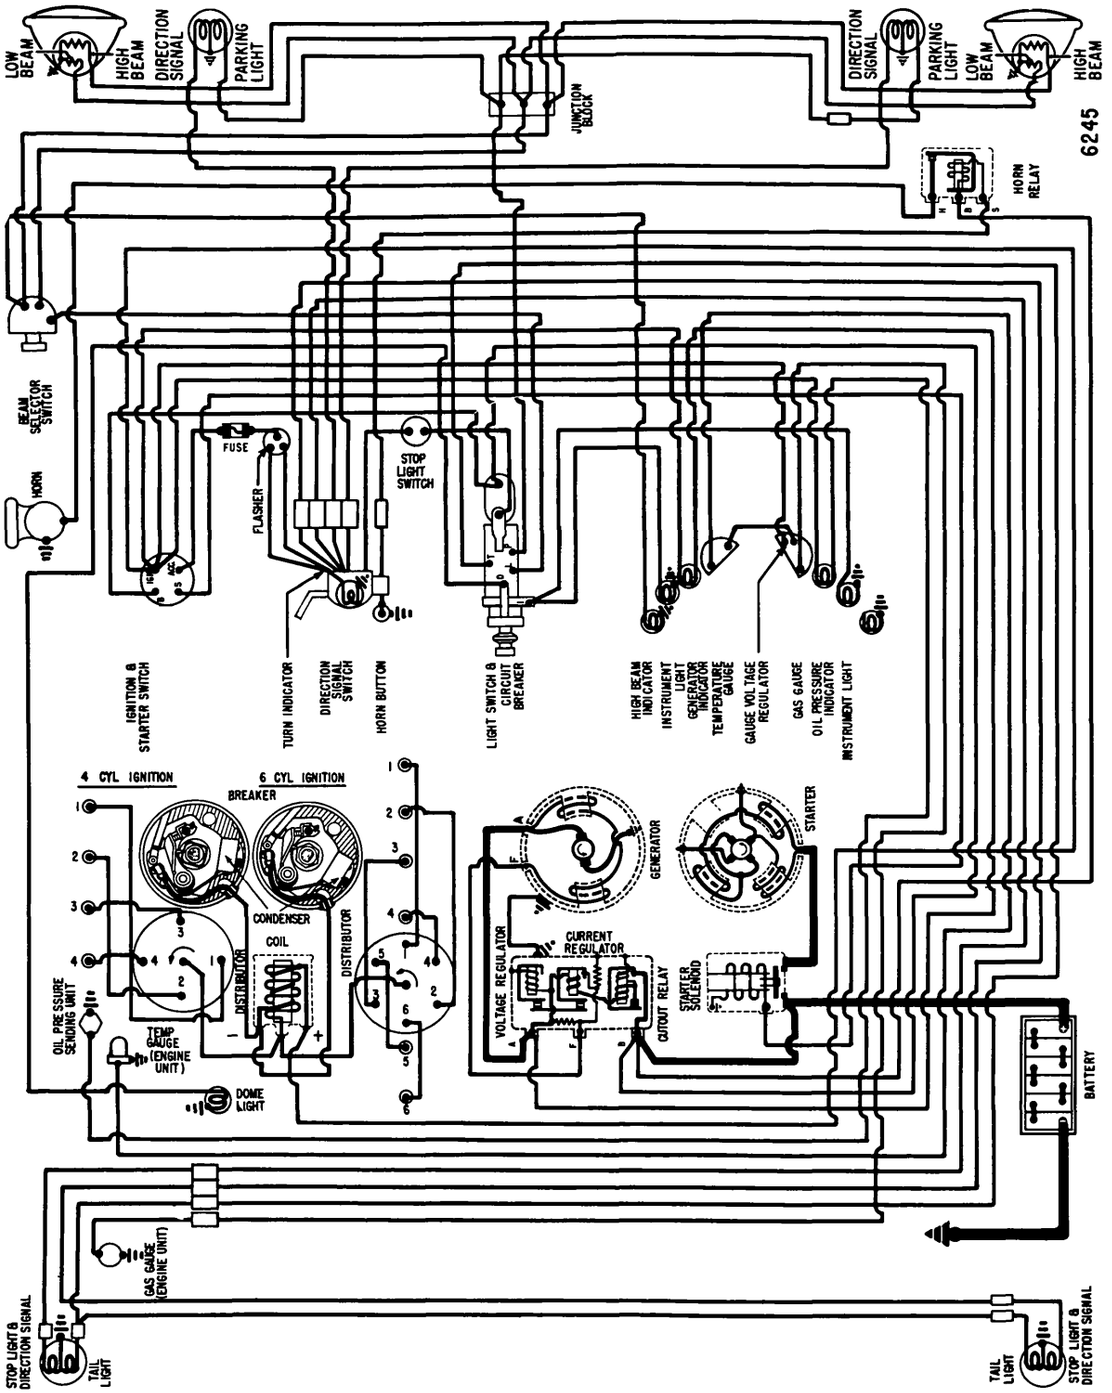
Cutout Relay

Cuts In - 12.5-13.5 volts.
Cuts Out - 3-5 amps. discharge after charging at 7 amperes.
Contact Gap - .015" Minimum.
Air Gap - .025-.027" with contacts open (check at hinge end of core).

Voltage Regulator

Setting - 14.2-14.8 volts at 80°F and charging at 7 amperes or with .25 ohm resistor in charging line.
Air Gap - .048-.052" with contacts just opening.

Current Regulator



►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A	Operating Amperes	Test B
44 Amperes max.		35 (33-37) Amps.

Test A - After 15 minutes operation, charging at 7 amps.
Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts).
Air Gap - .048-.052" with contacts just touching.

►*OTHER DATA: See "Autolite Regulators" in Electrical Section.*

WILLYS FORWARD CONTROL WIRING DIAGRAM

CONTINUED FROM PRECEDING PAGE

ALTERNATOR

Pr st lit (Aut lit) N . ALC-5001A. Three-phase A.C. unit with full wave rectifier.
R tation - Clockwise at drive end.
Fi ld Curr nt - 2.32-2.43 am ps. at 10 volts.
Rat d Output - 42 amps. at 14.2 volts and 4200 RPM.
►*OTHER DATA: S "Autolite Alternators & Regulators" in El ctrical S ction.*

ALTERNATOR REGULATOR

Pr st lit (Aut lit) N . VBS-6201A. Field control type. Temperature compensated. Vibrating type voltage regulator with two sets of contacts.
Air Gap - .034-.038". **P int Gap** - .010".
V ltag S tting - 13.9-14.3 volts (upper contacts), .1-.3 volt lower operating on lower c ntacts.
►*OTHER DATA: S "Autolite Alternators & Regulators" in El ctrical S ction.*

MISC. ELECTRICAL

Lighting Switch R moval: Loosen set screw on side of control knob and remove knob. Remove retaining nut and remove switch through panel.

CIRCUIT BREAKER: 25 Ampere. Protects Headlamps, High Beam Indicator, Parking, Tail, Stop, License Plate, Instrument and Dome Lights.

FUSES: 9 Amper . Direction Signals.
7½ Amper . Radio (Exc. Fwd. Control).
5 Amper . Radio (Forward Control).
9 Amp re. Heater (Exc. Fwd. Control).
19 Amper . Heater (Forward Control).

ENGINE

►*FOUR DIFFERENT ENGINES USED: See "Model Id ntification" for application.*

►*FOR ENGINE DATA, see Willys Car Model Pages in 1961 Final Data and note the following:*

►*METAL COVERED MANIFOLD GASKET NOTE (L6-226):* Use this metal covered gasket Part No. 930964 on L6-226 engines with single barrel carburetors that have considerable mileage or hours of service.
►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" Undersize main and connecting rod journals.
"N" .010" Oversize bore and pistons.
"AN" Indicates both above conditions.
"P" Indicates Late Production L-226 Engine equipped with new crankshaft, flywheel bolts, crankshaft bearings, connecting rods, and connecting rod bearings. *CAUTION - See following Parts Caution.*
►*LATE PRODUCTION L-226 ENGINE (WITH ENGINE NUMBER SUFFIX "P") PARTS REPLACEMENT CAUTION & CHANGEOVER NOTE:* Some late production L6-226 engines are equipped with new crankshaft, flywheel bolts, crankshaft bearings, connecting rods and connecting rod bearings, With the exception of flywheel bolt (Tufftrided bolt must be used on "P" Engine), parts for engines with "P" suffix MUST NOT BE INTERCHANGED with those of an engine without "P" suffix. *If new parts desired on engine without "P" suffix, replace all the above parts and stamp engine number with a "P" suffix.*

PISTON RINGS

Compr.Ratio	Rated HP	Developed HP
8.5-1	26.77	140 at 4000 RPM

Compression & Vacuum Reading - *See TUNE-UP*
►*ENGINE NOTE:* The "Jeep" Tornado Engine is of new design and careful attention should be given to procedures below.
►*ENGINE NUMBER NOTE: Letters following engine number on lower right front of cylinder block denote the following:*
"A" - ..010" undersize main & connecting rod bearings.
"B" - .010" oversize pistons.
"AB" - Combination of A and B.
ENGINE REMOVAL: *See "Engine" in Willys Special Data.*
CYLINDER HEAD & GASKET: *See "Cylinder Head & Gasket" in Willys Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Willys Special Data.*

PISTONS

►*ORIGINAL BORE DIAMETER:* 3.3430-3.3455".
►*PISTON OVERSIZE NOTE:* Letters B or AB after engine number indicate that cylinder bore and pistons are .010" Oversize.
Domed, aluminum alloy, cam ground, tin plated.
Removal - Pistons and rods removed from above.
Fitting New Pistons: Place .0015" x 1/2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove feeler should be 5-10 lbs.
Replacement Pistons: Std. & .010", .020", .030", .040" Oversize.
Installing Pistons: "F" mark cast on piston pin boss relief to front of engine. *See Rod Installation.*

PISTON PIN

Diameter - .8592". **Length** - 2.779".
Clearance in Piston - .0002" selective fit. Light thumb push fit.
Clearance in Rod - .004-.0008". Palm press fit at room temperature.
Piston Pin Fitting - Palm push fit. Ream connecting rod bushing for proper fit of oversize pin.
Replacement Pins: Std., .003" & .005" Oversize.

PISTON RINGS

Compression rings cast iron, with upper ring face chrome plated. Oil ring is 2 steel rails with steel spacer expander, and chrome plated face.

Ring	Gap	Side Clearanc
Compr. (1 & 2)	.010-.045"	.002-.0031"
Oil (3)	.015-.055"	

Replacement Rings: Furnished Std., & .010", .020", .030", .040" Oversize.
Installing Rings: Install chrome plated compression ring in top groove. When installing oil ring, be sure both green and orange dots are visible at the spacer gap to indicate that the ends do not overlap.

CONNECTING ROD

Length (Center-to-Center) - 7.000".
Crankpin Journal Diamet r - 2.0619-2.0627".
►*CONNECTING ROD JOURNAL DIAMETER UNDER-*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

SIZE NOTE: The letters A or AB following the engine number indicate that the main and connecting rod journals are .010" Undersize.

Bearings - Steel-backed, Copper-Lead, Tin plated. Removable.

Clearance - .0006-.0025".

Replacement Bearings: Std. & .002", .010", .020" Undersize.

Rod Installation: Install rod and bearing cap in original order. Oil spurt hole in connecting rod must face exhaust side of cylinder block and "F" mark cast in piston pin boss relief facing to front of engine.

CRANKSHAFT

►*CRANKSHAFT MACHINING CAUTION:* Because entire shaft was Tufftride treated, any machining must be followed by a reprocessing, using the Tufftride method.

Journal Diameter - 2.3747-2.3755".

►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letters A and AB following engine number indicate .010" Undersize main and connecting rod journals.

Bearings - Steel-backed, Copper-Lead, Tin plated.

Clearance - .0005-.0025". Wear limit .001".

Replacement Bearings: Std. & .002", .010", .020" Undersize. Manufacturer recommends all bearings be replaced as a unit.

End Thrust: Taken by No. 4 (Rear) main bearing which is flanged type.

Endplay - .003-.007". Replace bearing if over .007".

Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Willys Special Data.*

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Willys Special Data.*

CAMSHAFT

Journal Diameter - Front to rear: **(1)** 1.9965-1.9975", **(2)** 1.8715-1.8725", **(3)** 1.7465-1.7475", **(4)** 1.3715-1-3725".

►*CAMSHAFT NOTE:* Camshaft supported by 4 bearings in cam bearing support deck on cylinder head. Chain driven, camshaft sprocket mounts on pilot at front of camshaft and drives camshaft through a dowel. Camshaft has 6 cams, each of which operates the intake and exhaust valve rocker arms for one cylinder.

Bearings - Aluminum alloy, no bushings used. Replace cam bearing deck and/or camshaft when there is excessive clearance.

Clearance - .002-.004". Wear limit .004".

End Thrust: Controlled by thrust plate and a shim installed between thrust plate and cam bearing deck.

NOTE - Later production engines have no shim.

Endplay - .011-.018".

Camshaft Servicing: *See "Camshaft & Bearings" in Willys Special Data.*

Timing Chain: Timing chain tensioning device compensates for normal wear and stretch. If rubber facing of tensioner contact face is worn, replace tensioner. Timing chain should be replaced if distance between chain sides at narrowest point is less than 3.38" (Tensioner in place). *See "Timing Chain" in Willys Special Data.*

Camshaft Setting: Mesh chain with camshaft sprocket dowel downward & crankshaft sprocket key upward & copper links of chain aligned with timing marks on sprockets (No. 1 piston at TDC). *See illustration.*

Engine Front Cover Removal & Installation: *See "Engine Front Cover" in Willys Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Willys Special Data.*

VALVES

Tappet Clearance: .006" Intake, .008" Exhaust. Rotate camshaft until cam lobe points to 6 o'clock position. Adjust both valve rocker arm stud nuts to provide proper clearance between rocker arm and top of valve stem.

►*VALVE NOTE:* Valves and valve parts are mounted entirely on cylinder head, which can be removed for repair and overhaul. One camshaft lobe operates both intake and exhaust valve rocker arm.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.895"	.3400-.3410"	4.675"
Exhaust	1.618"	.3385-.3395"	4.485"

Valve	Seat Angle	Stem Clearance
Intake	45°	.001-.003"
Exhaust	45°	.0025-.0045"

Valve Seat Width - 5/64-3/32".

Valve Guides: Pressed in head. Replace when stem clearance specifications exceeded (see above). Using Tool W-265 press old guide out bottom of head and press new guide in from top of head. Use a spacing stop to limit distance guide can be installed. Properly positioned, top of valve guide will be .45" above machined surface of cylinder head. After installation, ream guide to .342-.343".

Rocker Arm Stud Replacement: *See "Rocker Arms" in Willys Special Data.*

Valve Springs: 1.60" free length.

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Closed	57	1.26"
Open	130	.885"

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE:* Specifications are with tappet clearance as follows: .006" Intake, .008" Exhaust.

Intake Valves - Open 15° BTDC. Close 55° ALDC.

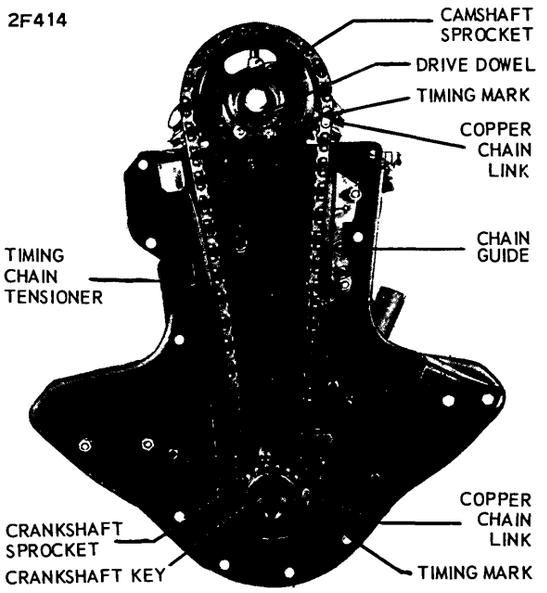
Exhaust Valves - Open 55° BLDC. Close 15° ATDC.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Willys Special Data.*

Crankcase Capacity - 4 qts. (4 Cyl.), 5 qts. (6 Cyl.), add additional qt. with filter change.

Normal Oil Pressure: 35 lbs. at 2000 RPM (4 Cyl.), 35 lbs. at 1700 RPM (6 Cyl. exc. Overhead Cam Eng.), 50 lbs. at 2000 RPM (Overhead Cam Eng.).



Pressure Regulator - In pump housing (4 Cyl. & 6 Cyl. Overhead Cam Eng.); right side of cylinder block below valve chamber to rear of engine (Other 6 Cyl.).

Oil Pressure Indicator: Red telltale light on instrument cluster operated by an oil pressure switch. Light comes on when ignition switch turned on and goes out when oil pressure reaches 6 lbs.

Oil Pump: 6 Cyl. Overhead Cam Eng. - Rotor type mounted on engine front cover.

Others - Rotor type on left side of engine (4 Cyl.), gear type attached to rear intermediate main bearing in crankcase (6 Cyl.).

Pump Overhaul - *See "Oiling System" in Willys Special Data.*

230" OHC VALVE TIMING MARKS

Oil Filter: 6 Cyl. Overhead Cam Eng. - Full-flow type located on right side of crankcase. Replace filter every 6000 miles or sooner if needed.

Partial-Flow Filter - Disposable type used on some engines. When replacing filter, tighten filter by hand until gasket contacts mounting flange, then tighten ½-turn additional.

Crankcase Ventilation: Standard - Filter in oil filler cap and outlet tube from crankcase ventilator baffle on side cover.

Positive - Road draft tube replaced by hose to manifold with valve in line. *See "Closed Crankcase Ventilation systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 10 qts. (FC-150), 11 qts. (FC-170) & 6 Cyl. Overhead Cam Eng.), 11 qts. (Other 4 Cyl.), 12 qts. (Other 6 Cyl.). On all models, add 1 qt. for heater.

Pressure Valve: Radiator filler cap. 9 lbs. (All Fwd. Control), 13 lbs. (4WD 6 Cyl.), 7 lbs. (Others).

Thermostat: Harrison. In water outlet elbow in cylinder head (All exc. 6 Cyl. Overhead Cam Eng.), on intake manifold (Overhead Cam Eng.). Opens at 163-168°F.

Water Pump: Overhead Cam Eng. - Centrifugal, packless ball bearing type. Service by replacement.

All Exc. Overhead Cam Eng. - Centrifugal, packless ball bearing type. *See "Cooling System" in Willys Special Data.*

Temperature Gauge: Stewart-Warner Electric Constant Voltage type with gauge voltage regulator in fuel gauge.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

MODEL IDENTIFICATION

Model	Model Designation
Checker 4-Door Sedan	A-11
Checker Superba & Marathon 4-Door Sedan	A-12
Checker Superba & Marathon Station Wagon	A-12W

►*ENGINE REFERENCE NOTE: In the following data, reference to engines will be: L-Head for "L" Head engine, OHV Eng. for Valve-In-Head engine.*

SERIAL NUMBER: Stamped on plate attached to dash panel under hood. Number (example below) includes identification data as follows:

① ② ③
A-12 456 34534

① - Model designation. *See table above.*
② - Production Order Number.
③ - Vehicle Unit Number.

ENGINE NUMBER: Stamped on left side of cylinder block and on serial number plate on dash.

TUNE-UP

VALVE TAPPET CLEARANCE: L-Head - .014" Intake & Exhaust, with engine idling. **OHV Eng.** - .017" Intake, .023" Exhaust, with engine idling. *NOTE - Set exhaust valve clearance with inlet water temperature of 115-140°F, and set intake valve clearance with engine hot.*

MANIFOLD HEAT CONTROL: Thermostatic coil spring type with counterweight (L-Head); Water jacketed intake manifold (water circulated from cylinder head through manifold to water pump) used on OHV Engine.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .028-.030" (L-Head), .032-.033" (OHV Eng.).

Spark Plug (L-Head) - Champion UD-16. 18 mm. Torque to 34 ft. lbs.

Spark Plug (OHV Eng.) - Champion N-8. 14 mm. Torque to 30 ft. lbs.

COIL: Prestolit (Autolite) No. 200654.

Ignition Current - 3.0 amps. stopped, 2.0 amps. idling.

Resistor - Prestolite No. 201008.

DISTRIBUTOR: Prestolit (Autolite) No. IGC-6002-1AC (L-Head), No. IAT-4406 (OHV Eng.). *NOTE - IGC Distributor has Centrifugal Advance only.*

Condenser & Contact Point Set - Prestolite.

Condenser Capacity - .20-.25 mfd. (IGC Distr.), .21-.25 mfd. (IAT Distr.).

Breaker Gap - .018-.022". Set at .020".

Cam Angle - 36-42°.

Breaker Arm Spring Tension - 17-20 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance - IGC-6002-1AC

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	275	0	550
1	430	2	860
5	1060	10	2120
8	1525	16	3050
9	1685	18	3370

Automatic Advance - IAT-4406

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	250	0	500
1	310	2	620
8	730	16	1460
15	1160	30	2320
16.5	1250	33	2500

Vacuum Spark Control: Prestolite integral type used on IAT Distributor only. None used on IGC Distributor.

Vacuum Advance - IAT-4406

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	10
1	2	11
3	6	13
4	8	14
5	10	15

IGNITION TIMING

Setting - 4° BTDC (L-Head), 3½° BTDC (OHV Eng.) at specified idle speed.

Timing Mark - Marks on vibration damper and pointer on engine front cover. Align correct mark with pointer. *NOTE - Facing the car, rear or left mark is TDC.*

CARBURETOR

►*CARBURETOR APPLICATION: Zenith single barrel used on L-Head Engine, Carter AS single barrel or Rochester 2GC two-barrel used on OHV Engine.*

THROTTLE LINKAGE ADJUSTMENT (AUTO. TRANS. CARS): None required. Transmission shift points controlled by Vacuum & Solenoid unit on transmission case.

ZENITH

Zenith Model 228BV10C, No. 0-12469. Single barrel downdraft type with automatic choke. *NOTE - Automatic choke has an electric heating coil.*

Idle Setting - Initial setting ¾-1½ turns out. Turn screw out for richer mixture.

Idle Speed - Initial setting 1½ turns in from point where throttle stopscrew contacts stop on throttle body. Idle speed should be 375 RPM (Synchro-mesh), 425 RPM (Auto. Trans in "D").

Float Level - 1 1/2"±1/32" from machined surface of air horn casting to top of float. To adjust, bend float lever.

Accelerating Pump - Install hairpin cotter pin in proper groove in pump guide rod as follows: Bottom groove for full stroke (Winter), middle groove for ⅔ stroke (Normal), upper groove for ½ stroke (Summer).

Fast Idle: No adjustment. Fast idle will be correct when slow idle correctly set.

Automatic Choke Setting: 15 points rich.

►*OTHER DATA: See "Zenith Carburetors" in Carburetion Section.*

CARTER

Carter AS, No. 3290S. Single barrel downdraft type with automatic choke.

Idle Speed - 375 RPM (Synchro-mesh), 425 RPM (Auto. Trans. in "D").

►*OTHER DATA: See "Carter AS Carburetors" in Carburetion Section.*

ROCHESTER 2GC

Rochester 2GC, No. 7023096. Two-barrel downdraft type with automatic choke.

Idle Speed - 375 RPM (Synchro-mesh), 425 RPM (Auto. Trans. in "D").

►*OTHER DATA: See "Rochester 2G & 2GC Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. M873S. Fuel & Vacuum.
Fuel Pump Pressure - 3-5 lbs. at 500 RPM.

Gasoline Gauge: Stewart-Warner electric type.

Air Cleaner: Dry filter element type. Clean element every 5000 miles (2000 miles under severe dust conditions). *NOTE - Oil bath type optional on L-Head Engine.*

►*CLEANING CAUTION:* Clean element by tapping lightly or blowing out with a low pressure stream of air directed from the inside surface of element. DO NOT oil, wash or lubricate element.

BATTERY

Willard H-11-50. 12 volt, 9 plate, 50 ampere hour capacity (20 hour rate).

Battery Ground - Negative, to cylinder block.

STARTER

Prestolite (Autolite) No. MDL-6023 (Synchro-mesh), No. MDU-7002 (Auto. Trans.).

Drive - Bendix "Folo-Thru" type.

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 31-47 ozs.

Performance Data - MDL-6023

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10.0	60
6.0 ft. lbs.	Lock	4.0	225

Performance Data - MDU-7002

Torque	RPM	Volts	Amperes
0 ft. lbs.	5300	10.0	50
6.2 ft. lbs.	Lock	4.0	280

Starting Switch: Magnetic switch controlled by Ignition and Starter Switch. Neutral Safety Switch mounted at lower end of steering column used on Automatic Transmission cars.

GENERATOR

Prestolite (Autolite) No. GJP-7103A. *NOTE - "B" circuit type. See "Prestolite (Autolite) B Circuit Regulators" in Electrical Section.*

Performance Data - GJP (Cold - 70°F)

Amperes	Volts	RPM
16.0 Min.	15.0	1750
35.0	15.0	2600 Max.

Brush Spring Tension - 18-36 ozs.

Field Current - 1.6-1.7 amps. at 10.0 volts and 70°F.

Motoring Current - 3.1-3.5 amps. at 10.0 volts and 70°F.

Rotation - Counterclockwise at commutator end.

GENERATOR REGULATOR

Prestolite (Autolite) No. VBO-6201-A1. "B" Circuit type.

Cutout Relay

Cuts In - 12.5-13.5 volts.

Cuts Out - 3-5 amps. discharge current after charging at 7 amps.

Contact Gap - .015" minimum.

Air Gap - .025-.027".

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

V Itag Regulat r

Setting - 14.3-14.8 volts charging at 7 amperes and 80°F or with a .25 ohm resistor in series between regulator and battery.

Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Test A - Operating Amperes -	Test B
44	35 (33-37)

Test A - After 15 minutes operation charging at 7 amps.

Test B - After additional 15 minutes operation with current regulator operating and load applied to hold voltage down to 13.6-13.8 volts.

Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).

►*OTHER DATA: See "Prestolite (Autolite) B Circuit Regulators" in Electrical Section.*

ALTERNATOR

Prestolite (Autolite) No. ALD-5001 or ALB-5002. Three-phase type with internal rectifiers.

Rotation - Clockwise at drive end.

Rated Output - 40 amps. (ALD-5001), 60 amps. (ALB-5002).

Field Current - 2.34-2.42 amps. (ALD-5001) at 10 volts and 70°F.

Capacitor Capacity - .1 mfd.

Performance Data - Cold (70°F)

Alternator	Amperes	Volts	Alt. RPM
ALD-5001	38	14.2	℄ 4200

℄ - 1750 Engine RPM.

►*OTHER DATA: See "Prestolite (Autolite) Alternator & Regulator" in Electrical Section.*

ALTERNATOR REGULATOR

Prestolite (Autolite) No. VBT-6201A (ALD-5001 Alternator). Field control type with voltage regulator only.

Contact Gap (Lower Contacts) - .010". **Air Gap** - .034-.038".

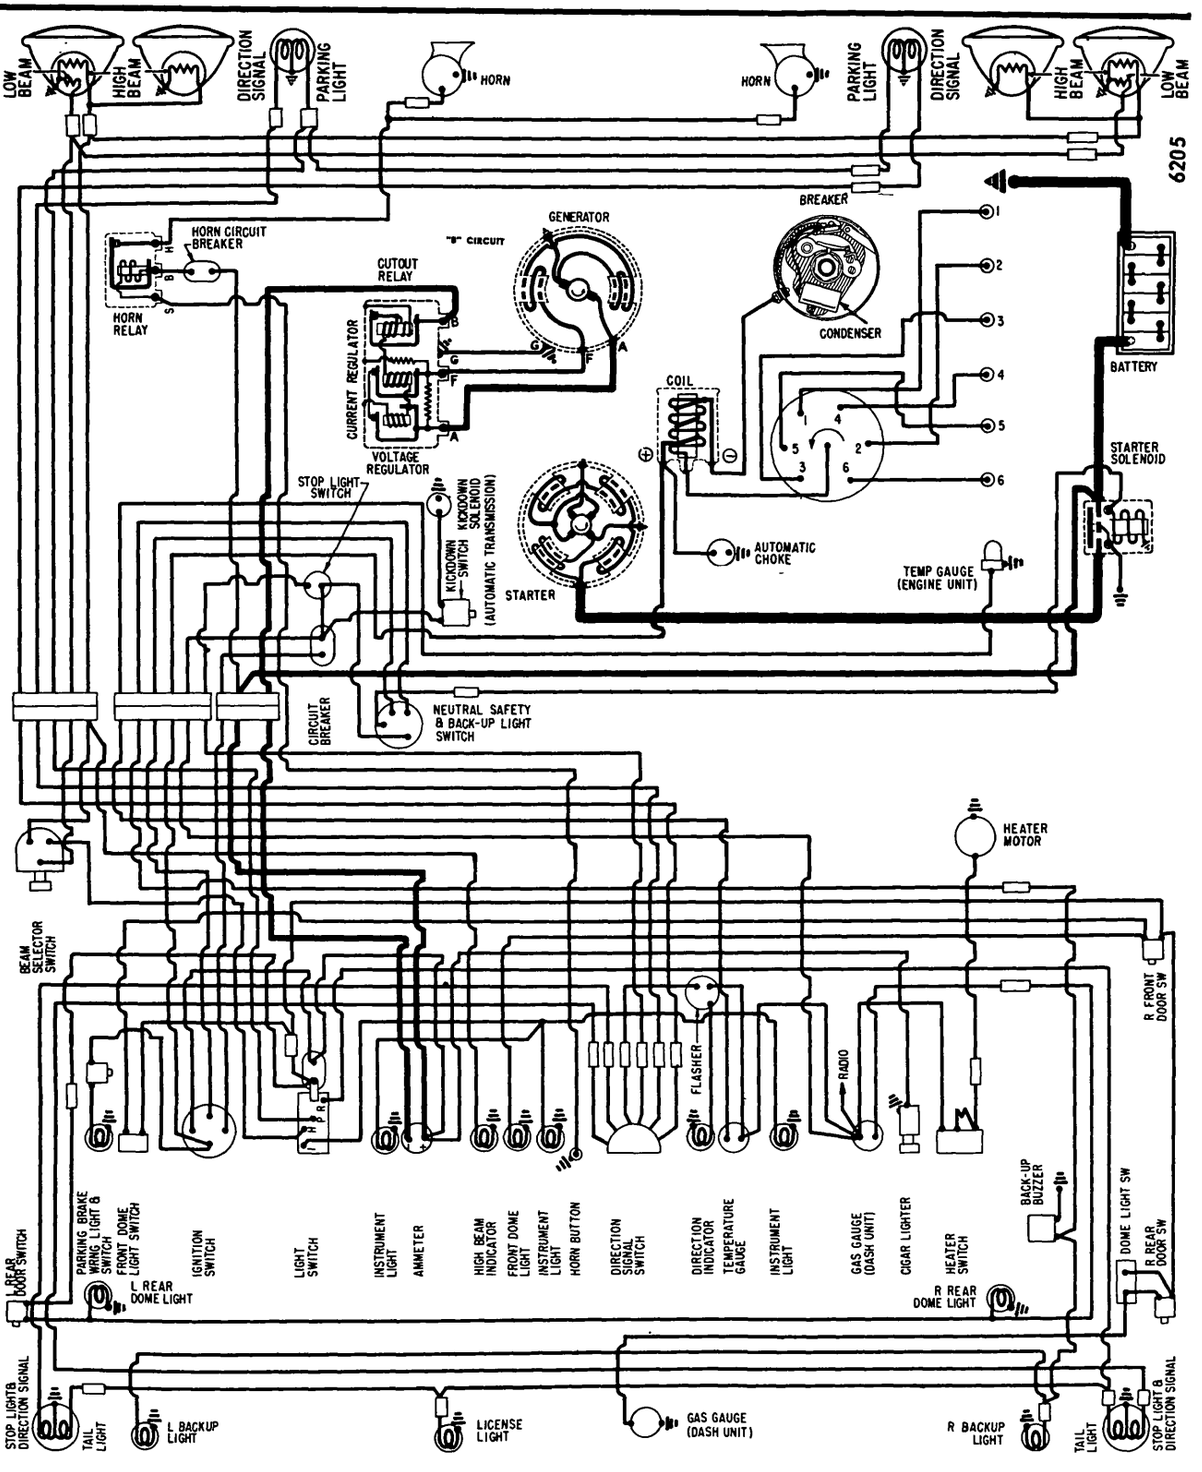
Voltage Setting - 13.9-14.3 volts at 80°F.

►*OTHER DATA: See "Prestolite (Autolite) Alternator & Regulator" in Electrical Section.*

MISC. ELECTRICAL

CIRCUIT BREAKERS: 15 Ampere - Entire lighting system (except direction signals and back-up lights). In headlight switch.

15 Ampere - Direction signals & back-up lights.



FUSES: 15 Ampere - Overdrive.

7.5 Ampere - Radio.

ENGINE

ENGINE SPECIFICATIONS: C ntinental M tors M d l F6226. 6 Cylinder with either "L" Head or Overhead Valve system.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Bore	Stroke	Displacement	Rated HP
3.312"	4.375"	226 cu. ins.	26.33

Engine	Compr. Ratio	Developed HP
L-Head	7.3-1	80 at 3100 RPM
OHV (Carter AS Carb.)	8.0-1	122 at 4000 RPM
OHV (Rochester 2GC Carb.)	8.0-1	141 at 4400 RPM

CYLINDER HEAD & MANIFOLD: Tighten cylinder head bolts from center outward to 45 ft. lbs. Tighten intake and exhaust manifold bolts to 25-30 ft. lbs.

FLYWHEEL: Tighten flywheel-to-crankshaft bolts to 35-40 ft. lbs.

OIL PAN: Tighten oil pan bolts to 15-20 ft. lbs.

PISTONS

Aluminum alloy, flat head, cam ground with T-slot. L-Head engine has five rings per piston with 5th ring on piston skirt below piston pin. OHV Engine has standard four ring piston.

Weight - 16.448 ozs. (L-Head), 15.312 ozs. (OHV Engine).

Clearance - .0015-.0025" (L-Head), .0010-.0020" (OHV Engine) at bottom of skirt. Pull required to withdraw .002" feeler gauge inserted between piston and cylinder wall should be 5-10 lbs.

Replacement Pistons: L-Head - Furnished in 14 sizes in .0005" steps from 3.31095" to 3.31745" for engines "A" through "N".

OHV Engine - Furnished Std. size only finished or semi-finished with or without rings and pin.

PISTON PIN

Floating type with retaining ring at each end.

Diameter - 55/64". **Length** - 2 13/16".

Clearance In Piston - .0001-.0003" (L-Head), .0002" (OHV Engine). Light push fit.

Clearance In Rod - .0003-.0005".

Replacement Pins: Furnished Std., & .003", .005" Oversize.

PISTON RINGS

L-Head - Nos. 1, 2, 3, 5 are compression rings, No. 4 is oil ring.

OHV Engine - Nos. 1 & 2 are compression rings, Nos. 3 & 4 are oil rings.

L-Head Engine

Ring	Width	End Gap
Compr. (1)	3/32"	.010-.020"
Compr. (2 & 3)	1/8"	.010-.020"
Oil (4)	1/4"	.010-.018"
Compr. (5)	5/32"	.010-.020"

OHV Engine

Ring	Width	End Gap
Compr. (1 & 2)	3/32"	.010-.020"
Oil (3)	ℂ	.015-.055"
Oil (4)	5/32"	.010-.018"

ℂ - Three-piece steel rail type.

Replacement Rings: L-Head - Std. & .020", .040", .060" Oversize. **OHV Engine** - Furnished Std. size only.

CONNECTING ROD

Length (Center-to-Center) - 7".

Weight - 32.24 ozs.

Crankpin Journal Diameter - 2.062".

Lower Bearing - Babbitt lined steel back type.

Clearance - .0027". **Sid play** - .008".

►*BEARING INTERCHANGEABILITY NOTE:* Bearings No. 1, 3, 5 are **not** interchangeable with bearings No. 2,4, 6.

Connecting Rod Bearing Cap Bolt Torque - 35-40 ft. lbs.

Replacement Bearings: Furnished Std. & .020" Undersize.

CRANKSHAFT

Journal Diameter - 2.375".

Bearings - Babbitt lined steel back type.

Clearance - .0034".

Replacement Bearings: Furnished Std. & .020" Undersize.

►*BEARING INTERCHANGEABILITY NOTE:* Bearings No. 2 & 3 are interchangeable.

Main Bearing Cap Bolt Torque - 85-95 ft. lbs.

End Thrust: L-Head - Taken by thrust washers, shims, and thrust plate assembled behind crankshaft timing gear. Shims furnished in .002" & .008" thicknesses.

Endplay - .004-.006".

OHV Engine - Taken by flanged rear main bearing.

Endplay - .002-.006".

Crankshaft Rear Oil Seal Replacement: Remove filler block and oil guard and clean thoroughly. Crush new jute seal in a vise until narrow enough to fit grooves in filler block and oil guard. Press seal in until firmly seated and expanded to seize sides of block and guard. Cut ends of seal so they protrude 1/32" above surface of castings. Insert guard into cylinder block. Hold neoprene filler block-to-oil pan seal in place with a small spot of non-hardening cement at center of seal and insert into groove in filler block. Install front filler block seal in same manner. Tighten filler block retaining bolts to 15-20 ft. lbs.

CAMSHAFT

Bearings - Steel back babbitt lined bushings.

Clearance - .001-.003" except No. 3 bearing. No. 3 bearing .001-.0027".

End Thrust: Controlled by thrust plate located behind camshaft sprocket.

Timing Chain: Width 7/8". **Pitch** 1/2". **Length** 46 links.

Engine Front Cover Bolt Torque - 15-20 ft. lbs.

Vibration Damper Bolt Torque - 15-20 ft. lbs.

VALVES

Tappet Clearance: L-Head - .014" Intake & Exhaust, with engine idling.

OHV Engine - .017" Intake, .023" Exhaust, with engine idling.

►*TAPPET CLEARANCE NOTE:* Set exhaust valve clearance with inlet water temperature of 115-140°F, and set intake valve clearance with engine hot.

Valve Specifications - L-Head Engine

Valve	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	11/32"	5 3/16"
Exhaust	1 21/64"	11/32"	5 11/64"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.284"	.0012-.0030"
Exhaust	44°	.284"	.0032-.0050"

Valve Specifications - OHV Engine

Valve	Head Diameter	Stem Diameter	Length
Intake	1 25/32"	11/32"	4.941"
Exhaust	1 27/64"	11/32"	5.4165"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	.4088"	.0012-.0030"
Exhaust	44°	.4088"	.0032-.0052"

Exhaust Valve Seat Inserts - Used on OHV Engine. Replacement inserts furnished .010" Oversize for shrink fit.

Valve Stem Oil Seal - "O" ring seal used on stems of intake valves on OHV Engine.

Valve Rotators - Used on exhaust valves of OHV Engine.

Valve Guides - Pressed in block or head.

Valve Springs: Single spring used on all valves.

Spring Specifications - L-Head Engine

Valve	Pressure	Length
Closed	47-53 lbs.	1 21/32"
Open	103-110 lbs.	1 3/8"

Spring Specifications - OHV Engine

Valve	Pressure	Length
Closed	72.5-79.5 lbs.	1.817"
Open	174.3-175.7 lbs.	1.405"

Spring Free Length (L-Head Engine) - 1 31/32".

Valve Lifters: Mechanical barrel type used on all engines.

Rocker Arm Assembly (OHV Engine): Rear end bracket is drilled for oil supply line to rocker shaft assembly. Front end bracket is drilled for locating plug to retain rocker shaft in position. These brackets are not interchangeable with other support brackets.

VALVE TIMING

Valve Timing Specifications - L-Head Engine

Intake Valves - Open 2° BTDC. Close 42° ALDC.

Exhaust Valves - Open 42° BLDC. Close 8° ATDC.

Valve Timing Specifications - OHV Engine

Intake Valves - Open 17° BTDC. Close 54° ALDC.

Exhaust Valves - Open 62° BLDC. Close 9° ATDC.

ENGINE OILING SYSTEM

Crankcase Capacity: 5 quarts refill.

Normal Oil Pressure: 25 lbs. at 375 RPM.

Oil Pressure Relief Valve (OHV Engine) - In pump body, not adjustable.

Oil Pressure Indicator: Direct reading, non-electric type.

Oil Pump: Gear type. Mounted on center main bearing cap (L-Head), on right side of cylinder block (OHV Engine).

Oil Pump Attaching Bolt Torque - 25-30 ft. lbs. (L-Head), 15-20 ft. lbs. (OHV Engine).

Oil Filter: Partial flow, disposable type.

Crankcase Ventilation: Filter element in oil filler cap and breather tube in engine right side cover. Clean filter in filler cap by washing in solvent and oiling with light engine oil.

ENGINE COOLING SYSTEM

Water Capacity: 12 quarts. Add 1 quart for heater.

Pressure Valve: 4 lb. radiator filler cap.

Thermostat: Choke type located in water outlet elbow.

L-Head - 170° type. Starts to open at 167-177°F.

OHV Engine - 180° type. Starts to open at 177-182°F.

Water Pump: Packless sealed ball bearing type. No lubrication required.

Pump Removal & Disassembly - Remove fan hub and remove pump from engine. Remove pump cover and gasket and pull impeller from shaft. Remove seal and shedder, shaft and bearing retaining rings and press shaft through front of body.

Water Pump Attaching Bolt Torque - 25-30 ft. lbs.

Temperature Gauge: Stewart-Warner Direct reading electric type. Engine unit located between No. 5 & No. 6 spark plugs.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

⑤ - Super Hydra-Matic.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 CADILLAC COLD WEATHER HARD STARTING CORRECTION & PRODUCTION CHANGE:* A new choke baffle, Part No. 1480363 is being used in production after Eng. No. 083297 and may be used on earlier models to prevent partial choke "come on" in cold weather at low traffic speeds, and, to improve restarting. If new baffle is installed on carburetors before above engine number, be sure to position the two locating tabs on inside of the restriction in the inside diameter of heat passage (this will assure correct positioning of baffle).

►*1962 DODGE & PLYMOUTH (EXC. 318" ENG.) EXCESSIVE EARLY WARM-UP RICHNESS CORRECTION: Adjust "Cross-Over" type choke, Carter Part No. 170-BA-706A, to Index. Original setting is two notches rich. NOTE - Choke units identified with red paint or dye have been changed to "Centered on Index".*

►*1962 CHRYSLER, DODGE & PLYMOUTH AUTOMATIC CHOKE COIL STICKING CORRECTION:* Loosen both attaching screws and shift choke assembly as far rearward as possible and retighten screws. Check choke rod for improper bends that may cause binding. Check choke rod for possible binding within limits of choke travel. Check choke shaft for free operation. *NOTE - When engine is at normal operating temperature, choke valve in carburetor must be wide open. Make sure air cleaner is installed so intake air horn is slightly to right hand side of engine and is not interfering with choke operation.*

CARTER AFB 4-BARREL CARBURETOR THROTTLE BODY (WITH AUXILIARY THROTTLE VALVES)

►*1962 DODGE & PLYMOUTH 361" ENGINE CHOKE OVERLOADING CORRECTION & PRODUCTION CHANGE:* On early cars, this condition may be caused by improper choke vacuum piston "pull-off" at idle speed due to choke piston link brackets (on choke valve) being bent toward the piston which causes an enrichening condition. To correct, bend bracket on choke valve away from choke piston, being careful not to bend it in excess of 5° beyond the straight (perpendicular to valve) position. After bending bracket, make sure the link passes freely through the port in end of piston cylinder, since over-bending can cause

CONTINUED ON NEXT PAGE

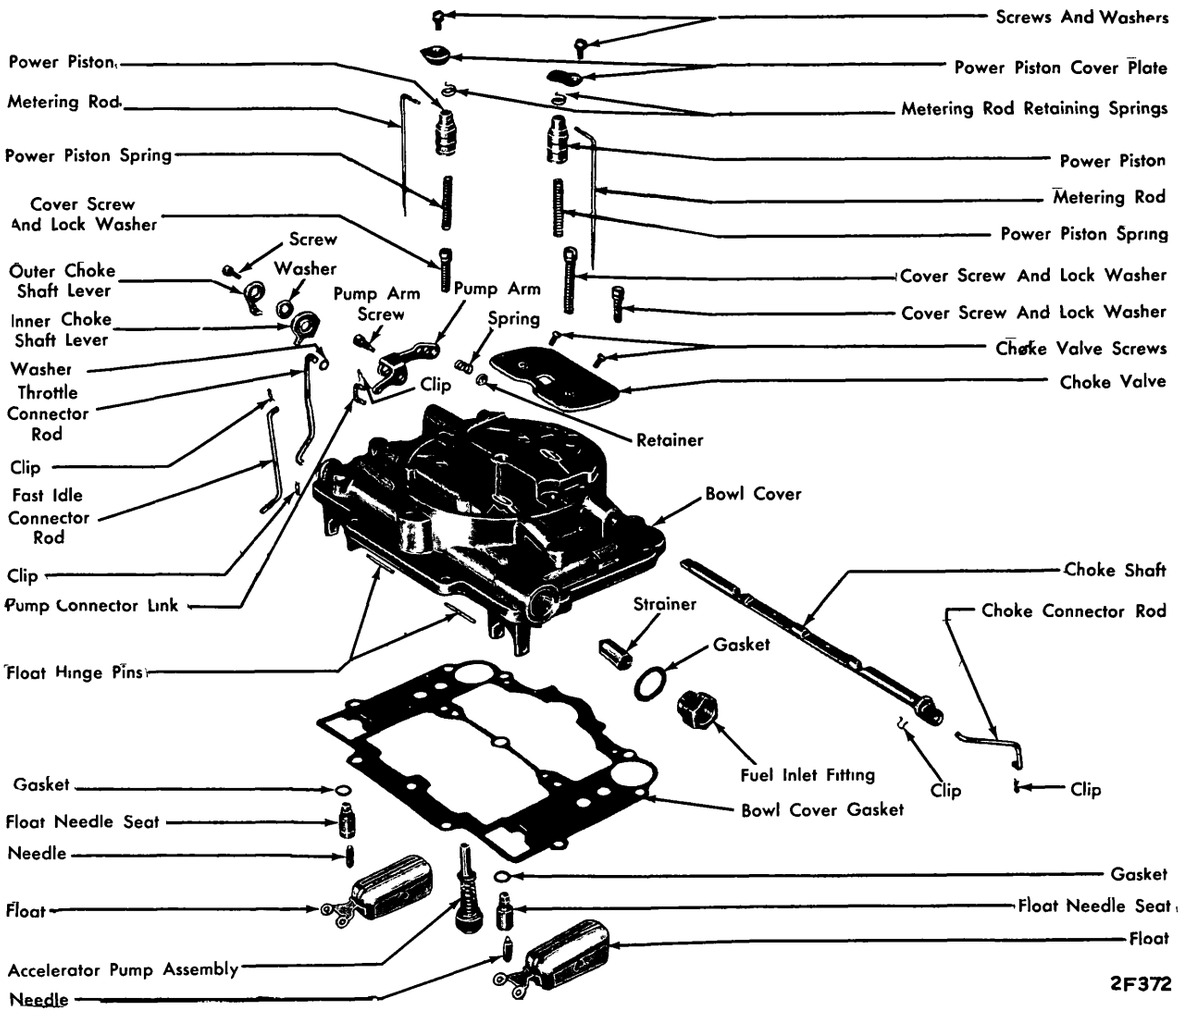
CARTER AFB 4-BARREL CARBURETORS (C nt.)

interference at about half open choke. Cars build after approximately Oct. 1, 1962 have the above changes made in production.

►*1962 PONTIAC (HYDRA-MATIC TRANS. CARS) CARBURETOR PRODUCTION CHANGE (To Eliminate Part Throttl Stumbl and to Improve Operation During Warm-up):* Carburetors, No. 3300S and 3326S have been replaced in production by Carburetors, No. 3300SA and 3326SA which have recalibrated metering rods, Part No. 7016797, and new step-up springs, Part No. 1332553. A new choke piston, Part No. 7017538 is also used with later carburetors.

DESCRIPTION: Four-barrel downdraft type with automatic choke. *NOTE - Automatic choke, fast idle and unload r syst ms n t us d n secondary (front) carburet r of dual-carbur t r quipped engines.* Carburetor design is similar to previous AFB carburetors having the following features.

Idl Air Syst m (Cadillac 3351S, 3352S; Chrysler, Dodge, Plym uth 2790S, 2791S, 2903S, 3084S, 3447S, 3258S, 3259S; P ntiac 3123S,SA, 3300S,SA, 3326S,SA): Throttle valves are completely closed at "slow" idle speed with air admitted through Idle Air System which consists of an air bypass passage (primary side only). Air for closed throttle operation is taken from above throttle valves through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore. An Idle Speed Screw (single screw for both primary bores) controls adjustable orifice and all idle speed adjustments are made with this screw (throttle stop-screw not used). Throttle valves are completely closed at "slow" idle speed.



Idl C mp nsat r Valv (Buick 3297S; Cadillac 3351S, 3352S; P ntiac 3300S,SA, 3326S,SA): Assembly is mounted between main venturi on secondary side and consists of a valve, bi-metal strip, holder and mounting bracket. Unit is not adjustable and must be replaced if faulty. Purpose of compensator is to admit additional air under hot operating conditions and to prevent stalling. With high air temperature in carburetor, the valve opens and allows additional air to be drawn into carburetor bores below throttle valve to offset enrichening effects of hot idle. *CAUTION - Idl c mpensator must be closed whil adjusting idl spe d.*

Cr ss-Ov r Typ Aut matic Choke (Chrysler 3251S, 3256S; D dg & Plymouth 3247S, 3249S, 3252S, 3253S, 3257S): This type automatic choke is a separate unit mounted in a well in intake manifold (at exhaust cross-over passage) and linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in carburetor air horn and linked directly to choke valve. *S "Carter Cr ss-Over Type Automatic Choke" in 1957 Final Data, Pag 244, or later Manual edition.*

ADJUSTMENTS: Make all adjustments as indicated below.

►*CHRYSLER, DODGE & PLYMOUTH IDLE SETTING CAUTION:* When making idle speed and mixture adjustments, observe the following:

1) Turn headlights on to high beam to compensate for alternator load (alternator charges battery at idle speed).

CARTER AFB 4-BARREL CARBURETOR AIR HORN & FLOAT ASSEMBLY (TYPICAL)

2) On automatic transmission cars (Exc. 300H), loosen carburetor throttle rod locknut in sliding link so transmission internal stop will not interfere with carburetor throttle lever. When adjustments are completed, move throttle lever rod to rear against its stop and tighten locknut.

Idle Mixture & Speed Adjustment (Cars with One Carburetor): *CAUTION - On cars with Idle Compensator, the compensator valve must be held closed while adjusting idle speed (use pencil or other instrument to hold compensator down on its seat). On cars with Idle Air System, adjusting the air adjustment screw (to adjust ngin sp d) will chang th idl mixture s tting which should always b r ch ck d aft r an ngine idl sp d adjustm nt has b n mad .* If initial adjustment required to allow engine to be warmed up, turn both idle mixture screws in until lightly seated, then back screws out the correct number of turns shown in table below. Run engine until it reaches normal operating temperature with choke valve wide open and fast idle inoperative (engine idling at hot or slow idle speed). Then proceed as follows; Connect vacuum gauge and tachometer. Adjust ending idle speed to correct RPM shown in table below. *NOTE - Make sure transmission selector lever is in correct range as indicated in idle speed table.* Make this adjustment by turning throttle stop-screw (or Idle Air Bypass Screw on carburetors with this type adjustment). Adjust each idle mixture adjusting screw in or out for smooth idling, highest vacuum reading and engine RPM. *NOTE - On Buick, s t ach scr w midway*

CONTINUED ON NEXT PAGE

CARTER AFB 4-BARREL CARBURETORS (C nt.)

lean and rich mixtur . Recheck and if necessary reset idle speed, then recheck idle mixture setting. *CAUTION* - On cars with Idle Air Bypass adjusting screw, always recheck idle mixture adjustment after changing setting of idle air adjusting screw. On cars with automatic transmission, check and adjust Throttle Linkage. *See Throttle Linkage Adjustment under CARBURETOR on each car model page.*

Idle Mixture Screw Setting

Car & Carb.	Idle Screw Opening
Buick 3297S	1/4-1 3/4 turns
Cadillac 3351S, 3352S	1-3 1/4 turns
Chevrolet 3269S, 3270S	1 1/2 turns
Chrysler & Imperial 3084S	1/8-1 1/2 turns
Dodge & Plymouth 2903S	1/8-1 1/2 turns
Dodge & Plymouth 2790S, 2791S	1/2-2 turns
Dodge & Plymouth 3251S	3/4-2 1/4 turns
Dodge & Plymouth 3258S, 3259S	1/8-2 turns
Dodge & Plymouth 3247S, 3249S	1/4-2 1/4 turns

① - Throttle stopscrew or Idle Air Adjusting Screw.
② - With headlights turned on.
③ - Air Conditioner turned ON.
④ - Air Conditioner turned OFF.
⑤ - Transmission in "N" (Neutral) or "P" (Park).
⑥ - Transmission in "D" (Drive).

Idl Mixture & Sp ed Adjustment (Chrysler, D dg & Plymouth M d ls With Two Carbur t rs): *NOTE - Th s carbur tors hav an Idl Air Bypass Scr w for idl speed adjustment.* Before adjusting idle speed, check and adjust interconnecting linkage *(see CARBURETOR on car model pag)*, and ignition timing. *NOTE - If pr liminary adjustm nt required to enable ngin to b started for warm-up, s t all idl mixture screws 1-2 turns p n from a lightly seat d p sition and set idle air bypass screws (one on each carburetor) 1 turn open.* Connect a tachometer, then operate engine until it reaches normal operating temperature. Adjust Ram Manifold (separate carburetors for each engine bank), and Runner Manifold (front and rear carburetors on single manifold) as follows:

Ram Manifold Engine - Turn engine off and disconnect each carburetor throttle rod at bellcrank on manifold. Turn all adjusting screws (mixture and idle bypass) in finger tight, then open idle air bypass screw (one on each carburetor) one full turn. Open each idle mixture screw (two on each carburetor) ¾ turn. Start the engine and turn idle mixture screws on left carburetor 1/8 turn at a time until smoothest idle is obtained. Repeat this procedure on right carburetor, keeping mixture screws within 1/8 turn of each other. With transmission in "N" (Neutral), air conditioner ON (if so equipped), adjust idle speed to engine RPM indicated in table (above) by adjusting idle air bypass screw on each carburetor equally. Repeat the idle mixture adjustment and idle speed adjustment until a smooth idle is obtained at indicated engine RPM. Connect each carburetor throttle rod at bellcrank.

Runner Manifold Engine - Turn engine off and disconnect interconnecting linkage at rear carburetor throttle lever. With engine at curb idle speed (off fast idle), turn idle mixture screws 1-2 turns open, then set idle bypass screws one turn open and adjust idle speed to engine RPM indicated in table (above) by opening or closing bypass screws. *CAUTION - Rotate both bypass screws equally.* Adjust idle mixture screws on front carburetor for maximum engine RPM, then repeat on rear carburetor. Readjust front carburetor if necessary. Readjust idle air bypass screws as necessary to maintain correct engine idle speed. *NOTE - Before attaching interconnecting rod at rear carburetor (on Automatic Transmission cars), check and adjust throttle linkage so that idle position is not disturbed.*

Idle Speed & Mixture Adjustment (Chevrolet 409" Engine With Two Carburetors): *NOTE - If preliminary adjustment required to enable engine to be started for engine warm-up, set all idle mixture screws ¼ turn open from a lightly seated position, then back both idle speed screws just off throttle levers, and turn in 1½-2 turns.* Start engine and bring to normal operating temperature, then adjust both idle speed screws equally to obtain an engine speed of 700 RPM. Adjust each idle mixture screw separately to obtain highest vacuum and engine RPM, then readjust idle speed screws equally to maintain proper engine RPM. Repeat idle mixture screw and idle speed screw adjustment.

►*CADILLAC IDLE SPEED ADJUSTMENT CAUTION:* Due to vacuum released parking brake, it is impossible to set the brake with transmission selector lever in "DR" position unless vacuum release is disconnected. Disconnect vacuum diaphragm at neutral safety switch and tape switch opening to prevent any air leakage.

►*CHRYSLER, DODGE & PLYMOUTH IDLE SPEED ADJUSTMENT CAUTION: S "Idle S tting Cauti n" ab v .*

Anti-Stall Dashp t (Throttl Return Check): Dashpot is a separate unit mounted on carburetor or elsewhere in throttle linkage. *For adjustm nt, s "Throttl Linkag Adjustment" und r CARBURETOR on car model pag s.*

Idl Sp ed-Up C ntrol (Cadillac Air Conditi ned Cars): This unit increases engine idling speed when air conditioner is turned on and transmission selector lever is in neutral. *For adjustment, se CARBURETOR on Cadillac car model page.*

Metering Rods: No adjustment required. Metering rods not used on secondary side.

Float Setting: *NOTE - Befor adjusting float lev l and float drop, floats must b align d as follows:* Align floats by sighting down side of float to determine if side of float is parallel to outer edge of air horn casting. To adjust, bend float lever by applying pressure to end of float shell with finger while supporting float lever with thumb. *CAUTION - Apply only n ugh pr ssur to bend float lever.* After aligning float, remove as much clearance as is possible between arms of float lever and support lugs on air horn by bending both arms of lever. Arms should be parallel to inner surfaces of support lugs and float must operate freely without excess clearance on hinge pin.

►*FLOAT SETTING CAUTION (CARBURETORS WITH RESILIENT INLET VALVE SEAT):* When bending float lever to adjust height on carburetors with resilient inlet valve seats, do not allow float lever to contact inlet needle as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle. Float level specifications are different for carburetors with resilient type inlet valve seats. *See "Fl at Lavel S ttina" bel w.*

Float Level - Both floats are set to same height. With air horn inverted, bowl cover gasket in place and needle valve seated, measure distance from top of float at outer end to air horn gasket with proper gauge (see table below). Adjust by bending float arm.

Float Drop - With bowl cover held in upright position so that floats hang down at lower end of travel, measure from outer (free end) of float to float bowl gasket. This should be 23/32" plus or minus 1/16" for all models.

Float Lev l S tting

Car & Carb.	① H ight	Gauge N .
Buick 3297S	7/32"	T109-106
Cadillac 3351S, 3352S	3/8"	T109-80
Chevrolet 3269S	5/16"	T109-107
Chevrolet 3270S, 3361S, 3362S	7/32"	T109-106
Chrysler 3251S, 3256S, 3259S	7/32"	T109-106
Chrysler 3374S, 3375S	7/32"	T109-106
Chrysler 3084S, 3258S	9/32"	T109-126

Dodge & Plymouth 3447S	7/32"	T109-106
Pontiac (All Carbs.)	② 21/64"	T109-294

① - If inlet valve is equipped with a resilient type seat, REDUCE float setting 1/32".
② - Float gauge must be placed in line with center of indentation (at outer end).

Accelerating Pump Stroke: This is a pump stroke adjustment and not a seasonal setting. On all models with provision for seasonal setting, make certain that connector rod is engaged in correct hole of pump arm as

CONTINUED ON NEXT PAGE

CARTER AFB 4-BARREL CARBURETORS (Cont.)

listed below. Back out throttle stopscrew so that throttle valves fully seated, then use scale to measure from top surface of bowl cover to top of pump plunger stem. If this distance not correct as shown in table below, adjust by bending connector rod at lower angle using Tool T109-213.

Pump Stroke Setting

Car & Carb.	Plunger Height	Connector Rod
Buick 3297S	7/16"	Center
Cadillac 3351S, 3352S	15/16"	Inner
Chevrolet 3269S, 3270S	1/2"	Non. Adj.

Dodge & Plymouth 3447S	7/16"	Center
Pontiac (All Carbs.)	5/16"	Inner

Automatic Choke (Cross-Over Type): This choke assembly is mounted in well in intake manifold "cross-over" passage. To adjust with unit off engine, loosen mounting post locknut and turn mounting post with screwdriver until index mark on disc is positioned opposite correct mark on scale (see table below for proper setting). When choke is installed on engine, lift cover disc and open and close choke manually to make sure connector rod clears sides of hole in housing cover. If rod does not clear, replace unit (bending rod will affect choke calibration).

Automatic Choke (Integral Type): *NOTE - Adjust choke after Choke Piston Lever Adjustment or Choke Countershaft Adjustment has been completed.* Settings are shown in table below. Adjust by loosening choke cover screws and rotating cover and thermostatic coil assembly.

Automatic Choke Setting

Car & Carb.	Choke Setting
Buick 3297S	Centered
Cadillac 3351S, 3352S	1 Point Rich
Chevrolet 3269S, 3270S, 3361S, 3362S	Centered
Chrysler 3251S. 3256S, 3259S, 3375S	① 2 Points Rich
Chrysler 3258S, 3259S	1 Point Rich
Chrysler 3084S	① 1 Point Rich
Dodge & Plymouth 2791S	① 1 Point Rich
Dodge & Plymouth 3247S, 3249S, 3251S	① 2 Points Rich
Dodge & Plymouth 3252S, 3253S, 3257S	①② Centered
Dodge & Plymouth 2903S, 3259S	1 Point Rich
Pontiac 3123SA, 3300S, SA, 3326S, SA	1 Point Rich

① - "Cross-Over" type choke.
② - This supersedes previous setting of 2 points rich.

Choke Piston Linkage Adjustment: Remove choke cover and coil assembly (except carburetors with "Cross-Over" type choke) for access to choke piston.

Buick - Bend .026" wire gauge (Tool T109-189) at a 90° angle approximately 1/8" from end, then open choke valve and insert wire gauge so that bent portion is between top of slot in choke piston cylinder and bottom of slot in piston. Hold wire gauge in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. There should be 3/32" clearance (Gauge T109-125) between top of choke valve and air horn. To adjust, bend choke connector rod.

Cadillac - With choke valve closed, choke piston should be flush with top of piston housing. To adjust, bend choke connector rod. *NOTE - Choke valve should be held closed by applying pressure to piston lever in piston housing.*

Chevrolet - Use same procedure as for Buick (see above). Clearance between top of choke valve and air horn should be .210" (409" Engine); .0825" (327" Engine).

Chrysler, Dodge & Plymouth (2903S, 3084S, 3259S) - Use same procedure as for Buick (see above). Clearance between top of choke valve and air horn should be 1/8".

Pontiac - With choke valve closed, piston should be flush to 1/64" below outer lip of cylinder. To adjust, bend choke connector rod.

Fast Idle Linkage: This adjustment must be made before checking and adjusting Fast Idle and Unloader. Adjust each model as follows:

Buick 3279S; Chevrolet 3269S, 3270S, 3362S; Chrysler 3374S, 3375S, 3251S, 3256S; Dodge & Plymouth 3251S, 3252S, 3253S, 3257S - With choke valve closed, index mark on fast idle cam should align with adjusting screw. To adjust, bend fast idle connector rod.

Cadillac 3351S, 3352S; Chrysler 3259S; Dodge & Plymouth 2791S, 3247S, 3249S, 3259S - With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever, align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod.

Chrysler, Dodge & Plymouth 2903S; Pontiac 3123SA, 3300S, SA, 3326S, SA - With choke valve tightly closed, trip lever and cam arm in alignment, align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

Fast Idle Setting: *NOTE - This adjustment can be made with carburetor on the bench (Off Engine) but setting should be checked after carburetor is installed (On Engine) as follows:*

Fast Idle Adjustment (Off Engine) - Open throttle and close choke valve tightly (this will allow fast idle cam to assume fast idle position). With choke valve closed and index mark on fast idle cam aligned with fast idle adjusting screw, turn screw in or out until throttle valve opening or clearance between lower edge of valve and carburetor wall is correct as shown in table below.

Fast Idl Setting (Off Engin)

Car & Carb.	Valve Op ning	Checking Gaug
Buick 3297S	.030"	T109-29
Cadillac 3351S, 3352S	.023"	T109-189
Chevrolet 3270S, 3362S	.025"	T109-189
Chrysler 3251S, 3256S	.020"	T109-29
Chrysler 3374S, 3375S	.020"	T109-29
Chrysler 3259S	.012"	T109-200
Chrysler 3084S	.010"	T109-200
Dodge & Ply. 3247S, 3249S	.020"	T109-29
Dodge & Ply. 3251S, 3252S	.020"	T109-29
Dodge & Ply. 3253S, 3257S	.020"	T109-29
Dodge & Ply. 2791S	.012"	T109-200
Dodge & Ply. 2903S	.010"	T109-200
Pontiac 3213SA, 3300S, SA	.026"	T109-189
Pontiac 3326S, SA	.026"	T109-189

Fast Idle Adjustment (On Engine) - With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on high step of fast idle cam and in alignment with index mark (Exc. Buick). On Buick, place fast idle adjusting screw on lowest (last) step of fast idle cam. On all models, operate engine and adjust fast idle screw for correct engine speed as listed below.

Fast Idle Setting (On Engine)

Car Model	Engine RPM
Buick	①650
Cadillac	1700-1750
Chevrolet	1750
Chrysler (Exc. 3259S)	1800
Chrysler 3259S	1400
Dodge & Plymouth 318" Eng. (Single Carb.)	1800
Dodge & Plymouth 361" Eng. (Single Carb.)	②2200
Dodge & Plymouth 2791S & 3259S	1400
Pontiac	2200

① - With fast idle screw on lowest (last) step of fast idle cam.
② - Supersedes previous setting of 1800 RPM.

Unloader: After fast idle linkage adjusted (see above), rotate primary throttle valves to wide open position and check choke valve opening or clearance between upper edge of valve and air horn wall using gauge listed in table below. If clearance not correct, adjust by bending unloader lip on primary throttle lever using bending tool T109-214.

►*PONTIAC NOTE: Car manufacturer recommends that throttle valves be opened by depressing accelerator pedal (to simulate actual driving conditions and assure unloader functioning properly in service).*

Unloader Setting

Car Model	Choke Opening	Checking Gaug
Buick	7/32"	T109-106
Cadillac	5/16"	T109-107
Chevrolet	1/4"	T109-31
Chrysler	1/4"	T109-31
Dodge & Plymouth	1/4"	T109-31
Pontiac	5/32"	T109-154

Auxiliary Throttle Valves: Velocity type valves (counterweighted free valves without linkage). No adjustment required. Used on all models except as indicated in following note. *NOTE - Auxiliary throttl valves used on Chrysler 3258S & 3259S.*

CONTINUED ON NEXT PAGE

CARTER AFB 4-BARREL CARBURETORS (Cont.)

Secondary Throttle Lever Adjustment: This adjustment required to insure correct action of primary and secondary throttle valves.

Chevrolet - *NOTE - Pickup lever located on primary throttle shaft has two points of contact with loose lever on primary shaft. Caution should be taken that pickup lever contacts loose lever at both points at same time.*

Buick, Cadillac, Chrysler, Dodge, Plymouth & Pontiac - Block choke valve wide open. Open throttle valves until clearance between lower edge of valve and throttle bore on side opposite idle port is correct as shown in table below. Secondary valves should just start to open at this point. Adjust by bending secondary throttle operating rod using Tool T109-213. Open primary valves fully.

Car & Carb.	Secondary Throttle Lever Setting Primary Throttle Opening
Buick	23/64"
Cadillac	23/64"
Chrysler 3251S, 3256S, 3374S, 3375S	3/8"
Chrysler 3258S, 3259S	23/64"
Chrysler 3084S	29/64"
Dodge & Plymouth 2790S, 2791S, 3247S, 3249S	3/8"
Dodge & Plymouth 3251S, 3252S, 3253S, 3257S	3/8"
Dodge & Plymouth 3258S, 3259S	23/64"
Dodge & Plymouth 2903S	29/64"
Pontiac (All Carbs.)	7/16"

Secondary Throttle Lockout Adjustment: Open throttle valves slightly to clear fast idle cam, then open and close choke valve manually Lockout tang on secondary throttle lever should freely engage notch in lockout dog. Adjust by bending tang on secondary throttle lever

Cadillac 3351S, 3352S; Chrysler, Dodge & Plymouth 3259S; Dodge & Plymouth 2791S - Hold lockout dog tight against stop on flange. With secondary valves partially open, clearance between secondary throttle lever and lockout arm should be .026" (Cadillac), .020" (Others). Bend arm at slot on lockout dog

Primary & Secondary Throttle Lever Closing Shoe Adjustment: With primary and secondary throttle valves closed, check clearance between positive closing shoes on throttle levers using Gauge T109-29 (.020"). Clearance at closest point should be .010-.030" Adjust by bending shoe on secondary lever

OVERHAUL: *See 1958 Final Data, Page 240, or later Manual edition.*

℄ - Closed Crankcase Ventilation

►CHANGES, CAUTIONS, CORRECTIONS

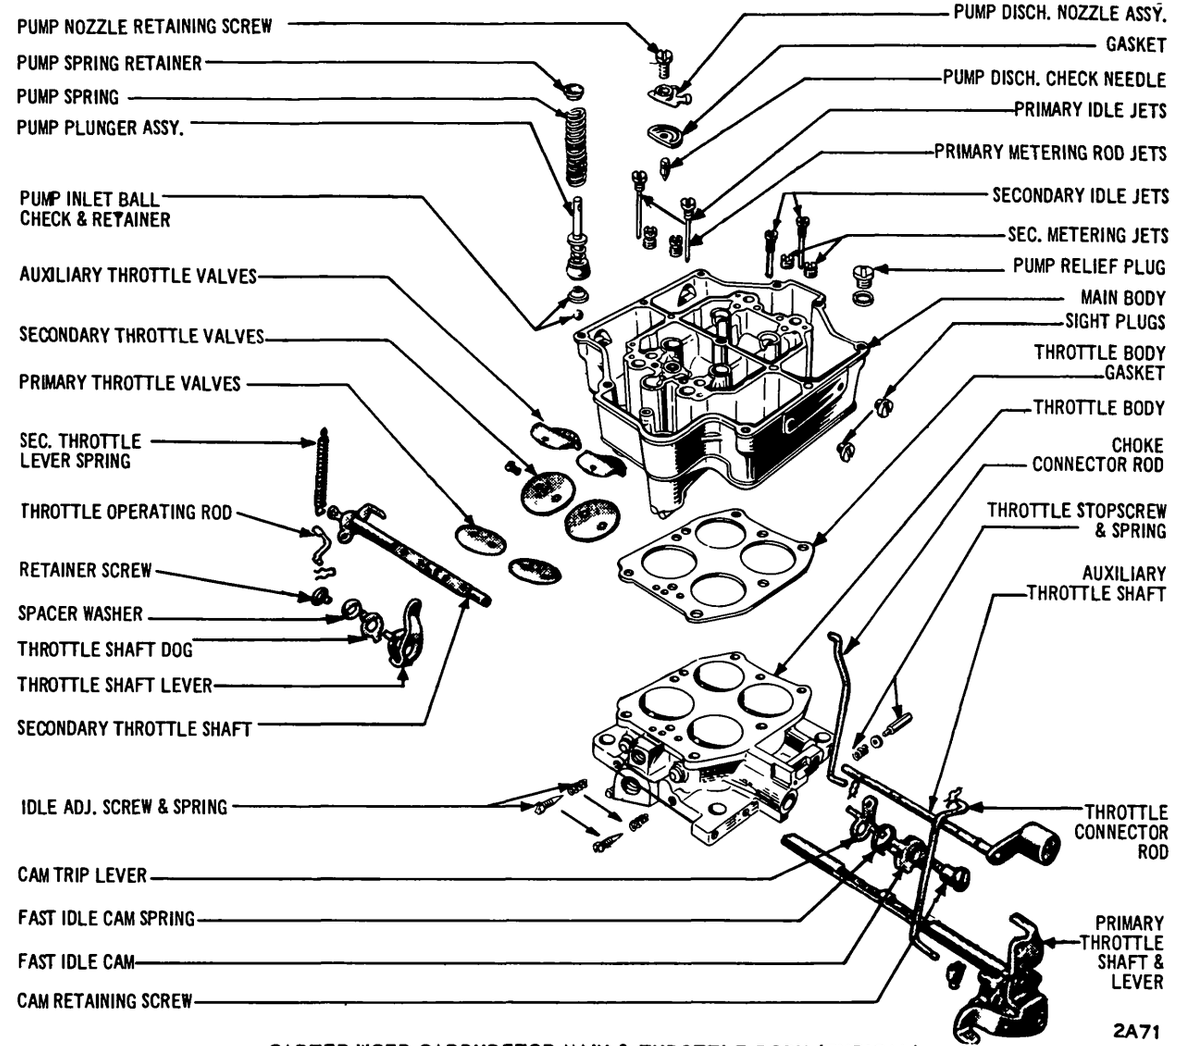
►*1962 STUDEBAKER CARBURETOR PRODUCTION CHANGE & SERVICE MODIFICATION (To correct rough idl or a stumbl condition on acceleration at at low r car sp ds, particularly on left turns):* New carburetors (see application list above) are being used in later production to correct the above conditions. Early carburetors (2829S, 2830S, 3165S, 3166S) can be modified by installing the new parts listed below and changing carburetor adjustments as indicated.

N w Adjustments (Primary Float Level) - Adjust primary float level to 9/64" (Studebaker Gauge No. J-7479-4). *CAUTION - R silient type Needle Valve & Seat Ass mbly is us d. When bending float tab to adjust, do not apply any pr ssure to needle valve.*

Idl Sp ed & Mixture - When making idle speed & mixture adjustments, thermostatic air bleed valve on throttle body must be held closed.

Aut matic Chok - 1 point rich.

Ch k Unl ad r - 1/8" clearance between lower edge of choke valve and air horn. *See "Unloader" adjustm nt below.*



Carbur t r Modification Parts

D scripti n	Studebaker Part No.
Thermostatic Air Bleed Valve	1556107
Throttle Body Gasket	1556399
Air Horn Assembly	1556400
Float	1556401
Bushing	1556402
Needle Valve & Seat Assembly	1556488
Gasket	537187
Gasket	537188
Gasket	537189
Tee ℄	G444255
Screws (Two)	537168

℄ - Use on cars with closed crankcase ventilation.

DESCRIPTION: 4-barrel downdraft type of same general design used on previous models. These carburetors include the following features:

Therm static Air Ble d Valve (Studebaker 3419S, 3420S, 3422S, 3423S): This valve, which is screwed into carburetor throttle body casting, assists in reducing rich air and fuel mixture during hot idling by allowing additional air to be drawn into carburetor at a point below the throttle valves. When adjusting idle speed, hold thermostatic valve closed.

CARTER WCFB CARBURETOR MAIN & THROTTLE BODY (TYPICAL)

Auxiliary Throttle Valves; Velocity type valve located directly over secondary throttle valves in main body. Auxiliary throttle valve action is controlled by counterweight on shaft and is not operated by throttle linkage. On Chevrolet models, auxiliary throttle valves are locked out when choke is operating and this lockout must be adjusted. *See Adjustments below.*

ADJUSTMENTS: *Make all adjustments in sequence indicated below.*

Idling Adjustment: If necessary, make preliminary idle mixture and idle speed adjustments to enable engine to be warmed up. Run engine until it reaches normal operating temperature with choke valve wide open and fast idle inoperative. Then make adjustments as follows:

Ch vr let - Connect vacuum gauge and tachometer. Set throttle stopscrew for correct idling speed. Adjust each idle mixture screw for highest RPM and vacuum reading. Reset idle speed.

Studebaker - *CAUTION - On later carburetors with Thermostatic Air Bleed Valve (Throttle Body) hold valve closed when making idle speed adjustments.* Set throttle stopscrew for correct idle speed. Adjust both idle mixture screws equally for smooth idling performance, then turn screws out (richer mixture) until engine RPM shows a slight drop. Reset engine idle speed.

Idle Mixture Setting

Car & Carb.	Idle Screw Opening
Chevrolet 3190S, 3191S	½-2 turns
Studebaker 2829S, 2830S, 3422S, 3423S	½-1½ turns
Studebaker 3165S, 3166S, 3419S, 3420S	¼-1½ turns

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

Idle Speed Setting

Car Model	Engine RPM S.M. Trans.	Auto. Trans.
Chevrolet	500	①475
Studebaker	550-600	②550-600

① - Transmission selector lever in "D" (Drive).
② - Transmission selector lever in "N" (Neutral).

Throttle Return Check (Dashpot Adjustment): *See "Throttle Linkage" under CARBURETOR on each car model page.*

Accelerating Pump Stroke: *This is a linkage adjustment and not a seasonal change recommendation, and is not dependent on operating conditions.* Remove dust cover, place connector link in hole indicated in table below.

Car	Initial Stroke Setting
Chevrolet	Outer Hole
Studebaker	Outer Hole

Pump Stroke Adjustment - Back off throttle stopscrew so that primary throttle valves are fully closed. Hold a straightedge across dust cover boss at pump arm. Flat on top of arm should be parallel with straightedge. Adjust by bending pump connector link at lower angle.

Metering Rod (Primary Side): No gauge required for this adjustment and no metering rods are used on secondary side. With dust cover removed and primary throttle valves fully seated (as for Pump Stroke Adjustment), loosen setscrew in metering rod arm on pump countershaft enough so that arm has a slight bind on shaft, then lift arm slightly and depress metering rod link until metering rods just bottom in bowl casting. Position metering rod arm so that it just contacts link and tighten setscrew. Adjust Atmospheric Idle Vent (below).

►*FLOAT LEVEL SETTING CAUTION (CARBURETORS WITH RESILIENT INLET VALVE SEATS):* When bending float lever to adjust height on carburetors with resilient inlet valve seats, do not allow float lever to contact inlet needle seat as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle. Float level setting specifications are different for carburetors with resilient type inlet valve seats. *See "Float Level Setting" below.*

Float Setting: *CAUTION - Primary and secondary floats must be checked and adjusted separately and both Float Level and Float Drop must be checked for each assembly.*

Float Level - Check and adjust as follows: Remove bowl cover gasket (take out float hinge pins, remove float assemblies with intake needles and clips attached, then remove gasket and reinstall float assemblies). Invert bowl cover. Install correct gauge for each float assembly (see table below) on bowl cover under center of floats with notched ends of gauge fitted tightly against side of bowl cover casting. Both floats should just clear horizontal section of gauge (adjust by bending float arms as required) and each float should just touch vertical uprights on gauge (bend arms sideways for clearance). This sideway adjustment is extremely important to prevent floats hanging up on sides of bowl casting.

Float Level Setting
Primary Floats

Car & Carb.	Height	Gauge No.
Chevrolet (All Carbs.)①	7/32"	T109-283
Chevrolet (All Carbs.)②	3/16"	T109-222
Studebaker (All Carbs.)③	3/16"	T109-222
Studebaker (All Carbs.)④	9/64"	⑤J-7479-4

Secondary Floats

Car & Carb.	Height	Gauge No.
Chevrolet (All Carbs.)①	9/32"	T109-284
Chevrolet (All Carbs.)②	1/4"	T109-223
Studebaker (All Carbs.)	3/16"	T109-222

① - With solid needle seat.
② - With resilient needle seat.
③ - Early carburetors without Thermostatic Air Bleed Valve.
④ - Later carburetors with Thermostatic Air Bleed Valve.
⑤ - Studebaker gauge number.

Float Drop: Hold bowl cover assembly upright so floats hang down freely. Use a scale to measure distance from bottom of float at free end to bowl cover (Chevrolet); from top of float at center to bowl cover (Studebaker). If distance not correct (see table below), adjust by bending tab on float bracket. *CAUTION - Do not put any pressure on inlet needle valve when adjusting floats.*

Float Drop Setting

Car & Carb.	Primary	Secondary
Chevrolet (All Carbs.)	2"	2"
Studebaker (All Carbs.)	11/16"	11/16"

Bowl Vapor Vent (Atmospheric Idle Vent): Chevrolet - With dust cover and gasket installed, back out throttle lever stopscrew so that primary throttle valves are fully closed. Check clearance between lower edge of vapor vent valve and dust cover. Vent clearance should be 3/32". Adjust by bending vapor vent valve arm (remove dust cover).

Automatic Choke: See table below for setting. Adjust by loosening choke cover screws and rotating cover and coil assembly, then adjust connector rod.

Automatic Choke Setting

Car & Carb.	Choke Setting
Chevrolet (All)	Centered
Studebaker①	1 point lean
Studebaker②	1 point rich

① - Early carburetors without Thermostatic Air Bleed Valve.
② - Later carburetors with Thermostatic Air Bleed Valve and early carburetors that have been modified. *See "Correction" above.*

Choke Rod: This adjustment is preliminary to checking and adjusting fast idle, unloader, and secondary throttle lockout. Loosen choke lever clamp screw and insert .020" wire gauge, Tool T109-29, between tang on fast idle cam and boss on throttle body casting (hold gauge in place by pressure on choke lever) and take up all slack in linkage. Hold choke valve tightly closed and tighten clamp screw.

Choke Piston Lever Adjustment (Chevrolet): Bend a .026" wire gauge (T109-189) at a 90° angle 1/8" from end, then remove choke coil housing, gasket and baffle plate. Block throttle about half open so fast idle cam does not contact adjusting screw. Open choke valve and insert wire gauge so bent portion is between top of slot in choke piston cylinder and bottom of slot in choke piston. Hold wire gauge in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. Clearance between top of choke valve and air horn should be .067" (Gauge T109-234). To adjust, bend choke connector rod.

Unloader: After choke rod adjusted, rotate primary throttle valves to wide open position and close choke. Clearance between upper edge of choke valve (Chevrolet), lower edge of choke valve (Studebaker), and inner wall of air horn should be 1/4" (Chevrolet), 9/64" (Studebaker early carburetors without Thermostatic Air Bleed Valve), 1/8" (Studebaker later carburetors with Thermostatic Air Bleed Valve and early carburetors that have been modified, *see "Corrections" above*). Adjust by bending unloader tang on throttle shaft lever with Tool T109-41. With correct setting, choke valve should have a slight drag on gauge.

Fast Idle (Off Engine): Studebaker - With fast idle screw on high step of fast idle cam, there should be a clearance of .023" between throttle valve and bore on side opposite idle port. To adjust, turn fast idle screw.

Fast Idle (On Engine): Chevrolet - 1600-1800 RPM with engine at normal operating temperature and idle speed screw on high step of fast idle cam. No adjustment.

Secondary Throttle Lever Adjustment: Chevrolet - Block choke valve wide open and back out throttle stopscrew so primary valves are seated in bores. With primary valves open 7/32" (Gauge T109-125), secondary valves should just start to open. To adjust, bend throttle operating rod. *NOTE - Secondary valves will be a few degrees from wide open position when primary throttle valves are wide open.* With primary and secondary valves tightly closed, there should be .010-.030" (Gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

Studebaker - Primary and secondary throttle valves should reach wide open position at the same time. *NOTE - Secondary valves will be a few degrees from wide open position.* To adjust, bend throttle operating rod at upper angle with Tool T109-213. With primary and secondary throttle valves in tightly closed position, there should be .010-.030" clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

Secondary Throttle Lockout Adjustment: Studebaker - Crack throttle valves and hold choke valve closed, then close throttle. Tang on secondary throttle lever should engage notch in lockout lever. To adjust, bend tang on secondary throttle lever. *NOTE - With choke valve open, lockout lever should fall free allowing secondary throttle valves to open before primary valves reach wide open position.*

Auxiliary Throttle Lockout Adjustment: Chevrolet - Crack throttle valves and hold choke valve tightly closed, then close throttle valve. Tang on lockout arm should freely engage notch in auxiliary throttle shaft dog. To adjust, bend tang on lockout arm.

OVERHAUL: *See 1957 Final Data, Page 221, or later Manual edition.*

CARTER AS SINGLE BARREL CARBURETORS

Lark 6 (Taxi) (CCV) ℂ	3186S

ℂ - Closed Crankcase Ventilation.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 STUDEBAKER STUMBLE DURING SLOW SPEED ACCELERATION CORRECTION:* This condition is noticeable briefly after engine is restarted, and can be improved by installing a new Accelerator Pump Plunger, Part No. 64-285S (Carter Carburetor No.). This new plunger has a bleed hole diameter of .024" (earlier type has a .016" bleed hole). Later production carburetors have the above change made during manufacture. Also, later carburetors have a larger idle tube orifice of .031" in carburetors used on cars without closed crankcase ventilation.

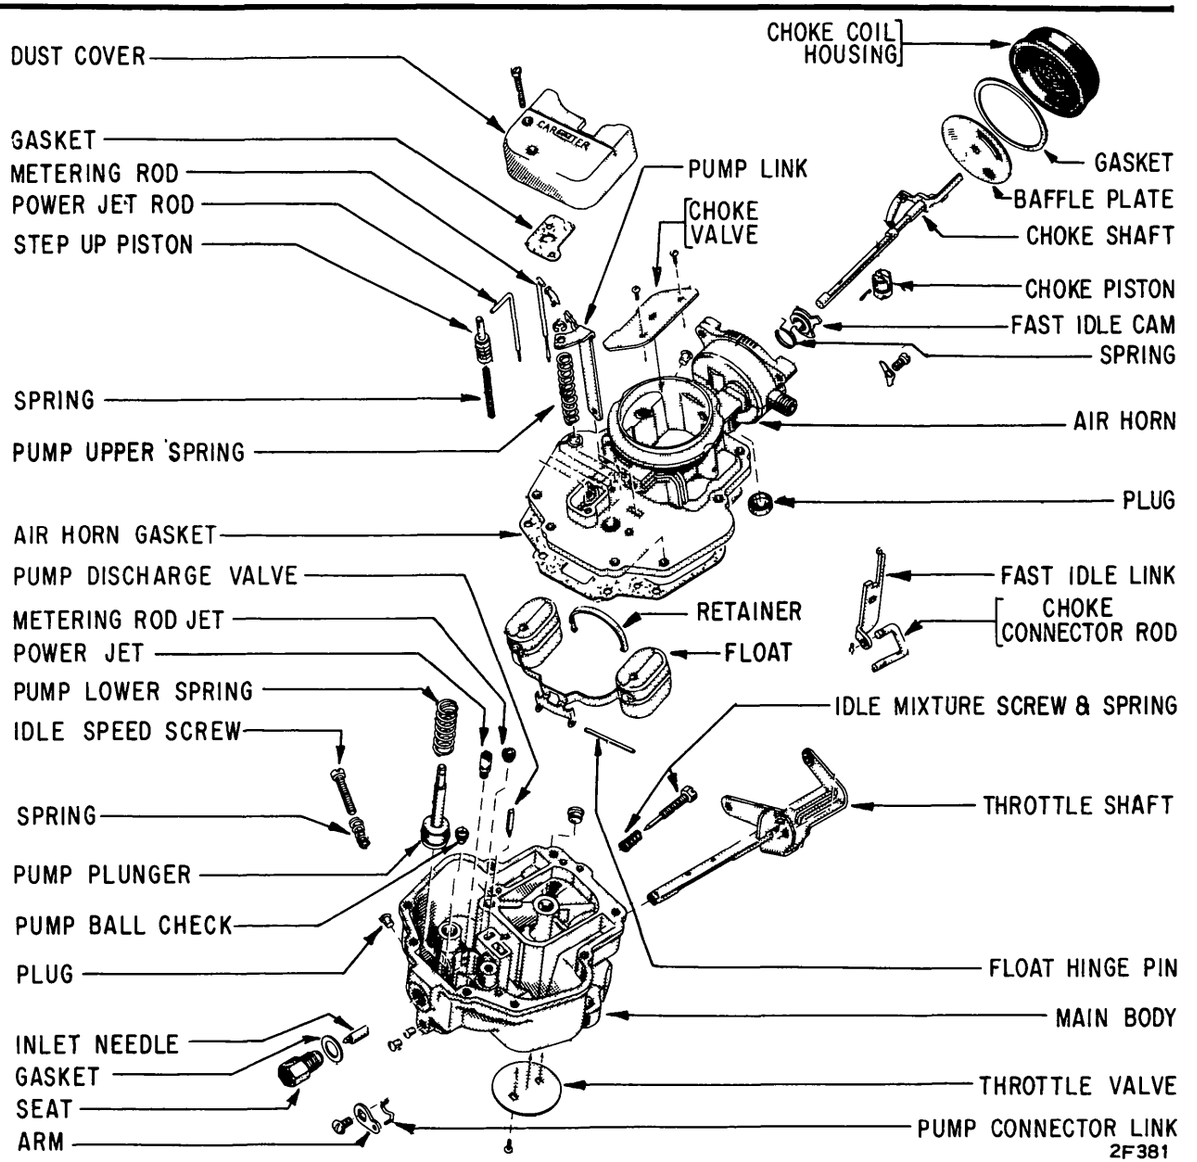
DESCRIPTION: Single barrel downdraft type with automatic choke.

ADJUSTMENT: Make all adjustments exactly as follows:

Idling Adjustment: Warm up engine thoroughly, so that choke valve is wide open and fast idle inoperative. See table for idle screw setting. Turn screw out for richer mixture. See car model pages for complete tune-up data.

Idl Mixture Setting

Car & Carb.	Idle Screw Opening
Checker	1/2-1 3/4 turns
Rambler (All)	1/2-1 1/4 turns
Studebaker (Exc. 3186S)	1/8-1 1/2 turns
Studebaker (3186S)	1/2-2 turns



Idl Speed Setting

Car	Engine Speed
Checker	ℂ 400 RPM
Rambler	ℂ ② 500 RPM
Studebaker (All Trans.)	ℂ 550 RPM

ℂ - Auto. Trans. in "N" (Neutral).
② - Air Conditioner turned ON.

Float Level: *NOTE - "Split Type" float used in Checker Superba carburetors. "Single Type" float used in all other carburetors.*

►*FLOAT SETTING CAUTION (CARBURETORS WITH RESILIENT INLET VALVE SEAT):* Resilient type inlet valve seats used on all 1962 "AS" carburetors (Exc. 2858S & 3186S). When bending float lever to adjust height on carburetors with resilient inlet valve seat, do not allow float lever to contact inlet needle as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle. If resilient inlet needle valve assembly is installed on 2858S & 3186S reduce float setting 1/16" from setting indicated in "Float Setting Table".

CARTER "AS" CARBURETOR

"Split Type" Floats (Checker Superba) - Remove bowl cover gasket and float pin retainer. Check each float separately while holding lip of float arm against seated needle. *CAUTION - Float pin must be at bottom of guide slots.* Place correct gauge squarely on top edge of bowl at free end of float with ridge on top of float just contacting step of gauge. Adjust by bending lip on float arm. Make sure that floats clear side of bowl (adjust float arms as required). Install float pin retainer, then invert carburetor so that both floats rest against seated needle. Clearance between overlapping tangs on float levers should be .010-.015". Adjust by bending long tang on left hand float. Recheck float level.

"Single Type" Floats (Resilient Type Inlet Needle Valve Seat) - With body gasket removed, invert bowl assembly while holding float pin lever retainer in place so weight of float only is resting on needle. Distance from top of float at free end to top of gasket surface on bowl should be as indicated in table below. To adjust, remove float lever pin retainer and install float holding tool, T109-389 and bend float lip as

CONTINUED ON NEXT PAGE

CARTER AS SINGLE BARREL CARBURETORS (C nt.)

necessary. *NOTE - Tool T109-389 prevents needle from pushing against resilient needle valve seat.* After adjustment, remove tool and install lever pin retainer, then recheck float setting.

"Single Type" Floats (Solid Type Inlet Needle Valve Seat) - With gasket removed, invert bowl assembly and measure distance from top of each float at free end to gasket surface on bowl. This distance should be as indicated in table below. To adjust, bend float lip.

Float Setting

Car & Carb.	Checking Gauge	Float Setting
Checker	T109-282	① 1/4"
Rambler 3206S	T109-148	① 5/32"
Rambler 3206S	T109-50	② 3/32"
Studebaker(Exc.3186S)	T109-338	② 3/16"
Studebaker 3186S	T109-280	① 5/16"

① - "Solid Type" Inlet Needle Valve Seat.
② - "Resilient Type" Needle Valve Seat.

Pump Adjustment: Top of pump arm that engages slot in pump shaft must be parallel to top surface of bowl cover with throttle in wide open position. Adjust by bending pump arm up or down as necessary.

Metering Rod Adjustment: With throttle wide open, metering rod should just bottom in carburetor casting. To adjust bend metering rod arm. When metering rod is properly adjusted, some movement can be noted around eye of metering rod retainer clip when throttle is moved slightly from wide open position. If rod is too low, it will tend to push metering rod retainer clip up. If rod is too high, it will be possible to push rod down.

Fast Idle Adjustment: Remove thermostat coil housing, gasket and baffle plate. Crack throttle valve and hold choke valve closed to rotate fast idle cam to fast idle position. Close throttle. Measure clearance between throttle valve and bore of carburetor (side opposite idle port) using gauge listed in table below. Adjust by bending choke connector rod at lower angle using bending tool T109-213.

►*RAMBLER FAST IDLE (ON CAR) ADJUSTMENT NOTE: 1800-2000 RPM. Engine at normal operating temperature and fast idle link on high step of fast idle cam.*

Fast Idle Setting

Car & Carb.	Checking Gaug	Throttl Opening
Checker (All Carbs.)	T109-29	.030"
Rambler (All Carbs.)	T109-193	.037"
Studebaker (All Carbs.)	T109-234	.065"

Unloader Adjustment: Hold throttle valve wide open and close choke valve without forcing it. Measure clearance between upper edge of choke valve and inner wall of carburetor air horn. See table below. To adjust, bend choke shaft unloader arm.

Unloader Setting

Car & Carb.	Checking Gauge	Choke Opening
Checker (All Carbs.)	T109-34	9/64"
Rambler (All Carbs.)	T109-36	1/8"
Studebaker (All Carbs.)	T109-28	3/16"

Studebaker (Exc. 3186S)	Centered (On Index)
Studebaker 3186S	1 Point Lean

OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Take out two dust cover retaining screws, remove dust cover and gasket. Remove step-up jet piston, rod and spring from bowl cover. Disconnect spring clip from actuating link and remove metering rod and spring clip retainer. Take out throttle shaft arm screw, remove throttle shaft arm and pin assembly. Remove choke piston link-to-throttle valve arm lever connector rod retainer and remove rod. Take out cover retaining screws and remove bowl cover and gasket. Push accelerating pump plunger toward cover and disconnect it from actuating link, remove plunger and actuating link. Remove spring from pump plunger. Take out choke cover retaining screws, remove choke cover and coil assembly, gasket, and baffle. Slip fast idle link out of housing. Remove staking from ends of choke valve screws, remove screws, lift choke valve out. Disconnect fast idle cam spring from choke shaft lever, rotate choke shaft to withdraw choke piston from cylinder, remove choke shaft, lever, and piston assembly from housing. Disconnect piston by pushing out piston pin. Remove fast idle cam and spring assembly from choke housing. Remove float lever pin retainer, remove needle valve and seat assembly, remove float and pin assembly. Separate floats by taking out the retaining pin. Remove metering rod jet, step-up jet, and low speed jet. Remove pump discharge ball retainer and check ball. Remove idle mixture adjusting screw and spring, and idle speed screw and spring.

Inspection: Thoroughly clean and inspect all carburetor parts. *CAUTION* - Take care not to damage percolator tube which extends above top surface of carburetor bowl. Replace all worn or damaged parts.

Reassembly: Use all new gaskets. Reassemble all parts in reverse order to disassembly procedure and note the following points:

Accelerating Pump Jet Aim (Stud bak r) - Check pump discharge jet by filling bowl with clean gasoline and operating pump plunger with several quick full strokes. Pump jet should be parallel to choke shaft and stream should strike side of small venturi about 1/8" down from top edge. Adjust by bending pump jet tube. *CAUTION - Use care not to damag m t ring end of tub .*

Assembling Air Horn to Body - Install body gasket on air horn. Install metering rod retainer on pump lifter link but **do not install metering rod**, insert pump lifter link through operating slot in air horn, place pump spring over pump plunger and install plunger in air horn, install fast idle link in choke piston housing. Hold pump plunger, lifter link, and gasket in position and lower air horn and bowl cover onto carburetor body.

Metering Rod Installation - Place metering rod retainer in position on actuating link. Lower metering rod into place until end of rod enters hole in retainer, push metering rod and retainer down into operating position, push retainer toward rod until retainer ears engage slot in arm on lifter link.

Service Parts

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 LINCOLN CARBURETOR CHOKE STICKING CORRECTION:* An accumulation of deposits on choke mechanism may be causing a sticking condition due to fuel vapor entering choke housing through inlet air opening. To correct, use piece of 1/8" O.D. copper or brass tubing 3/4" long (remove burrs from inside at both ends), then taper one end slightly with a file. *NOTE - Make sure inside of tube is clean.* Insert tapered end of tube in choke air inlet opening (small 1/8" diameter hole located in boss adjacent to vertical wall on choke side of air horn opening). Carefully tap tube into hole approximately 3/16", then prick punch boss in several places adjacent to tube to secure tube in position.

►*1962 LINCOLN HARD COLD STARTING CORRECTION:* This condition may be caused by choke valve not closing properly because of gummy deposits on choke and carburetor linkage. Use a carburetor cleaning solvent, lacquer thinner, or alcohol to wash dirt, gum, carbon, and other material off linkage pivot points. Rinse parts with kerosene and blow dry with air. DO NOT OIL linkage pivots and connections. After cleaning, make sure choke assembly is operating properly.

DESCRIPTION: Design is similar to previous carburetor models having an Idle Air Bypass System. In addition, a new automatic choke assembly controlled by engine heated water is used.

CONTINUED ON NEXT PAGE

CARTER ABD 2-BARREL CARBURETORS (Cont.)

Automatic Choke: Heated water for choke control is obtained from heater hose connection on intake manifold. Water flow from choke control is routed to water return line from heater to engine pump. Engine water does not contact thermostatic spring in choke housing. Only heat radiated from housing jacket affects spring.

Idle Air Bypass System: Throttle valves are completely closed at slow idle speed. Air for closed throttle operation is taken from top of primary venturi through an adjustable orifice to throttle bores below throttle valves. An Idle Air Speed Screw controls the adjustable orifice and all idle speed adjustments are made with this screw. Throttle stop screw not used.

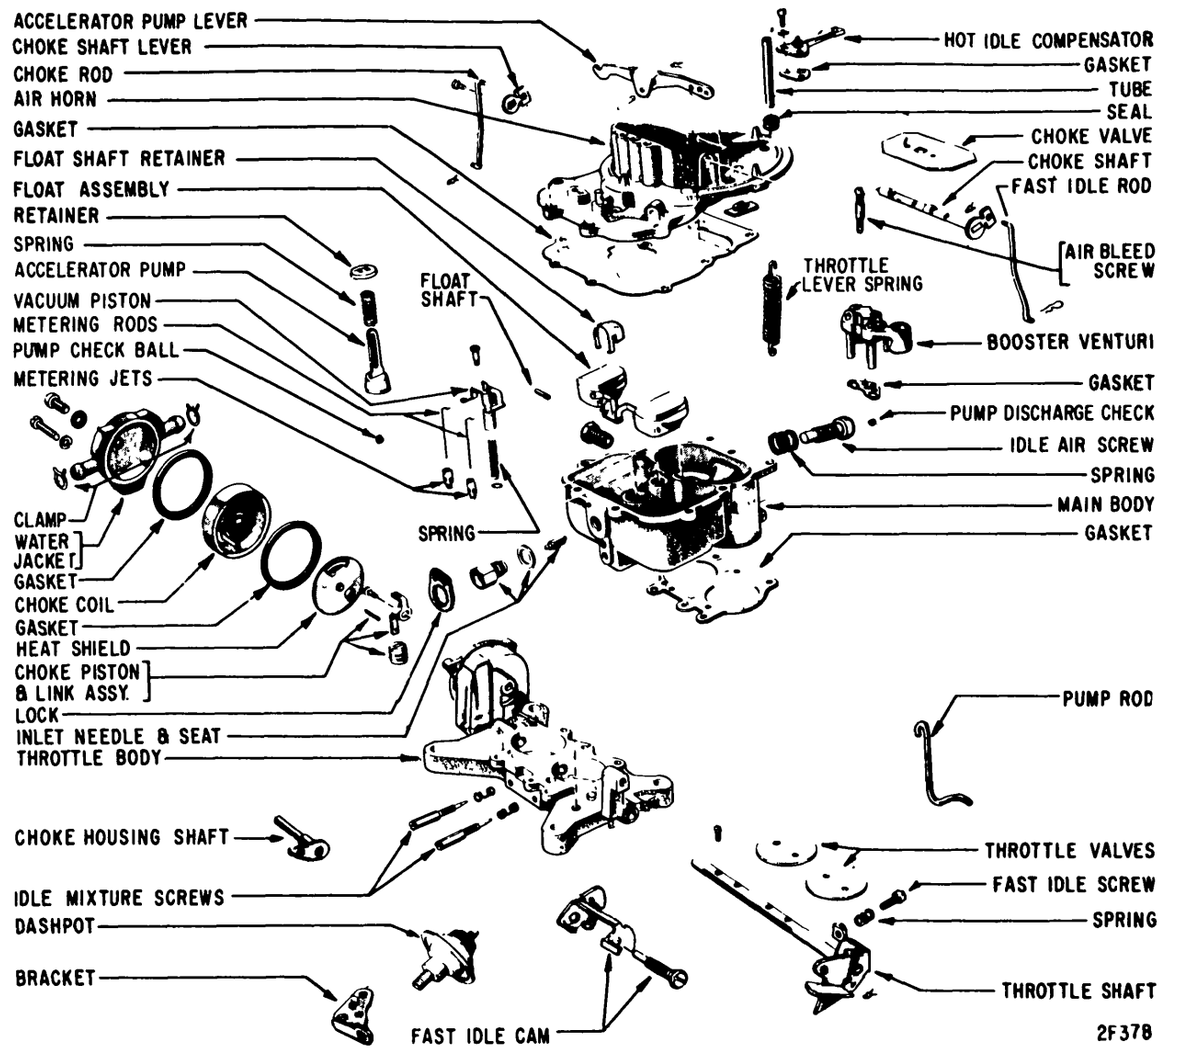
ADJUSTMENTS: *NOTE - All adjustments except float setting and fast idle throttle clearance can be made with carburetor installed on engine.*

Idle Mixture & Speed Setting: For initial adjustment, turn idle mixture screws (one for each throttle bore) 1/4-2 turns open from a lightly seated position, then turn Idle Air Speed Screw 3½ turns open from a lightly seated position. For final adjustment, with engine at normal operating temperature, adjust Idle Air Screw for correct idle speed of 450-475 RPM (transmission selector lever in "D"), or 500-550 RPM (transmission selector lever in "N"). Adjust each idle mixture screw for smooth idling and highest vacuum reading and engine RPM. Recheck and if necessary, reset idle speed, then reset idle mixture setting. *NOTE - Hold hot idle compensating valve closed while adjusting idle speed.*

Fast Idle Speed: With engine at normal operating temperature, transmission selector lever in "D" (Drive) and fast idle screw on lowest (slowest) step of cam, adjust fast idle screw to obtain 600-650 RPM.

Anti-Stall Dashpot: .090—.120" clearance between dashpot plunger and throttle operating lever with dashpot plunger held in to limit of travel and with throttle valves closed. To adjust, loosen locknut and rotate dashpot in bracket.

Choke Setting: 1 point rich. To adjust, loosen three retaining screws attaching choke assembly to carburetor and rotate assembly as necessary. *NOTE - Do not loosen center screw retaining jacket to choke coil housing unless it is necessary to replace gasket or clean unit. The special jacket retaining screw can be removed by using a screwdriver that has been slotted in center portion of blade.*



►*ACCELERATING PUMP STROKE ADJUSTMENT CHANGE: For average temperature, year around operation, place accel rator pump operating rod in hole marked "W" on throttle lever. For extremely high temperature and/or high altitude operation, place pump operating rod in hole marked "S" on throttle lever. Change accel rator pump lever return spring to correspond ing summer or winter hole.*

Accelerating Pump: 17/32" from top of accelerator pump plunger to top of bowl cover with pump operating rod in outer hole (marked "W") of throttle lever with throttle valve closed.

Choke Valve & Piston Lever Linkage: Bend 1/8" of end of Tool T109-189 (.026" wire gauge) at a 90° angle, then insert bent end of gauge into choke housing piston bore so that it is between bottom of slot in choke piston and top edge of vacuum slot in choke housing. Close choke valve by pressing on piston lever until it stops, then check clearance between upper edge of choke valve and air horn which should be 5/32" (Tool T109-154). To adjust, use parallel jaw pliers and bend choke operating lever at the reduced area to obtain proper adjustment.

Unloader: 1/8" clearance between upper edge of choke valve and wall of air horn with throttle valves wide open. To adjust, use 1/8" gauge, Tool T109-36 or a 1/8" drill to check clearance. Bend tang on choke unloader lever as required.

Fast Idle Cam: With choke valve closed, fast idle adjusting screw should rest at index mark on high step of fast idle cam. To adjust, bend fast idle cam pickup lug on choke unloader lever as required.

CARTER ABD 2-BARREL CARBURETOR ASSEMBLY

Fast Idle Throttle Valve Clearance: With fast idle adjusting screw on index mark of cam, clearance between lower edge of valve and throttle bore should be .015".

Float Level: 5/16" measured at free end of float as follows: Press down on float shaft retainer and hold float and lever assembly in uppermost position against fuel inlet needle. Distance between top of float (end furthest from hinge pin) and top machined surface of main body should be 5/16" (Tool T109-280). Bend float lever arm as required to obtain proper alignment (parallel). Bend inlet needle tab as required for correct float level.

OVERHAUL: *See 1960 Annual Data, Page 268, or later Manual edition.*

SERVICE PARTS: Gasket Set - Carter No. 484. Zip-Kit - Carter No. 902-180.

CARTER BBD 2-BARREL CARBURETORS

CHRYSLER	Carter N.
383" Eng. (Std.)	3244S
361" & 383" Eng. (CCV) ℄	3245S

318" Eng. Auto. Trans. (Std.)	3241S
361" Eng. (Custom 880) (CCV) ℄	3245S

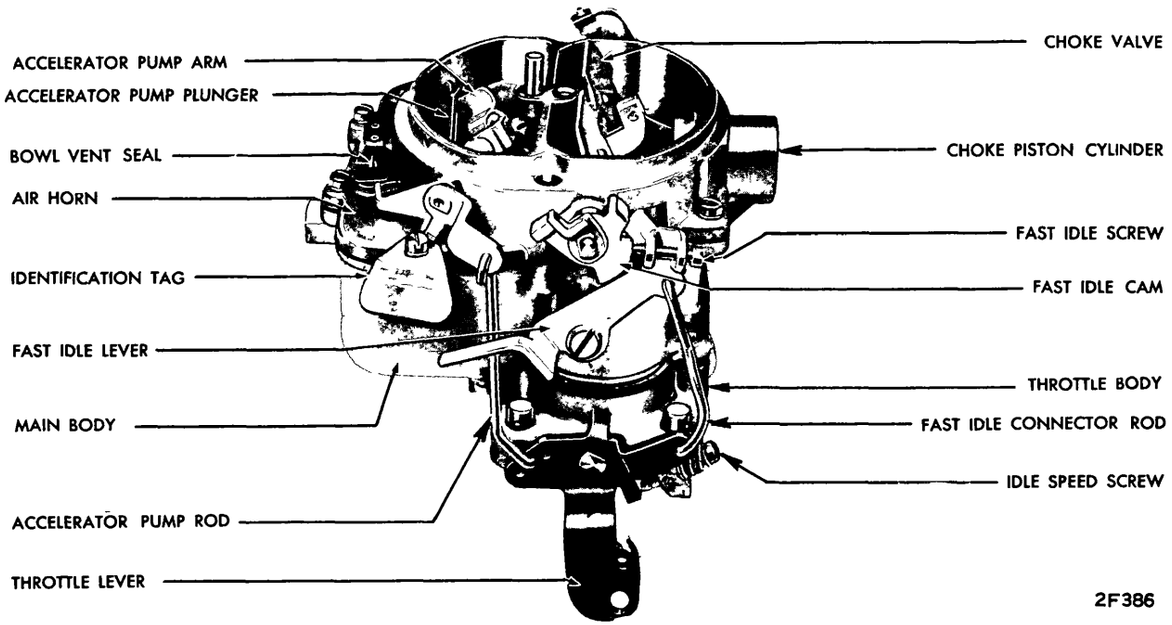
℄ - Closed crankcase ventilation.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 DODGE & PLYMOUTH FLAT SPOT OR STUMBLE (DURING PART THROTTLE ACCELERATION) CORRECTION:* Replace Step-up Piston Spring, Part No. 61-538 with Part No. 61-549.

►*1962 DODGE & PLYMOUTH 318" ENG. (CARB. 3241S) CONSTANT SPEED SURGE CORRECTION:* Richen fuel mixture by installing Metering Rod, Part No. 75-1600 to replace Part No. 75-1605. Make sure float setting set at 1/4"

►*HARD COLD WEATHER STARTING CORRECTION:* This condition may be caused by choke vacuum unloader piston sticking. To correct, remove air cleaner and squirt a suitable carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke valve to flush out gum formation.



DESCRIPTION: Two–barrel downdraft type with "Cross–Over" type automatic choke. Design is similar to previous models having the following features:

Bowl Vapor Vent (3244S,3245S): Consists of an atmospheric vent in bowl cover flange which is closed by a rubber grommet on a spring arm (saxophone key). A loose lever on pump countershaft opens bowl vent when throttle valve is closed. Bowl vapor vent adjustment should be checked whenever accelerator pump setting is changed.

Bowl Vapor Vent (3240S,3241S): Consists of an atmospheric vent in bowl cover flange at slot for accelerator pump shaft. The vent valve which is installed over the accelerator pump shaft is operated by a special clip (adjustable) on pump shaft that opens vent when throttle valves are closed. *NOTE – If pump rod is installed in either the long or short stroke hole in throttle lever, it will be necessary to move clip (located under vent valve) either up or down to compensate for change in pump stroke.*

Fast Idle (3244S, 3245S): Fast idle cam is located directly on end of choke shaft. Fast idle lever is pivoted on side of main body and is linked to throttle lever by a fast idle connector rod.

Fast Idle (3240S, 3241S): Fast idle cam is located on carburetor main body adjacent to throttle lever and is linked to choke shaft lever by a connector rod. The fast idle lever is pivoted on throttle valve shaft and contacts the fast idle cam.

CARTER BBD CARBURETOR ASSEMBLY (3244S, 3245S)

Automatic Choke (Cross-Over Type) All Models - This type of automatic choke is a separate unit located in well in intake manifold (in exhaust cross-over passage) and is linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder on the air horn and is linked directly to choke valve. *See "Carter Cross–Over Type Automatic Choke" in 1957 Annual Data, Page 244, or later Manual editions.*

ADJUSTMENTS: *Make all adjustments exactly as detailed below.*

►*IDLE SETTING CAUTION:* When making Idle Speed & Mixture adjustments, note the following: Turn headlights on High Beam to compensate for alternator load (alternator charges battery at idle speed). On automatic transmission cars (except Ram Induction Engines), loosen nut on sliding link of carburetor–to–bellcrank rod so transmission internal stop will not interfere with carburetor throttle lever. When adjustments completed, move carburetor throttle rod to rear against its stop and tighten locknut.

Idle Adjustment: Make preliminary setting of both idle mixture screws by turning each screw in until it is lightly seated and then backing screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative.

Idle Mixture - With engine at normal operating temperature and idling at correct idle speed, adjust idle mixture screws until engine operates smoothly. Recheck engine idle speed, adjust for correct engine RPM.

Carburetor	Idle Mixture Setting Idle Screw Opening
3240S, 3241S	1/4-1 1/2 turns
3244S, 3245S	1/8-1 1/2 turns

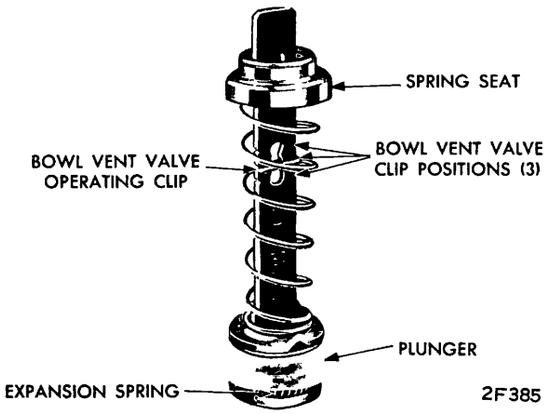
Car	Idle Speed Setting Synchro-mesh	℄Aut. Trans.
Chrysler	500 RPM	℄500 RPM
Dodge & Plymouth	500 RPM	℄500 RPM

℄ - Automatic transmission in "N" (Neutral).
℄ - Air Conditioner operating.

Accelerating Pump (3244S, 3245S): Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as indicated below: *CAUTION – Bowl vapor vent adjustment must be checked whenever pump setting is changed.*

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that pump connector rod engaged in center hole (medium stroke) of throttle lever. Use scale to measure distance from top surface of bowl cover to top of pump plunger shaft (within air horn - remove air cleaner for access). This distance should be 1"±1/64" (all models) Adjust by bending connector rod at lower angle.

Pump Seasonal Setting - Standard setting is with connector rod engaged in center hole of throttle lever (medium stroke). Outer hole will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).



Accelerating Pump (3240S, 3241S): Three holes in throttle lever and two holes in pump arm are provided for connector rod engagement to provide seasonal setting as indicated below. *CAUTION - Bowl vapor vent adjustment must be checked whenever pump setting is changed.*

CONTINUED ON NEXT PAGE

CARTER BBD 2-BARREL CARBURETORS (Cont.)

Pump Stroke Adjustment - *NOTE - Pump stroke adjustment will be correct when bowl vapor vent is properly adjusted (see "Bowl Vapor Vent" below).*
Pump Seasonal Setting - Standard setting is with connector rod engaged in center hole of throttle lever and inner hole of pump arm (Medium Stroke). Outer hole in throttle lever will provide maximum stroke (greater discharge) and inner hole minimum stroke (less discharge).

Bowl Vapor Vent Adjustment (3240S, 3241S): Back off idle speed adjusting screw and open choke valve so throttle valves are fully closed (fast idle adjusting screw not contacting fast idle cam). With pump operating rod in medium stroke hole in throttle lever, and bowl vent clip on pump stem in center notch, close throttle valves tightly. Clearance between bowl vent and air horn should be 5/64". To adjust, bend pump operating rod. *CAUTION - If pump rod is installed in either the long or short stroke holes, it will be necessary to move hairpin clip, located directly under bowl vent valve, either up or down to compensate for change in pump stroke and to maintain proper adjustment.*

ACCELERATING PUMP PLUNGER ASSEMBLY (3240S, 3241S)

Fast Idle Cam Clearance: Open throttle valves and hold choke valve fully closed, then close throttle valves and release choke valve only. Index mark on cam should split center of fast idle adjusting screw. To adjust, bend tang on choke shaft lever as necessary until index mark on cam indexes with adjusting screw.

Fast Idle Throttle Valve Clearance: On Bench - With fast idle adjusting screw on index mark of cam, clearance between throttle valve and carburetor wall on side opposite idle ports should be .015" (3240S, 3241S); .018" (3244S, 3245S). To adjust, rotate fast idle screw.

Fast Idle Speed (On Car): With engine at normal operating temperature, adjust idle speed to 1400 RPM (All Models), with fast idle adjusting screw on index mark of fast idle cam.

Unloader: All Models - Hold throttle valves in wide open position, then insert a 1/4" (3240S, 3241S); 15/64" (3244S, 3245S) drill shank between upper edge of choke valve and inner wall of air horn. With slight pressure against choke valve, a slight drag should be felt as drill shank is withdrawn. To adjust, bend tang on fast idle lever (3244S, 3245S); unloader tang on throttle lever (3240S, 3241S) for correct clearance.

Bowl Vapor Vent Adjustment (3244S, 3245S): With throttle valves held closed, clearance between bowl vent valve and air horn should be .060" (use a drill shank). To adjust, bend short tang on vent valve operating lever until correct clearance is obtained.

Float Level: *NOTE - Either a "Viton" tipped inlet needle valve or a "Resilient" type inlet valve seat is used. Float level specifications for both types is the same (see table below). When checking float level, weight of float only, should be forcing needle against the seat.* Invert main body so that weight of float only is resting on needle valve (hold finger against retainer to fully seat fulcrum pin). Distance from surface of fuel bowl to crown of each float at center should be as indicated in table. To adjust, hold floats on bottom of bowl and bend float lip as necessary.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 6 CYL. ENGINE HARD COLD STARTING & SLOW WARM-UP PERFORMANCE CORRECTION:* Check to see if a 1961 model choke assembly, Part No. 170-BC-634S or 170-BC-667S is installed in place of a correct 1962 choke assembly, Part No. 170-BC-716S (Exc. Taxi); 170-BC-717S (Taxi). *The 1962 Series choke rod is slightly shorter than the 1961 Series choke rod.*

►*HARD COLD WEATHER STARTING CORRECTION:* This condition may be caused by choke vacuum unloader piston sticking. To correct, remove air cleaner and squirt a suitable carburetor cleaner, lacquer thinner or alcohol through piston link opening while operating choke valve to flush out gum formation.

DESCRIPTION: Single barrel downdraft type similar to design used on previous models.

ADJUSTMENTS: *Make all adjustments exactly as listed below.*

Idle Adjustment: Make preliminary setting of idle adjustment screw by turning screw in until it is lightly seated, then turn screw out 1 turn. Bring engine to normal operating temperature so that choke valve is wide open and fast idle is inoperative. Set engine speed to correct RPM, then adjust idle mixture as follows:

Idle Mixture Setting - With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn idle mixture screw in until speed starts to drop. Turn screw out just enough to recover engine speed that was lost. Readjust idle speed screw for correct engine RPM.

►*IDLE SPEED SETTING CAUTION:* When making Idle Speed & Mixture adjustments, turn headlights on high beam to compensate for alternator load (alternator charges battery at idle speed). On automatic transmission cars, unsnap ball joint connection at accelerator shaft bellcrank so that stop in transmission will not interfere with free movement of carburetor throttle lever. After adjustment is completed, screw the ball joint connector up or down until ball on bellcrank will exactly mate with socket, then snap into place.

Idl Sp d - 550 RPM (All Models). *S "Idl Spe d S tting Caution" abov .*

Acc l rating Pump & B wl V nt Adjustment: *NOTE - Thr hol s ar provided in throttl l v r for pump connector r d engag m nt t pr vid s asonal pump s tting as indicated below.* With throttle stopscrew backed off and throttle valve fully closed, place connector rod in center hole (Exc. 3233S, 3235S, 3286S, 3287S); inner hole (3233S, 3235S, 3286S, 3287S) of throttle lever and plunger pin spring in center groove (Exc. 3233S, 3235S, 3286S, 3287S); in upper groove (3233S, 3235S, 3286S, 3287S), bend connector rod as necessary to provide a measurement of 27/32" between top of air horn and end of plunger shaft. With plunger shaft correctly adjusted, there should be 5/64" clearance between top of bowl cover and bowl vent valve.

Pump Seasonal Setting - Standard setting is with pump connector rod engaged in center hole (Exc. 3233S, 3235S, 3286S, 3287S); inner hole (3233S, 3235S, 3286S, 3287S) of throttle lever. *NOTE - Outer hole in throttle lever provides greater discharge. Inner hole provides less discharge.*

Float Level: *NOTE - Either a "Viton" tipped inlet needle valve or a "Resilient" type inlet valve seat is used. Float level specifications for both types is the same (see table below). When checking float level, weight of float only, should be forcing needle against seat.* Invert main body so that weight of float only is resting on needle valve (hold finger against retainer to fully seat fulcrum pin). Distance from surface of bowl to crown of each float at center should be as indicated in table. To adjust, hold float on bottom of bowl and bend float lip as necessary.

Float Level Setting

Carburetor	Checking Gauge	Float Level
Exc. 3233S, 36S, 86S, 87S	T109-239	7/32"
3233S, 36S, 86S, 87S	T109-239	9/32"

Fast Idle Cam Index Setting: With choke valve tightly closed and choke connector rod in upper end of slot in cam, align center of adjusting screw with index mark on cam. To adjust, bend throttle connector rod.

Fast Idl Thr ttle Valve Clearanc : With adjusting screw on index mark of cam, there should be .030" - Gauge T109-29 (Exc. 3233S, 3236S, 3286S, 3287S); .026" - Gauge T109-189 (3233S, 3236S, 3286S, 3287S) clearance between lower edge of throttle valve and bore.

Fast Idle Speed: 170" Eng. - 1300 RPM (Auto. Trans. without Closed Crankcase Ventilation). 1400 RPM (Others).

225" Eng. - 1300 RPM (Synchro-mesh), 1400 RPM (Auto. Trans.).

Unloader: After completing fast idle adjustment (above), hold throttle valve in wide open position, then close choke valve as far as possible without forcing. Measure choke valve opening or clearance between upper edge of valve and air horn wall using gauge listed in table below. Adjust by bending arm on choke trip lever which actuates choke lever. After adjustment, reassemble and adjust automatic choke.

Unloader S tting

CARTER BB UPDRAFT

CHEVROLET TRUCKS	Carter No.
1962 6 Cyl. Forward Control Models	871SC

►**ACCESS TO CARBURETOR (for Adjustment or Removal): Forward Control Models**—Remove toe pan attaching screws, disconnect wires at stop light switch, disconnect accelerator pedal rod from throttle control rod, remove toe pan.

DESCRIPTION: Plain tube, updraft type of same design as used on previous Chevrolet models

ADJUSTMENT & SERVICING: *See complete "Carter (BB) Updraft Type" carburetor in Carburetor Section of Manual and set this carburetor to the following specifications:*

IDLING ADJUSTMENT

Idle Screw Setting—½-1½ turns open (turn screw out for richer mixture).

Idle Speed—450-500 RPM (Std. Trans.), 400-450 RPM (Auto. Trans. in Neutral).

FLOAT LEVEL SETTING

Float L v l—0-1/32" (Carter Gauge T109-49 or Chevrolet J-818-13A) from top of float to top edge of bowl with needle valve seated.

CAUTION—Use 1/32" side of gauge (other side used for 1/16" settings).

Intake Needle & Seat Ass mbly— Carter No. 25-44S

ACCELERATING PUMP

Pump Seasonal Setting—Short Stroke—Summer, Long Stroke—Winter.

Pump Stroke - 9/16" (Short Stroke) with connecting screw in holes in throttle lever and pump link nearest throttle shaft, 1" (Long Stroke) with screw in holes farthest from shaft.

THROTTLE VALVE SETTING

Idle Port—.005-.009" from top of lower idle port to lower edge of throttle valve.

Vacuum Spark Port—.000-.004" top of port below lower edge of throttle valve.

NOTE—Above specifications apply with throttle valve. tightly closed.

SERVICE PARTS

Gask t S t - Carter No. 202.

R pair Pkg. (With Std. Met ring J t) - Carter No. 1539A.

CORVAIR MONZA SPYDER SUPERCHARGER

C rvair M nza (1962)

DESCRIPTION: This is an exhaust driven supercharger unit consisting of a precision balanced rotating group with a turbine wheel at one end and a centrifugal impeller at the other. Hot gases directed against turbine wheel blades spin the wheel, shaft and impeller at a high rate of speed, causing the compressor impeller to draw air-fuel mixture from carburetor and direct it into intake manifold at a higher-than-atmosphere pressure. The supercharger is provided with a semi-floating sleeve bearing which is lubricated with engine oil taken from the oil filter adapter and drained through a larger tube into rocker arm area of right hand cylinder head.

►*CAUTION: DO NOT attempt to install a supercharger unit fr m a special Corvair engine on a standard Corvair engin . The sp cial engine is designed with heavy duty parts for us with a supercharger.*

INSPECTION: Each Tim Engine is Serviced - Inspect hoses and connections of air intake system between carburetor and supercharger and from supercharger to intake manifold for leakage due to cracks, damaged gaskets, loose clamps or connections and for restrictions due to collapsed hoses or dented tubing. Inspect for exhaust leakage due to cracked exhaust manifold, loose supercharger mounting or damaged gaskets. Inspect oil lines and fittings for kinks, damage or leakage. Check engine exhaust. Excessive smoking may indicate a restricted air cleaner, overrich mixture, or faulty supercharger (seal) operation.

Ev ry 50,000 Mil s: *NOTE - This inspection should also be mad wh n v r troubl is suspected in supercharger.* Disconnect oil drain line at supercharger elbow, then connect a hose from elbow to a separate container at side of engine. Start engine and run at idle speed for one minute to determine oil flow (should be approximately one quart per minute at idle speed). Remove supercharger and carburetor assembly (see below), then remove carburetor from supercharger assembly. Inspect turbine wheel for cracks, erosion, chipped, nicked, missing or bent blades. Check for carbon build-up on blades and for carbon accumulation on back face of turbine wheel. Depress shield plate, back of turbine wheel, against spring ring and rotate turbine wheel. If turbine wheel does not rotate freely, dissassemble unit and inspect for damaged parts or foreign material causing interference. Remove compressor housing and gasket and inspect for scoring, wiping, erosion or pit marks on inner contour. Inspect impeller wheel for damaged blades or evidence of rubbing on housing. Check for oil accumulation on impeller or in housing which would indicate a defective oil seal. If necessary to clean impeller, use a nylon bristle brush and diesel fuel or kerosene. *CAUTION - Failure to remov all dirt may r sult in a more severe unbalance than xisted prior to cl aning.* Check endplay and radial play of turbine shaft (see below). If unit is in good condition, install compressor housing, using a new gasket, and tighten housing bolts to 80 inch lbs.

TURBINE SHAFT ENDPLAY: .005"-.008". To check endplay, attach a dial indicator to bearing housing so that indicator point is contacting impeller nut, then rest supercharger assembly squarely on hub of turbine wheel and push down on housing. Record the indicator reading, then release pressure on housing and repeat the operation at least once more to check measurement. *NOTE - Th shi ld spring acts to return wh el and shaft opposite pressure on housing. It is not necessary to hold shield away from turbine wheel.*

TURBINE SHAFT RADIAL PLAY: .022" (maximum). Place supercharger assembly on support ring, Tool J-21004, and position dial indicator so its point is resting on a flat of impeller nut. With indicator needle at zero, push impeller from side to side against indicator point and record the reading. Repeat this operation to to check reading. Recheck at 90° position to give a cross reading. If radial play is not within limits, the supercharger should be rebuilt.

TROUBLE SHOOTING: Smoking Exhaust, Loss of Engine Power, Low Boost Pressure - Dirty or undersize air cleaner. Restricted intake manifold or piping. Foreign matter or dirt accumulation on impeller. Interference or binding in rotary assembly. Damaged impeller or turbine wheel. Excessive oil leakage from seals.

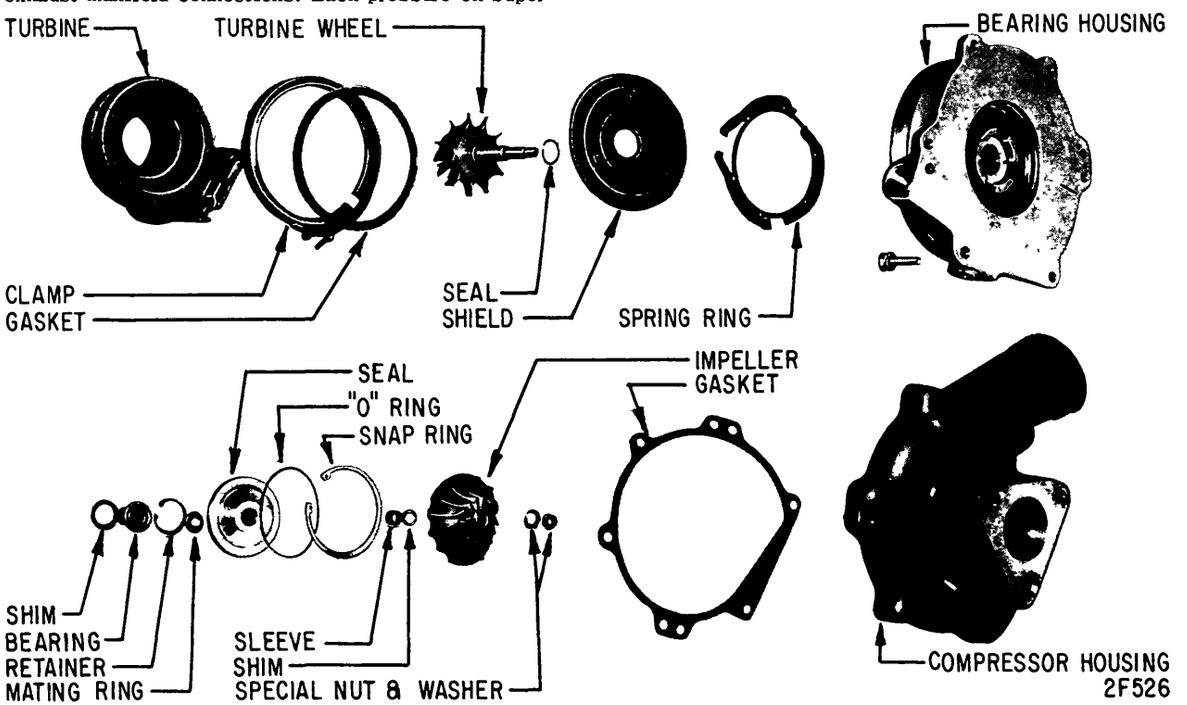
Noisy Rotating Assembly: Damaged bearing or other components causing rotating assembly to rub against housing. Foreign matter or carbon accumulation obstructing rotation.

Excessive Vibration: Damaged bearing. Damaged impeller or turbine blades. Restricted induction system.

Excessive Oil in Intake Manifold or Exhaust Stack: Excessive oil leakage from seals.

Supercharger Speed Low, Power Low (Clean Exhaust): Insufficient fuel supply to engine. Leaking intake or exhaust manifold connections. Back pressure on supercharger exhaust too high. Improper accelerator linkage adjustment. Improper ignition timing.

Fails T Return T Idl : Faulty throttle return check valve. Accelerator linkage adjustment.



CARBURETOR: *See "Carter YH Carburetors" in this section.*

SUPERCHARGER OVERHAUL: *NOTE - Always cov r supercharger openings when working on other parts f engine requiring supercharger openings to be expos d or when unit is stored.*

Removal: Remove spare tire, then remove air cleaner assembly and disconnect oil feed line and drain line at supercharger housing. Disconnect accelerator linkage at carburetor. Loosen turbine housing "V" clamp nut, then support supercharger and carburetor; remove clamp and lift assembly out of car carefully to avoid damage to turbine wheel or spillage of gasoline from carburetor. Remove carburetor attaching nuts and remove carburetor from supercharger housing.

Disassembly: *NOTE - Disassemble supercharger in a clean, dust-free location, using clean tools and equipment. Avoid contact with dust or grit that could scor machined parts.* Remove compressor housing from bearing housing, then hold turbine wheel blades with a cloth and remove self-locking nut *(Left Hand Threads)* from impeller end of turbine shaft, then remove washer. Support supercharger in a press with parallel blocks or support ring, Tool J-21004 so impeller wheel is upward. *NOTE - Place a folded cloth on bed of press or insid*

CONTINUED ON NEXT PAGE

CORVAIR SUPERCHARGER

CORVAIR MONZA SPYDER SUPERCHARGER (C nt.)

support ring to avoid damage to turbine wheel as it drops out of housing. Place a ¼" diameter brass rod on end of turbine shaft and press turbine shaft from impeller wheel. Remove impeller wheel, shims, shaft sleeve, turbine wheel and shaft assembly, turbine shield and shield spring ring. Remove oil seal retaining ring from bearing housing with snap ring pliers, then turn bearing housing over and push oil seal, "0" ring, and mating ring out of housing with a ½" diameter rod. Remove bearing retaining ring, bearing and shim.

Cleaning & Inspection: Wash all parts with diesel oil or kerosene, allowing to soak, if required, to remove carbon deposits. Use a nylon bristle brush to remove heavy carbon deposits. *CAUTION - Never use caustic solutions or other cleaner that may attack metal, or a wire brush that could score finished parts.* Inspect each part as follows:

Turbine Housing - Wiping, scoring or pit marks in inner contour. Cracks along dividing tongue, damaged threads in tapped holes or on studs.
Compressor Housing - Wiping, scoring, eroding or pit marks in inner contour and scroll. Damage on gasket surface.
Turbine Wheel & Shaft Assembly - Nicked, bent, broken or missing blades. Cracks at edge of blades. Scoring on back face or back hub. Excessive side wear or carbon build-up in shaft seal groove. Shaft discoloration due to overheating. *NOTE - Normal color of shaft is light tan.*
Impeller - Nicked, broken or missing blades. Evidence of rubbing on blades or back face. Fit of impeller on turbine shaft (impeller must be a press fit).
Bearing Housing - Scoring, heavy wear on bearing bore. Cracked or damaged bearing flange face. Damaged "0" ring seats or snap ring grooves. Thread damage in oil inlets or outlets. A secure bearing roll pin.

Bearing - Scuffing, pit marks or scratches. Imbedded foreign material. Damage to thrust surfaces. Damage on external diameter or shim surface.
Turbine Shield - Check for flatness, scoring, eroding or pitting. Damage to spring ring such as warpage or loss of tension. Check mating ring for scuffing, discoloration or carbon buildup on sealing or thrust surfaces.
Oil Seal Assembly - Chipping, scoring or uneven and excessive wear on carbon face seal insert. "0" ring groove damage. Make sure carbon seal is free floating and has a satisfactory spring tension.

Reassembly: *NOTE - Replace all gaskets "0" ring seal, and damaged or worn parts.*

1) Support bearing housing on ring, Tool J-21004, with flat surface (impeller side) upward, then install a new roll pin in bearing housing (if required) so slot is aligned radially inward.
2) Check shaft-to-bearing play as follows: Place bearing, mating ring and sleeve on turbine shaft. Hold mating ring against shoulder on turbine shaft, then hold bearing up against mating ring and measure clearance between bearing and lower shoulder with a feeler gauge. Record this measurement for later use when determining impeller end clearance.
3) Determine bearing-to-housing endplay and select proper shims as follows: Install bearing into housing, lining up roll pin and hole in flange, then install bearing snap ring. Position a dial indicator with point resting on bearing, and set indicator to zero. Push bearing upward against retaining ring and then down to bottom in housing and record the variation (repeat this measurement at least once to be sure of reading). Remove retaining snap ring and bearing and select a shim that will reduce endplay to .001-.002". As an example: If endplay was .015", use one .014" shim to reduce endplay to .001-.002". *NOTE - Shims are available in thicknesses of .008", .009", .010", .011", .012", .014".* The adjusted endplay of bearing-to-housing (.001-.002") plus shaft-to-bearing endplay (see paragraph 2) is total shaft endplay.
4) Install selected shim, bearing and bearing retainer ring (beveled side upward), then position mating ring so it is centered on bearing flange face. Lubricate "0" ring seal with silicone grease and install in groove of oil seal assembly. Install oil seal assembly into housing by pressing by hand as far as it will go, then install retaining ring (beveled side upward) to hold it in place.
5) Determine impeller shims requirements (for impeller-to-housing clearance) as follows: Place shaft sleeve in center of oil seal assembly, then place the impeller over seal so its center hub rests on shaft sleeve. Install gasket and compressor housing in position on bearing housing and install every other bolt. Tighten to 80 inch lbs. Position a dial indicator with point contacting impeller hub and set indicator at zero. Use long nose pliers to hold hub of impeller and lift straight up on impeller as far as it will go, then record indicator reading. Repeat this operation to check reading. Subtract total shaft endplay (paragraph 3) from the indicator reading just recorded and select shims to reduce impeller clearance to .015-.020". As an example: If impeller movement indicated a clearance of .037", subtract total shaft endplay (.005" as an example); leaving an indicated clearance of .032". Shim thickness must be between .012" and .017" to provide a maximum clearance of .015-.020". *NOTE - Shims are available in thicknesses of .010" and .015".*
6) Remove compressor housing, gasket, impeller and shaft sleeve from bearing housing, then turn bearing housing over (on ring support tool) and install spring ring. Position turbine shield to install with three projections spaced over flat areas of spring ring. Lubricate turbine shaft seal ring groove with oil and install ring into groove. Compress ring into groove using a tag wire or a plastic compression ring. *NOTE - If tag wire is used, make one twist with pliers and bend wire to form it around curvature of shaft and back face of turbine wheel. Remember dir ction of twist in wire for easy removal.*
7) Lubricate bearing area of shaft and install shaft through bearing. *NOTE - If a plastic compr ssion ring was used, leave it on shaft as it will burn away after installation. If tag wire was used to compr ss ring, remove wire by a reverse twist and slid it out from between shield and whe l. Hold wh l so it will not slide out past ring.*
8) Hold turbine wheel tightly against shield (so seal ring will not fall out of seal area), then turn assembly over and place in a press so turbine wheel hub rests on press plate. Install shaft sleeve, impeller shim (as determined in paragraph 5), and start impeller on turbine shaft. Press impeller onto shaft, using a hollow spacer, until it bottoms. *NOTE - As an alt rnate method of installation, the impeller may be heated to a temperature of not more than 300°F and installed onto shaft by hand, without the need of a pr ss.* Remove assembly from press and position special impeller washer with dished head upward and install self-locking nut (left hand threads) on shaft. Hold turbine wheel with a folded cloth and tighten nut to 80 inch lbs.

9) Place gasket and compressor housing on bearing housing, secure with six bolts and tighten to 80 inch lbs. Remove holding tool from oil drain opening, then with assembly in approximate installed position, add oil into oil inlet until it flows from drain opening. Install holding tool and install carburetor. *NOTE* - If supercharger is not going to be installed immediately, cover all openings to prevent damage or entrance of foreign matter.

10) If it is necessary to replace turbine housing (attached to exhaust pipe flange), disconnect inlet and outlet flanges, then loosen muffler mounting strap so turbine outlet pipe can be wobbled. Slide turbine outlet pipe flange from turbine by wobbling as needed, then remove from inlet pipe flange. Remove choke heat tubes from inlet flange on housing and install them in new housing flange. To reinstall turbine housing, reverse removal procedure and tighten stud nuts to 80 inch lbs.

Installation: Reverse removal procedure and tighten clamp nut to 30-40 inch lbs.

CARTER YH HORIZONTAL CARBURETORS

CORVAIR **Cart r Carb. N .**

1962 Monza (Supercharged Engine).....3311S

DESCRIPTION: Single barrel, side draft (horizontal) type with diaphragm operated metering rod (vacuum & mechanically controlled by action of accelerator pump assembly). An automatic choke assembly is used on all models. Heated fresh clean air is drawn from carburetor air cleaner through choke heat passages in turbine housing-to-exhaust pipe attaching flange, then into choke housing for automatic choke control.

►*SUPERCHARGER NCTE: See "Corvair Supercharger" in this s ction.*

ADJUSTMENTS: Idle Setting - For initial adjustment to start and warm-up engine, turn idle mixture screw out 3/4 turn from a lightly seated position. With engine at normal operating temperature (tachometer and vacuum gauge connected), proceed as follows:

Idl Sp ed: 850 RPM with choke valve fully open and fast idle inoperative.

Idl Mixtur : With engine operating at correct idle speed, adjust idle mixture screw to obtain highest vacuum. Readjust idle speed and repeat idle mixture adjustment.

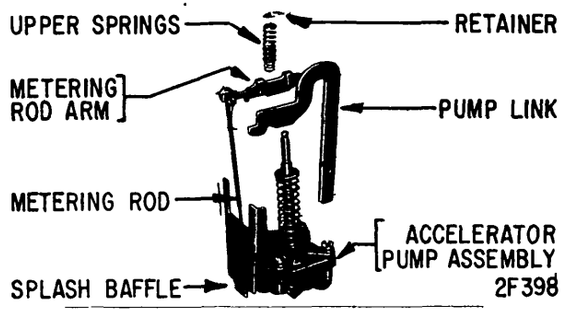
Thr ttle R turn Check: With engine at normal operating temperature and correct idle speed (choke valve fully open and fast idle not operating), measure distance between throttle valve lever and return check valve bolt. This distance should be .030". To adjust, hold a wrench on flat of diaphragm stem and turn self-locking nut as necessary.

Fl at Lev l: 5/8". Invert bowl cover and measure distance between float at center and gasket surface of bowl cover (gasket removed). Adjust by bending float arm.

Fl at Drop: 2 3/8". Hold bowl cover in upright position and float hanging free. Measure distance between gasket surface (gasket removed) and float seam at free end of float. Adjust by bending tang at hinge end of float.

Aut matic Ch ke: 1 notch rich. Loosen choke coil housing retaining screws and rotate cover as necessary.

Fast Idle (On Engin): No adjustment required.



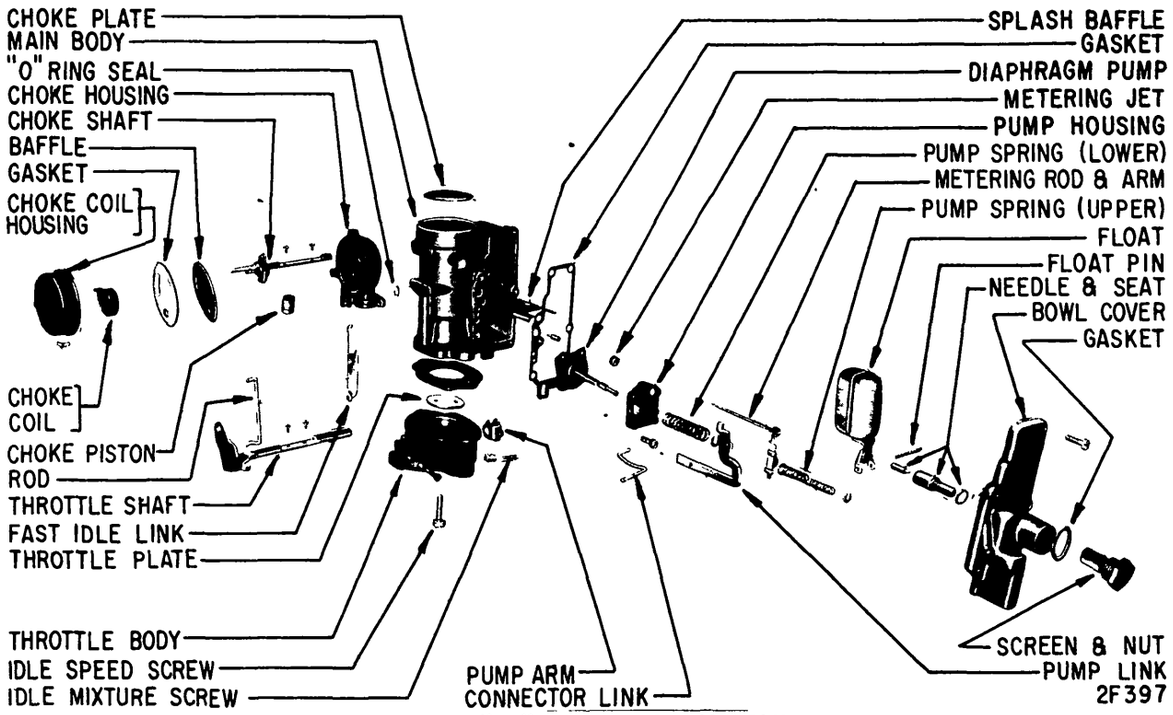
Fast Idl (Off Engin): Hold choke valve tightly closed and close throttle valve as far as it will go (fast idle link on high step of fast idle cam). Clearance between throttle valve and bore on side opposite idle port should be .030". Adjust by bending fast idle connector link. *NOTE - Fast idl adjustm nt must be made before unl ad r is adjusted.*

Unloader: With fast idle properly adjusted, open throttle to wide open position while holding tension on choke valve. Measure distance between edge of choke valve and side of bore opposite vent tube. This measurement should be 7/16". To adjust, bend unloader tang on fast idle cam.

Metering Rod: With throttle valve held tightly closed, remove metering rod and install Tool T109-104 in metering jet. Push down on pump diaphragm rod until metering rod arm just touches lifter link. At this point, metering rod arm pin should just contact top gauging surface of tool. To adjust, bend metering rod arm at undercut portion. Remove gauge and reinstall metering rod.

OVERHAUL: Disass mbly - Remove inlet filter screen nut and screen, then remove float bowl cover. Remove float and float needle and seat. Remove bowl cover gasket and tip carburetor and remove pump discharge needle valve. Loosen pump lever screw from throttle shaft and slide lever off shaft and link. Depress small spring on pump with a screwdriver and remove spring seat and spring, then lift metering rod arm and rod from pump rod and metering jet. Raise pump arm enough to remove link, and remove pump arm. Remove diaphragm pump assembly, splash deflector plate and metering jet. Remove choke link clip and choke link, then remove choke housing cover, gasket and baffle plate, and slide choke lever out of housing. Remove throttle body flange assembly from carburetor main body, then remove idle speed screw and spring from throttle body. *NOTE - Do not remove choke valve, choke piston, or throttle valve unless shaft and piston are binding or if parts must be replaced.* File staked ends of throttle plate and choke plate screws level with shaft, then remove screws and plates. Remove throttle shaft by sliding out of throttle body. Rotate choke shaft until piston comes out of bore, then slide shaft assembly from main body. Remove choke housing and discard vacuum passage "O" ring.

Inspection: Wash all parts except choke coil housing assembly in cleaning solution. Remove all carbon from throttle body bore and blow out all passages with air. If choke piston is not free in housing bore, remove welch plug from housing and clean cylinder bore with fine sandpaper if necessary. Install a new welch plug



ACCELERATOR PUMP & LINKAGE

so it is air tight. Inspect all parts for wear or damage and replace as necessary.

Reassembly: If throttle shaft was removed, slide shaft into throttle body and position throttle plate on flat of shaft with numbered side to shaft, then install screws loosely. Center throttle plate on shaft and in throttle bore, then tighten screws and peen securely. If choke shaft was removed, install a new "O" ring seal and position choke housing on air horn. Tighten attaching screws just snug. Slide choke shaft into air horn part way, then install piston to shaft and position shaft by rotating while installing piston into cylinder bore. Tighten choke housing screws securely.

CONTINUED ON NEXT PAGE

CARTER "YH" CARBURETOR ASSEMBLY

CARTER YH HORIZONTAL CARBURETORS (Cont.)

Position choke plate on flat of shaft so identification numbers are on air cleaner side, then complete installation in same manner as for throttle plate. Install throttle body on main body and tighten attaching screws securely (use a new gasket). Install diaphragm assembly in diaphragm housing, then install lower spring and retainer. Install metering jet (no gasket), then install diaphragm housing screws and thread them in two or three turns to hold diaphragm in alignment and install diaphragm assembly in carburetor bowl. Tighten attaching screws securely. Install splash shield between metering rod jet and pump housing, then install metering rod onto rod arm, hook spring, and install clip. Place pump lifter link in guide opening and insert throttle lever connector link onto pump lifter link (connector must be installed before lifter link assembly is completely in position) then place lifter arm down over pump rod. Place metering rod in jet with arm over pump rod and lifter arm, then place upper springs over pump rod. Compress springs with a screwdriver and install retainer. Install throttle shaft pump lever over throttle shaft and pump link, then tighten retaining screw. Adjust metering rod (see above). Install float needle seat, needle valve, and float assembly in bowl cover (float hinge pin shoulder to outboard side of of bowl), and adjust float level and drop. Install pump discharge needle, then install bowl cover (and a new gasket) and tighten cover screws. Install fast idle link into choke housing and hook unloader projection over tang on fast idle cam assembly. Install choke link connector link to throttle lever keyed hole, then to choke link with a clip. Adjust fast idle (see above), then adjust unloader. Install choke baffle plate, gasket, choke coil housing, retainer clips and screws. Adjust automatic choke (see above).

CARTER WCD 2-BARREL CARBURETORS

RAMBLER — **Carter No.**
Classic 6 Cyl. 3322S

DESCRIPTION: Dual downdraft carburetors with automatic choke. Same design as used on previous models.

ADJUSTMENT: *Make all adjustments exactly as follows:*
Idling Adjustment: Warm up engine thoroughly so that choke valve wide open and fast idle inoperative. Adjust throttle stopscrew for correct engine speed, then adjust both idle mixture screws equally for smooth running and highest RPM. Turn screws out for richer mixture. Recheck idle speed.

Idle Mixture Screw Setting

Car	Idle Screw Opening
Rambler	½-2 turns

Idle Speed Setting

Car	Synchro-mesh	① Auto. Trans.
Rambler	550 RPM	② 500 RPM

① - With selector lever in "N" (Neutral).
② - Air Conditioner turned ON.

Accelerating Pump: Check and adjust pump stroke as follows: With pump connector link installed in outer hole (long stroke) of pump arm under dust cover on bowl cover, back off throttle stopscrew so that throttle valves fully closed. Place straightedge across dust cover boss directly above pump arm. Flat on top of pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at upper angle using bending tool T109-213.

Metering Rods: *CAUTION - Check and adjust metering rods after Pump Stroke Adjustment has been completed.*
Metering Rod Adjustment - No gauge required. With throttle stopscrew backed off and throttle valves fully closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover). Press down on vacumeter link until both metering rods just bottom in carburetor casting, then rotate metering rod arm until finger on arm contacts lip on vacumeter link, carefully tighten clampscrew. *CAUTION* - Do not disturb arm position.

Float Level: *NOTE* - Float assembly consists of two floats (right and left hand) and auxiliary lever. Floats are adjusted separately and should be set for uniform height (float level or vertical adjustment)

►*FLOAT SETTING CAUTION (CARBURETORS WITH RESILIENT INLET VALVE SEAT):* When bending float lever to adjust height on carburetors with resilient inlet valve seat, do not allow float lever to contact inlet needle as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle. Float level specifications are different for carburetors with resilient type inlet valve seats. *See "Float Level Setting" below.*

Float Level Setting - With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket, install correct gauge (see table below) on cover directly below floats with notched portions of gauge fitted over edge of cover casting. Make vertical and lateral adjustments on each float

Vertical Adjustment - Top of each float should just clear horizontal portion of gauge. Adjust by bending float arms. *CAUTION* - Adjust both floats evenly.

Lateral Adjustment - Sides of floats should barely touch vertical uprights of float gauge (necessary to prevent floats hanging up in bowl). Adjust by bending float arms.

Float Level Setting

Car	Float Level	Checking Gauge
Rambler	① 5/32"	T109-196

① - If inlet valve is equipped with resilient type seat, REDUCE float level setting 1/32".

Fast Idle: *CAUTION - Two settings (1) and (2) required.*

(1) Fast Idle Cam Clearance - Loosen choke lever clampscrew on choke valve shaft, insert correct gauge (see Checking Gauge (1) in table below) between lip on fast idle cam and boss on flange casting. Hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position, tighten choke lever clampscrew.

(2) Fast Idle Screw Setting - With choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite idle ports is correct (see Checking Gauge (2) in table below).

Fast Idle Setting

Car	Setting & Checking Gauge (1)	(2)
Rambler	.010" T109-200	.020" T109-29

Fast Idle Speed (On Car): 1750-1850 RPM with engine at normal operating temperature and fast idle screw on high step of fast idle cam.

Unloader: Hold throttle valve wide open and check choke valve opening or clearance between edge of valve and air horn wall. Adjust by bending unloader lip on throttle lever using bending tool T109-41.

Unloader Setting

Car	Choke Opening	Checking Gauge
Rambler	3/16"	T109-28

Automatic Choke: Adjust by loosening choke cover screws and rotating cover and coil assembly.

Automatic Choke Setting

Rambler	Centered (At Index)

THROTTLE VALVE SETTING: Check when overhauling carburetor.

Throttle Valve Setting

Car	Idle Port	Vacuum Spark Port
Rambler	① .095-.101"	② .028-.038"

① - Opening above upper edge of throttle valve.
② - Top of port above top edge of valve.

OVERHAUL: *See 1955 Annual Data, Page 257, or later Manual Edition.*

Service Parts

Gasket Set - Carter No. 360.

Zip Kit - 900-126.

CARTER YF SINGLE BARREL CARBURETORS

RAMBLER	Carter No.
American (Exc. "E" Stick)	2014S
American ("E" Stick)	3331S
WILLYS	
4 Cyl. "L" Head Jeep Dispatcher (Early)	2392S
4 Cyl. "L" Head Jeep Dispatcher (Late)	2392SA
4 Cyl. "F" Head Universal Jeep	938SD
4 Cyl. "F" Head 4x2, 4x4, 4WD	951SA
4 Cyl. "F" Head Fleetvan (Post Office)	3200S
4 Cyl. "F" Head Fleetvan (Others)	938SD
4 Cyl. "F" Head Forward Control	938SD
6 Cyl. "L" Head All Models	2467S

DESCRIPTION: Single barrel downdraft type with automatic choke (Rambler), manual choke control (Willys). Same design as used on previous models.

ADJUSTMENT: *Make all adjustments exactly as follows:*

Idling Adjustment: Warm up engine thoroughly so that choke valve wide open and fast idle inoperative. Adjust throttle stopscrew for correct engine idle speed, then adjust idle mixture screw for smoothest running and highest RPM. Turn screw for richer mixture. Recheck idle speed.

Idl Mixtur Screw Setting

Car & Carb.	Idle Screw Opening
Rambler 2014S, 3331S	½-1½ turns
Willys 938SD, 951SA, 3200S	¾-1¾ turns
Willys 2392S, 2392SA	½-2 turns
Willys 2467S	1-2½ turns

Idl Speed Setting

Car	Synchro-mesh	Auto. Trans.
Rambler	① 550 RPM	①② 500 RPM
Willys 4 Cyl.	600 RPM	② 600 RPM
Willys 6 Cyl.	550 RPM	

① - 500 RPM (Air Cond. Cars) with compressor operating.
② - Transmission selector lever in "N" (Neutral).

Float Setting: Invert air horn and float cover assembly allowing float to hang freely, then measure from top of float at free end to bowl cover (gasket removed). Adjust by bending lip that contacts inlet needle valve (do not bend float arm).

►*FLOAT SETTING CAUTION (CARBURETORS WITH RESILIENT INLET VALVE SEAT):* Resilient type inlet valve seat used on some 1962 YF carburetors. When bending float lever to adjust height on carburetors with resilient inlet valve seat, do not allow float lever to contact inlet needle as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle. If resilient type inlet valve seat assembly is installed in a carburetor having a solid type needle valve (not spring loaded), float level setting is not changed. If resilient type inlet valve seat assembly is installed in a carburetor having a spring loaded type needle valve, adjust float level to ½". *See "Float Setting Table" below.*

►*WILLYS CARBURETOR FLOAT SETTING CAUTION: A "spring loaded" intake needle valve is used on all models. Do not compress this spring when checking float level as a false float setting will be obtained.*

Float Level Setting

Car & Carb.	Float Setting	Checking Gauge
Rambler 2014S, 3331S	① 1/2"	T109-83
Willys 938SD, 951SA, 3200S	② 5/16"	T109-107
Willys 2392S,SA, 2467S	② 9/32"	T109-126
Willys (All Carbs.)	③ 1/2"	T109-83

① - With either a "resilient type" or solid inlet valve seat.
② - With solid inlet valve seat.
③ - With "resilient type" inlet valve seat and "spring loaded needle valve".

Accelerating Pump: Diaphragm type pump on all models, with ball check discharge valve (except 2467S), discharge needle (2467S). *CAUTION - On 2467S only, check pump adjustment whenever carburetor disassembled or pump linkage disturbed BEFORE checking and adjusting Metering Rod.*

Pump Adjustment (2467S) - With idle screw backed out so that throttle valves are fully seated, press down on upper end of diaphragm shaft until it is bottomed in diaphragm housing (Tool T109-212 may be used to hold diaphragm shaft down in this position). In this position, metering rod arm should contact lifter link at outer end nearest the springs. Adjust by bending pump connector link at lower angle using bending Tool T109-213. *CAUTION - Bending link at any other point may cause binding of pump lifter link.*

Metering Rod Adjustment: With throttle valve seated in bore of carburetor, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod. Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at outer end nearest the springs and at supporting lug. Adjust by bending lip of metering rod arm to which metering rod is attached.

Automatic Choke: *Used on Rambler 2014S & 3331S only. Willys carburetors have manual choke control.* Adjust by loosening cover screws and rotating cover and thermostatic coil assembly.

Automatic Choke Setting

Rambler 2014S, 3331S	1 Point Lean

Fast Idle Adjustment (Manual Choke Control): With choke valve in wide open position, check to see that lip on fast idle arm is in contact with boss on carburetor body casting. To adjust, bend fast idle arm rod at lower offset.

Fast Idle Adjustment (Automatic Choke Control): Remove thermostatic coil housing gasket and baffle plate. Crack throttle and hold choke valve fully closed, then close throttle. With fast idle cam revolved to fast idle position, hold choke valve and throttle valve closed as far as possible, there should be .054" clearance (Gauge T109-193) between throttle valve and bore of carburetor (side opposite idle ports). Adjust by bending connector link at lower angle.

Unloader Adjustment (Automatic Choke Control Carbs.): *NOTE - This adjustment must be made after fast idle adjustment.* Hold throttle valve in wide open position and close choke valve as far as possible without forcing. Clearance between lower edge of choke valve and inner wall of air horn should be 9/32" (Gauge T109-126). Adjust by bending arm of choke trip lever.

Anti-Stall Dashpot (Rambler with "E-Stick" Clutch Control): Turn idle speed screw out to allow throttle valve to close tightly in bore. Depress dashpot diaphragm stem fully, then adjust by turning dashpot in or out to obtain a clearance of 1/8" between dashpot stem and throttle lever. Tighten locknut, then reset idle speed.

OVERHAUL: *See 1956 Final Data, Page 258, or later Manual edition.*

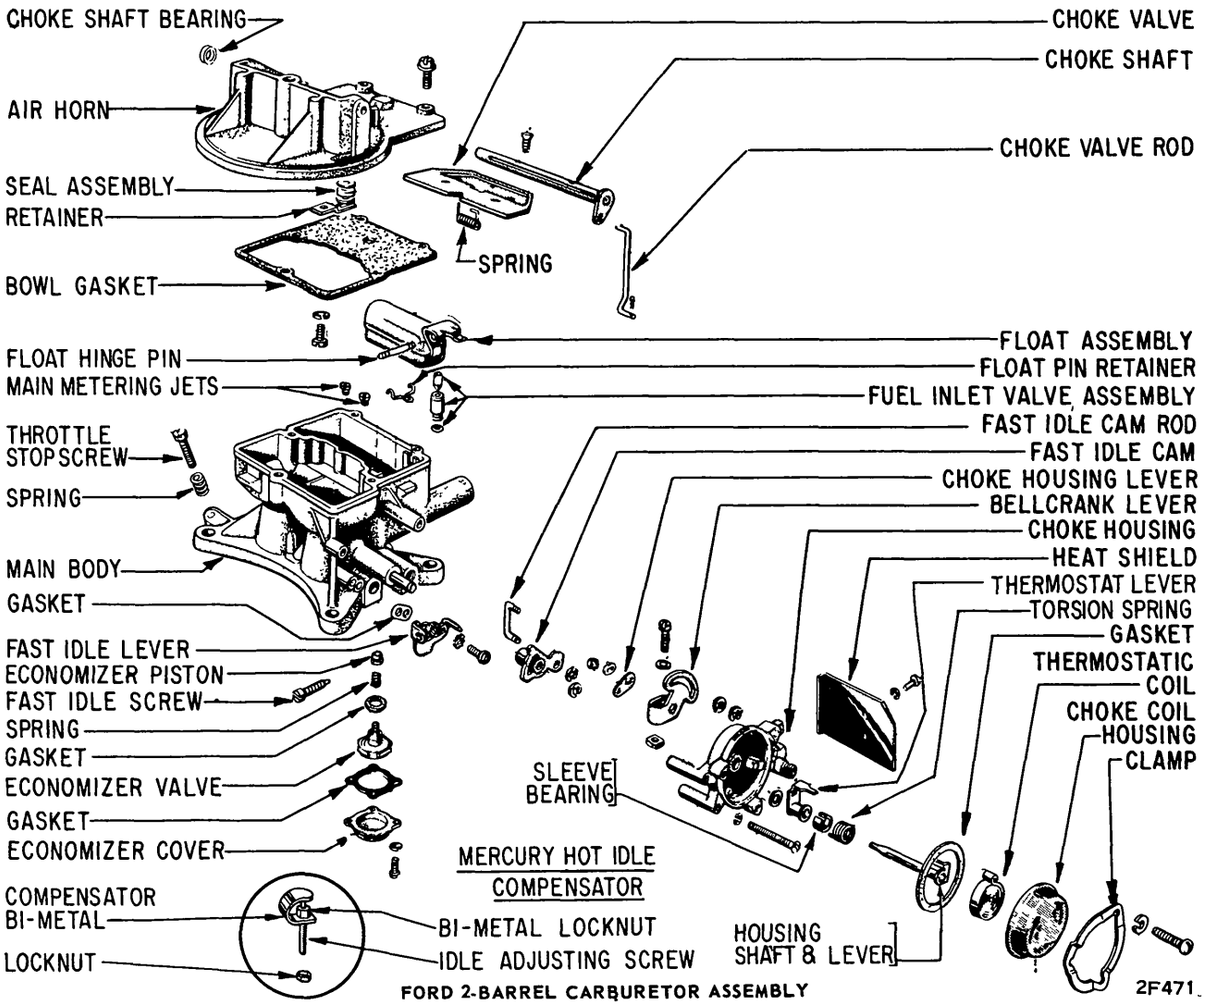
►CHANGES, CAUTIONS, CORRECTIONS

►*1962 221" ENGINE STUMBLE OR HESITATION CORRECTION:* This condition may be caused by improper fuel level setting. If fuel inlet needle is tipped with a resilient type material (Viton), check and adjust as indicated below for "Fuel Level Setting (Wet)".

►*1962 390" ENGINE STALLING, ROUGH, OR EXCESSIVE SMOKING ON STARTING CORRECTION:* Adjust fast idle speed and automatic choke initial choke valve "pull-down" to proper specifications (see below). If the loading condition exists after correct adjustments are made, replace original choke housing torsion spring with Part No. C2AZ-9A590-BI (plain color).



DESCRIPTION: Design is the same as used on previous models except as follows: Float design on 2-Barrel carburetors has been changed (same as primary float on 4-Barrel Carburetors). On all carburetors, the accelerator pump diaphragm has been changed, and the choke shaft design has been changed to provide for torsion spring adjustment. *NOTE - By adjusting torsion spring tension, the initial cold start opening of choke plate can be controlled.* Choke plate clearance adjustment procedure has been changed as noted below. On some carburetors, the fuel inlet needles are tipped with "Viton" to assure more positive closing.

ADJUSTMENT

►*ADJUSTMENT NOTE: Adjustments are the same for 2-Barrel and 4-Barrel carburetors except as noted below.*

Idle Mixture Setting: Initial adjustment is 1-1½ turns open from a lightly seated position (to warm-up engine). For final adjustment, with engine at normal operating temperature, and at normal idle speed (see idle speed below), proceed as follows: Turn idle mixture screws in until engine begins to run rough from lean mixture, then turn idle mixture screws out until engine begins to roll from rich mixture. Finally turn screws in just enough for smooth idling and highest vacuum reading. *NOTE - Always favor a slightly rich mixture rather than a lean mixture.* Recheck and adjust engine idle speed.

FORD 2-BARREL CARBURETOR ASSEMBLY

FORD 2 & 4-BARREL CARBURETORS (C nt.)

Idle Speed Setting (Hot Engine)

Engine	Idle Speed
All Exc. 390" (Synchro-mesh)	500-525 RPM
221" & 260" (Auto. Trans.)	Ⓒ475-500 RPM
221" (Auto. Trans.)	Ⓒ475-500 RPM
292" & 352" (Auto. Trans.)	Ⓒ450-475 RPM
390" Std. (Auto. Trans.)	Ⓒ475-500 RPM
390" Police (Synchro-mesh)	575-600 RPM
390" Police (Auto. Trans.)	Ⓒ550-575 RPM

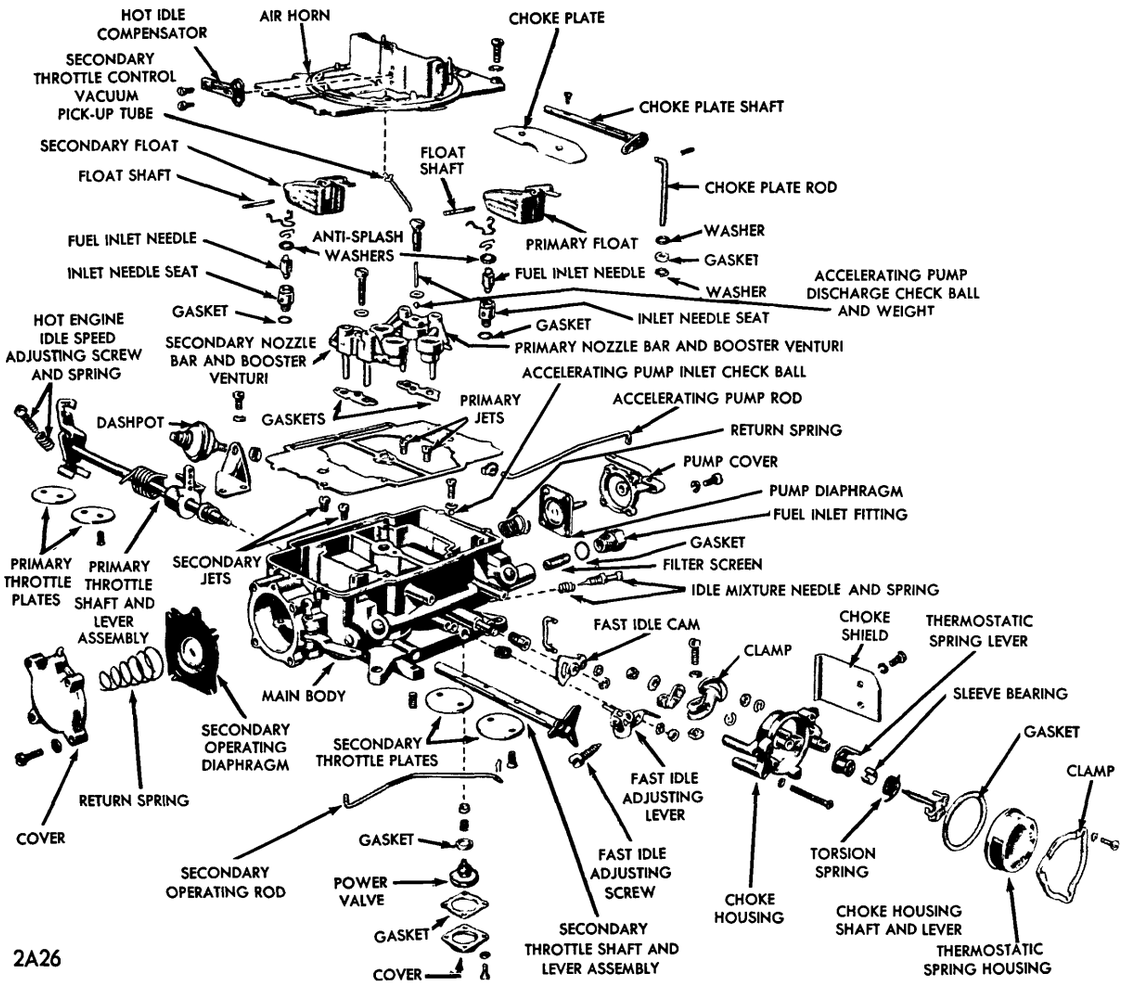
Ⓒ - Automatic transmission in "D" (Drive).

►*AIR CONDITIONED CAR IDLE SPEED NOTE: Operate air conditioner at least 20 minutes before setting idle speed.*

Anti-Stall Dashpot (Auto. Trans. Cars): *See Car Model pages for adjustment.*

Manual Throttle Control (Air Conditioned Cars): *See Car Model pages for adjustment.*

Accelerating Pump Stroke: *NOTE - Pump overtravel lever has four holes and the accelerating pump link has two holes.*



292", 352" & 390" Engines - Install accelerating pump operating rod in second hole from throttle shaft (average year around operation); in third holes from throttle shaft (extremely low operating temperatures); in first hole from throttle shaft (extremely high operating temperatures). Install opposite end of pump rod in inner hole of pump operating link (for all climatic conditions).

221" & 260" Engine - Install accelerating pump operating rod in outer holes, furthest from throttle shaft (average year around operation); in inner hole, nearest throttle shaft (extremely high operating temperatures). Install opposite end of pump rod in inner hole of pump operating link (for all climatic conditions).

Float Level (Initial Bench Setting): *CAUTION - Do not place excessive force on float needle as it may be tipped with "Viton" and damage would result.* Remove air horn, then with float raised and needle seated, check distance between gasket surface of main body and top of float at a point 1/8" from free end of float and 5/16" in from side of float adjacent to inside wall of fuel bowl. This measurement should be 21/32" (All Carbs.). To adjust, bend tab on float arm.

Fuel Level (Dry): *NOTE - If fuel inlet needle is "Viton" tipped, see "Fuel Level (Wet)" below.* With correct float setting, fuel level should be 29/32" ± 1/16". Secondary fuel level on 4-Barrel carburetors is the same as primary fuel level.

Fuel Level (Wet): *NOTE - If fuel inlet needle is "Viton" tipped, fuel level must be adjusted with carburetor installed on engine.* With engine at normal operating temperature and car on a flat level surface, remove air cleaner and carburetor air horn. Temporarily install air horn gasket in position on carburetor main body and start the engine. Allow engine to idle for several minutes, then remove air horn gasket. Distance from top machined surface of carburetor main body to level of fuel in bowl (with engine idling) should be 7/8" ± 1/16" (221" Eng.); 29/32" ± 1/16" (All other engines). *CAUTION - To obtain a true measurement, scale or depth gauge must be at least ¼" from any vertical surface because of capillary action of the fuel. Use care to measure fuel at the point of contact with the fuel and not after fuel is attracted to scale by capillary action.* To adjust, stop engine and bend float tab contacting fuel inlet valve upward to raise the fuel level, and downward to lower it. Each time an adjustment is made, restart engine and allow to idle for at least three minutes to stabilize fuel level. Recheck after each adjustment until correct fuel level is obtained.

FORD 4-BARREL CARBURETOR ASSEMBLY

Fast Idle Cam & Bellcrank Lever (On Bench): Open throttle valves (primary throttle valves on 4-Barrel carburetors) so fast idle adjusting screw will not interfere with fast idle cam when bellcrank is rotated, then hold choke plate in closed position by turning choke housing shaft to left (counterclockwise). Measure clearance between cast stop on back of choke housing and edge of fast idle cam. This clearance should be .050" (221" & 260" Engs.); .040" (All others). To adjust, loosen bellcrank lever screw and turn bellcrank lever as necessary to obtain correct clearance. *NOTE - To maintain proper vertical alignment between bellcrank lever and fast idle cam, bellcrank lever must be positioned against "E Clip" retainer on choke housing shaft.*

Fast Idle (On Engine): With slow (hot) idle speed properly adjusted, engine at normal operating temperature and throttle valves in closed position, position fast idle screw on second step of fast idle cam so it is against shoulder of highest step, then turn screw to obtain an engine speed as indicated below.

Fast Idle Speed

Engine	Engine RPM
221" & 260" Eng. (Synchro-mesh)	1300 RPM
221" & 260" Eng. (Auto. Trans.)	1600 RPM
292", 352", 390" Eng. (Synchro-mesh)	1200 RPM
292", 352", 390" Eng. (Auto. Trans.)	1500 RPM

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (Cont.)

Fast Idl (Off Engin): With fast idle screw resting on lower step of fast idle cam next to shoulder of highest step, turn fast idle adjusting screw until clearance between throttle valve and carburetor bore on side opposite idle ports is .017" (221" & 260" Eng.); .020" (292" Eng.); .028" (352" Eng.); .018" (390" Eng.).

Aut matic Ch k : Loosen thermostatic coil housing clamp screws and align index mark on coil housing with middle index mark on choke housing (292", 352", 390" Eng. with synchro-mesh transmission); 2 points lean (All other engines).

Automatic Chok Housing Torsion Spring Adjustment: *NOTE - After a cold start at low temperatures, if engine stumbl s or h sitat s (caused by lean mixture) or if engin runs rough (caused by rich mixture), change torsion spring t nsion as foll ws:* Remove thermostatic spring housing and place short tang of spring in the left prong to increase tension and correct for leanness. Place tang of spring in right prong to decrease tension and correct for richness. *NOTE - Normal position of spring tang is in the center prong.*

Automatic Choke Initial Choke Valve "Pull-Down" Opening Adjustment: Turn choke coil housing 90° counterclockwise to position choke linkage in fully closed choke position, then press choke valve toward open position until resistance to movement is felt. *CAUTION - Do not use force or tang on the lever in choke housing will be bent.* Measure clearance between lower edge of choke valve and inside vertical surface of air horn. This clearance should be 7/64" (221" & 260" Eng.); 3/16" (292", 352", 390" Eng. with synchro-mesh transmission); 5/32" (292", 352", 390" with automatic transmission). To adjust clearance, loosen setscrew on choke plate operating lever clevis with a 1/16" Allen wrench and move choke plate operating lever up or down as necessary to obtain correct clearance. Recheck fast idle-to-stop on choke housing clearance and adjust if necessary.

OVERHAUL: *See 1958 Final Data, Pg. 269, or later Manual Edition and note the following:*

Choke Housing Removal & Disassembly: Remove choke shield, fast idle cam retainer, thermostatic spring housing, clamp and gasket. Remove choke housing and gasket, then remove choke housing lever retaining nut, spacer and lever. Loosen screw on bellcrank clamp and slide bellcrank off choke housing shaft. Remove fast idle cam pickup rod from fast idle cam and bellcrank lever. Remove retainer from choke housing shaft and slide shaft assembly out of choke housing. Remove spacer, lever, and torsion spring from shaft.

① - This number stamped on choke plate flange.
② - Replacement carburetor part number is same as stamped on choke plate flange.
③ - Replacement carburetor, Ford No. C2SZ-9510-B.
④ - Replacement carburetor, Ford No. C2SZ-9510-C.
⑤ - Replacement carburetor, Ford No. C2TZ-9510-D.
⑥ - Replacement carburetor, Ford No. C2TZ-9510-E.
⑦ - Closed Crankcase Ventilator.
⑧ - Replacement carburetor, Ford No. C1TE-9510-AM.

DESCRIPTION: 2 & 4-Barrel carburetors similar in design to 1961 carburetors.

ADJUSTMENTS: Idle Mixture Setting (Exc. Ford & Mercury Triple Carburetors) - Initial adjustment is 1 turn open (Rambler); 1-1½ turns open (Ford Pass. Cars, Ford Trucks & Mercury); ½-turn open (Willys), from a lightly seated position. For final adjustment, bring engine to normal operating temperature and place transmission selector lever in "N" (Neutral). Turn both idle mixture screws in until engine runs rough from a lean mixture, then turn screws out until engine rolls from a rich mixture. Finally turn screws in just enough for smooth idling at highest RPM and highest vacuum. Reset engine idle speed to correct RPM (see table below).

Idle Mixture Setting (Ford & Mercury Triple Carburetors): Initial adjustment is 1-1½ turns open (Center Carb.); ¾-1¼ turns open (Front & Rear Carbs.), from a lightly seated condition. For final adjustment, proceed as for other models (see above), adjusting each carburetor separately, starting with center carburetor, followed by front carburetor, then rear carburetor.

HOLLEY 2-BARREL CARBURETOR (TYPICAL)

Initial Idle Speed Setting (Ford & Mercury Triple Carburetors): Back off idle speed adjusting screws on front and rear carburetors enough to allow plates to seat in throttle bores, then turn idle speed screws inward until screws end just touches throttle shaft arm. Turn screws in one full turn additional. *NOTE - Final idle speed adjustment must be made on center carburetor only.*

Synchronizing Throttle Linkage (Ford & Mercury Triple Carburetors): Disconnect linkage at front and rear carburetors and at bellcrank lever (center carburetor-to-bellcrank rod). Adjust length of front carburetor rod so that, when installed, throttle lever on front carburetor will be against wide open throttle stop when center carburetor lever is in wide open position against stop. Adjust length of rear rod in same manner, then install front and rear carburetor rods on throttle levers and tighten rod locknuts. Adjust length of center carburetor-to-bellcrank rod to 7¼" (center-to-center) and install rod on bellcrank lever. Disconnect accelerator-to-bellcrank lever rod at bellcrank lever, then synchro-mesh transmission cars (without overdrive), adjust length of accelerator-to-bellcrank rod to obtain wide open throttle when accelerator pedal is depressed to floor. On overdrive transmissions, depress accelerator pedal enough to close overdrive kickdown switch, then with accelerator in this position, adjust length of accelerator-to-bellcrank rod to obtain wide open throttle on center carburetor. Assemble rod to bellcrank lever and tighten clevis locknut.

CONTINUED ON NEXT PAGE

HOLLEY 2 & 4-BARREL CARBURETORS (Cont.)

Idl Sp d (H t Engin) S tting: All Models - *NOTE - On Ford & M rcury Tripl Carburetors, idle speed adjustm nt is mad on c nt r carburetor only. If engine will not idl at sp cifi d RPM, adjust front and rear carbur tors (s "Initial Idl Speed Setting, Ford & Mercury Tripl Carbur tors" above).* With engine at normal operating temperature, fast idle screw backed off so it does not touch fast idle cam, choke valve wide open, and transmission in neutral (synchro-mesh) proper range (automatic transmission - see table below). adjust engine idle speed to correct RPM (see table below).

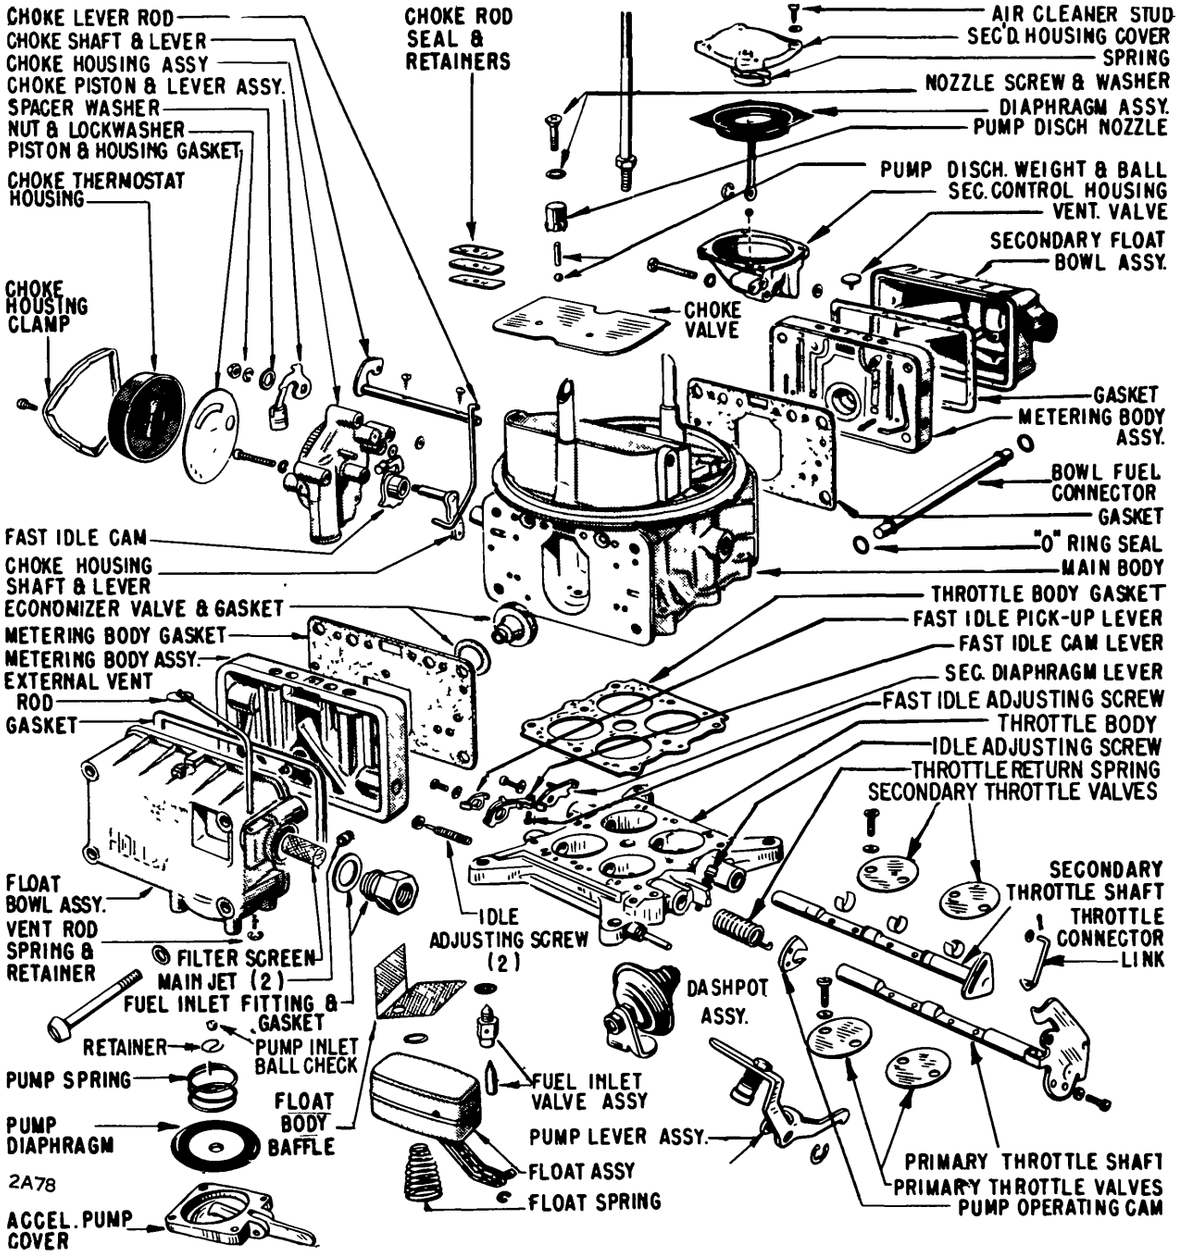
Car M d l	Engin Idle Speed S.M. Trans.	Auto. Trans.
Ford Pass. Car (All)	675-700 RPM	
Ford Truck (2-Bbk.)	500-550 RPM	① 475-525 RPM
Ford Truck (4-Bbl.)	525-575 RPM	① 475-525 RPM
Mercury (All)	675-700 RPM	
Rambler	500 RPM	②③ 475 RPM
Willys	590-600 RPM	

① - Transmission in "D" (Drive).
② - Transmission in "N" (Neutral).
③ - 500 RPM on Air Cond. cars with compressor operating.

Acc l rating Pump Ov rride Adjustment: Hold throttle valves wide open and depress pump arm fully. Distance between pump lever adjusting screw hex head and pump arm should be .015" (Exc. Rambler 2-Barrel Carbs.). To adjust, hold hex nut stationary and turn screw on pump lever. On Rambler 2-Barrel carburetors, turn adjusting screw in until it just contacts pump lever, then tighten screw ¼ turn. Check accelerating pump to make sure that when throttle lever starts to move pump lever also starts to move.

Acc l rating Pump Strok Adjustment: *NOTE - This is a seas onal s tting on all models.*

N rmal (Summ r) Setting - Install pump cam screw in No. 1 hole in cam. *NOTE - This provides minimum strok .*



Winter Setting - Install pump cam screw in No. 2 hole in cam. *NOTE - This provides maximum stroke.*

Fu l Bowl V nt Setting (Rambler): With throttle valves fully closed, distance between top of fuel bowl and vent button should be .050-.070". To adjust, bend vent arm of accelerating pump lever. *CAUTION - Do not bend v nt valv rod.*

Fl at Lev l (Dry S tting - On Bench): *NOTE - Float l vel s ttings are int nded for initial bench adjustment only. Aft r carbur tor installed on engine, the fuel l v l must b ch ck d and the necessary float level adjustments made. S "Fuel Level" below. Float level will be correct when fuel level adjusted.* With fuel bowl inverted, lower side of float should be parallel to floor of fuel bowl (Exc. Ford & Mercury 390" and 406" Engines with 4-Barrel carburetor or with Triple Carburetors & Ford Truck). On Ford & Mercury 390" & 406" Engines with 4-Barrel carburetor or Triple Carburetors & Ford Truck, distance from lower side of float to fuel bowl should be 7/8" (2-Barrel Carbs. and Primary float on 4-Barrel Carbs.). To adjust, loosen top lock screw on needle and seat assembly and rotate adjusting screw as necessary.

Fu l Lev l: With car on a level floor, bring engine to normal operating temperature, then remove air cleaner and stop engine. Remove sight plug in end of fuel bowl (use container to catch fuel). Fuel level within bowl should be at lower edge of sight plug hole (±1/16"). To adjust, proceed as follows

Fuel Level T o High - With engine stopped, loosen lockscrew on top of fuel bowl just enough to allow rotation of nut underneath. *CAUTION - Do not unl ck lockscrew or attempt to adjust fuel level with engine running.* Turn adjusting screw ½ turn clockwise to lower fuel level below specifications. Tighten lock-

HOLLEY 4-BARREL CARBURETOR (TYPICAL)

CONTINUED ON NEXT PAGE

HOLLEY 2 & 4-BARREL CARBURETORS (Cont.)

screw, then run engine to stabilize fuel level. Check fuel level at sight plug hole. If level is not below specified level, repeat above step. With fuel level below specified level, turn adjusting nut in increments of 1/6 turn until correct fuel level is obtained. *NOTE - 1/6 turn of adjusting nut will change fuel level at sight plug opening 3/64".*

Fuel Level Too Low - Proceed as for "Fuel Level Too High" except that it will not be necessary to initially decrease fuel level below specifications.

Unloader (Rambler): With throttle valves in wide open position, distance from top of choke valve to wall of air horn should be 3/16". To adjust, bend tab on throttle shaft lever (where it contacts fast idle cam).

Fast Idle - Off Engine (Rambler): With choke valve fully closed and fast idle adjusting screw on high step of fast idle cam, the clearance between throttle valve and bore on side opposite idle ports should be .025" (4-Barrel Carb.); .024" (2-Barrel Carb.). To adjust, turn fast idle adjusting screw.

Fast Idl - Off Engin (F rd Pass. Cars & M rcury with 4-Bbl. Carb.): With fast idle cam in slow idle position (bottom step of cam contacting fast idle screw), turn fast idle screw until it just touches lowest step on cam, then back screw off ¼ turn (.005-.008" clearance between fast idle adjusting screw and fast idle cam).

Fast Idle - On Engine (Ford Pass. Cars & Mercury 390" & 406" Engines with 4-Bbl. or Triple Carbs.) With fast idle screw on top step of fast idle cam, engine at normal operating temperature, adjust fast idle screw (center carburetor only with triple carburetors) to obtain an engine speed of 1800 RPM (Triple Carbs.); 1500 RPM (4-Bbl. Carb.).

Fast Idle - On Engine (Ford Trucks): *NOTE - On 2-Barrel carburetors, fast idle will be properly adjusted when engine hot idle speed is adjusted.* On 4-Barrel carburetors, proceed as follows: With engine at normal operating temperature and "hot" idle speed adjusted, place primary throttle valves in closed position and check clearance between fast idle cam and head of fast idle screw. Clearance should be .010-.015". If clearance not correct, remove governor housing and insert a .060" wire rod into hole in end of fast idle screw fitting to prevent it turning, then turn fast idle screw as necessary for desired clearance. *NOTE - ¼ turn f scr w (in r out) will change cl aranc approximately .008".*

Fast Idl - On Engin (Rambler): With engine at normal operating temperature, place fast idle screw on high step of fast idle cam and adjust engine speed to 1600-1800 RPM.

Fast Idle - On Engine (Willys): Fast idle will be properly adjusted when engine hot idle speed is adjusted.

Automatic Choke Setting (Exc pt F rd Trucks & Willys): Loosen choke cover retaining screws and rotate cover to align index mark on cover with correct mark on choke housing as indicated in table below.

Automatic Chok S tting

Car & Carb.	Ch ke S tting
Ford Pass. Cars (All)	Centered (On Index)
Mercury (All)	Centered (On Index)
Rambler (2-Barrel)	Centered (On Index)
Rambler (4-Barrel)	1 Point Lean

OVERHAUL: *See 1958 Final Data, Pag 274, or lat r Manual edition and note the following:*

Balance Tube (Ford Truck 4-Barr l Carbur t r): Install balance tube "O" rings and washers so balance tube extends equally from faces of primary and secondary metering bodies.

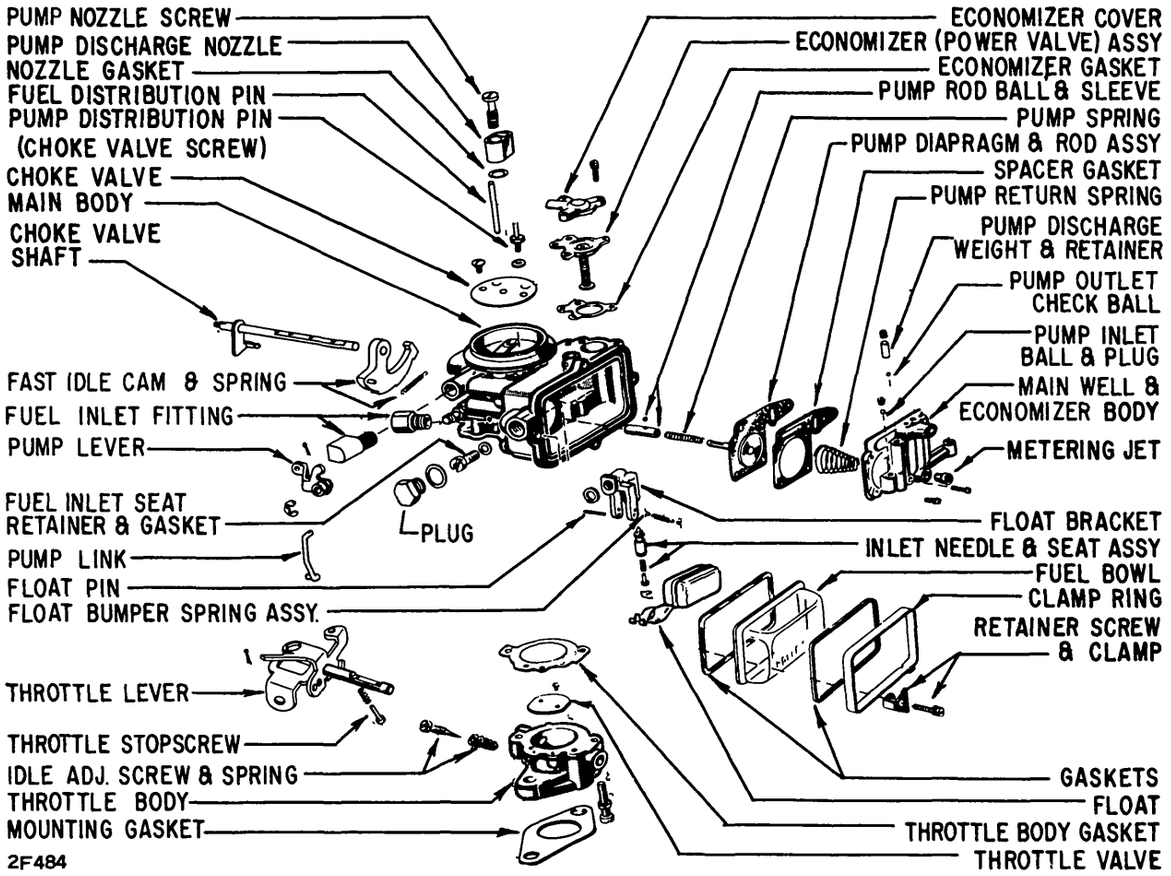
℄ - Part No. stamped on carburetor.
② - Closed Crankcase Ventilation.



►CHANGES, CAUTI NS, CORRECTIONS

►*CARBURETOR IDENTIFICATION NOTE: Part number is stamp d n flat surfac of main body at fuel inlet.*

►*HIGH FUEL CONSUMFTION CORRECTION (EXC. ECONOMY CARBS):* Power valve may be damaged or improperly installed. Check diaphragm for tears and replace if necessary, then install as follows: Be sure there are no restrictions in vacuum passages of cover, then install screws through cover. Carefully thread screws through diaphragm and plate and install gasket next to plate. Hold assembly together (do not allow diaphragm to drop away from cover) and locate the assembly squarely on carburetor bowl and tighten the screws to 13-17 inch pounds evenly. *CAUTION - Do not ov rtight n cover scr ws.*

DESCRIPTION: Single barrel downdraft type with either manual or automatic choke. Designs are similar to previous models and have the following features:

H lley Model 1904: Main nozzle tube is pressed into venturi wall directly below choke valve axis and discharges into a cutout section of choke valve. A fuel distribution pin (crosswise in choke shaft) extends into air stream and improves nozzle action. Pump discharge nozzle is a separate part mounted on upper ledge of venturi and is retained by a special nozzle retainer screw. *NOTE - This nozzle must be adjusted after carburetor is installed on engine.*

HOLLEY MODEL 1904 SINGLE BARREL CARBURETOR (WITH MANUAL CHOKE)

Holley Model 1908: Main nozzle tube and pump discharge nozzle are pressed into wall of venturi and are not removable. Choke valve plate is linked to choke shaft and lever assembly, choke valve plate is mounted in upper part of air horn. On models with automatic choke, fast idle cam is mounted on choke shaft (behind choke housing) and, on Rambler models, serves as a stop for idle speed adjusting screw (separate fast idle adjustment not required).

Spark Control Valve (Holley 1904 & 1908 Models, Except Rambler): This unit is a spring loaded diaphragm type valve located in distributor control vacuum passage terminating at throttle valve edge (manifold vacuum). The valve is normally open but closes momentarily during acceleration (when manifold vacuum drops) to prevent excessive distributor advance (second port terminating at venturi provides vacuum to control distributor under these conditions). The valve also provides an intermediate distributor retard position under load conditions when normal spark advance would be too great and where wide open throttle spark retard is not required. No adjustment is provided.

ADJUSTMENT: Make all adjustments as follows:

Idling Adjustment: If initial adjustment required to warm engine, turn idle mixture screw in until lightly seated, then back screw out 1-1½ turns (Exc. Rambler); 1¼ turns (Rambler). Operate engine at fast idle until normal operating temperature reached, then adjust as follows: **Idle Mixture** - With engine at normal operating temperature (choke valve wide open, fast idle inoperative), adjust idle speed (see below), turn idle mixture adjusting screw in until engine runs rough from lean mixture, then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough so that engine idles smoothly. This will provide a slightly rich mixture which is desired. Recheck idle speed.

Idle Speed - With engine at normal operating temperature so that throttle stopscrew resting on lowest point of fast idle cam (choke lever), adjust stopscrew for correct idle speed as listed in table below. *NOTE* - On Fordomatic cars, set hand brake to hold car and place selector lever in Neutral, then recheck idle speed with selector lever in Drive "D" position.

CONTINUED ON NEXT PAGE

HOLLEY SINGLE BARREL 1904 & 1908 CARBURETORS (C nt.)

Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans.
Econoline Truck	525-575 RPM	
Ford Pass. Cars	500-525 RPM	② 450-475 RPM
Ford Truck (144" Eng.)	525-575 RPM	
Ford Truck (Others)	500-575 RPM	② 475-525 RPM
Mercury	500-525 RPM	② 450-475 RPM
Rambler	① 550 RPM	③ 500 RPM

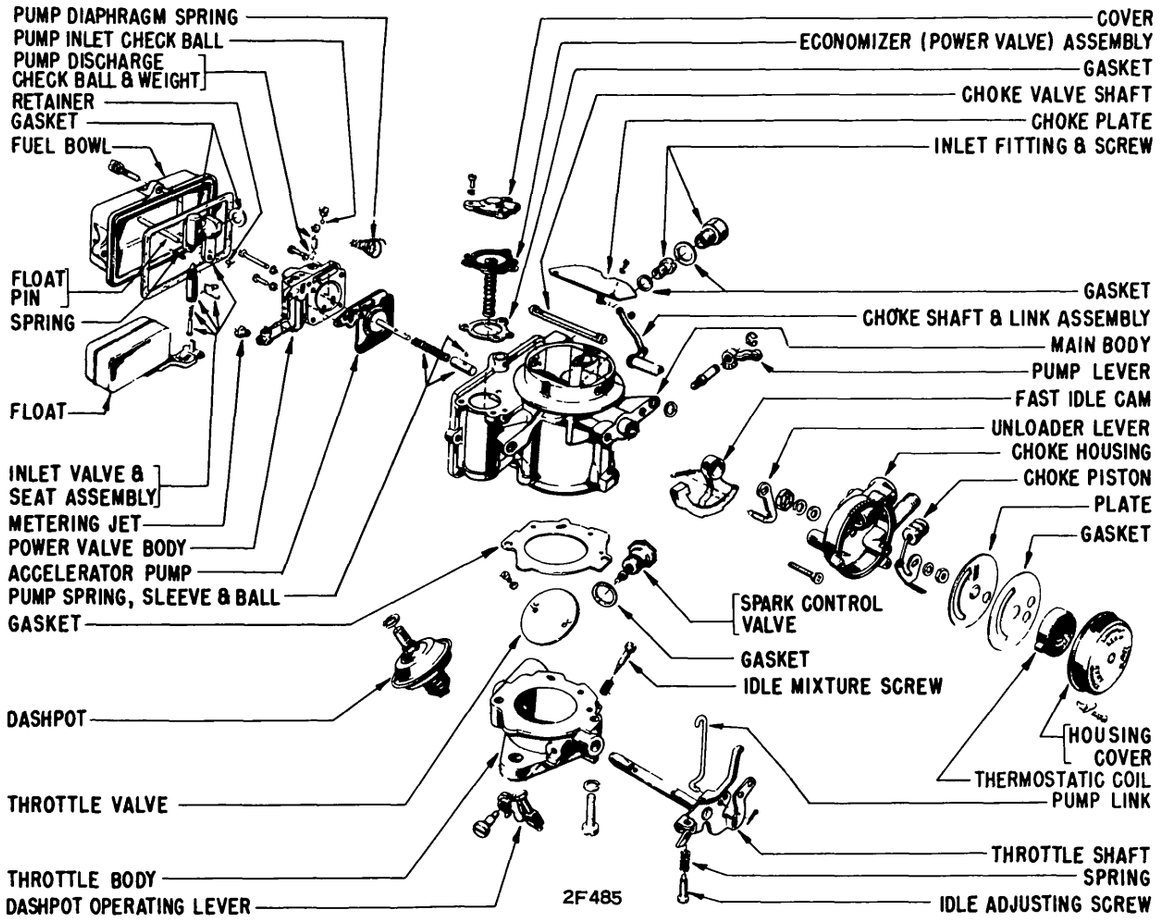
① - 500 RPM on Air Conditioned Cars, with compressor operating.
② - Transmission in "D" (Drive) Range.
③ - Transmission in "N" (Neutral).

Anti-Stall Dashpot Adjustment (Exc. Rambler): *See CARBURETOR on Car Model pages.*

Accelerating Pump: Seasonal adjustment provided by two holes in throttle lever for pump link engagement:
Inner Hole - Normal or hot weather (short stroke).
Outer Hole - Cold weather operation (long stroke).

Fuel Level: *See table below for fuel level and checking gauge.* To check fuel level, remove Power Valve diaphragm cover and valve assembly. Install checking gauge in this opening and crank engine to fill bowl. Fuel in bowl should touch "Low" gauge pin and should not touch "High" gauge pin. If adjustment required, remove float bowl and install dummy bowl (with open top) using three of the regular retaining screws. Adjust by using bending tool to bend float arm tab, recheck fuel level before installing regular bowl.

RAMBLER NOTE - Use scale inserted through power valve mounting hole to measure fuel level.



Fuel Level Setting

Car Model	① ② Fuel Level	Checking Gauge
Econoline Trucks	23/32"	T52L-9550-AEE
Ford Pass. Cars	11/16"	T52L-9550-AEE
Ford Truck (144" Eng.)	23/32"	T52L-9550-AEE
Ford Truck (262" Eng.)	3/4"	
Ford Truck (Others)	11/16"	T52L-9550-AEE
Mercury	11/16"	9550-AE-3
Rambler (R2381-1A, R2446-A)	3/4"	Scale
Rambler (R2138-1A)	11/16"	Scale

① - Plus or Minus 1/32".
② - Below mounting surface of power valve.

Float Level: *This is a bench check and Fuel Level should be checked after carburetor has been installed on engine.* On all models, use float gauge furnished in repair package (see table below). *NOTE - On Rambler models, if gauge is not furnished with repair package, use Holley Tool No. indicated in table.* With bowl removed and carburetor inverted, place gauge on bowl mounting flange at free end of float. Lowest point on float should clear lower leg of gauge. Adjust by bending small tab on float lever that contacts head of fuel inlet needle.

►*FLOAT SETTING CAUTION (CARBURETORS WITH "VITON" TIPPED INLET NEEDLE VALVE):* When bending float lever or tab on carburetors equipped with "Viton" tipped inlet needle valve, do not allow float lever or tab to contact inlet needle valve as tip can be compressed enough to cause a false setting or result in damage to tip. Check float level with weight of float only resting on needle.

HOLLEY MODEL 1908 SINGLE BARREL CARBURETOR (WITH AUTOMATIC CHOKE)

Float Level Setting

Car Model	① Float Level	Checking Gauge
Econoline Truck	11/64"	MC-157
Ford Pass. Cars	13/64"	MC-157
Ford Truck (144" Eng.)	11/64"	MC-157
Ford Truck (262" Eng.)	17/64"	MC-157
Ford Truck (Others)	13/64"	MC-157
Mercury	13/64"	9590-1
Rambler		② 10-231

① - Plus or minus 1/64". ② - Holley Tool number.

Power Valve: *NOTE - Used on all carburetors except "Economy Models".* No adjustment provided. Power valve opens when manifold vacuum drops to 4-7" Hg.

Spark Control Valve (Except Rambler): Spark control valve is not adjustable.

Automatic Choke (Rambler): Adjust by loosening cover retaining screws and rotating cover and thermostatic coil assembly. Set choke at Index (Exc. R-2381-1A & 2446-A); 3 Points Lean (R-2381-1A & 2446-A).

Fast Idle: No adjustment required.

Unloader (Rambler): With throttle valve in wide open position and choke valve closed against unloader lever, clearance between edge of choke valve and wall of air horn should be 7/16". To adjust, bend unloader tab on throttle lever.

OVERHAUL: *See 1960 Final Data, Page 289, Rambler Manual edition.*

SERVICE PARTS: Gasket Set - Ford Part No. B8A-9502-C (C2AE-9510-A,B,E,F); COAZ-9502-C (C2AE-9510-AC,C,D); CODZ-9502-A (C2UE-9510-A,B,C,D, C1UE-9510-D, C2TE-9510-C); C1TZ-9502-B (C2TE-9510-E,F,G,H,J,K,L). Holley No. 85G-1006 (R-2381-1A, R-2138-1A, R-2446-A).

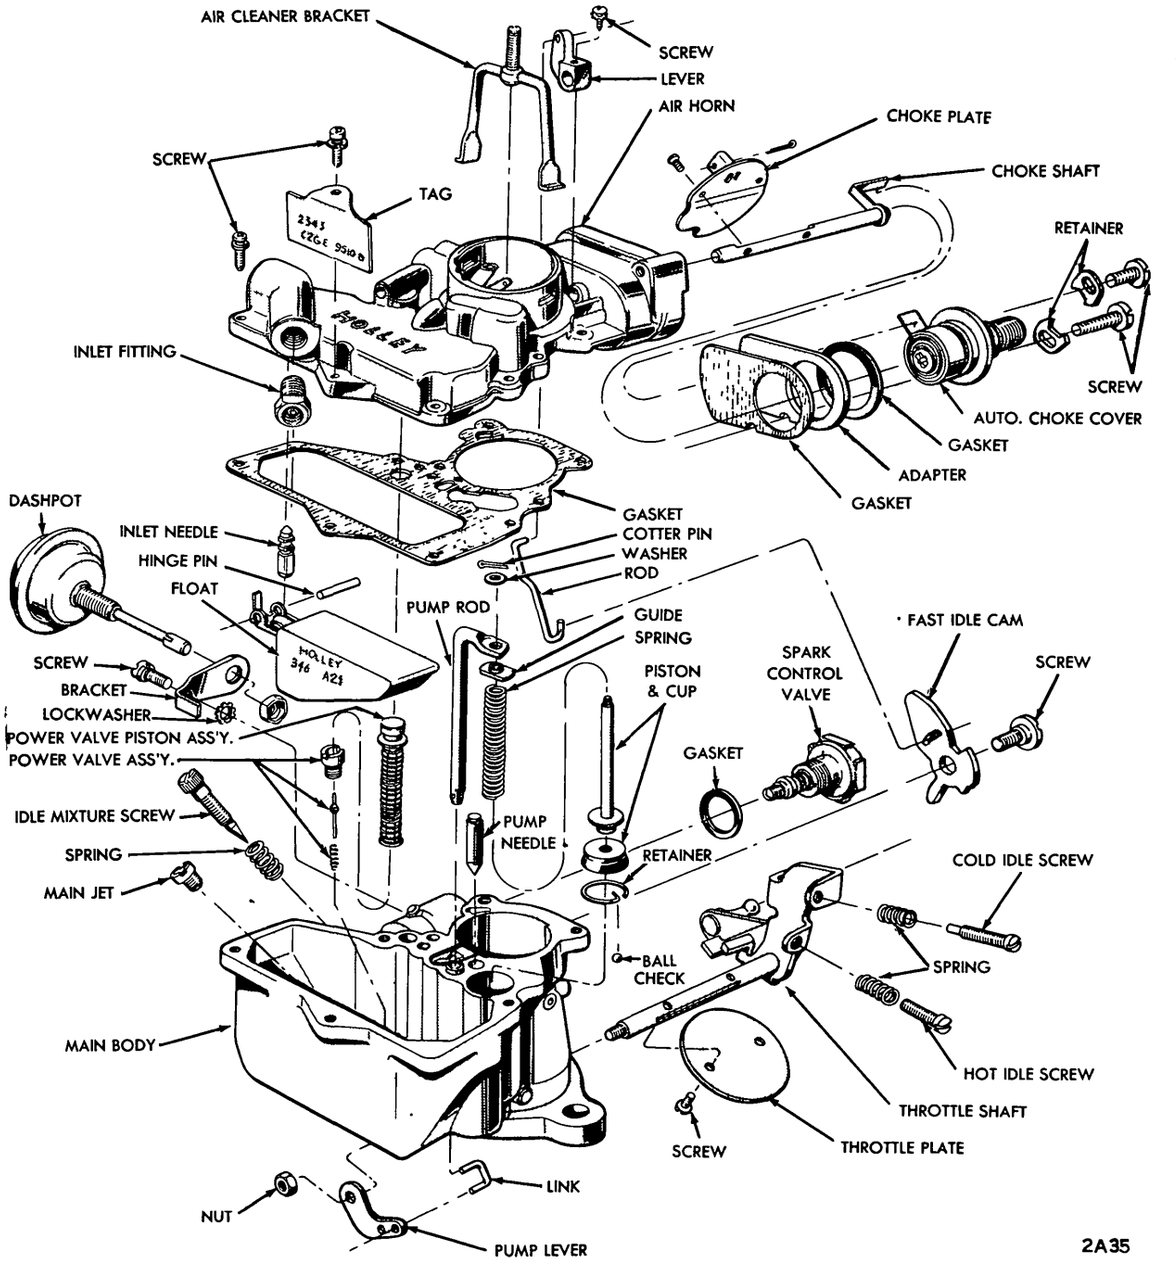
℄ - This number stamped on brass tag and on main body of carburetor .

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 COMET & METEOR CARBURETOR HIGH FREQUENCY BUZZ CORRECTION:* On cars built before Feb. 1, 1962, increase diameter of vacuum passage in carburetor air horn to expose a larger area of power valve piston to manifold vacuum (later carburetors have been modified in production). Remove air horn and cover assembly, then remove float assembly and fuel inlet needle. Use Tool 9904-E and remove power valve piston assembly. Enlarge vacuum orifice at top of piston bore by drilling a 3/16" diameter counterbore to a minimum depth of 3/64" or all the way through to a connecting horizontal passage. Use a hook type tool and compressed air to clean, scrape, and blow out all burrs and metal passages. Install power valve piston assembly and restake retainer securely in four places. Reassemble carburetor using a new air horn-to-main gasket. Readjust idle speed and mixture.

►*1962 CARBURETOR PRODUCTION CHANGE:* Late carburetors (see application above) have been changed in production as follows:



Main Well in Carburetor Body - Diameter has been increased to ¼" and a standpipe has been inserted into vertical passage of main discharge nozzle.

Accelerator Pump Vent - Pump well vent has been eliminated and venting is now accomplished with a free floating piston cup. Pump check ball retainer has been eliminated and an accelerator pump plunger return spring has been added. Return spring also serves as a check ball retainer.

Float Assembly - A boss has been added to air horn casting directly above free end of float to limit float overtravel. Float hinge tab has been reinforced by the addition of an embossed rib.

Check Cover Retainer - A one-piece automatic choke cover retainer replaces the two individual retainers.

Main Jets - One size larger main jets are used to compensate for flow characteristics of main well changes.

HOLLEY (MODEL 1909) CARBURETOR ASSEMBLY WITH AUTOMATIC CHOKE

DESCRIPTION: Single barrel downdraft type of new design with manual choke (Ford Falcon & Fairlane), and automatic choke (Mercury Comet & Meteor). This carburetor consists of two main sub-assemblies (air horn and main body) with the throttle body assembly integral with main body. The float is made of plastic material and the fuel inlet needle is tipped with "Viton". Accelerating pump is plunger type.

CONTINUED ON NEXT PAGE

HOLLEY SINGLE BARREL MODEL 1909 CARBURETORS (Cont.)

ADJUSTMENT

Idling Adjustment: If initial adjustment required to warm-up engine, turn idle mixture screw in until lightly seated, then back screw out 1-1½ turns (Ford Falcon & Fairlane), 1½ turns (Mercury Comet & Meteor). Operate engine at fast idle until normal operating temperature is reached, then adjust as follows:

Idle Mixture - With engine at normal operating temperature (choke valve wide open, fast idle inoperative), adjust idle speed (see below), then turn idle mixture adjusting screw in until engine runs rough from lean mixture. Now turn screw out until engine begins to roll from rich mixture. Finally turn screw in just enough so that engine idles smoothly. This will provide a slightly rich mixture which is desired. Recheck idle speed.

Idle Speed - With engine at normal operating temperature so that throttle stopscrew is resting on low step of fast idle cam, adjust throttle stopscrew for correct engine idle speed as indicated in table below. *NOTE - On automatic transmission cars, selector lever must be in "D" (Drive) position.*

Car Model	Idle Speed Setting Synchro-mesh	① Auto. Trans.
All Models (Std.)	500-550 RPM	475-525 RPM
All Models (CCV) ②	550-600 RPM	525-575 RPM

① - Automatic transmission in "D" (Drive).

② - Closed crankcase ventilation.

Anti-Stall Dashpot (Automatic Transmission Cars): With engine idle speed and mixture properly adjusted, loosen locknut and screw the dashpot away from throttle lever. Hold throttle lever in closed position, then depress plunger to bottom with a screwdriver blade. Screw dashpot toward throttle lever until clearance between throttle lever and tip of plunger is .120-.150".

Accelerating Pump: Seasonal adjustment provided by two holes in accelerating pump lever (on throttle shaft) for pump link engagement. *NOTE - The following adjustments supersede previous recommendations.*

Average Temperature (Year Around Operation) - Install pump operating link in outer hole of pump operating lever (hole furthest from throttle shaft).

High Temperature (And High Altitude) - Pump link may be placed in inner hole of pump operating lever (hole closest to throttle shaft) to suit individual operating conditions.

Fl at Level: *NOTE - Fuel level cannot be checked and adjusted with carburetor on engine. Float level setting is a bench check and adjustment when overhauling carburetor.* With air horn inverted and weight of float on inlet needle valve, measure distance between float (at a point ¼" from toe) and gasket surface (gasket removed) of air horn. This distance should be 5/16"± 1/64", Gauge 10-238 (Falcon & Fairlane); Gauge 9550-MFC (Meteor & Comet). To adjust, bend float tab with needle nose pliers to decrease float clearance, or with a thin bladed screwdriver to increase clearance. *CAUTION - To prevent damage to float or "Viton" tipped needle valve, never d cr as clearance by pr ssing d wn on float.*

P wer Valv : Not adjustable. Power valve opens when vacuum drops to 5-8" Hg. (Falcon & Fairlane); 4.5-7.5" Hg. (Comet & Meteor).

Spark Control Valv : Not adjustable.

Automatic Ch k (Comet & Meteor): Centered (On Index). To adjust, loosen cover retaining screws and rotate choke cover and ther mostatic coil assembly.

Choke Piston: To check choke plate initial opening, insert a small wire between piston link and side of slot in air horn, positioning wire so that piston is forced against stopscrew. While holding piston against screw, press check plate lightly towards closed position. Clearance between upper edge of choke valve and air horn wall should be 3/16" (144" Engine); 7/32" (170" Engine. If necessary to adjust, turn stopscrew located in piston housing to obtain proper setting.

Fast Idle (Comet & Meteor): With engine at normal operating temperature, idle speed and mixture properly adjusted, place fast idle screw on high step of fast idle cam and turn fast idle screw to obtain an engine speed of 1500 RPM (Synchro-mesh), 1800 RPM (Auto. Trans.).

Unloader (Comet & Meteor): With throttle valve in wide open position, clearance between inner wall of air horn and choke plate should be 9/32". To adjust, bend unloader lever portion of throttle shaft lever.

OVERHAUL

Disassembly: Air Hom - Remove fuel inlet fitting, gasket, and screen, then compress air cleaner bracket with channel lock pliers and remove bracket from air horn. *CAUTION - Do not compress bracket more than is necessary to clear air horn.* On automatic transmission cars, remove dashpot and bracket. On Comet & Meteor, remove fast idle cam retaining screw and disconnect choke operating rod from choke shaft lever, then remove automatic choke cover and gasket and the adapter plate and gasket. On all models, remove air horn attaching screws and remove air horn and gasket. Remove plastic float hinge pin, float, and needle. Remove power valve piston assembly with tool 10-238 (Falcon & Fairlane); 9904-E (Comet & Meteor). On Comet & Meteor, remove cotter pin retaining choke piston link to choke plate. On all models, remove choke plate screws and remove plate from choke shaft. On Comet & Meteor, remove choke operating rod lever from choke shaft. On all models, slide choke shaft out of air horn. On Falcon & Fairlane, remove choke shaft operating lever spring from slots and separate choke shaft and operating lever.

Main Body - Tip throttle body to remove accelerating pump needle, then remove nut and lockwasher from throttle shaft and remove accelerating pump operating lever and link. Pull pump piston from main body and remove piston cup. Remove accelerating pump ball check retainer and ball, then remove spark control valve and gasket. Remove main jet using a main jet socket wrench. Remove power valve, pin, and spring with tool 10-185 (Falcon & Fairlane); 9904-G (Comet & Meteor), then remove idle mixture adjusting screw and spring. If it is necessary to remove throttle valve plate and shaft, lightly scribe a light line along throttle shaft so plate can be installed in its exact original position. *NOTE - Throttle plate and shaft are not interchangeable between carburetors, nor are they serviced as separate parts.*

Reassembly: Air Horn - On Falcon & Fairlane, position choke shaft operating lever and spring on choke shaft and slide choke shaft into air horn. On Comet & Meteor, install choke shaft in air horn, then position operating rod lever and piston link. *NOTE - D not install lev r retaining screw at this time.* On all models, install choke plate and hold plate in a closed position while installing attaching screws. On Comet & Meteor, install choke operating lever screw. On all m dels, open and close choke to make sure there is no binding. If choke is operating freely, fully tighten attaching screws and stake the screws with duckbill pliers or other suitable staking tool. On Comet & Meteor, secure choke piston link to choke plate with cotter pin. On all models, install power valve piston with tool 10-236 (Falcon & Fairlane); 9904-F (Comet & Meteor). Use a prick punch to stake piston assembly in four places to air horn. Install fuel inlet needle, float and plastic hinge pin. *CAUTION - Do not tap needl into its s at, causing damage to "Vito n" tipped n edle valv .* Adjust float level (see "Float Level Adjustment" above). Carefully compress air cl aner bracket and install bracket in slots in carburetor air horn.

Main Body - If throttle plate was removed, reinstall it and align plate with previously scribed marks. Install idle mixture screw and spring and turn screw in until it is lightly seated, then back off 1-1½ turns. Install power valve assembly with tool 10-185 (Falcon & Fairlane); 9904-G (Comet & Meteor). *NOTE - Spring must be positioned on shoulder of needl and th assembly must be placed on t ol and installed in main body with main body in an inv rted positi n.* Install main jet using same tool used for removal. Install spark control valve and gasket, then install accelerator pump ball check and retainer. *NOTE - Proj ction of retainer must be positioned over th ball check. S at ball check with one gentle tap of a light hamm r and a brass drift.* Install accelerating pump piston cup on pump assembly and install it into main body. *NOTE - Plastic pump guide must be p sitioned properly to avoid interference with air horn.* Install accelerating pump lever, lockwasher and nut, then install connecting link in hole closest to throttle shaft (warm weather) and hole furthest from throttle shaft (cold weather). Install accelerating pump needle valve in passage next to pump rod. Position cover gasket and air horn on main body and install retaining screws. Install carburetor identification tag under the end bowl retaining screw. On Comet & Meteor, install automatic choke adaptor plate and gasket and the cover plate and gasket. *NOTE - Tab of thermostatic spring must b positioned so spring pressure closes chok plat .* Lock cover in position with screws and retainers so that index mark is at its midposition (centered on index). Position fast idle cam operating rod in choke lever and fast idle cam, then secure cam with shoulder screw. On all models with automatic transmission, install dashpot assembly. On all models, install fuel inlet fitting and screen.

SERVICE PARTS: Gasket Set - Ford Part No. C2DZ-9502-A (Falcon & Fairlane); Mercury Part No. C2GY-9502-A (Comet & Meteor).

Repair Kit - Ford Part No. C2DZ-9590-A (C2DE-9510-A,B); C2DZ-9590-B (C2DE-9510-C,D); C2DZ-9590-C (C2DE-9510-L,M); C2DZ-9590-D (C2DE-9510-N,R); C2DZ-9590-B (C2DE-9510-J,K). Mercury Part No. C2GY-9590-A (C2GE-9510-A,B); C2GY-9590-B (C2GE-9510-C,D); C2GY-9590-D (C2GE-9510-J,K).

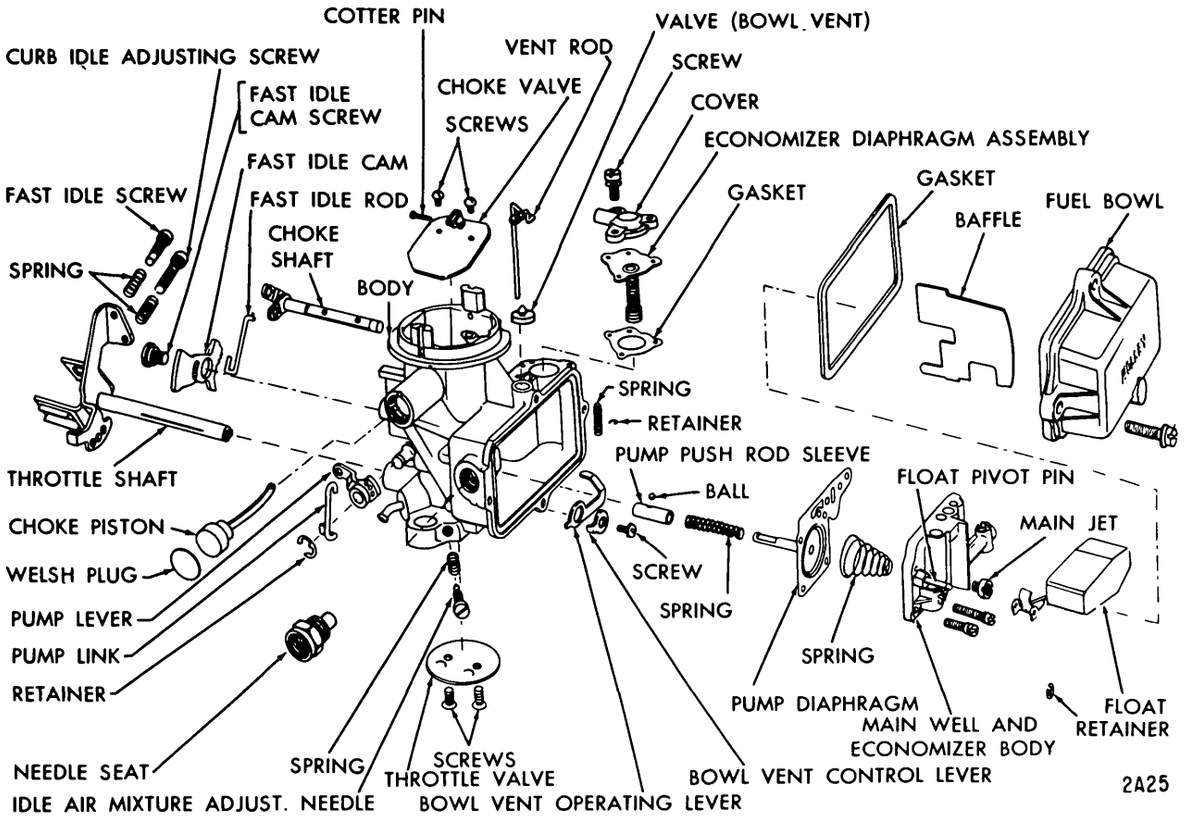
HOLLEY SINGLE BARREL MODEL 1920 CARBURETORS

DODGE DART & PLYMOUTH 6 CYL.	Holley No.
225" Eng. (Synchro-mesh)	R-2418A
225" Eng. (Auto. Trans.)	R-2419A
DODGE LANCER & PLYMOUTH VALIANT	**Holley No.**
170" Eng. (Synchro-mesh)	R-2136A
170" Eng. (Auto. Trans.)	R-2416A
225" Eng. (Synchro-mesh)	R-2303A
225" Eng. (Auto. Trans.)	R-2417A

►*CLOSED CRANKCASE VENTILATION NOTE:* Carter BBS Carburetor used on all models with closed crankcase ventilation.

DESCRIPTION: Single barrel downdraft type of new design consisting of a single casting (air horn, main body and throttle body are integral). A separate fuel bowl cover is used to enclose the float assembly. Power valve (economizer) and accelerating pump assemblies are diaphragm type. The float in this carburetor is made of a solid plastic material. A separate "cross-over" type automatic choke is used with the choke piston incorporated into the air horn assembly.

ADJUSTMENT



Idling Adjustment: If initial adjustment required to warm-up engine, turn idle mixture screw in until lightly seated, then back screw out approximately 1 turn. Operate engine at fast idle until normal operating temperature is reached, then adjust as follows:

Idle Mixture & Speed Setting - *NOTE - Turn headlights on to assure setting idle speed to compensate for alternator load, then proceed as follows:* On automatic transmission cars, unsnap ball joint connection at accelerator shaft bellcrank. Adjust idle speed screw to obtain an engine speed of 550 RPM, making sure that choke valve is fully open and that fast idle adjusting screw is not contacting fast idle cam. Adjust idle mixture screw to obtain highest engine RPM, then turn idle mixture screw clockwise (leaner) until engine speed starts to drop. Turn screw in opposite direction just enough to recover speed lost. Adjust idle speed screw as necessary to bring engine speed to 550 RPM. Repeat adjustment of idle mixture screw. When idle speed is correct, on automatic transmission cars, screw ball joint connector at accelerator bellcrank up or down until ball on bellcrank freely enters socket, then snap into place.

Fast Idle Adjustment (On Car): With engine at normal operating temperature and running, open throttle slightly and rotate fast idle cam until fast idle screw contacts second step of fast idle cam (step below highest step), then release throttle. Rotate fast idle screw to obtain an engine speed of 1500 RPM (Synchro-mesh); 1800 RPM (170" Eng. with Auto. Trans.); 1700 RPM (225" Eng. with Auto. Trans.).

Fuel Level Check: *NOTE - This is a check only. To adjust fuel level, see "Float Level" below.* With engine running and car on a level floor, remove power valve (economizer) diaphragm cover and assembly. Measure distance from machined surface of opening to the exact fuel surface with a 6" depth gauge. This measurement should be 11/16".

Bowl Vent Adjustment: With throttle valve at curb idle speed, it should be possible to insert a 1/16" drill between bowl vent and seat. *NOTE - This measurement should never exceed 3/32".* To adjust, bend tab on operating arm until correct clearance is obtained. *CAUTION - Be sure vent rod does not bind in guide after adjusting.*

HOLLEY SINGLE BARREL (MODEL 1920) CARBURETOR ASSEMBLY

Unloader: Unloader will be properly adjusted when fast idle cam is properly indexed (see below).

Automatic Choke: Centered (on index). *CAUTION - This unit is serviced as a complete assembly. Do not attempt to repair or change the adjustment.*

Fast Idle Cam Index (Carburetor Off Engine): Open throttle valve and hold choke valve in fully closed position, then close throttle valve. Index mark on cam should be centered on end of fast idle screw. To adjust, bend fast idle connector rod at the angle as necessary to center mark on screw,

Float Level (Carburetor Off Engine): *NOTE - The following procedures are new and supersede previous float level adjustment procedures.* With carburetor inverted, position float gauge C-3903 on carburetor body with "touch" leg of gauge at bottom. *NOTE - Use two cover attaching screws to hold gauge in position.* The float should come within 3/32" of gauge (use a 3/32" drill to measure distance). Reverse the gauge and check the "no touch" leg. Float should clear by 3/32" to 1/8". To adjust, bend float tab (which touches end of fuel inlet needle) with a pair of needle nose pliers. *CAUTION - To prevent damage to "Viton" tipped fuel inlet needl and to obtain a corr ct float setting, do not allow float tab to contact needle when bending float tab.* Recheck float setting. After carburetor is installed on engine, check fuel level (see above).

OVERHAUL

DISASSEMBLY: Remove bowl vent rod retaining clip and slide rod and bowl vent valve out of carburetor, then remove bowl vent lever spring. Remove fuel inlet needle valve and seat. Remove power valve (economizer) retaining screws, then lift economizer cover, diaphragm and stem out of carburetor. Remove fuel bowl, baffle and gasket, then slide baffle out of bowl and discard gasket. Remove float retaining clip and slide float off fulcrum pin. Remove screws attaching economizer body and plugs, then remove economizer body. Lift out pump return spring. Slide pump diaphragm and spacer assembly out of fuel bowl. To disassemble pump diaphragm, compress spacer slightly toward diaphragm until ball drops out, slide spacer and spring off diaphragm stem. Use Tool C-3748 and remove main jet from economizer body. Remove pump cam retaining clip and slide cam off pivot, then disengage choke link. Remove idle mixture adjusting screw from throttle flange and remove fast idle and throttle stop screws and springs from throttle lever. Invert carburetor and

CONTINUED ON NEXT PAGE

HOLLEY SINGLE BARREL MODEL 1920 CARBURETORS (C nt.)

remove bowl vent operating lever and dog retaining screw, then remove lever and dog from end of throttle shaft. Remove cotter pin connecting choke piston link to choke valve and disengage link from choke plate. Remove screws holding choke valve plate assembly to choke shaft. *NOTE - These screws are staked in place.* Lift out choke valve and slide choke shaft out of carburetor. Use a sharp punch to pierce center of choke piston welch plug and remove plug, then remove piston and link. If necessary to remove throttle valve shaft, mark position of throttle valve in bore and scribe a line across valve at shaft, then remove screws holding valve to shaft and slide shaft out of throttle body and valve out of bore. *NOTE - Valve-to-shaft screws are staked in place.*

REASSEMBLY: If throttle valve and shaft were removed, install shaft and valve, then install new screws, but do not tighten. Hold valve in place with fingers pressing on high side of valve. Tap valve lightly with a screwdriver to seat in throttle bore, then tighten screws securely and stake by squeezing with pliers. Install idle mixture screw and spring, turning it lightly against its seat, then back screw off one full turn. Slide choke piston and link into piston cylinder, with piston link arc uppermost. Install a new welch plug and seat by tapping with a ball peen hammer at center of plug. Slide choke shaft into position, then install choke valve plate assembly. Install new attaching screws, but do not tighten. Check choke valve for binding, then tighten screws and stake in place with pliers. Install fast idle screw and spring and throttle stop-screw and spring in throttle lever. Slide pump diaphragm spacer spring over diaphragm stem, followed by the spacer. Compress spring and spacer far enough to install the ball. Use Tool C-3748 and install main jet in economizer body. Slide pump diaphragm and stem into position in carburetor, then install pump return spring. Turn carburetor so bowl opening is up, then position main well and economizer body in carburetor and tighten attaching screws securely. *CAUTION - Be sure spring is correctly centered.* Engage pump cam link with cam and throttle lever, then install cam and secure with clip. *NOTE - Install link in center hole of throttle lever.* Engage choke link with choke lever and fast idle cam, then place cam in position and install and tighten retaining screw. Position bowl vent operating lever and dog on end of throttle shaft and retain with screw. Slide float into position over fulcrum pin and secure with clip, then install fuel inlet needle, seat and new gasket. Tighten seat securely, then adjust float level (see above). Slide power valve (economizer) diaphragm and stem assembly into position, making sure that vacuum holes are aligned and that stem is on the power valve. Install cover and tighten screws securely. Slide baffle into position in fuel bowl and install fuel bowl cover and gasket. Tighten screws alternately to prevent distorting cover. Slide bowl vent rod down into position, at the same time threading spring over rod, then secure with clip.

SERVICE PARTS: Gasket S t - Holley Part No. 85G-1088 (All Models).
Repair Kit - Holley Part No. 85R-1087 (All Models).

1962 ROCHESTER FUEL INJECTION

Corvette (1962)

►*1962 CORVETTE HOT STARTING & UNLOADING NOTE:* Hold throttle valve WIDE OPEN to prevent high manifold vacuum at cranking signal valve (air volume is increased and fuel flow is reduced).

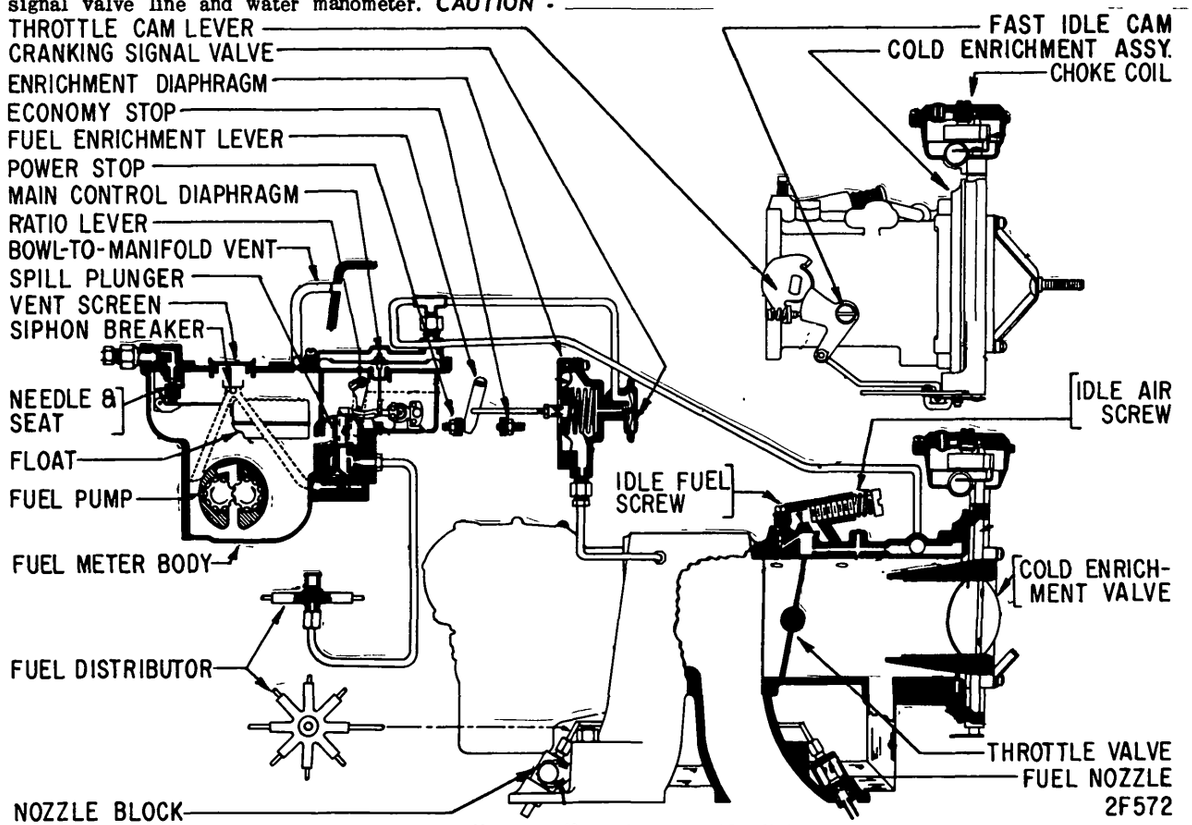
►*FUEL FILTER NOTE:* Either a replaceable element filter or a throw-away canister type filter is used in production. Replace element or canister every 15,000 miles.

DESCRIPTION: Design is similar to previous models except for a new cold enrichment and diffuser cone assembly which incorporates a conventional blade type choke valve. The electrically heated thermostat coil, mounted on air meter inlet, positions the choke valve to provide necessary venturi signal boost for fuel enrichment. Fuel meter design is the same except for a poppet type metering valve in place of the spill plunger.

ADJUSTMENT

Idle Speed & Idle Fuel: For initial adjustment, turn idle speed screw and fuel adjusting screw out 1½ turns from a lightly seated position. With engine at normal operating temperature, adjust idle speed screw for an engine speed of 700 RPM, then adjust idle fuel screw for best engine idle operation. Readjust idle speed screw as necessary. *NOTE - It is possible to develop a condition where the two idle adjusting screws become compl tely out of phase. If this happens, purge system or shut the engine off and repeat Idle Speed & Idle Fuel Adjustment.*

Fast Idle Speed: *NOTE - Before adjusting fast idle speed, check to make sure there is clearance between fast idle screw and edge of fast idle cam when cam is in the "off" position. If necessary, bend connecting link to provide a small amount of clearance.* With engine off, slightly open throttle valve and close cold enrichment, then allow throttle valve to close (this will position fast idle screw on fast idle cam). Release cold enrichment valve and start engine, then adjust fast idle screw to obtain a fast idle speed of 1800 RPM (hot engine).



Cold Enrichment: 3 notches lean. To adjust, rotate cold enrichment cover. *NOTE - Check to see that air meter adapter does not interfere with valve linkage at main diaphragm vent tube connection.*

Ratio Lever Stop Settings: With engine at normal operating temperature, proceed as follows:

Manometer Installation - Attach manometer unit, Tool J-7090, in a suitable location (see illustration). Use the two position bracket to obtain the most vertical position possible, then level unit with the attached leveling vial. Open both manometer valves and check water manometer to see if a zero reading can be obtained. Adjust to zero by turning oil leveling screw. *NOTE - If zero reading cannot be obtained, back leveling screw out and add red oil (specific gravity of .826).* Remove both hose adapters on mercury manometer and punch out plug located in each adapter. Install tee fitting in fuel nozzle circuit most easily accessible (see illustration), then connect fuel pressure line to tee fitting and mercury manometer. *CAUTION - Make sure fuel trap inlet is properly located in line.* Connect venturi signal line with clamp to cranking signal valve line and water manometer. *CAUTION - Make sure clamp is closed securely on this line during engind starting, otherwise high vacuum will cause red oil to be lost.* Remove main diaphragm vent tube and install large rubber tube (part of Tool J-7090) in its place. Set mercury manometer at zero inches by sliding scale up or down. Check leveling vial again and adjust as necessary.

Economy Stop - With engine at normal operating temperature and Tool J-7090 installed, check to see that unit is operating on economy stop. *NOTE - If engine will not start with cranking signal valve line disconn-*

CONTINUED ON NEXT PAGE

ROCHESTER "RAMJET" FUEL INJECTION SYSTEM

ROCHESTER FUEL INJECTION (Continu d)

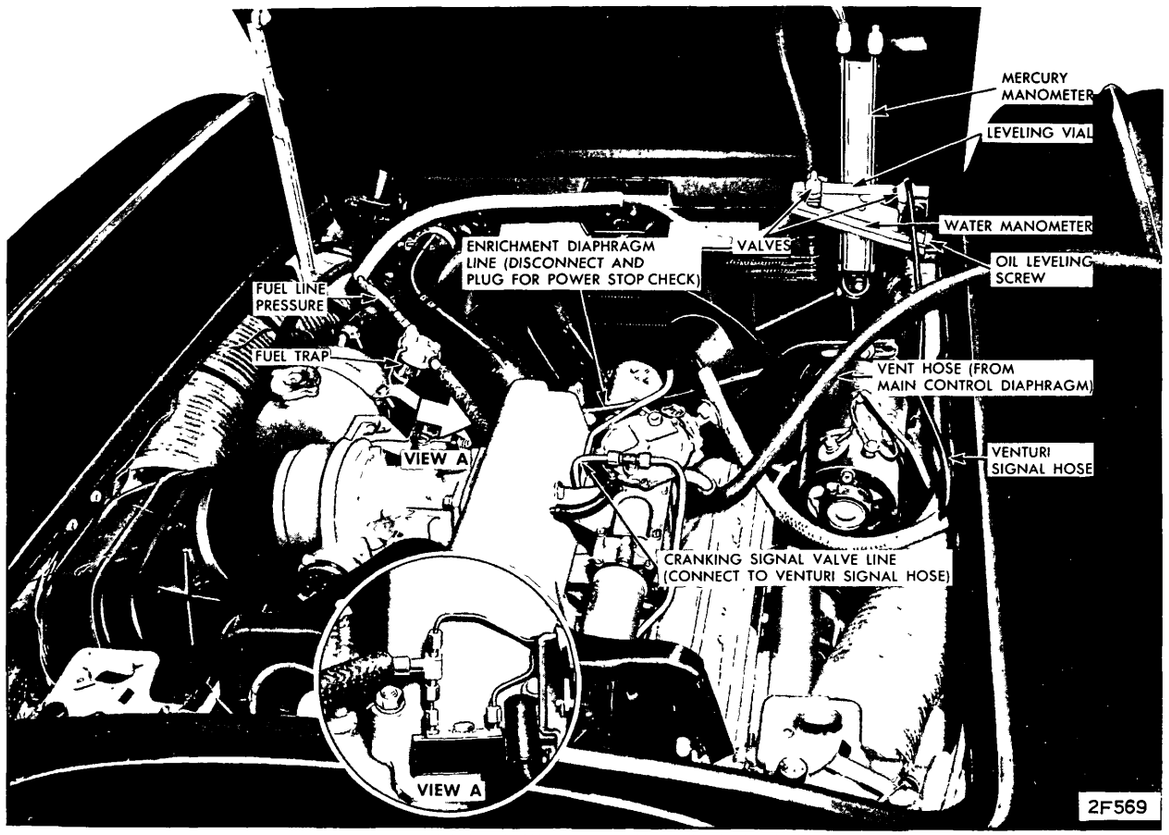
nected, reconnect lin during initial starting procedure. Increase engine speed until a reading of 0.5" is obtained on water manometer, then hold engine at this speed by using fast idle screw and cam. Record reading on mercury manometer, then return engine to a lower speed and repeat the above procedure. Take three readings, the average of which should be 1.0" Hg. ± .1" Hg. To adjust, rotate "Economy Stop" setscrew on Fuel Meter (screw closest to diaphragm) as necessary to obtain correct reading.

Power Stop - With manometer connected as for "Economy Stop" (above), disconnect and plug vacuum line going to enrichment diaphragm. This will cause injection unit to operate on "Power Stop" only. *NOTE - Prolonged operation on "Power Stop" will cause spark plug fouling.* Take three mercury manometer readings in same manner as for "Economy Stop" (above). Average of the three readings should be 2.2" Hg. ± .1" Hg. To adjust, rotate "Power Stop" setscrew on Fuel Meter (screw farthest from diaphragm) as necessary to obtain correct reading.

Float Setting: With fuel reservoir cover inverted and weight of float resting on inlet valve needle, distance from surface of cover to top of float at outer end should be 2 9/32". To adjust, bend float arm.

Float Drop: With fuel reservoir cover held upright and float hanging free, distance between machined surface of cover and bottom of float at outer end should be 2 27/32". To adjust, bend tang on float arm.

Enrichment Diaphragm Clearance: .040" minimum, measured with a wire gauge between diaphragm and diaphragm housing (through rod opening in housing). To adjust, change rod length as necessary. *CAUTION - Hold shaft securely while loosening locknut.*



Throttle Valve Clearance: .0045" clearance, measured between throttle valve and air meter body directly below idle fuel screw with throttle resting solidly against stopscrew. To adjust, remove lead plug in boss on housing adjacent to throttle valve lever and turn setscrew. *CAUTION - Change throttle valve setting only if a poor or no-idle condition can be traced to improper setting.*

TROUBLE SHOOTING & DIAGNOSIS

FAILS TO START: No fuel to fuel meter (check fuel supply and engine fuel pump). No fuel at nozzles (check for broken fuel meter pump drive cable). No vacuum signal at main control diaphragm (check for leaking or ruptured main control diaphragm, defective cranking signal valve, or broken main control diaphragm linkage).

DIFFICULT STARTING: Improper cold starting procedure (check fast idle cam setting and operation; check for choke valve stuck open). Improper hot starting or unloading procedure (use wide open throttle when starting; che ck for defective cranking signal valve). No vacuum boost at disconnected signal line (check for defective cranking signal valve or cold enrichment housing; check for vacuum leaks at main control diaphragm or signal line).

NO IDLE (High Sp d Operati n Not Aff ct d): Idle adjusting screws out of phase *(see "Adjustments" abov)*. Idle speed too low- distributor advance in-

MANOMETER INSTALLATION FOR TESTING

correct (adjust idle speed, check distributor, check air meter throttle valve clearance). Idle fuel screw turned all the way out (check for dirty air meter passages, vacuum or air leaks, or defective main diaphragm). Idle fuel screw turned all the way in (check nozzle vent tubes and nozzles for plugged condition; check nozzle-to-insulator gaskets for defects). No idle boost signal (check defective cranking signal valve; check for plugged main control diaphragm vent tube, check for sticking spill plunger, check for main diaphragm shrinkage).

ROUGH IDLE (High Speed Operation Not Affected): Idle adjusting screws out of phase *(see "Adjustments" above)*. Excessive fuel at idle (purge system by accelerating a few times to clear manifold, check for defective cranking signal valve, check for plugged nozzles and nozzle vent tubes, check main diaphragm vent tube for obstruction, check engine valve lash setting).

ERRATIC IDLE SPEED (High Speed Operation Not Affected): Engine idle speed fails to return to same speed each time pedal is operated (check for sticking throttle valve shaft at air meter bushings or for linkage binding, check for sticking spill plunger or choke valve).

POOR ACCELERATION (Idl & Wide Op n Throttle Operation Not Affected): Unit will take throttle when applied slowly (check for defective fuel meter pump drive cable or pump drive shaft, check for dirty signal tube, check for interference between enrichment housing and diaphragm, check for improper "Power Stop" setting, check for sticking spill plunger).

POOR PERFORMANCE: Hesitation or flat spot (check for defective main control diaphragm or vacuum leaks; check for faulty spill plunger operation, check for incorrect "Economy Stop" setting). Surging at steady engine speed (check for plugged nozzles or nozzle vent tubes, check for incorrect "Economy Stop" setting, check for faulty integral siphon breaker operation, check for plugged main control diaphragm vent tube). Wide open throttle - engine missing (check fuel meter pump drive cable and drive shaft for out of square condition, check engine fuel pump, check for dirty air cleaner or fuel filter, check for defective spark plugs). Excessive fuel consumption (check for defective cranking signal valve or cold enrichment housing valve sticking, check for open electric choke coil, check for fuel leakage or faulty integral siphon breaker operation, check for fouled plugs).

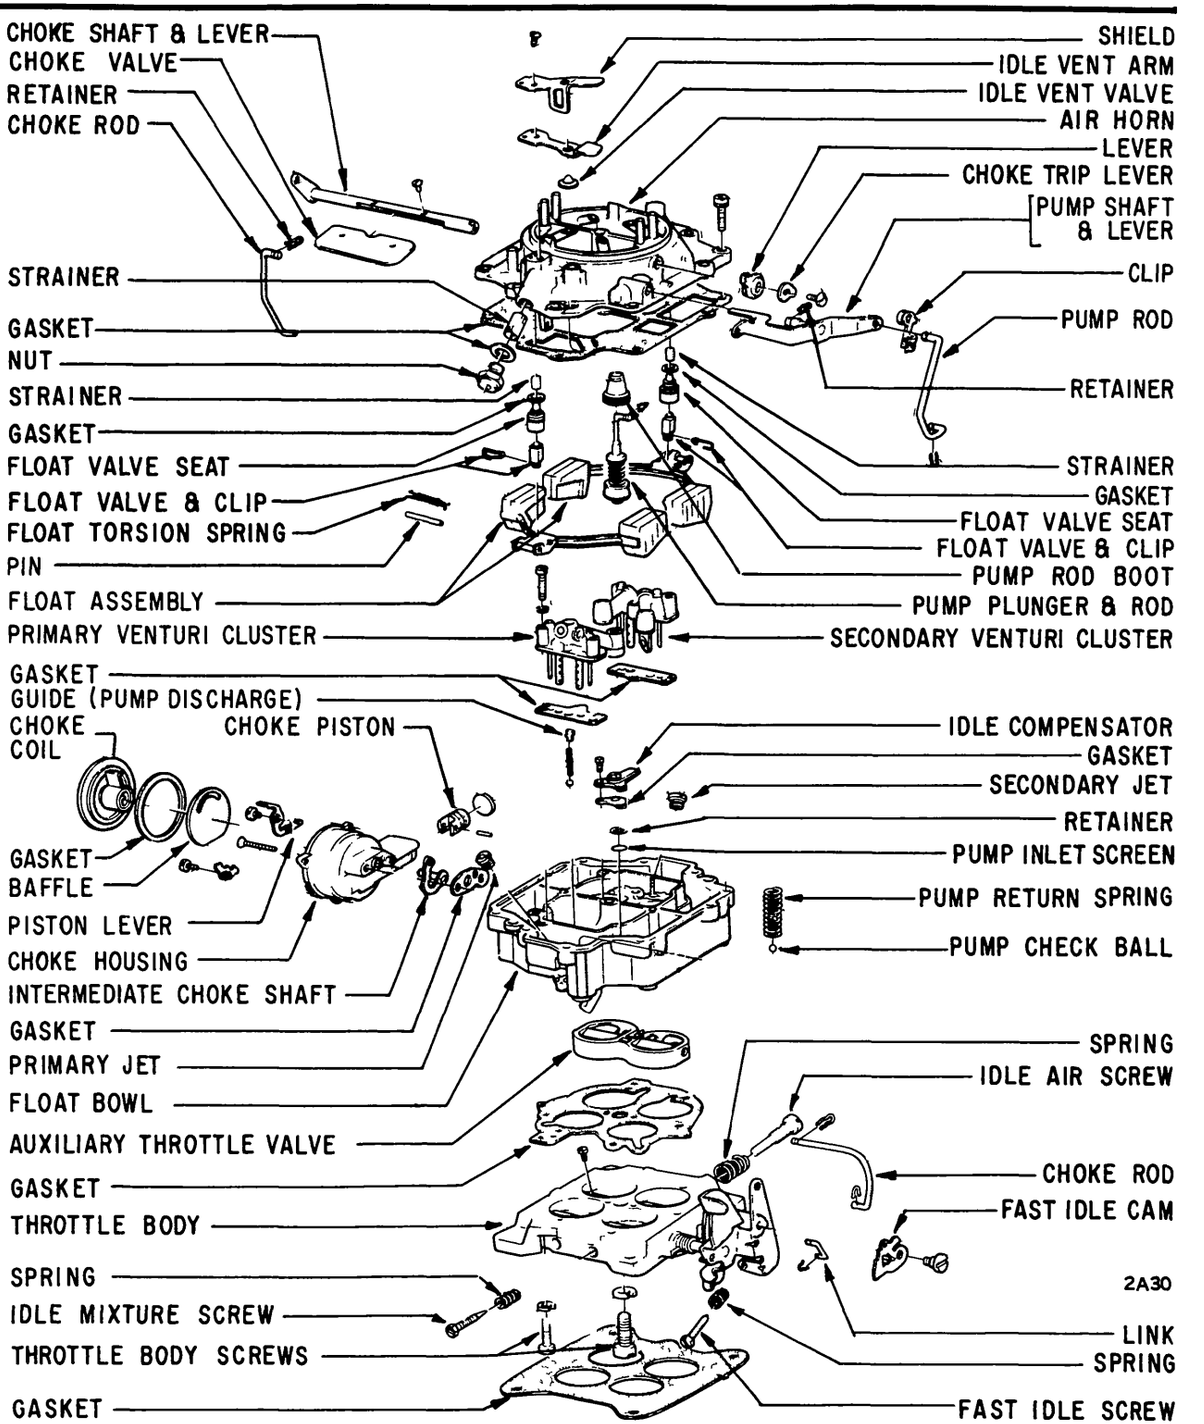
►CHANGES, CAUTIONS, CORRECTIONS

►*1961-62 BUICK SPECIAL & 1962 PONTIAC TEMPEST V8 4-BBL. CARBURETOR VENTURI CLUSTER GASKET REPLACEMENT CAUTION:* When replacing the venturi cluster gasket on Carburetors No. 7020043, 7020045, 7020078, make sure the gasket is Part No. 7007803 (see illustration). DO NOT USE Gasket No. 7021637 on these carburetors. *NOTE - Both f thes gaskets ar included in some "Overhaul", "OK Kits" and "Gasket Kits".*



7007803 7021637

VENTURI CLUSTER GASKET

►*1961-62 BUICK SPECIAL HESITATION ON ACCELERATION CORRECTION:* If carburetor accelerator pump system is not defective, trouble may be due to

CONTINUED ON NEXT PAGE

ROCHESTER 4-BARREL CARBURETOR ASSEMBLY (TYPICAL)

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

incorrect pump stroke setting which depends on average daytime temperature. S *"Acc lerating Pump Adjustment" below.*

DESCRIPTION: 4-barrel downdraft type with automatic choke. Design is similar to carburetors used on corresponding previous models.

ADJUSTMENTS: *Make all adjustments in sequence given below (except for Idle Speed & Mixture adjustments).*

►*CADILLAC & PONTIAC TEMPEST 4 CYL. ENG. IDLE SPEED SETTING NOTE:* Throttle valves are completely closed at low idle speed and air is admitted through Idle Air System which consists of a bypass passage (primary side only) through which air for closed throttle operation is taken from above the throttle bores through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore. An idle speed screw (single screw for both primary bores) controls the adjustable orifice and all idle speed adjustments are made with this screw (throttle stopscrew not used).

►*IDLE SETTING CAUTION (CARS WITH IDLE COMPENSATOR):* Make sure that idle compensator is closed when adjusting idle speed. If necessary, idle compensator valve can be closed with a pencil. After idle speed is adjusted, press down on idle compensator valve to see if speed is affected. If speed drops, readjust idle speed, being sure that idle compensator valve is closed.

Idle Speed & Mixture Setting (Except Cadillac & Pontiac Tempest 4-Cyl): If preliminary adjustment required to warm-up engine, set both idle mixture screws 1½ turns open from a lightly seated position. With engine at normal operating temperature (choke valve wide open and fast idle inoperative so that engine idles at hot or slow idle speed), set throttle stopscrew for correct idle speed as listed below. Adjust both primary idle mixture screws equally so that engine idles smoothly and RPM is at maximum (see special notes below). Recheck idle speed.

►*BUICK NOTE:* Turn each adjusting screw in until engine begins to lag or run unevenly from lean mixture then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough to provide smoothest operation. Adjust both screws alike.

►*CHEVROLET NOTE:* Turn adjusting screw in to lean mixture until engine is moderately rough (slight vacuum and RPM drop), then turn screw out ¼ turn to enrich mixture. Adjust both screws alike.

►*OLDSMOBILE NOTE:* After adjusting idle mixture screws (above) for smoothest idle with highest RPM, turn each adjusting screw out ¼ turn (vacuum and RPM will drop slightly).

Idle Speed & Mixture Setting (Cadillac & Pontiac Tempest 4-Cyl. Eng.): On Cadillac, disconnect parking brake vacuum diaphragm line from neutral safety switch and tape over switch opening to prevent any air leak (hose must be disconnected at this connection only). On all cars, with engine at normal operating temperature, transmission in "N" (Neutral) choke valve fully open and carburetor on slow idle speed (throttle valves fully closed), connect a tachometer to engine. On Cadillac, loosen front and rear throttle valve jam nuts at carburetor throttle lever trunnion. On all cars, place automatic transmission in "D" (Drive), then adjust engine idle speed to (see below) using the idle air bypass screw (idle speed adjusting screw on throttle body). Turn one idle mixture screw until highest engine RPM is reached and highest vacuum is obtained at the same time, then repeat this operation with other idle mixture screw. Check and reset engine idle speed. Repeat idle mixture adjustment until turning the idle mixture screws will not increase engine speed and the smoothest idle is obtained. *CAUTION - Idle mixture screws must be adjusted last and must always be re-adjusted when the idle speed screw setting is changed.*

Idle Speed Setting (Eng. RPM)

Car Model	Synchro-mesh	Auto. Trans.

Pontiac Tempest 4-Cyl.	③ 680-700	Ⓒ④ 580-600

Ⓒ - Transmission in "D" (Drive).
② - Air Conditioner operating.
③ - Air Conditioner turned off.
④ - Air Cond. cars 630-650 with air conditioner off.
⑤ - Transmission in "P" (Park).
⑥ - Air Cond. cars 575 RPM.
⑦ - Air Cond. cars 550 RPM.

Anti-Stall Dashpot & Throttle Return Check Adjustment: *See "Throttle Linkage Adjustment" under CARBURETOR on car model page.*

Float Setting: *Both Primary and Secondary Float Assemblies must be checked and adjusted separately and FLOAT LEVEL & FLOAT DROP (Vacuum Assist Spring on carburetors with this feature) must be checked for each assembly.* Remove bowl cover and float assemblies from carburetor but do not remove bowl cover gasket.

Primary & Secondary Float Level Adjustment (Chevrolet & Pontiac Tempest 4 Cyl.): *NOTE - Both floats are adjusted in same manner. Different gauges and settings required for primary and secondary floats are listed below.* With bowl cover and float assembly inverted and gasket in place, install correct float level gauge over floats and against curvature of air horn so that gauging legs rest on cover gasket with locating lugs on inner legs extending into air horn. Make two adjustments as follows: 1) With gauge vertical, upper surface of floats should just touch edge of cutouts in float gauge. Adjust by bending arm at rear. 2) With gauge still in place and centered in air horn, floats should be centered between gauge legs. Adjust by bending float arms horizontally. Check adjustment by moving float assembly from side to side at hinge pin. Floats must not rub on sides of gauge legs.

Primary Float Level Adjustment (Except Chevrolet & Pontiac Tempest 4 Cyl.): *NOTE - Pump side of gauge should always face pump assembly when checking float level.* With air horn inverted and gasket in place, install float level gauge under heel of primary float With gauge vertical, float should just touch gauge. To adjust, bend float arm at rear. Slide gauge under toe of floats. Lower surface of float should just touch gauge. Bend float arm adjacent to float as necessary. Lower surface of floats should be parallel with air horn surface and gauge should slide freely under floats. On all carburetors (except Buick, Buick Special & & Pontiac Tempest V8), leave gauge under floats and hold lug on lower surface of gauge against outside of air horn casting. Floats should just center in cutout portion between gauge legs. To adjust, bend float arms horizontally until floats are centered at heel and toe. Move float assembly from side to side at hinge pin and check to make sure floats do not rub sides of gauge legs.

Secondary Float Level Adjustment (Exc pt Ch vrolet & Pontiac Tempest 4 Cyl.): After checking primary floats (above) and with air horn inverted, place float gauge over heel end of secondary floats so that gauging legs rest on cover gasket with locating lugs on inner gauge legs extending into air horn. Make two adjustments as follows: 1) With gauge vertical, upper surface of floats should just touch edge of cutouts in gauge. Adjust by bending float arms at rear. 2) With gauge still in place and centered in air horn, floats should be centered between gauge legs. Adjust by bending float arms horizontally. Check adjustment by moving float assembly from side to side at hinge pin. Floats must not rub on sides of gauge legs. Check and adjust float toe.

Secondary Float Toe Adjustment (Buick, Buick Sp cial & Pontiac Tempest): With air horn inverted and gasket in place, distance from center of dimple on side of float at toe to gasket should be 3/8". To adjust, bend toe of float as necessary while holding float arm adjacent to float. Recheck float heel adjustment if toe adjustment is necessary.

Secondary Float Toe Adjustm nt (Cadillac & Oldsmobil): With bowl cover and float assembly inverted, raise gasket and sight across flat surface of cover at toe end of secondary floats. Toe end of each float must be FLUSH with this surface. Adjust by bending float arm at point close to float. *CAUTION - Aft r making this adjustment, recheck float l v l and adjust if n cessary.*

Float Alignment (Except Chevrol t): After centering floats, recheck alignment by aligning screw holes in air horn gasket with screw holes in air horn, then make sure float pontoons are centered in cutout areas of gasket and sides of float pontoons are parallel with adjacent edges of gasket.

Float L v l S tting

Car Model & Carb.	Height & Gaug No. Primary	S condary
Buick (7020040, 41)	9/64" BT-178	1 3/8" BT-171
Buick Spec. (7020043, 45)	9/64" BT-178	1 3/8" BT-171
Cadillac (All)	15/64" BT-172	1 3/8" BT-172
Chevrolet (All)	1 33/64" BT-182	1 37/64" BT-183
Olds (7020950, 55)	9/32" BT-171	1 3/8" BT-171
Olds F-85 (7020952, 53)	7/32" BT-198	1 3/8" BT-198
Olds F-85 (7020984, 85)	9/32" BT-171	1 3/8" BT-198

Tempest (7020066, 79)	1 21/64" BT-196	1 21/64" BT-196
Tempest (7020078)	9/64" BT-178	1 3/8" BT-171

Primary Float Vacuum Assist Spring Adjustm nt (Cadillac & Oldsmobile): With bowl cover and float assembly held upright, hold vacuum piston in full up position, jounce floats slightly to make certain that vacuum assist spring cup is not binding on piston stem. Use a scale to measure from face of gasket to center of dimple on side of primary float at toe (free end) with power piston held in up position. If this distance is not 1 3/32" (Cadillac), 1 1/32" (Olds F-85, 7020984, 7020985); 29/32" (Olds F-85, 7020952, 7020953), adjust by bending tang on

CONTINUED ON NEXT PAGE

ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

float arm which engages power piston stem. Use Bending Tool BT-142.

Float Drop Setting: *Check the Float Drop after Float Level Setting & Vacuum Assist Spring Adjustments have been made.*

Primary & Secondary Float Drop Adjustment (Exc. Chevrolet) - *NOTE - On carburetors with Vacuum Assist Spring Primary Floats, vacuum assist piston must be fully extended in the "down" position when checking float drop of primary floats.* With bowl cover and float assembly held upright, use a scale to measure from face of gasket to center of dimple on side of float at toe (free end). *CAUTION - On vacuum assist spring type primary floats, make certain that piston is fully extended so that float is positioned by stop tang on rear of float arm rather than by tang engaging vacuum piston spring.* If this distance not correct as shown in table below, adjust as follows: Bend tang at rear of float arm toward needle seat (or balance spring) to decrease drop, and away from needle seat (or balance spring) to increase drop.

Float Setting

Car Model	Primary Floats	Secondary Floats
Buick (Exc. Spec.)	1 7/16"	1 5/16"
Buick Special	1 9/16"	1 9/32"
Cadillac	1½"	1 5/16"
Olds (Exc. F-85)	1½"	1 5/16"
Olds F-85 (7020952,53)	1½"	1 3/8"
Olds F-85 (Others)	1½"	1 1/8"
Tempest 4 Cyl.	1⅛"	1 1/4"
Tempest V8	1 9/16"	1 9/32"

Primary & Secondary Float Drop Adjustment (Chevrolet) - With bowl cover and float assembly held upright, use a scale to measure from face of gasket to lowest portion of float (bottom of float at center). This distance should be 2¼". Adjust by bending tang at rear of float arm toward needle seat to decrease float drop, away from needle seat to increase float drop.

Accelerating Pump Adjustment: Back out slow idle speed and fast idle speed screws until throttle valves are completely closed. Make sure pump rod is connected in proper hole of arm as indicated in table below. Hold throttle valves in closed position and use indicated gauge (see table below) or scale to check pump adjustment. *NOTE - If gauge is used, place it on top of air horn next to pump plunger.* End of pump plunger shaft should slide freely into hole in gauge marked "Pump". If a scale is used, measure distance from top of air horn casting to bottom of pump plunger shaft. If height not correct (see table below) adjust by bending pump rod with Tool BT-18.

Accelerating Pump Stroke Setting

Car Model	Gauge No. ⑥	Pump Shaft Height
Buick (Exc. Spec.)	Scale	①1 1/64"
Buick Special	Scale	②61/64"
Cadillac	BT-180	27/32"
Chevrolet	BT-145	31/32"
Olds (Exc. F-85)	BT-166A	③1 1/64"
Olds F-85	BT-213	④1 1/64"
Tempest 4 Cyl.	Scale	③⑤15/16"
Tempest V8	Scale	①61/64"

① - With pump rod in center hole of pump arm.
② - Dependent on average daytime temperature as follows: Below 0°F (Inner hole); 0° to 60°F (Center hole), Above 60°F (Outer hole). *NOTE - Place pump rod in center hole of pump arm for checking and adjusting, then replace in proper hole.*
③ - With pump rod in inner hole of pump arm.
④ - With pump rod in outer hole of pump arm.
⑤ - Five holes in pump arm (Inner hole is No. 1). Normal setting is with rod in No. 3 (center) hole. Install in other holes to provide satisfactory performance. Adjust idle vent after moving pump rod from one hole to the other.
⑥ - Use either indicated gauge or scale.

Atmospheric Idle Vent Adjustment: Cadillac - *NOTE- Make fast idle adjustment before adjusting idle vent.* With fast idle screw on high step of fast idle cam, vent valve should just be closed. To adjust, bend tang on pump lever.

Chevrolet & Oldsmobile - Place combination "Pump" and "Vent" gauge BT-145 (Chevrolet); BT-166A (Oldsmobile, Exc. F-85); BT-213 (Oldsmobile F-85) next to pump plunger shaft. Open throttle valves to point where vent valve is just closed. With throttle valves held in this position, hole in gauge marked "Vent" should slide freely over pump shaft. To adjust, bend tang on pump lever. If a scale is used instead of gauge, distance from top of air horn to bottom of pump plunger shaft should be 31/32" (Chevrolet); 29/32" (Oldsmobile, Exc. F-85); 15/16" (Oldsmobile F-85).

Pontiac 4-Cyl. Tempest - Measure distance from top of air horn casting to bottom of pump plunger rod (primary throttle valves opened to a point where idle vent valve just closes). This distance should be 55/64" (Synchro-mesh); 53/64" (Auto. Trans.). To adjust, bend tang on pump lever.

Automatic Choke Setting (All Models): Loosen three retaining screws and rotate thermostat cover until index mark is in line with correct mark on housing (see table below). Tighten cover retaining screws. *NOTE - "Centered" point on housing is indicated by a raised section on housing casting.*

Automatic Choke Setting

Car Model	Choke Setting
Buick (All Models)	Centered (At Index)
Cadillac	1 Point Rich
Chevrolet	Centered (At Index)
Oldsmobile (All Models)	Centered (At Index)
Olds F-85 (7020952,53)	1 Point Rich
Olds F-85 (7020985, 7022752)	2 Points Rich
Tempest 4-Cyl. (All)	①1 Point Rich
Tempest V8	Centered (At Index)

① - Supersedes previous setting of "Centered At Index" on synchro-mesh transmission cars.

Intermediate Choke Rod Adjustment (Exc. Oldsmobile & Olds. F-85) *NOTE - This rod connects lever on choke valve shaft to choke lever on automatic choke housing.* Hold choke valve completely closed and bend intermediate choke rod as necessary so choke piston is flush with end of choke piston sleeve.

Oldsmobile & Olds F-85 - *NOTE - Make fast idle adjustment before adjusting intermediate choke rod (see below).* With fast idle properly adjusted, place fast idle screw on high step of fast idle cam and raise intermediate choke lever to its full up position. Make sure all lash is removed from rods in slots. Choke piston should be flush to 1/32" out from end of choke piston sleeve. To adjust, bend intermediate choke rod to correctly position choke piston.

Fast Idle Setting: *NOTE - Chevrolet Fast Idle adjustment will be correct when "slow idle" speed and choke rod adjustments have been made. On other models, the "On Engine" fast idle adjustment must be made after carburetor installed to insure proper warm-up performance.*

"Off Engine" Adjustment - Turn fast idle screw against high step of fast idle cam until throttle opening or clearance between edge of throttle valve and bore on side opposite idle mixture adjusting screws is correct as shown in table below.

Fast Idle Setting

Car Model	Throttle Valve Opening	Checking Gaug
Buick (Exc. Spec.)	.028"	BT-79
Buick Special	.032"	BT-121
Cadillac	.024"	BT-90
Oldsmobile (Exc. F-85)	.024"	BT-90
Oldsmobile F-85	.024"	BT-90
Tempest 4-Cyl.	.028"	BT-79
Tempest V8	.032"	BT-121

"On Engine" Adjustment - With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on high step of fast idle cam (Exc. Buick & Buick Special); on low step of cam (Buick & Buick Special). Start engine and adjust fast idle speed for correct engine RPM as shown in table table below. *NOTE - On Chevrolet, fast idle engine RPM will be correct after hot or slow idle speed has been correctly set.*

Fast Idle Speed

Car Model	Engine Speed
Buick (All Models)	①625 RPM
Cadillac	1700-1750 RPM
Oldsmobile	1600 RPM
Olds F-85	1800 RPM
Tempest 4-Cyl. (Synchro-mesh)	2800 RPM
Tempest 4-Cyl. (Auto. Trans.)	3000 RPM
Tempest V8	2800 RPM

① - With fast idle screw on low step on fast idle cam.

Choke Rod Adjustment: *NOTE - On all carburetors except Oldsmobile (All Models), this rod connects choke valve shaft to fast idle cam. On Oldsmobile (All Models), the rod connects intermediate choke lever to fast idle cam.* Rotate choke valve and fast idle cam until fast idle screw (slow idle screw on Chevrolet) is in contact with SECOND step of fast idle cam and against shoulder of highest step of fast idle cam. On Oldsmobile, raise the intermediate choke lever to full up position making sure that intermediate rod and choke rod are at upper limit of travel in the slots and that all lash is removed. On all models, bend choke rod to obtain specified clearance between choke valve and dividing wall of air horn. *See table below.*

Choke Rod Setting

Car Model	Choke Opening	Gauge No.
Buick (Exc. Spec.)	.052"	BT-68
Buick Special	.045"	BT-131
Cadillac	.040"	BT-102
Chevrolet	.055"	BT-216
Oldsmobile (All Models)	.052"	BT-68
Tempest 4-Cyl.	.028"	BT-79
Tempest V8	.045"	BT-131

CONTINUED ON NEXT PAGE

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

Unloader Adjustment: With throttle valves wide open, clearance between upper edge of choke valve and dividing wall of air horn should be as indicated in table below. To adjust, bend tang on fast idle cam using Tool BT-69.

Car Model	Unloader Setting Choke Opening	Gauge No.
Buick (All Models)	.128"	BT-135
Cadillac	.125"	BT-102
Chevrolet	.250"	BT-211
Oldsmobile (Exc. F-85)	.115"	BT-90
Oldsmobile F-85	3/16"	BT-217
Tempest 4-Cyl.	.152"	BT-119
Tempest V8	.128"	BT-135

Secondary Throttle Lockout Adjustment: Close choke valve fully so that lockout lever tang is engaged in slot of fast idle cam. Measure clearance between side of lockout lever tang and edge of slot in cam (use feeler gauge). Clearance should be .015" (all models). Adjust by bending tang on fast idle cam using tool BT-18 or BT-91A.

Secondary Throttle Contour Adjustment: Open choke valve fully so that tang on lockout lever is positioned over contoured section of fast idle cam. Measure clearance between tang and edge of fast idle cam (use feeler gauge). If clearance is not .030" (Buick, Buick Special, Oldsmobile, Oldsmobile F-85 & Pontiac V8); .015" (others), adjust by bending tang up or down using bending tool BT-91A.

Secondary Lock Spring Adjustment (Pontiac Tempest 4-Cyl.): After idle speed adjustment is made (be sure secondary valves are closed), place idle screw on second step of fast idle cam. Clearance between secondary lock spring and secondary lever should be .028". To adjust, bend lock spring.

OVERHAUL: *Se 1958 Final Data, Page 279, or lat r Manual editions.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 BUICK (EXC. SPECIAL) HESITATION DURING MODERATE ACCELERATION CORRECTION:* This condition which occurs after engine is warmed up can be corrected by installing a new power piston, Part No. 7006323. Carburetors having the code letter "B" or later stamped on metal tag will have the new piston installed in production.

►*1962 BUICK V6 ENG. CHOKE ASSEMBLY MODIFICATION NOTE & PRODUCTION CHANGE:* The following changes were made in production, and may be made in service, to cause choke to come off position more quickly and to insure choke remaining in off position during cold weather operation,

Choke Baffle - Install a new choke baffle, Part No. 7010598 (copper colored), having a reduced height of 1/16". Carburetors having the code letter "B" or later stamped on metal tag have the new baffle installed in production.

Choke Housing Outlet Restriction - On synchro-mesh cars, the outlet restriction has been increased from .081" to .093". Carburetors having the code letter "C" stamped on metal tag will have the larger size hole drilled in production. When increasing the hole size on earlier carburetors, use a hand drill and be careful not to deepen outlet hole.

Heat Insulator Tube - On early cars, install heat tube insulator, Part No. 1170891 which is longer and made of heavier material for better insulation.

►*1962 PONTIAC NEEDLE VALVE INSTALLATION NOTE:* DO NOT install push-pull clip to needle valve when overhauling carburetor. If clip is included with overhaul kit, it should be discarded and not used.

►*1962 OLDSMOBILE (EXC. F-85) FLOAT SETTING CHANGE:* Carburetors having code letter "B" or later stamped on metal tag should be set to 13/32". Float level on earlier carburetors should be set to ½". *See "Float Setting" below.*

DESCRIPTION: Dual (2-Barrel) downdraft carburetor with manual choke control (2G), automatic choke (2GC). Carburetors are similar to previous models and have the following features.

Idle Air Compensator (Buick 7020047, 7020049; Chevrolet 7020018; Oldsmobile 7020058, 7020056; Pontiac 7020072, 7020073, 7020076, 7020077) - Consists of a thermostatically controlled idle air bypass which opens during prolonged hot idling to supply additional air at a point below the throttle valves to offset en-

CONTINUED ON NEXT PAGE

ROCHESTER 2G & 2GC 2-BARREL CARBURETORS (C nt.)

richening effects of high engine temperature. This idle compensator must be held closed when making idle mixture and idle speed adjustments.

Idl C mp nsat r (Olds F-85) - This "Carb-Airator" is a separate unit attached to carburetor on air conditioned cars to assist in reducing rich fuel mixture during hot idling. *Se "Carb-Airator Adjustment" below.*

Automatic Ch k Ass mbly (Oldsmobile 7020052, 7020058, 7020954, 7020956; Pontiac 7020070, 7020071, 7020072, 7020073) - Choke assembly is mounted on throttle body and linked to choke shaft lever by an intermediate rod. This intermediate choke rod must be adjusted for correct choke operation.

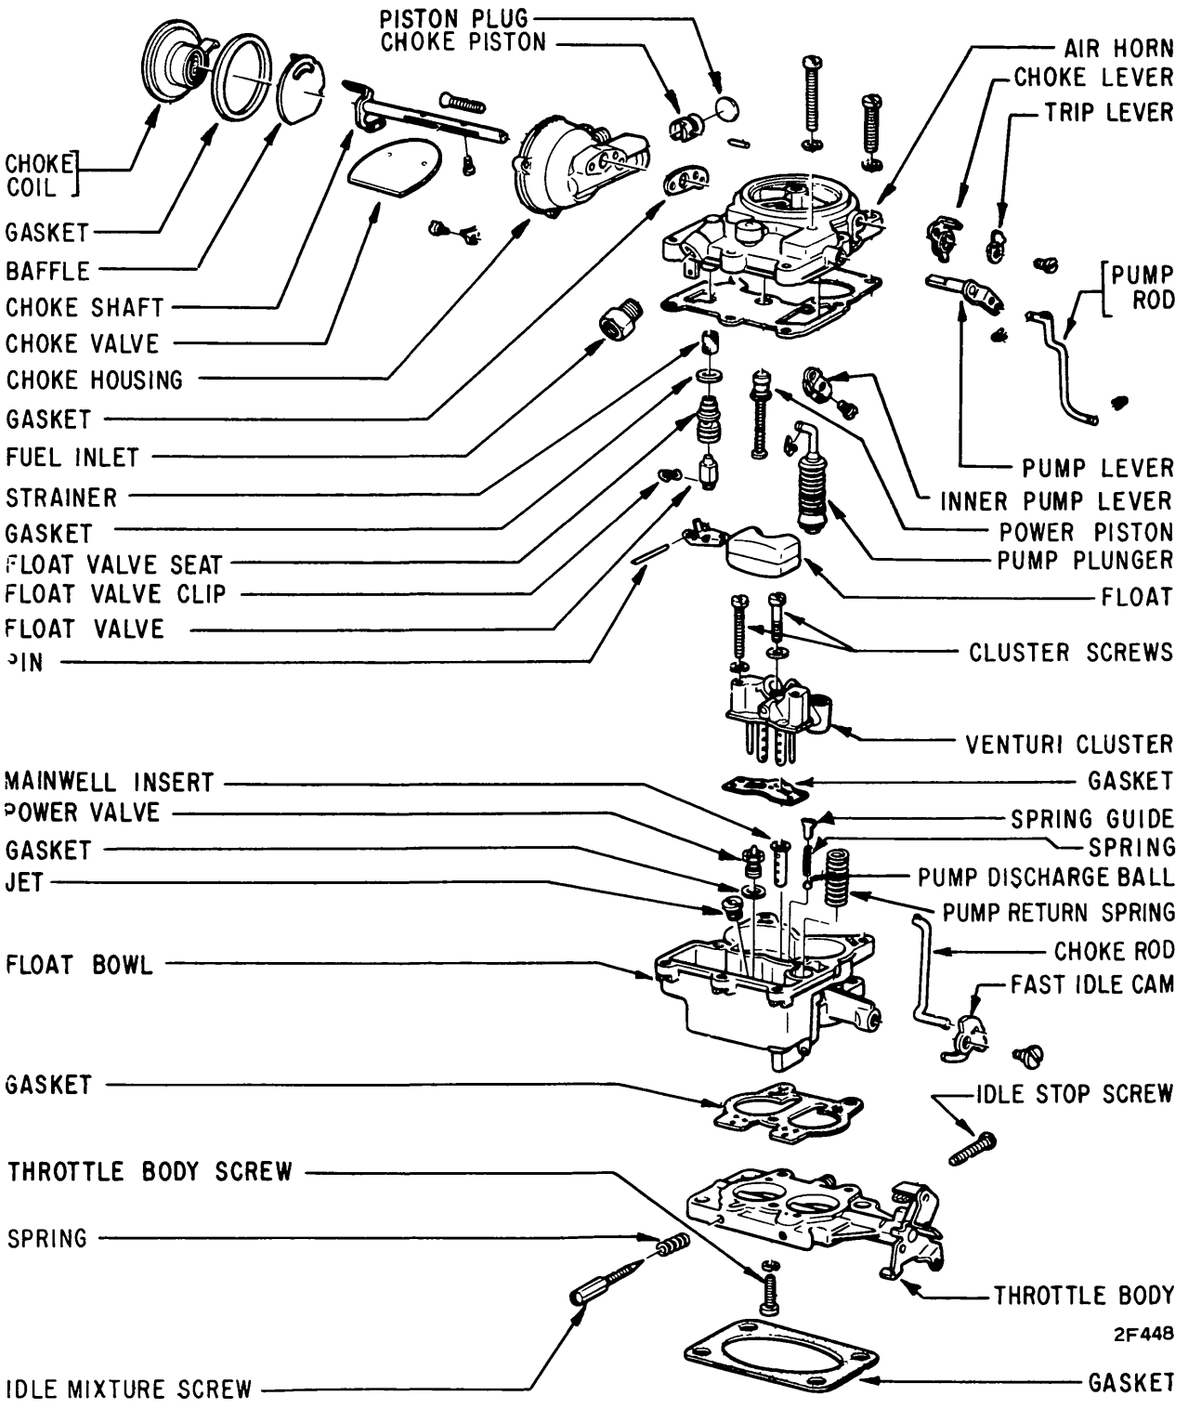
Aut matic Ch k Ass mbly (Except Above) - Choke assembly is mounted on air horn and directly connected to choke shaft. Intermediate rod adjustment not required.

ADJUSTMENT: *Mak all adjustments exactly as follows:*

Idling Adjustm nt: If preliminary adjustment required to warm engine, turn both idle mixture screws in until lightly seated, then back each screw out 1½ turns. Operate engine until normal operating temperature is reached with choke valve wide open and fast idle inoperative. Connect tachometer and vacuum gauge to engine, then adjust throttle stopscrew for correct engine idle speed (see table below). Adjust each idle mixture screw for smoothest idle performance with highest manifold vacuum and engine RPM *see special notes below.*

CAUTION - On cars with Idle Air Compensator, hold compensator valv cl s d by pressing in on spring-load d button n sid f main body (Chevrolet), removing air cleaner and pressing down on valve in air horn (Oldsmobil). Recheck engine idle speed.

CHEVROLET NOTE - Idle mixture adjustment can be made by leaning the mixture (turn screws in) for a moderate rough idle with slight vacuum and RPM loss, and then richening the mixture by turning the screws out ¼ turn.



OLDSMOBILE NOTE - After adjusting both idle mixture screws for highest manifold vacuum and engine RPM, turn each screw out ¼ turn for slightly richer mixture. Recheck idle mixture and idle speed after air cleaner installed.

Idl Sp ed Setting

Car M d l	Synchro-mesh	Auto. Trans.
Buick (Exc. Special)		①② 525 RPM
Buick Special V8	525 RPM	①② 525 RPM
Buick Special V6	575 RPM	①② 575 RPM
Chevrolet Pass.	500 RPM	③ 475 RPM
Chevrolet Truck	475 RPM	③ 450 RPM

Oldsmobile F-85	550 RPM	③④ 500 RPM
Pontiac(Exc.Tempest)	⑤480-500 RPM	③⑤ 480-500 RPM

① - 575 RPM on Air Conditioned cars.
② - Transmission selector lever in "N" or "P".
③ - Transmission selector lever in "D".
④ - 500 RPM on Air Conditioned cars.
⑤ - 540-560 on Air Conditioned cars with Air Cond. OFF.

CONTINUED ON NEXT PAGE

ROCHESTER "2GC" CARBURETOR (TYPICAL)

ROCHESTER 2G & 2GC 2-BARREL CARBURETORS (C nt.)

Carb-Airator Adjustment (Olds F-85): *NOTE - Make sure Carb-Airator valve closes when engine is started after normal idle speed adjustment (70°F).* If in extreme hot temperatures), (95°F outside temperature), engine idle is rough and erratic, or stalling occurs, tighten the temperature screw (upper screw on Carb-Airator) one turn and road test. *CAUTION - Do not upset normal idle and do not overtighten temperature screw.* If engine idles too fast under extreme hot conditions, tighten the air screw (lower screw on Carb-Airator).

Throttle Return Check (Dashpot) Adjustment: Used on Chevrolet and Oldsmobile with automatic transmission. *See "Throttle Linkage Adjustment" under CARBURETOR on each car model page for adjustment data.*

Float Level: *CAUTION- Two separate adjustments (Float Level & Float Drop) required.*

Float Level Setting (Chevrolet Pass. Cars & Truck, & Buick Special) - Remove and invert bowl cover and float assembly but DO NOT remove cover gasket. Install correct float gauge (see table below) over float with side of gauge resting against pump side of power piston shaft, and with outer leg of gauge in line with center of float. Bend float hinge arm so floats just clear top edge of gauge cutout and sides of floats are parallel with gauge legs.

Float Level Setting (Buick, Exc. Special; Oldsmobile, Olds F-85 & Pontiac - Remove and invert bowl cover and bowl assembly but DO NOT remove gasket. Install correct float gauge (see table below) on bowl gasket at free end of float. Lower edge (sharp edge) of float seam should just touch gauge. Adjust by bending float hinge arm.

Float Level Setting

Car & Carb.	Float Level	Checking Gauge
Buick (Exc. Spec.) (All)	23/32"	BT-214
Buick Special (All)	1 17/64"	BT-210
Chevrolet Pass. (All)	1 23/64"	BT-152
Chevrolet Truck (All)	1 23/64"	BT-152
Oldsmobile 88 (All) Early ①	1/2"	BT-197
Oldsmobile 88 (All) Later ②	13/32"	BT-212
Olds F-85 7020051,53,957,959	35/64"	BT-187
Olds F-85 7020980,81,82,83	25/32"	BT-215
Pontiac 7020070,71,72,73	5/8"	BT-177
Pontiac 7020060,74,75,76,77	11/16"	BT-176

① - Carburetors with "A" or no letter on tag.
② - Carburetors with "B" or later on tag.

Float Drop Setting (All Models) - Hold bowl cover and float assembly upright so that float hangs down at bottom of travel. Measure distance from lower face of cover gasket to bottom of float at free end using a scale or combination float setting gauge (see float checking gauge above). Distance should be 1 29/32" (All cars except Oldsmobile Series 88 & Pontiac); 1 3/4" (Oldsmobile Series 88 & Pontiac). Adjust by bending tang on rear of float hinge arm toward needle seal to decrease drop, or away from needle seat to increase drop.

Accelerating Pump Rod: *CAUTION - On Buick Special and Oldsmobile F-85, pump connector rod must be positioned in OUTER hole (furthest from pump shaft) of accelerating pump shaft lever. Other carburetors have a single hole.* With throttle stopscrew (and Fast Idle Screw on Oldsmobile 88) backed out so that throttle valves are completely closed, measure distance from top of air horn ring (Buick, except Special; Oldsmobile 88 and Pontiac); from top of air horn surface (Olds F-85); from top of pump housing (Buick Special, Chevrolet Pass. Cars & Trucks) to top of connector rod with a scale or combination gauge (see below). *NOTE - If gauge is used, leg of gauge should just touch top of connector rod.* To adjust, bend pump connector rod with Tool BT-18.

Accelerating Pump Rod Setting

Car & Carb.	Pump Rod Setting	Checking Gauge
Buick, Exc. Spec. (All)	1 7/16"	BT-214
Buick Special V6 (All)	1"	BT-210
Buick Special V8 (All)	1 3/32"	BT-188
Chevrolet Pass. Cars (All)	57/64"	BT-152
Chevrolet Trucks (All)	57/64"	BT-152
Oldsmobile 88 (All)	1 7/16"	BT-197 or 212
Oldsmobile F-85 (All)	59/64"	BT-187
Pontiac 7020070,71,72,73	1 3/4"	BT-177
Pontiac 7020060,74,75,76,77	1 1/8"	BT-176

Idle Vent: Adjust only after Accelerating Pump Rod Setting has been checked and adjusted. Use the same gauge (installed in same manner) as for pump rod setting (above). *NOTE - On Oldsmobile (Exc. F-85) & Pontiac, invert gauge so that leg marked "Vent" is down toward pump connector rod.* Slowly open throttle valves to point where vent valve just closes (rubber valve seats on pump housing on air horn). At this point, edge of cutout in gauge marked "Vent" (Chevrolet), or lower end of gauge marked "Vent" (Oldsmobile 88 & Pontiac), should just touch top of pump connector rod. Adjust by bending tang on pump lever which contacts vent valve arm.

Idle Vent Setting

Car & Carb.	Vent Setting	Checking Gauge
Chevrolet Pass. & Truck	49/64"	BT-152
Oldsmobile 88	1 11/32"	BT-197 or 212
Pontiac 7020060,74,75,76,77	1 5/64"	BT-176
Pontiac 7020070,71,72,73	1 17/64"	BT-177

Intermediate Choke Rod Adjustment (Oldsmobile 88) - *NOTE - Choke shaft lever has three holes for installation of intermediate choke rod. Normal position of rod in lever is "Center" hole. Other holes are for temperature and climatic condition adjustment, see "Automatic Choke Setting" below.* With intermediate choke rod installed in center hole of choke shaft lever, remove thermostatic cover and coil assembly and inside baffle plate. Open throttle valves and hold choke valve completely closed by pushing upward on intermediate lever. Adjust intermediate choke rod as necessary by bending so that choke piston first "V" groove is flush with end of piston bore.

Intermediate Choke Rod Adjustment: Pontiac 7020070, 71,72,73 - Remove choke cover and coil assembly, gasket and baffle plate. Hold choke valve completely closed by lifting up on intermediate lever. In this position, inner end of vacuum position should be flush with end of choke piston bore. Adjust by bending intermediate choke rod.

Automatic Choke Setting (All 2GC Carburetors): Adjust by loosening retainer screws on choke cover and rotating cover and coil assembly. Centered setting is with scribed index mark on cover in line with center (longest) mark on housing. *NOTE - Choke valve should be lightly closed at room temperature (75°F).*

Automatic Choke Setting

Car Model	Setting
Buick (Exc. Special)	Centered (At Index)
Buick Special V6	1 Point Lean
Buick Special V8	Centered (At Index)
Chevrolet Pass. (7020008,18)	Centered (At Index)
Chevrolet Pass. (7020007)	1 Point Lean
Oldsmobile 88	1 Point Lean
Oldsmobile F-85	Centered (At Index)
Pontiac	Centered (At Index)

►*OLDSMOBILE 88 CHOKE SETTING "TAILORING" FOR CLIMATIC & TEMPERATURE CONDITIONS:* Moving intermediate choke rod to next OUTER hole (away from choke shaft) will provide richer mixture during warm-up for acceleration or load. Moving intermediate rod to next INNER hole will provide leaner mixture under same operating conditions.

Fast Idle (2GC Carburetors): Adjust each model as follows:

All Models (Except Oldsmobile 88) - No separate fast idle adjustment required as fast idle speed is automatically set when hot (or slow) idle speed is adjusted (same screw controls both settings).

Oldsmobile 88 - As a preliminary adjustment (with carburetor off engine), close choke valve and place fast idle screw on high step of fast idle cam. Adjust fast idle screw for a throttle valve opening of .030" (Gauge BT-121) measured between edge of valve and carburetor bore on side opposite idle adjusting screw. Make final adjustment with carburetor on engine as follows: Connect tachometer, place transmission selector lever in "N" (Neutral) position, then rotate fast idle cam so fast idle screw is on high step of cam. With engine at normal operating temperature, adjust fast idle screw for an engine speed of 1900 RPM. *NOTE - Set engine speed at 2200 RPM for sub-zero operation.*

Choke Rod: Buick (Exc. Special), Oldsmobile F-85 & Pontiac - Turn idle screw into normal idle position (1½ turns open), then place idle screw on second step of fast idle cam and against shoulder of high step. Distance between upper edge of choke valve and wall of air horn should be as indicated in table (see below). To adjust, bend counterweight tang.

Buick Special, Chevrolet, & Oldsmobile 88 - Position fast idle screw (Oldsmobile 88), idle speed screw (others), on second step of fast idle cam, then close choke valve until screw is against shoulder of high step. *NOTE - On Oldsmobile 88, press up on intermediate choke lever and make sure that intermediate rod is at end of slot in intermediate lever.* In this position, choke valve opening, or clearance between upper edge of choke valve and air horn wall should be as indicated in table (see below). To adjust, bend choke lever tang (Exc. Oldsmobile 88); choke rod (Oldsmobile 88).

CONTINUED ON NEXT PAGE

ROCHESTER 2G & 2GC 2-BARREL CARBURETORS (C nt.)

Car & Carb.	Choke Valve Opening	Checking Gauge
Buick (Exc. Special)	.095"	BT-68
Buick Special	.052"	BT-190
Chevrolet Pass.	.089"	BT-108
Oldsmobile 88	.150"	BT-159
Oldsmobile F-85	.082"	BT-191
Pontiac 7020070,71,72,73	.080"	BT-195
Pontiac 7020060,74,75,76,77	.056"	BT-167

Unloader (2GC Carburet rs): Move throttle valves to wide open position (see Pontiac Note below) so that choke valve is partially open. Measure the choke valve opening or clearance between upper edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever using bending tool BT-69.

PONTIAC CHECKING NOTE - It is recommended that the throttle valves be opened by depressing accelerator pedal forcibly to the floor (by someone sitting in driver's seat) to simulate actual driving conditions. Make certain that pedal does not strike hump over transmission. Above procedure will eliminate all variances in linkage, floor mat, or pedal location.

Car Model	Choke Valve Opening	Checking Gauge

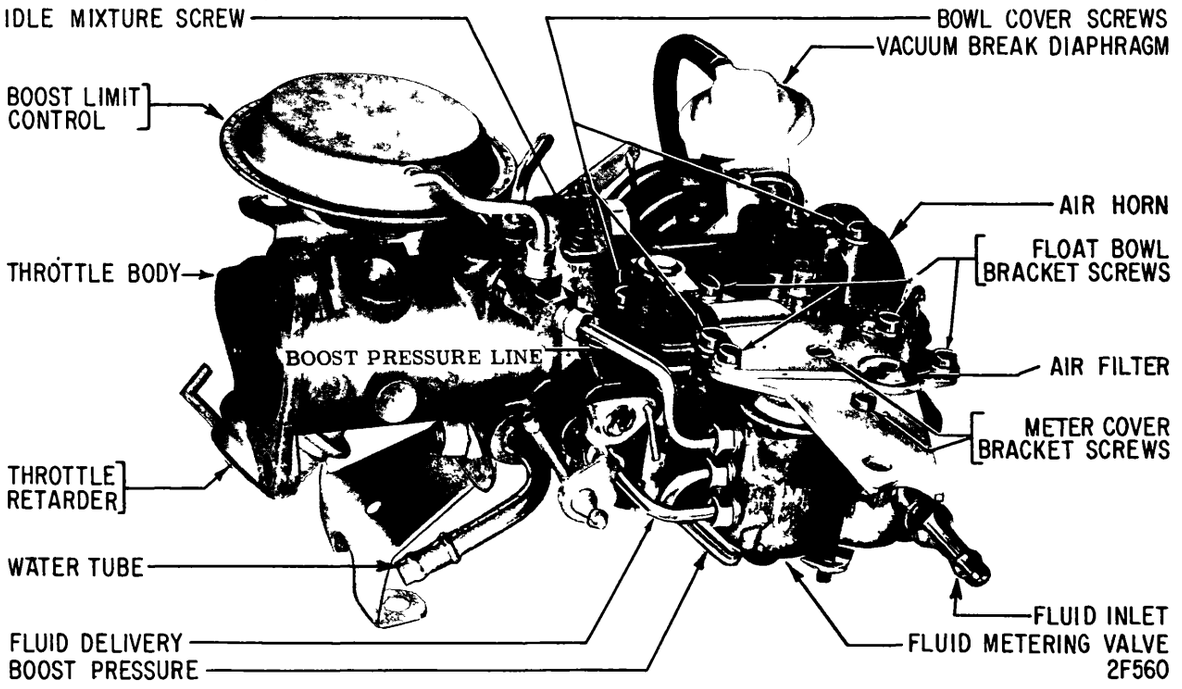
OLDSMOBILE F-85 JETFIRE CARBURETOR & FLUID INJECTION SYSTEM

Olds F-85 Jetfir (1962)

►*OLDSMOBILE F-85 SUPERCHARGED JETFIRE SERVICE NOTE: For s rvice procedures on Supercharg r, se "Oldsmobil F-85 Jetfire Supercharger"*



►*TURBO-ROCKET FLUID FILTER NOTE:* Sealed type filter located in line between supply tank and fluid metering valve. If filter becomes clogged or plugged, replace filter unit. DO NOT attempt to clean.

DESCRIPTION: This carburetion and fluid injection system consists of the following components:

Turb -Sup rcharger: *For d scription and servicing, see "Olds F-85 J tfir Supercharger" in this section.*

Carbur tor: Rochester Model "RC" side draft type of new design with automatic choke (Auto. Trans.); manual choke (Synchro-mesh). The float, idle, pump, and choke systems are similar to other Rochester carburetors. In the main metering system, a metering rod is used in place of a power valve. The rod is down in main metering jet during part throttle operation when manifold vacuum is high. In the power system, the vacuum operated power piston is connected to the metering rod to control fluid flow through main jet. When engine vacuum drops and more fuel is required, the power piston is forced upward by spring pressure, pulling metering rod out of main jet orifice, allowing more fuel to flow through jet. A Throttle Retard unit is used on all carburetors to control closing of throttle valve throughout entire range of throttle opening. On automatic transmission cars, a vacuum controlled Throttle Return Check prevents rapid closing of throttle valve. A secondary throttle valve located between primary throttle valve and supercharger is operated by Boost Limit Diaphragm to restrict maximum boost to 1.0 p.s.i. in the event Turbo-Rocket Fluid supply is exhausted or blocked. The manual choke assembly (synchro-mesh cars) is similar to the conventional automatic choke (Auto. Trans. Cars) except for the addition of an external operating lever and the substitution of a wrap-up type spring in place of the bi-metal spring. A spring loaded diaphragm mounted in a Delrin plastic case has been added to automatic and manual choke systems to provide a pulling action on choke shaft against tension of bi-metal or wrap-up

CONTINUED ON NEXT PAGE

CARBURETOR & FLUID METERING VALVE ASSEMBLY

OLDSMOBILE F-85 JETFIRE CARBURETOR & FLUID INJECTION SYSTEM (Cont.)

choke coil spring. This pull provides a definite amount of vacuum break for starting. An Idle Compensator Valve located on bottom of carburetor between air horn and fuel bowl consists of a thermostatically controlled idle air bypass which opens during prolonged hot idling to supply additional air at a point below the throttle valve to offset enrichening effects of high engine temperature.

Turbo-Rocket Fluid Injection System: Consists of a Fluid Metering & Boost Limit Control Valve Assembly, Check & Relief Valve, Depressure Valve, and Fluid Tank. The fluid injection system is designed to deliver Turbo-Rocket Fluid through carburetor throttle body to engine any time intake manifold pressure exceeds 1.0 p.s.i.

ADJUSTMENT

ADJUSTMENT: There are no adjustments required on turbo-charger or fluid injection system.

Throttle Linkage & Throttle Return Check Adjustment: *See CARBURETOR on car model page.*

Idle Mixture: For initial adjustment, turn idle mixture screw out approximately 1½ turns from a lightly seated position. After engine is brought to normal operating temperature, adjust idle mixture screw for highest manifold vacuum and engine RPM, then turn screw out ¼ turn for slightly richer mixture.

Idle Speed: 550 RPM (Exc. Air Cond.); 600 RPM (Air Cond. with compressor not operating). Place automatic transmission in "D" (Drive) when adjusting idle speed.

Fast Idle: With engine at normal operating temperature, transmission in neutral (air conditioner turned off), place fast idle screw on second step of fast idle cam and adjust engine speed to 1500 RPM.

Float Level: 12/32", measured from machined surface of bowl flange (gasket removed and carburetor upright) to top of float at end opposite fuel inlet with float needle seated by pressing downward at rear of float arm. If gauge BT-62-16 is used, top corner of float should just touch gauge. To adjust, bend float pontoon at float arm. Check to make sure float is centered in bowl and is not rubbing on walls.

Float Drop: Not required.

Vacuum Break Adjustment: 5/32" clearance between edge of choke valve and inner wall of air horn with diaphragm seated. To adjust, bend tang on linkage. Make sure that when diaphragm is released, choke valve closes completely. *NOTE - If a second method of adjustment is required, linkage arm may be bent slightly.*

Choke Rod Adjustment: .140-.160" clearance between edge of choke valve and inner wall of air horn with fast idle screw on second step of fast idle cam and against highest step. To adjust, bend choke rod (rod between fast idle cam and choke shaft lever) at center angle.

Unloader Adjustment: .308-.348" clearance between edge of choke valve and inner wall of air horn with throttle valve wide open. To adjust, bend tang on fast idle cam.

Thr ttl R tard Unit Adjustm nt: With throttle valve wide open and throttle retard plunger fully extended, connecting rod must freely enter hole in throttle lever. To adjust, bend rod at center angle.

Automatic Ch k : Centered (At Index).

Manual Ch k : P int r Adjustm nt - Loosen pointer screw, then with throttle held open to prevent weight of fast idle cam from affecting the adjustment, rotate pointer counterclockwise, then clockwise, until choke valve just closes. Continue rotating clockwise three notches, then tighten pointer screw.

Cable Adjustment - With choke cable wire set screw loosened and choke knob pushed all the way "in", adjust choke wire so that distance between choke valve lever and edge of cable conduit clamp is 2 5/8". Tighten cable wire setscrew and bend end of wire so it cannot contact adjacent hoses.

TESTING

CHECK & RELIEF VALVE ASSEMBLY, DEPRESSURE VALVE, SUPPLY TANK & HOSES: Install Gauge BT-6225 on fluid supply tank and start engine. Pump up gauge to 8 lbs. with engine idling. Pressure relief valve should drop pressure to 5¼-6¼ lbs. If pressure drops below 5¼ lbs., the depressure valve may not be closing, or leaks may be present in or about relief valve or hoses. To locate the leakage, clamp upper hose leading from fluid tank with Vise-Grip pliers Install Gauge BT-6225 and pump up to 8 lbs. Fluid tank should hold this pressure for 30 seconds. If gauge pressure drops, clamp upper and lower hoses, then pump system up to 8 lbs. If gauge holds the 8 lbs. for 30 seconds, leakage is in Fluid Metering & Boost Valve assembly. If gauge pressure continues to drop, check for air pressure leaks at fluid tank. If leaks are not detected, remove pliers from upper tank hose, then clamp hose between relief valve assembly and depressure valve. Pump system up to 8 lbs. If pressure drops below 5¼ lbs., check for external leaks at relief valve assembly. If neither of these show a leak, the relief valve may be leaking internally. Remove gauge and clamps.

TURBO-ROCKET FLUID TANK CAP: Install fluid tank cap on Gauge BT-6225 with cap reset button depressed, then pump tester up to 5 lbs. Cap should hold this pressure for 30 seconds. Pump up tester to 7½ lbs. Cap should release pressure between 6½ and 7½ lbs.

TROUBLE SHOOTING & DIAGNOSIS

DULL WHINE ON ACCELERATION OR DECELERATION: Center housing shaft bushings may be worn. Compressor impeller or turbine wheel may be rubbing on housing.

PRESSURE CAP RELEASES: Exhaust bypass valve or controller stem may be stuck.

MAXIMUM PERFORMANCE CANNOT BE OBTAINED: Primary diaphragm in controller may be broken.

NO BOOST OPERATION: Turbo-rocket fluid tank empty or fluid filter may be plugged. Fluid tank cap released (popped). Depressure valve not closing, or check and relief valve is defective. Leakage in fluid tank or hoses. Leak in upper diaphragm of fluid metering and boost limit control valve assembly. *NOTE - Test system (see above). If checking indicates malfunction in fluid metering and boost limit control valve assembly, disassemble and inspect upper diaphragm. If testing do s not show l akag in any compon nt, and still "no boost", insp ct lower diaphragm of fluid m t ring and boost limit control valve ass mbly for le akag . Also ch ck for brok n auxiliary throttl valv r turn spring.*

REMOVAL & INSTALLATION

TURBO-ROCKET FLUID TANK: Rem val - Loosen fluid filter clamp and lift filter up from mounting bracket, then disconnect and clamp fluid supply hose at fluid metering valve. Lower hose and filter to underside of car, release clamp and drain fluid into a clean container. Disconnect gauge wire and remaining hoses at tank. Remove attaching bolts and nuts at each side of tank, and remove tank.

Installation: Reverse removal procedure, then fill tank and check for leakage.

CHECK & RELIEF VALVE ASSEMBLY: R m val - Disconnect hoses and remove coil, valve assembly and nylon gasket. Lift connector, large washer and "O" ring from intake manifold.

Installation: Reverse removal procedure and tighten valve to 12-18 ft. lbs.

TURBO-ROCKET FLUID METERING VALVE: R moval - *NOTE - It is not necessary to r move carburetor.* Remove metering valve bracket-to-bowl screws, then remove three copper tubes, being careful not to damage rubber gaskets, and remove valve assembly.

Installation: Connect the three copper tubes, middle tube first, making sure that all tubes are in line with holes before tightening. Install valve bracket-to-bowl attaching screws.

CARBURETOR: Removal - *NOTE - If ngine is warm, release pressure in cooling system by loos ning radiator cap.* Remove hood, then remove air cleaner. Disconnect steel line from filter-to-carburetor inlet at carburetor, and compressor housing-to-throttle body water hose at throttle body. Disconnect line from turbocharger to bottom of float bowl at tee on bottom of float bowl, then disconnect carburetor rod. Disconnect choke cable if so equipped. Disconnect turbo-rocket fluid supply hose from metering valve, and the check valve-to-throttle body hose. Disconnect crankcase ventilation valve-to-throttle body hose, then remove carburetor lower mounting bracket bolts. Remove nuts attaching carburetor-to-turbo-charger. Remove remaining water hose and remove carburetor.

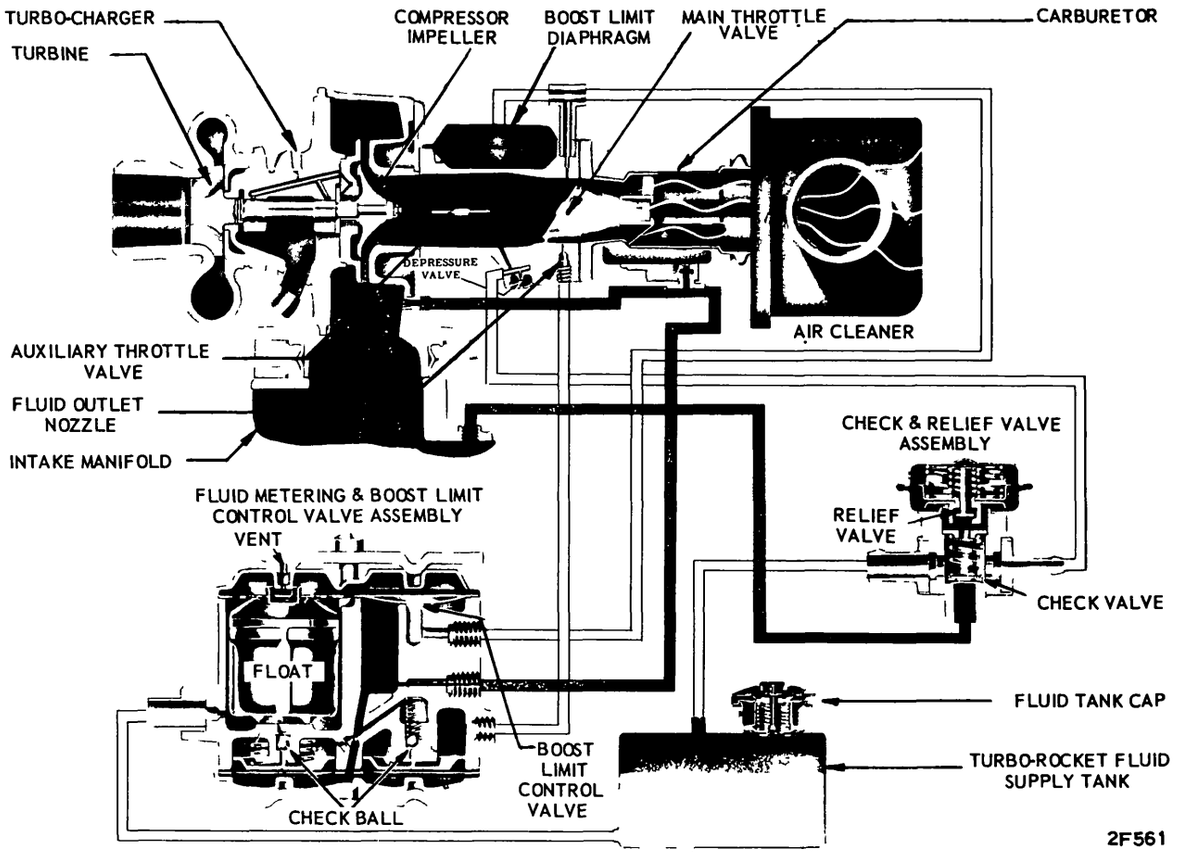
Installation: Reverse removal procedure. Install a new gasket between carburetor and turbo-charger. Tighten carburetor-to-turbo-charger attaching nuts to 9-12 ft. lbs. Oil mounting bracket-to-intake manifold bolts with engine oil and tighten to 20-25 ft. lbs.

OVERHAUL

CARBURETOR: Disassembly (Fl at Bowl) - Remove fluid metering valve and float bowl bracket. Retain felt air filter covering meter vent, then remove bowl cover attaching screws and cover. Remove cover gasket. Remove float hinge pin spring retainer, then remove float assembly and hinge pin together. Remove screen from main well, then remove float needle valve, seat, gasket and retainer. Remove power piston and metering rod assembly by turning small pin to one side, at top of power piston. *CAUTION - Piston is spring load d.* Pry upward on the small guide disc at top of main metering jet well, then use Tool BT-62-15 to remove main metering jet. Remove T-shaped retainer, spring and discharge ball check from discharge well with a pair of long nosed pliers. To remove pump plunger assembly, remove link connecting pump plunger to

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 JETFIRE CARBURETOR & FLUID INJECTION SYSTEM (Cont.)



throttle lever. Rotate throttle lever to wide open position, then remove pump plunger from pump well. Remove pump return spring. To remove pump arm and duration spring from plunger, remove spring clip at top of plunger stem. *NOTE - Idle tube and main well tube ar pr ss d in plac and should not be removed.*

Throttl B dy - Remove depressure valve, diaphragm cover and diaphragm. Remove boost limit diaphragm opening spring and disconnect diaphragm linkage from auxiliary throttle valve lever by removing hairpin clip. Loosen boost limit line from boost limit diaphragm and from tee fitting at base of float bowl, but do not try to pull line from tee fitting. Remove diaphragm from throttle body. Remove idle mixture screw and spring. If necessary to remove auxiliary throttle valve and shaft, remove valve-to-shaft attaching screws and remove valve, then remove shaft. *CAUTION - Main throttle valve and shaft sh uld not b r moved. If necessary to replace ith r valv r shaft, r place complete throttle body ass mbly.* Disconnect throttle retarder linkage, then remove nut holding bracket to throttle body. Disconnect throttle body from main body, then remove throttle return check (if so equipped).

Ch k (Manual & Aut matic) - *NOTE - Manual choke ass mbly is similar t automatic choke assembly ex- c pt f r th substituti n f a wrap-up coil spring used in plac f th bi-m tal spring. Choke housing hot air inlet is capped on manual choke carburetors.* Remove fast idle cam attaching screw, cam and link, then remove choke cover and gasket. Remove baffle plate, choke piston lever attaching screw, then remove lever link and piston assembly. Remove choke housing attaching screws and remove choke housing and spring loaded plastic washer from air horn assembly. Remove washer spring. Disconnect link from vacuum break diaphragm and slide vacuum hose from plastic case. Remove bracket and diaphragm assembly. Remove choke valve-to-shaft attaching screws and remove choke valve. Slide choke valve shaft out of air horn. Remove idle compensator cover and passage cover.

Cl aning & Inspecti n: Wash parts, except pump plunger, felt air filter, gaskets and diaphragms, in a cold immersion type carburetor cleaner. Blow out all passages with air. *CAUTION - Do not pass drills through j ts r m t ring passag s. Inspect all parts for wear or damag and replac as necessary.*

R ass mbly: Ch ke (Manual & Automatic) - Install choke shaft in air horn, then install choke valve on shaft and install screws loosely. Seat choke valve in air horn bore and tighten attaching screws securely. *NOTE - L tt rs "RP" n valv must face upward on choke valve shaft.* Install vacuum break diaphragm assembly on air horn and connect vacuum tube, then connect diaphragm link to choke lever and secure with hairpin clip. Assemble plastic washer and spring to choke housing and install housing on air horn. Tighten attaching screws securely. Install choke piston and link assembly in housing, positioning piston lever over choke shaft. Tighten retaining screw securely. Install choke baffle plate, then install thermostatic coil or wrap-up type spring and cover assembly. Install retaining screws and adjust choke *(see "Adjustment" above).* Install choke link and fast idle cam (looped ends of link facing away from air horn casting). Install fast idle cam attaching screw and tighten securely. Install new idle compensator passage gasket and cover and retain in place with two screws.

TURBO-ROCKET FLUID SYSTEM (SCHEMATIC)

Throttle Body - Install throttle retarder on throttle body and connect linkage to throttle valve. *NOTE - Link should be installed in hole in throttle lever closest to heated water inlet tube. Bend in link should point toward engine.* Install auxiliary throttle shaft and lever into throttle body bore, then install auxiliary throttle valve with identification on valve toward manifold mounting surface. Install screws and tighten securely. Install boost limit diaphragm on mounting bracket, then position boost pressure tube in fitting. Install diaphragm and bracket assembly on throttle body casting, connecting pressure tube at same time to tee fitting at base of float bowl. Tighten attaching screws securely, then tighten tube fittings. Install auxiliary throttle valve link to auxiliary throttle valve lever. *NOTE - Auxiliary throttle body diaphragm (b st limit c ntrol) should b centered on mounting brack t so that diaphragm plung r is parall l with thr ttl l v r, th n tight n diaphragm to brack t bolts.* Connect boost limit control diaphragm opening spring to auxiliary throttle shaft lever and to hole on diaphragm bracket (ends of spring loops pointing toward diaphragm). Install diaphragm in fluid tank depressure valve chamber, then install diaphragm cover, making sure diaphragm is not wrinkled. Install holding bracket and tighten screws evenly and securely. Install idle mixture screw and spring. Turn in until lightly seated, then back screw out 1½ turns for initial adjustment.

Float Bowl - Install new gasket on throttle body assembly, lining up holes in gasket with holes on face of throttle body flange, then install throttle body on main body so unloader tang on fast idle lever is above tang on fast idle cam. Install throttle return check on lower mounting stud, then install throttle body-to-main body attaching nuts and tighten evenly and securely. *NOTE - Make sure plunger on throttle return check lines up with pad on fast idle lever.* Connect throttle return check vacuum tube to fitting on air horn. Install pump return spring in pump well, pushing it into position so it is seated properly, then install pump plunger into pump well. *CAUTION - Do not distort pump cup.* Install pump link into pump plunger rod, then hook other end of link to throttle lever and retain in place with spring clip. Install pump discharge ball, spring, and T-shaped retainer into pump discharge well. Install

CONTINUED ON NEXT PAGE

OLDSMOBILE F-85 JETFIRE CARBURETOR & FLUID INJECTION SYSTEM (Cont.)

main metering jet with Tool BT-62-15, then install metering rod guide into top of main metering jet well. Install power piston spring into chamber, then install power piston over spring, while guiding metering rod through guide. *CAUTION - Make sure metering rod nters orifice in main metering jet.* Retain power piston in place by turning retainer wire toward power piston. Install screen into main well. Install float needle seat and gasket and tighten securely with Tool BT-52 so that needle seat will not be distorted, then install needle valve. Install hinge pin into float arm, then install float assembly in float bowl with hinge pin located in guide channels of bowl. Install spring retainer against float hinge pin with loop of spring upward toward bowl cover. Adjust float level *(see "Adjustment" above)*. Install float bowl cover gasket, pushing slotted section over power piston and metering rod assembly, locating gasket on lugs on side of float bowl. Install float bowl cover and tighten attaching screws. Attach fluid metering valve bracket to bowl cover bracket and tighten both screws securely, then install the assembly on carburetor, making sure fluid metering valve fittings are properly aligned with their respective fittings in throttle body and boost limit diaphragm line. Tighten attaching screws evenly and securely, then tighten all fittings.

TURBO-ROCKET FLUID METERING VALVE: Disassembly - Remove screws connecting upper and lower valve cover retaining brackets together (hold valve covers in place while removing brackets). Remove top cover, while holding bottom cover, and remove top gasket. Carefully remove diaphragm spacer, diaphragm, float weight and float assembly. *NOTE - Diaphragm can be removed from float by carefully bending tangs in float weight slot together, then remove weight and diaphragm from float.* Remove bottom cover and diaphragm (cover is spring loaded. Be careful not to damage diaphragm). Remove diaphragm from cover, then remove spacer and gasket. Remove diaphragm plunger and spring from float side, and diaphragm plunger from boost side of valve. *NOTE - Plungers are interchangeable.* Remove fluid outlet check ball retainer, check ball and spring.

Reassembly: Install check ball, spring, and retainer in housing (tapered end of spring toward ball). Assemble float to top of diaphragm with flat valve on diaphragm facing downward. *NOTE - Pr ngs n top f fl at should be installed thr ugh diaphragm at right angl s to c nt rline. Plac fl at w ight v r top f diaphragm and bend retaining clips on fl at into sl t in w ight.* Assemble float and diaphragm assembly in housing, making sure that wrinkles are removed from diaphragm and that it lays flat on face of housing. Install diaphragm spacer over diaphragm so center holes line up with holes in diaphragm and casting. Install gasket, then diaphragm cover, making sure center holes are aligned properly and that prongs on cover are aligned with holes in diaphragm. Install gasket into lower cover, then install copper spacer next to gasket. Line up holes in gasket and spacer with holes in cover, then install diaphragm in cover, lining up holes and prong apertures. Set diaphragm plungers in their centered positions on diaphragm with plunger stems pointing upward. Place diaphragm plunger spring on top of plunger on float side of fluid meter, then with casting held in upright position, lower casting onto cover making sure diaphragm plunger stems fit into their respective holes. Make sure diaphragm does not wrinkle, then assemble cover to casting. Install upper and lower cover retainer brackets and tighten both screws evenly and securely. *NOTE - Brackets are installed c rrectly wh n liquid inlet is pointing away from fl at bowl.*

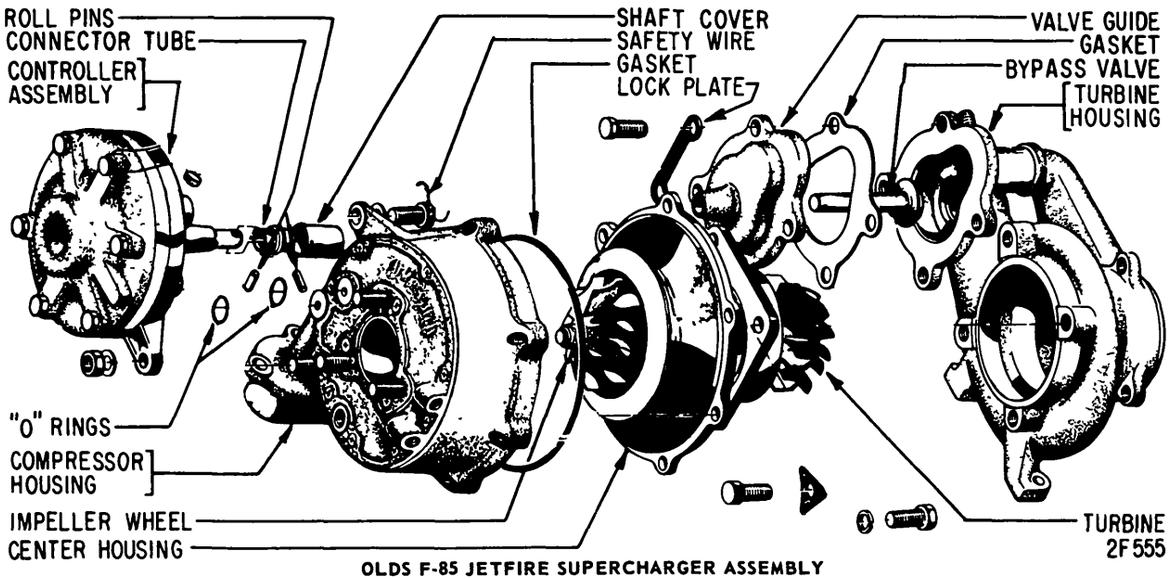
OLDSMOBILE F-85 JETFIRE SUPERCHARGER

Olds F-85 Jetfire (1962)

DESCRIPTION: Exhaust driven turbo supercharger assembly consisting of the following units:

Turbine & Compressor: Turbine wheel and compressor wheel are mounted on a common shaft (turbine wheel is welded to shaft and compressor wheel is pressed onto shaft and retained with a nut). The turbine wheel and compressor impeller are enclosed in separate housing by two floating bushings lubricated by engine oil pumped through housing and drained back to right hand rocker arm cover.

Controller Assembly: The poppet type bypass valve located in turbine housing is operated by the controller. When engine is first started the bypass valve is closed, causing increased engine RPM (and increased exhaust) to turn turbine at a greater speed. The bypass valve controls the amount of exhaust pressure used to turn turbine and compressor, thereby controlling engine power output and speed of turbo-charger. The controller unit bolted to compressor housing, with two passages to compressor housing, senses compressor inlet and outlet pressures. When pressure differential is enough to overcome controller spring (within controller), controller opens bypass valve to divert exhaust gases from turbine wheel. The controller limits the pressure the turbo-charger will deliver to engine to 5 to 6 p.s.i.



LUBRICATION: Periodic lubrication, other than changing engine oil at specified interval is not required.

REMOVAL: *CAUTION - Clean as much dirt as possible off unit and carburetor. Cover oil inlet and outer ports with tape or plastic plugs to prevent dirt entering unit.*

Turbo-Charger: Remove carburetor *(see "Rochester RC Carburetor" in this section)*, then remove turbo-charger exhaust inlet pipe by disconnecting at upper and lower flanges. *CAUTION - Install tool BT-6219 at turbo-charger and manifold p ning r cov r openings with tap.* Disconnect turbo-charger exhaust outlet pipe at upper flange, then drain engine coolant below level of turbo-charger. Disconnect oil feed line at center housing and disconnect oil return line. Disconnect compressor water inlet hose at compressor housing. *NOTE - Do not close compressor housing water hand shut-off valve.* Remove turbo-charger-to-intake manifold attaching nuts and remove turbo-charger.

Controller Assembly: *NOTE - Controller can be removed for service without removing turbo-charger.* Cut and remove safety wire, then loosen bolt at top of controller and nut at bottom mounting ear (remove carburetor rod to gain access to bottom nut). Slide cover on shaft toward controller and remove roll pin from bypass valve end of connector tube. Remove bolt and nut attaching controller to turbo-charger, then hold throttle valve wide open and remove controller. Remove sensing port "O" rings. Remove shaft cover and remaining roll pin, then remove connector tube.

Bypass Valve: *NOTE - Bypass Valv can b r moved for service without rem ving turbo-charg r.*

OLDS F-85 JETFIRE SUPERCHARGER ASSEMBLY

ROCHESTER H SINGLE BARREL CORVAIR CARBURETOR

CORVAIR PASS. CARS & TRUCKS Rch st r Carb. N .
Synchro-mesh 7020101
Powerglide.....7020100

DESCRIPTION: Single barrel downdraft type with automatic choke, fast idle and unloader. The automatic choke assembly consists of a thermostatic coil assembly mounted to lower side of engine cylinder head and linked directly to carburetor choke valve shaft. A vacuum diaphragm mounted on carburetor air horn replaces the conventional choke vacuum piston.

ADJUSTMENTS: Make final adjustments with carburetor installed on engine.

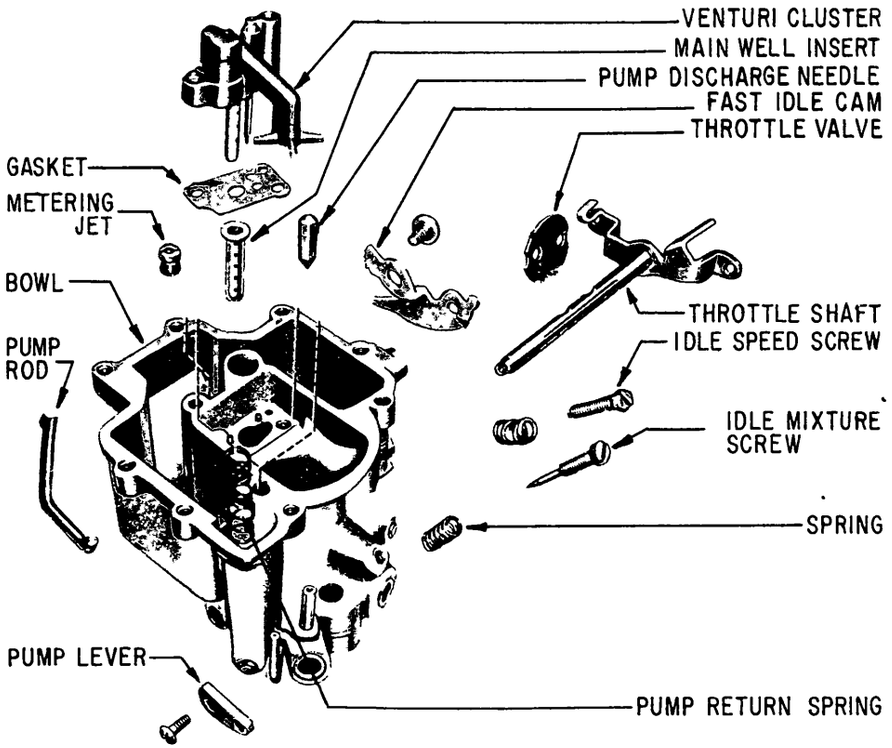
Final Adjustment (Synchr nization, Idle Speed & Mixture, Fast Idl , Aut matic Choke): *See CARBURETOR on car mod l pag .*

Initial Adjustm nt (Carburetor Off Engine): Idle Speed - Back out idle speed screw, then open choke valve so throttle lever does not touch fast idle cam. Place a .003" feeler gauge between idle speed screw and throttle lever, then turn idle speed screw in until it just touches feeler gauge. Turn idle speed screw in an additional 1½ turns.

Idl Mixtur - Turn idle mixture screw out 1½ turns from a lightly seated position.

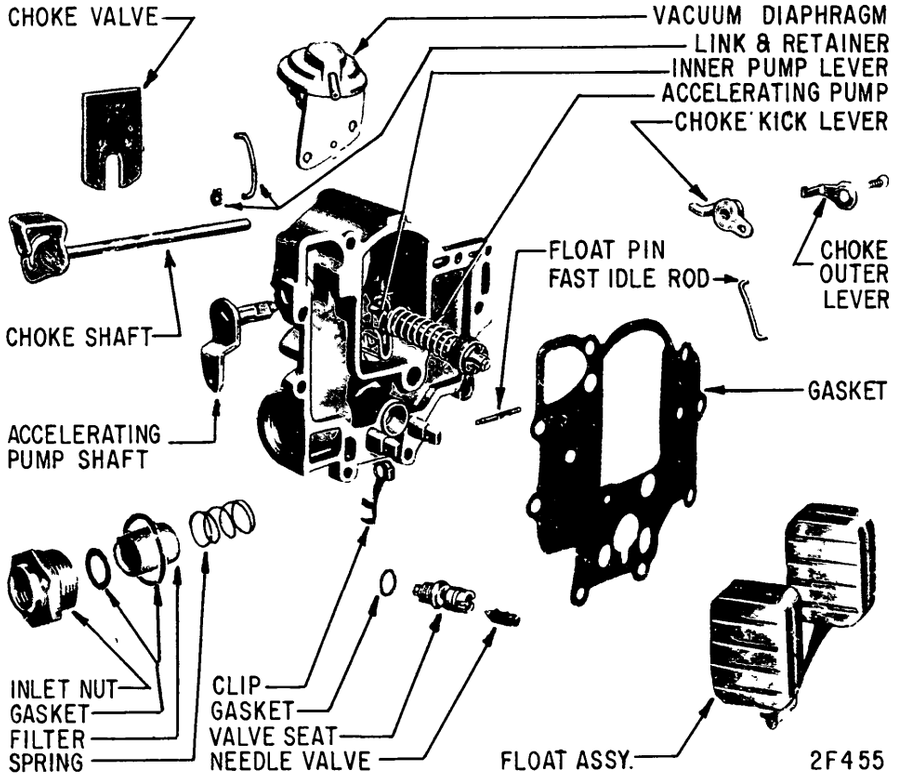
Vacuum Diaphragm - Hold diaphragm arm in against diaphragm and measure clearance between lower edge of choke valve and air horn wall. Clearance should be .145-.170". To adjust, bend diaphragm link. *NOTE - Throttl l ver fast idle tang sh uld r st on s cond highest step of fast idle cam when making this adjustment. If necessary, bend outer choke shaft lever tang .*

Pump Rod - Back out idle speed screw until throttle valve is completely closed, then bend pump rod as necessary to align index mark on upper pump lever with sharp edge on air horn casting. *NOTE - On cars with Powerglide (with two holes in lower pump lever), adjustment should be made with rod in outer hole. After adjustment is completed, move rod to inner hole of lever for proper operation.*



Float Level - 1 13/64" (Gauge BT-174) between air horn gasket and top surface of float with air horn inverted. Floats must be parallel with air horn. To adjust, bend tang at rear of floats.

Float Drop - With air horn assembly held upright and floats hanging free, distance from gasket to bottom of float at lowest point should be 1¾" (Gauge BT-174). To adjust, bend tang at end of float hinge arm.



Choke Rod - With fast idle tang on second step of cam next to highest step, close choke valve so trip lever on choke shaft just contacts choke tang on plastic lever and collar assembly. Clearance between lower edge of choke valve and inner wall of air horn should should be .161" (BT-194). Bend Tang on trip lever.

OVERHAUL: Disass mbly - Disconnect pump rod from pump lever, then remove fuel filter element and spring. Remove choke trip lever attaching screw and levers from choke shaft. Remove vacuum diaphragm assembly by rotating the assembly to align notch and free it from link. Remove float assembly and float needle, seat and gasket. Remove clip from accelerator pump and remove pump, then remove clip, shaft and lever. Remove screws from venturi cluster and lift out cluster, gasket and main well insert. Remove pump discharge valve, idle mixture adjusting needle and main metering jet.

Reassembly: Install throttle shaft and valve, carefully centering and seating valve in shaft end bore. Tighten screws securely. Install venturi cluster and gasket and install screws and lockwashers. Install accelerator pump assembly and pump return spring, then install pump discharge needle. Install choke valve, choke kick lever and outer lever cam. Tighten choke valve screws securely. Make sure choke shaft assembly rotates freely without binding. Install float needle valve seat and needle valve, then install a new air horn gasket and install float assembly. Adjust float level and float drop (see above), then install air horn assembly on bowl and install screws and lockwashers in their original positions. Replace filter return spring, filter gasket, gasket and inlet nut. Install pump rod.

►CHANGES, CAUTIONS, CORRECTIONS

►*1962 6 CYL. CHEVY II & CHEVROLET PASS. CARS (WITH SYNCHRO-MESH TRANS.) CARBURETOR LOAD-UP DURING WARM-UP CORRECTION & PRODUCTION CHANGE NOTE (EARLY CARS):* To minimize engine load-up after a cold start, change choke setting from "1 Point Rich" to "Index" (Chevy II); from "Index" to "1 Point Lean" (Chevrolet Pass. Cars). Later cars have this change made in production.

►*1962 CHEVY II 4 CYL. ENGINE CARBURETOR PRODUCTION CHANGE:* New carburetors, No. 7020114 & 7020115 with spring loaded float needle valve replace earlier carburetors in production. The new spring loaded needle valve can be installed in earlier carburetors by installing Float Assembly, Part No. 7022675 and Float Needle & Seat Assembly Unit, Part No. 7020681. *Procedure for adjusting float level on carburetors with spring loaded needle valve is different than on carburetors with solmd needle valve (see "Float Level" below).*

►*1962 CHEVY II 4 & 6 CYL. ENGINE SURGE CORRECTION (EARLY CARS):* If a surge condition exists on early cars with carburetors, No. 7020103, 7020105 (4 Cyl.); 7020105, 7020108 (6 Cyl.) which are equipped with Main Metering Jets, Part No. 7002652 (7020104); 7002654 (7020103); 7002658 (7020105); 7002654 (7020108), install a 1 step richer main metering jet. Later carburetors have the larger size jet installed in production.

CONTINUED ON NEXT PAGE

ROCHESTER "BC" CARBURETOR (TYPICAL)

ROCHESTER B & BC SINGLE BARREL CARBURETORS (C nt.)

DESCRIPTION: Single barrel downdraft carburetor with manual choke control (Model B), automatic choke (Model BC). Design is similar to previous carburetors except that the Model B carburetor used on Pontiac Tempest has an adjustable positive idle stop (eccentric washer).

►*FUEL STRAINER NOTE:* Strainer screen (under fuel inlet fitting nut) can be removed for cleaning. Replace filter every 15,000 miles or sooner if needed.

ADJUSTMENTS: Make all adjustments exactly as detailed below.

Idling Adjustment: If preliminary setting is required to warm up engine, turn idle mixture screw in until lightly seated, then back screw out correct number of turns (see table below). Start engine and allow to idle until normal operating temperature is reached, then adjust as follows:

Idle Mixture - With engine at normal operating temperature and idling at correct speed (see below), turn idle mixture adjusting screw in or out until smoothest engine performance is secured. Recheck idle speed.

Idle Mixture Setting

Car Model	Idle Screw Opening
Chevy II	2 turns
Chevrolet Pass	1½ turns
Chevrolet Truck	1½—2½ turns
Pontiac Tempest	1½ turns

Idle Speed - With engine at normal operating temperature, adjust throttle stopscrew for correct idling speed as listed below (*CAUTION* - On "BC" carburetors, stopscrew must be resting on lowest step of fast idle cam when adjustment being made).

Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans.
Chevy II 4 Cyl.	600 RPM	① 600 RPM
Chevy II 6 Cyl.	500 RPM	① 600 RPM
Chevrolet Pass.	475 RPM	① 450 RPM
Chevrolet Trucks	475 RPM	① 450 RPM
Pontiac Tempest	③ 680-700 RPM	①② 580-600 RPM

① - Automatic transmission in "D" (Drive).
② - 630-650 RPM on Air Conditioned cars.
③ - Air Conditioner turned off.

Throttle Return Check (Pontiac "BC" Carbs.): *See CARBURETOR n car model page.*

►*1962 PONTIAC 4 CYL. (WITH AUTOMATIC TRANSMISSION) THROTTLE RETURN CHECK NOTE & PRODUCTION CHANGE:* Later production cars WITHOUT air conditioning do not have a throttle return check. In the event of faulty throttle return check operation on these models, remove diaphragm, bracket, and hose, then plug manifold vacuum fitting. Do not replace any of these items with new parts.

Float Level: *CAUTION - Carburetors with "Spring Loaded" float needle valve require a different adjustment procedure than carburetors with "Solid Needle". See below.*

Float Level Setting - *CAUTION - When removing air horn and bowl cover on carburetors with automatic choke, disconnect at suction tube at upper coupling nut and use care not to disturb seal at lower end of tube.*

Carburetors With "Solid Needle Valve" - 1 9/32" (Gauge M-250) with air horn inverted, gasket in place and gauge tang inserted in discharge nozzle. Top of each float must just touch gauge and float must be centered between gauge legs. To adjust, bend tang on float arm.

Carburetors With "Spring Loaded Needle Valve" - 1 9/32" (Gauge M-250) with air horn inverted, gasket in place and gauge tang inserted in discharge nozzle. While setting float level, a 1/32" shim must be inserted between head of float needle pin and float arm. To adjust, bend float arms (there is no tang on float arm). *After adjustment, remove shim from between float needle and float arm.*

Float Drop: Hold float bowl cover assembly upright so that floats drop down to limit of travel. Measure distance from lower face of gasket on cover to bottom of floats at center using a scale. This distance should be 1¾" (all carburetors). Adjust by bending tang at rear of float assembly.

Positive Idle Stop Eccentric (Pontiac Tempest Manual Choke Carbs.): *NOTE - Not necessary to adjust unless eccentric becomes loose or is removed.* With choke valve wide open, rotate eccentric washer to a position where a clearance of .001—.006" is maintained between upper end of "kick—lever" and the "kick—cam". Secure eccentric washer in place with screw.

Fast Idle ("BC" Carburetors): *NOTE* - Fast idle speed is automatically set when hot or slow idle speed is adjusted (same screw controls both settings). Adjust fast idle cam position as follows:

Fast Idle Cam Position - Rotate fast idle cam until throttle stopscrew is on second (next to highest) step of cam and against the shoulder of the highest step. Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending choke connector rod at central angle using bending tool BT—18.

Fast Idle Cam Setting

Car & Carb.	Choke Opening	Checking Gauge
Chevy II "BC" Carbs.	.040"	BT-102
Chevrolet "BC" Carbs.	.040"	BT-102
Pontiac "BC" Carbs.	.081"	BT-193

Unloader ("BC" Carburetors): Open throttle valves to wide open position which will open choke valve slightly. Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever which contacts fast idle cam with bending tool BT—69.

Unloader Setting

Car & Carb.	Check Opening	Checking Gauge
Chevy II "BC" Carbs.	.230"	BT-99
Chevrolet "BC" Carbs.	.230"	BT-99
Pontiac "BC" Carbs.	.161"	BT-195

Automatic Choke: Adjust by loosening three retainer screws on choke cover and rotating cover and coil assembly. Centered setting is with scribed index mark on cover in line with longest (center) cast mark of scale on housing.

Choke Setting

Model & Carb.	Choke Setting
Chevy II (All)	① Centered (At Index)
Chev. Pass. (7020000, 106)	2 Points Rich
Chev. Pass. (7020003)	② 1 Point Lean
Chev. Pass. (7020107)	1 Point Rich
Chev. Pass. (7020005)	Centered (At Index)
Pontiac (All)	③ Centered (At Index)

① - Supersedes previous setting of "1 Point Rich" on synchro-mesh transmission cars.
② - Supersedes previous setting of "Centered At Index" on synchro-mesh transmission cars.
③ - Supersedes previous setting of "2 Points Rich".

OVERHAUL: *See 1961 Final, Page 261 and note the following:*

►*HEAT SUCTION TUBE SERVICING NOTE:* If tightening of loose seal with Tool BT—45 does not correct leakage, install new seal as follows: With carburetor fully assembled, loosen throttle body—to—bowl casting screws, then insert flared end of heat suction tube into hole in throttle body and tap seal lightly into position with Tool BT—45. Rotate tube while tapping to insure starting uniformly into throttle body. Tighten coupling nut at upper end of tube finger tight, using new packing on tube. Use a light hammer and Tool BT—45 to spread seal securely in throttle body (rotate tool to secure uniform spreading of seal). Loosen coupling nut at upper end of tube and check tube tightness in throttle body (tube should not turn). Tighten coupling nut securely, then tighten throttle body—to—bowl casting screws. Check seal for leaks after carburetor installed on engine.

SERVICE PARTS: Gasket Sets - Rochester No. 7015965 (Carb. No. 7015011, 7015021, 7015013); No. 7015966 (Carb. No. 7020000, 7020005, 7020106, 7020107, 7020003); No. 7016143 (Carb. No. 7020061, 7020062); No. 7016241 (Carb. No. 7020105, 7020108); No. 7016242 (Carb. No. 7020103, 7020115, 7020104, 7020114).
Off-Kar Kit - Rochester No. SR-301 (Carb. No. 7015011, 7015021, 7015013); SR-302 (Carb. No. 7020000, 7020003, 7020005, 7020106, 7020107); SR-306 (Carb. No. 7020105, 7020106); SR-307 (Carb. No. 7020103, 7020104); SR-308 (Carb. No. 7020114, 7020115); No. SR-603 (Carb. No. 7020062); No. SR-604 (Carb. No. 7020061).

No. 7020106, 7020107); No. 7016129 (Carb. No. 7020062); No. 7016221 (Carb. No. 7020105, 7020108); No. 7016222 (Carb. No. 7020103, 7020104); No. 7016231 (Carb. No. 7020061); No. 7016268 (Carb. No. 7020114, 7020115).

ROCHESTER TRIPLE CARBURETORS

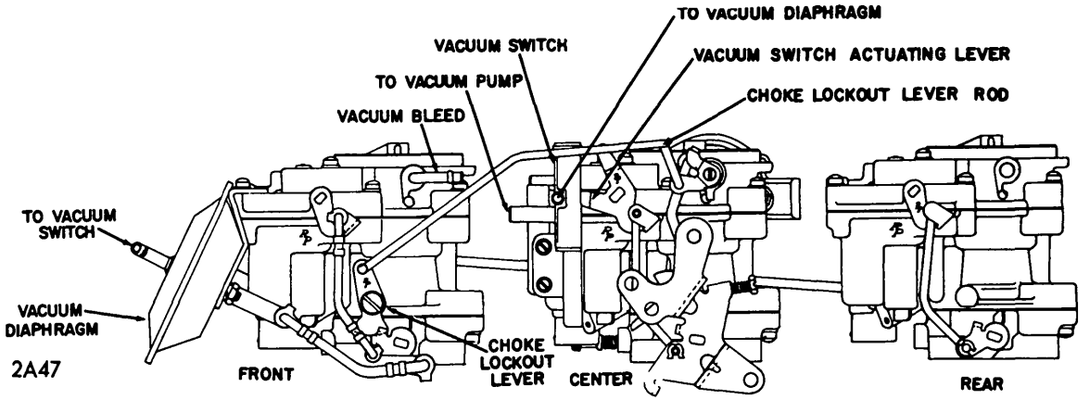
PONTIAC	Rochester Carb. No.
Synchro-Mesh Cars	
Front	2G 7013063
Center	2GC 7020064
Rear	2G 7013065
Automatic Transmission Cars	
Front	2G 7013063
Center (3-Spd. - 4-Stage - Hydra-matic)	2GC 7020069
Center (3-Spd. Hydra-Matic)	2GC 7020067
Rear	2G 7013065

DESCRIPTION: Carburetor design is same as used on previous models.

ADJUSTMENTS: Idle Speed & Mixture - *CAUTION - Make sure that the front and rear carburetor throttle valves are fully closed.* With engine at normal operating temperature, automatic choke not operating (choke valve wide open) and fast idle inoperative so engine idles at hot (or slow idle speed), and transmission selector lever in "D" (Drive) range on automatic transmission cars, proceed as follows: *NOTE - Carburetor air cleaner must be installed.* Set idle speed to correct engine RPM (see table below). Turn one idle mixture screw in or out to obtain highest vacuum and engine RPM, then repeat with other mixture screw (center carburetor only). Reset engine idle speed, then readjust idle mixture screws until highest engine RPM and smoothest idle mixture is obtained with highest vacuum.

►*IDLE SPEED ADJUSTMENT NOTE (Carburetors with Idle Compensator):* **This valve must be closed when idle speed is adjusted.** Press in on button located in idle compensator cover plate to hold valve closed during idle speed adjustment.

Car Model	Idle Speed Setting Synchro-mesh Trans.	Automatic Trans.
Pontiac (No Air.Cond.)	480-500 RPM	②480-500 RPM
Pontiac (With Air Cond.)	①540-560 RPM	②540-560 RPM



① - With Air Conditioner turned "OFF".
② - Transmission selector lever in "D" (Drive) range.

Throttle Return Check Adjustment: *See CARBURETOR on car model pages.*

Float Level: *CAUTION - Two separate adjustments (Float Level & Float Drop) required.*

Float Level Setting - Remove and invert float bowl cover and float assembly but do not remove cover gasket. Install Float Gauge BT-175 (23/32") on cover gasket at free end of float with long leg of gauge "T" seating squarely on gasket. Edge of float seam should just clear upper edge of gauge. Adjust by bending float arm near hinge pin.

Float Drop Setting - Hold bowl cover and float assembly upright so float hangs down at bottom of travel. Measure distance from lower face of cover gasket to bottom of float at free end using a scale or float level gauge BT-175 (with end of long leg of float gauge against cover gasket, bottom of float should be even with scribed line on gauge). This distance is 1¾". Adjust by bending float tang on rear of float arm as necessary.

ROCHESTER TRIPLE CARBURETOR INSTALLATION (TYPICAL)

Accelerating Pump Rod: *CAUTION - This is a linkage adjustment and not a seasonal setting.* With throttle valve completely closed (throttle stopscrew backed off on center carburetor), check distance from top of air horn as follows: Place float gauge squarely across top edge of air cleaner ring on air horn with "Pump" end of gauge "T" down toward connector rod. End of gauge should just touch top of pump connector rod. This distance is 1 1/8" (Center Carbs.); 55/64" (Front & Rear Carbs.). Adjust by bending pump connector rod.

Idle Vent (Center Carburetor): *NOTE - Adjust only after Accelerating Pump Rod Setting has been checked and adjusted.* Use the same gauge installed in same manner as for pump rod setting check (above) except that gauge should be inverted so that leg marked "Vent" is down toward connector rod. Slowly open throttle valves to point where vent valve just closes (rubber valve seats on pump housing on air horn). At this point, top of connector rod should just touch end of gauge. Adjust by bending tang on pump lever which contacts vent valve arm. Vent setting should be 1 1/32" (Gauge BT-175).

Vacuum Switch Setting (Center Carburetor): With throttle valves wide open, measure distance from top of switch housing to top of sliding switch post. This distance should be 1 5/32". To adjust, loosen two switch retaining screws holding switch on bracket, then move switch up or down as required. Check adjustment by opening and closing throttle valves with sliding switch post in upward position. Inside edge of vacuum switch closing tang must clear side of switch post.

Automatic Choke (Center Carburetor): Adjust by loosening choke cover retaining screws and rotating cover thermostatic coil assembly so it is Centered (At Index). *NOTE - With this setting, choke valve should be lightly closed at 75°F.*

Fast Idle Setting: Fast idle adjustment will be correct after "slow idle" speed and choke rod adjustments have been made (see below).

Choke Rod (Center Carburetor): Place idle speed screw on second step of fast idle cam next to high step. With choke trip lever in contact with choke counterweight lever, clearance between upper edge of choke valve and air horn wall should be .056" (Gauge BT-167). To adjust, bend tang on choke counterweight.

Unloader (Center Carburetor): With throttle valve held wide open, clearance between upper edge of choke valve and side of air horn wall should be .163", with .143-.183" permissible (Gauge BT-168). To adjust, bend tang on throttle lever as necessary to obtain correct clearance.

►*PONTIAC CHECKING NOTE:* It is recommended that throttle valves be opened by depressing accelerator pedal forcibly to the floor (by someone sitting in drivers seat) to simulate actual driving conditions. Make certain that pedal does not strike hump over transmission. Above procedure will eliminate all variances in linkage, floor mat, or pedal location.

Throttle Linkage (Front-to-Rear Carburetors): Disconnect throttle rod at rear carburetor throttle lever. With front and rear carburetor throttle valves completely closed, throttle rod should center in slot in throttle lever. Adjust by bending rod at existing bend, then connect rod.

Vacuum Diaphragm Link: With end carburetor throttle valves completely closed and vacuum diaphragm stem fully extended, end of vacuum unit actuating link should fit freely in hole in throttle lever on front carburetor. Adjust by bending actuating link.

OVERHAUL: *See 1960 Final Data, Page 301, or later Manual edition.*

SERVICE PARTS: Gasket Sets - Rochester No. 7015957 (Carb No. 7013063, 7013065); No. 7016148 (Carb. No. 7020067, 7020069); No. 7016146 (Carb No. 7020064).

Off-Car Kit - Rochester No. TR-607 (Carb. No. 7013063, 7013065); No. TR-611 (Carb. No. 7020064); No. TR-613 (Carb. No. 7020067, 7020069).

Repair Kit - Rochester No. 7015939 (Carb. No. 7013063, 7013065); No. 7016124 (Carb. No. 7020067, 7020069); No. 7016125 (Carb. No. 7020064).
